Differences of opinion about task issues (substantive/procedural conflicts) are considered healthy and can lead to improved performance (Ross, 1989). Having members participate in the development of a set of norms of acceptable and unacceptable behavior is one way to set the stage for positive group interaction (Schwarz, 1994) and discourage personal attacks. An example of a ground rule related to conflict is, "Criticize ideas, not people." Examples 2 and 3 under Internal Conflicts are examples of substantive/procedural issues. The facilitators in these cases attempted to increase information flow and clarify the perspectives of the different parties. Jandt and Gillette (1985) would agree that people in conflict situations should be encouraged to move away from polarized, single-issue positions and toward an understanding of the complexity of conflict. In other words, there is rarely just one right way to approach a situation. When multiple issues and alternative approaches are uncovered, there is greater chance for group members to make a decision that is agreeable to everyone. Groups often try to make decisions with insufficient information (Gouran, 1986; Kolb, 1996). That, in itself, may cause frustration and conflict as members form perceptions and make assumptions based on insufficient or erroneous information.

Affective Conflicts

Affective conflicts involve emotional battles that may or may not need to be resolved in order for the group to accomplish its purpose. Facilitator attempts to resolve such conflicts are sometimes called maintenance process interventions (Reddy, 1994) or deeper-level interventions (Schwarz, 1994). According to Schwarz, an interpersonal conflict situation between group members that keeps the group from accomplishing its goal would be classified as a Level 3, Instrumental intervention. In this case, the facilitator might ask the group, "Exactly what did members do in working with each other that led to not accomplishing the goals?" (Schwarz, 1994, p. 113). The extent to which group members should be involved in any attempted resolution of these conflicts depends on factors such as the purpose of the group (specifically whether one of the purposes of the group is to also improve its process), the skills of group members, time available, and the skills of the facilitator (Reddy, 1994; Schwarz, 1994). Facilitators may decide, as was the case in several situations cited in this article, to talk privately with individuals. In the case of substantive and/or procedural conflicts, however, group members should be involved since the conflict is related to the task. Interventions at Level 4, Interpersonal and Level 5, Intrapersonal, according to Schwarz (p. 113), involve such facilitator questions such as "How do you feel toward Joe and Bob when this happens?" and "Bob, why do you think you end up in conflicts more frequently than other group members?" Level 5 interventions, in particular, delve into emotional areas that are beyond the scope of most organizational facilitation situations and the skills of most facilitators.

An additional issue that emerged from the examples related to conflict is the extent to which facilitators report to management the results of a facilitation effort and/or process issues that might arise during a group meeting--e.g., Example 2 under Dysfunctional/Disruptive Member(s) where the facilitator reports the dysfunctional individual to his/her manager. Did the member know that this might occur? Questions of loyalty, trust, and credibility are involved in such decisions. Keyton (1994) and Seibold (1994) both raise questions about divided loyalties related to the conflict that may arise between the interests of management and the interests of group members. Whose interests must take precedence?" What about individual privacy rights when the facilitator decides that the group

should discuss why one person always ends up in conflict? Questions like this seem to make a further argument against facilitators becoming involved in Level 5 interventions.

It is interesting to reflect on how a facilitator's personal views and comfort level with conflict might affect the climate of the group, the group's approach to handling conflict, and the facilitator's own view on the disruptive nature of conflict. For example, a facilitator who is very uncomfortable with conflict of any kind might keep the group from fully discussing substantive issues that are essential for the group's success by intervening at the first sign of disagreement. Alternatively, a facilitator who enjoys "stirring things up" might encourage a level of conflict that is inappropriate given the purpose and culture of the group.

Contribution to HRD

Facilitators deal with a variety of issues and process concerns. The more information they have relevant to these issues and concerns, the better equipped they are to help groups improve their process and complete their tasks. This study is one step toward providing that information. In terms of future studies, research that sheds light on how facilitators and members might positively deal with conflict in task groups would be useful. Additionally, quantitative and qualitative studies that focus on the behaviors, skills, competencies, and concerns of facilitators working with groups and teams in organizational settings are needed.

Results of this study have implications for facilitator training. Training programs that include role plays and discussions of small group conflict situations would allow facilitators to practice and receive feedback on a variety of conflict management strategies. Pairing trainees with experienced facilitators for on-the-job training is another way for novice facilitators to develop skills.

A Test of a Rapid Developer Model: Workplace Factors Associated with Learning and Development

James A. Alexander
Instituto Tecnológico y de Estudios Superiores de Monterrey

The author constructed a literature-based "rapid developer model" that identified the work environment factors that could be expected to be associated with rapid development. The author then conducted an empirical test to determine the extent to which the model was supported in actual experience. The main hypothesis that employees identified as "rapid developers" by management would report differences from the comparison group was not supported. However, when employees themselves identified other employees as rapid developers, differences as predicted by the model were consistently discovered.

Keywords: Organizational Learning, Work Environment, Organization Changes

Introduction

How quickly individuals learn and develop new knowledge, skills, and mindsets directly contributes to performance. In fact, speed may well be the critical source of competitive advantage (Stalk & Hout, 1990). In order to flourish, people and organizations must learn to adapt faster and faster or be weeded out in the economic evolutionary process.

Three elements affect how quickly individuals learn and develop in organizations. The characteristics of the individual, the quality of the learning intervention, and the elements that compose the work environment have all been shown to impact the transfer of learning from formal setting to the job (Baldwin and Ford, 1988). All three of these must be considered both from the standpoint of their individual merits as well as from the effects of interaction among each other.

Analysis of learner characteristics and evaluations of effective learning interventions have been studied extensively, while very little research has examined the impact of workplace factors on learning. This is in spite of the fact that the role of the work environment has been speculated to be the most important contributor to how quickly learning and development occurs. Experts have estimated that factors in the workplace may well account for 80 to 85% of problems associated with learning and performance (Deming, 1982; Rummler & Brache, 1990); however, more empirical support is needed for the views of these authors.

This paper explores the work environment's role in how quickly people learn and develop in organizations undergoing significant change. First, a "rapid developer" model is presented. Next, the findings of an empirical test of the model are reviewed to determine the extent to which the rapid developer model was supported in actual experience. Finally, implications are explored and ideas offered for researchers and practitioners interested in improving the quality and the speed of learning.

Model Development

The literature on learning and development is distributed across a number of fields of study. The author reviewed the literature pertaining to workplace learning and development by experts in, performance technology, training, total quality, organization learning, and organization culture.

Quality experts Deming (1982) and Juran (1995) both state the critical importance of management providing a work environment with the correct elements in place for all employees to do their job well. The work environment factors of data, instruments, and incentives (Gilbert, and performance specifications, task interference, consequences, and feedback (Rummler & Brache, 1990) been proposed by performance technologists as the most critical elements to address in efforts to improve learning and performance. Tannenbaum and Yukl (1992) in their review of the training literature also provide evidence of the significance of both the pre- and post-training environment in transfer of training. For example, the presence of rewards and job aids encourage the application of new knowledge and skills, while lack of appropriate tools (such as necessary equipment) prohibit application. Later research demonstrates that social and goal cues, positive feedback, negative feedback, punishment consequences, extrinsic reinforcement consequences, intrinsic reinforcement consequences all have direct effect on post-training

Copyright © 1999 James A. Alexander

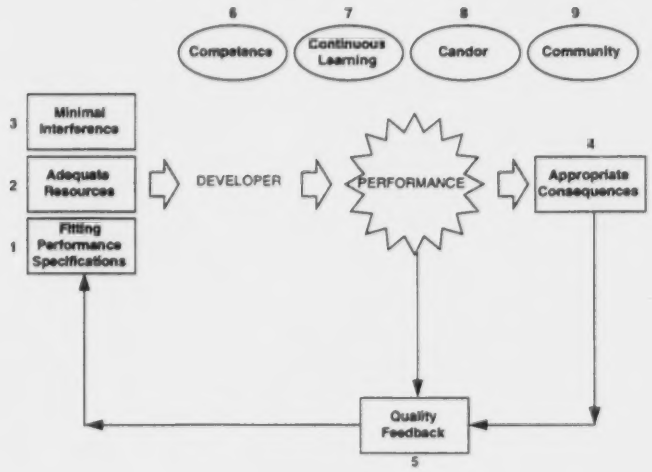
behavior (Tracy, Tannenbaum, & Kavanaugh, 1995). A common characteristic of the above factors is that all of them are under the immediate and the direct control of management.

Other workplace factors associated with learning and development uncovered in the literature review stem from the organization's culture. Culture is the set of shared, taken-for-granted, implicit assumptions that a group holds and determine how it perceives and reacts to various situations (Schein, 1992). Significant learning, (what Argyris and Schön (1997) call "double-loop learning," or what Juran (1995) terms "breakthrough") must address the culture by modifying the underlying norms, policies, and objectives of the organization.

Numerous cultural factors have been identified as contributing to learning and performance. What the authors describe as a continuous-learning culture (social support, continuous innovation, and competitiveness) had direct effects on post-training behavior (Tracy, Tannenbaum & Kavanaugh 1995) and job performance (Martineau, 1995). It has been postulated that in order to achieve organizational excellence, learning, competence, and justice must be an everyday part of the organization (Argyris 1990), and all members of the organization must begin struggling with a new level of self awareness, candor, and responsibility (Argyris 1994). Finally, and most importantly, it has been demonstrated that culture can have a major effect on an organization's long-term economic performance (Kotter & Heskett, 1992).

However, culture is the result of actions that take place over many years. Members of the culture will resist any and all efforts that they feel attack "their way of life" and efforts to change it in the short-run usually fail (Juran, 1995; Kotter, 1996). Since learning demands change and culture abhors change, the challenge then is to develop, over time, a culture that both embraces (and holds constant) learning and change (Schein, 1992). It is the primary role of the leader to create such a culture.

Figure 1: Rapid Developer Model



Based upon the commonalties discovered in the review, the researcher created a nine factor model which identified and defined the contextual factors that could be expected to be associated with rapid development. Five "situational factors", that appear to be under the immediate and direct control of management, and four "cultural factors", that are the product of leadership activities often formed over the course of years. Figure 1 displays the Rapid Developer Model.

Situational Factors

1. Fitting Performance Specifications

The fitting performance specifications factor is a central element of the work environment. The underlying rationale is that the better people understand expectations, where they come from, and why they are important, the better people will perform. This factor is present when performance specifications are clear, realistic, align with other expectations, and support the business strategy.

2. Adequate Resources

People need resources to meet the expectations of their jobs. Ideally, these resources should be available immediately whenever needed and packaged appropriately to productively complete required tasks. This factor is present when performers have the following resources when they need it: information, staffing, time and the appropriate tools.

3. Minimal Interference

For people to exhibit new behaviors, the proper steps must be in place that support their work efforts. Anything that interferes with people performing priority tasks must be eliminated or at least minimized. This factor is present when job procedures and workflow are logical for the new tasks, there are ample opportunities to perform new tasks, and the tasks can be done without interference from other tasks.

4. Appropriate Consequences

Consequences play an important role in the achievement of expectations. Along with the intrinsic consequences that the individual brings with him or her to the job, extrinsic consequences that impact behavior are found in the work setting. The appropriate positive consequences reinforce desired behavior while the appropriate negative consequences stifle undesired behavior. This factor is present when consequences are aligned to support the newly desired performance, aligned with other performance expectations, timely, and meaningful to the performer.

5. Quality Feedback

Feedback is important for individuals to gauge their performance in respect to goals and expectations. Feedback is especially important when people are experimenting with new behaviors. Quality feedback reinforces desired behavior and reduces non-productive behavior. This factor is present when feedback is relevant, accurate, timely, specific, and easy to understand.

Cultural Factors

6. Competence

Organizations can no longer tolerate individuals who do not contribute to the success of the enterprise. Politics can not be considered more important than performance in measuring employee value. Although hard work is often still seen as both admirable and desirable, it is being placed secondarily behind smart work that produces the same or greater results with less effort. This factor is present when: results are valued more than hard work, performance is more important than political connections in getting recognized and rewarded, individuals take personal responsibility for their actions, and there is tolerance of unusual style or behavior of the people who do good work.

7. Continuous Learning

Continuous learning is an organizational mindset that recognizes and values the need for both incremental gains and brand-new innovations by all organization members. Mistakes are not only tolerated but expected as a natural part of learning. This factor is present when: both continuous improvement and innovation are valued,

methodologies are present to support them, systems are in place to capture, store, and transfer knowledge, and quality failure is acceptable.

8. Candor

Candor is present in organization culture when people routinely question and challenge the unsupported talk and actions of all individuals whatever their rank or base of power. Organizational candor means that truth is much more important than saving face and that trust evolves through open and honest dialogue and reflection. This factor is present when: people are frank even when ideas directly confront those of superiors, people challenge the unsupported talk and actions of others, and people routinely stop to reflect about what they are doing and why.

9. Community

In a time of major change, people need the support and fellowship of other individuals at work. Shared commitment helps individuals to take risk knowing that others will help them. This factor is present when: people routinely support individuals who ask for help, people think of their roles in terms of the larger organization, and people are involved in change efforts and feel they can influence what happens.

Hypothesis

The hypothesis developed to test the credibility of the model was that rapid developers perceive more work environment factors are present than not-rapid developers. If the evidence supports this hypothesis, the case could be made that the work environment plays an important role in the speed of learning and development and the model is a useful tool in helping to determine rapid developers.

Methodology

Three organizations undergoing significant organizational change in which important learning interventions were occurring were chosen to participate in this study to test the rapid developer model. Populations from which research respondents were drawn were sales, service, and first-line supervision. Through personal and telephone interviews, extensive background research was conducted by the researcher to understand the organization history, context of the change, issues being addressed, details of the learning intervention, and new expectations of the target population.

A detailed process was put in place by the researcher to develop a criteria for rapid development specific to each organization. With researcher guidance, managers from the three organizations learned about rapid development and discussed the implications for their organization. A rapid developer was defined for the managers as "someone who has learned new information and exhibited new behaviors relevant to the changes quicker than other individuals. Ideally, these changes in behavior lead to results that align with the new expectations." The researcher emphasized that today's rapid developers are not necessarily today's top performers.

The group was then asked to list behaviors that would represent rapid development in their specific situation. Next, the managers were given a list of all the individuals in the population being studied and asked to identify the 10 individuals whom they thought were the most rapid developers from the start of the change intervention till the day of the session. Managers presented their choices giving examples of behavior to support their selection. The researcher facilitated the groups to discuss and come up through consensus a final list of 10 rapid developers. Random samples from the remaining individuals in the population were selected to act as a comparison group.

Early in the study, a design concern arose concerning the participating organization management's ability to identify rapid developers. This was first made evident during the gathering of background information and confirmed during the facilitation of the nomination of rapid developers. Managers, at least in these three organizations, are not accustomed to thinking about learning and development behavior nor monitoring developmental behavior outcomes. Managers may not have acquired the rational evidence needed to make valid judgments about who among their reports are rapid developers. Therefore, an additional source for nominating rapid developers was sought. It was postulated that the actual members of the population under study could accurately identify rapid developers based upon their first-hand experience. For these reasons, prior to actual implementation, a

"reality check" was integrated into the study with a question added to the interview in which all research respondents were asked to nominate their own list of rapid developers from the population under study.

An individual from each participating organization took the names of the 10 rapid developers nominated by management and the 10 individuals selected at random and faxed them to the interviewer. Individuals were not identified in any way. The interviewer was familiar with the general focus of the research but unaware of the research hypothesis or the specifics of the study design. Following the same questioning guidelines, extensive telephone interviews of the research respondents averaging about 30 minutes in length were conducted to learn their perceptions of the work environment factors purported by the research model to impact the speed of learning and development. All 58 interviews (two individuals were contacted but never interviewed) were recorded and transcribed word-for-word substituting names with codes.

Using the software program HyperResearch as a sorting tool, the researcher read each interview transcript, coding relevant comments into one of nine categories each representing a model factor. Rereading the comments relevant to a specific category, the researcher scored each of the nine factors as either being "present," "not present" or "not able to tell" for each participant. The "not able to tell" was chosen when either the participant stated that he or she did not know the answer to the question asked, the appropriate question was not asked, or the answer was ambiguous. Prior to conducting the research, certain questions were chosen to be the main determiners of the presence or absence of a factor. For example, here are the questions asked to learn about each respondent's perception of the fitting performance factor: "What are ___ expectations of you?" "What else?" "Any other expectations?" "It sounds like lots of things have changed these past ___ years. Which of these expectations are different than in the past?" "How so?" "Any other changes in what you are supposed to do?" "Are these new expectations clear?"* "Why do you say that?" "Are the new expectations realistic?"* "Say more". "Who was involved in determining these new expectations?" "How?" "What's the reason for all the changes any way?" For the researcher to consider this factor present for the respondent, positive responses were needed for each of the two asterisked questions. A similar approach was used for all nine factors.

At a later point in time, the researcher sorted the data by category. Not referencing the earlier analysis, the researcher read through the data by category and again scored each factor as present, not present, or not able to tell. The researcher then compared the two analyses finding a discrepancy rate of 8%. The researcher investigated each discrepancy by re-examining the sorted information as well as reading the entire transcript in question again to determine a final score.

Before learning which research participants had been selected by management or respondents as rapid developers, the researcher ranked respondents by the total number of factors perceived present and predicted that the top 10 individuals from each participating organization were the rapid developers. The researcher recorded the codes to these ten respondents in a memo and sent it to the organization sponsor before learning the organization's predictions of rapid developers.

Results

Table 1 demonstrates how well the model holds up when manager-selected rapid developers are compared to a randomly-selected group. The left-hand column labeled "category" shows that there were 28 individuals in the rapid developer group and 28 individuals in the comparison group for a total of 56 respondents. The next column to the right shows the counts and the percentages of the comparison groups by factor. For example, 48%, or 13 or 27, of the manager-selected rapid developer group, perceived that the Fitting Performance Specification factor was present. 50%, or 14 of 28, of the randomly-selected comparison group felt that the Fitting Performance Specification was present. This approach is used for all factors with the column at the far right providing totals for the rows.

The third row shows the column totals representing the overall average perception of all research participants combined. For example, scores ranged from a low of only about 12% of all respondents feeling that the Candor factor was present in their work environment to about 93% of all respondents feeling that the Community factor was present. Overall, the individuals interviewed felt that about 53% of the workplace factors were present in their work environment.

Logistic regression was chosen as the inferential statistics tests as it is appropriate both for the testing of categorical data as well as dealing with the multiple variables under analysis. The logistic regression test analyzes whether the proportion of factors present is greater for one group than another. Therefore, the null hypothesis was that there is no difference in the proportion of factors present between manager-selected and the comparison group. Statistics confirm what is visually apparent, there are no differences between the manager-selected and the randomly-selected comparison groups. The logistic regression analysis reveals a probability of 0.52. A probability of

less than .05 is necessary to reject the null hypothesis. Hence, the null hypothesis in not rejected and the model is not supported when managers select the rapid developers.

Table 2 shows counts and percentages for the respondent-selected rapid developers versus a comparison group. The respondent-selected group is composed of the 13 individuals selected by respondents as rapid developers who were actually interviewed. The comparison group consists of the remaining 43 individuals interviewed who were not selected as rapid developers by research respondents. Review of the data shows that respondent-selected rapid developers show more presence than the comparison group on all nine of the work environment factors. The logistic regression test was again used to look for differences between these two groups. In this case, the null hypothesis was that there is no difference in the proportion of factors present between the respondent selected and the comparison group. When making this comparison, the logistic regression analysis displays a probability of 0.03 with a positive parameter estimate. Thus, there is a difference between these two groups and the model is supported when respondents select the rapid developers.

Conclusion

Assuming that managers did not know who the rapid developers were and the peer group did, the data show that the presence of workplace factors are associated with rapid development. These research findings provide needed empirical support for the thinking of theorists, the research-to-date on the work environment, and the experience of practitioners. An enabling work environment appears to be vital to learning, change, and performance. If the results of this study are representative of what would be found in other organizations, then these findings help provide rationale for: (a) why major organizational change is so difficult, takes so long, and often fails; (b) why individuals undergo such stress, frustration, and great difficulty in adapting to major change; and (c) why the return on training and other learning interventions is typically so marginal.

However, the findings also present a major opportunity. On average, the data show that the organizations participating in the study were operating at about 50% of their desired level of performance regarding workplace factors associated with learning and development. The opportunity to close this gap provides a performance improvement potential of 100%. Focusing management resources on improving the work environment can provide an excellent learning and performance ROI. If additional research continues to support these findings, it would support several recommendations that can be made at this time.

Fix the Work Environment First. In two of the three organizations, senior management strongly stated their commitment to dramatic change in the operation of their organizations. Great emphasis had been placed upon providing whatever resources were required including large amounts of training and other learning interventions to all members of the populations under study. However, after one and two years respectively, results had not met senior manager expectations. Although these executives strongly espoused the business need for rapid learning and development, none had taken steps specifically aimed at addressing the work environment. In light of the limited presence of overall work environment factors, the principle of fixing the learning environment before addressing the specific needs of the learner (Gilbert, 1978; Rummler & Brache, 1990) gains credence. The data suggest that management efforts aimed at first clearly understanding, defining, and communicating each of the model factors in light of the organizational changes could speed learning and performance.

Provide Managers with the Information They Need. Although the concept of rapid development was readily confirmed as being extremely significant, the construct of rapid development specific to any of the organizations had not been developed. No definition existed, no goals were in place, no measures upon which to compare and improve were available. When management determined a clear definition of what rapid development should look like in their organization, they had very little data upon which to make selections. Without the appropriate information, management was out of touch and therefore unable to identify rapid developers nor able to provide the appropriate managerial support necessary to accelerate the learning process. Educating managers about the significance of the work environment regarding change, learning, and performance, then defining and operationalizing rapid learning and development relative to their organization can help provide managers with the necessary information required to guide, monitor, and support organization change.

Use the Model as a Change Tool. The model may have use at several points whenever organization change is occurring and subsequently learning and development is important. The model may be used at the onset

of a change intervention to evaluate organization readiness. The findings can be used to increase management's awareness of the work environment relevant to learning, its importance in the change process, and assess areas of strength and concern. It can also postpone the seemingly ever-present urge to hurl training immediately at all concerned.

For example, a task force of individuals targeted for the change can be armed with the model and charged with determining the status of the current work environment and suggesting changes to make it supportive of the new expectations. If the model is supported by further research it could also be used to measure progress by reassessing the work environment during the change. This will give information toward successes and challenges as well as help focus remedial activities and improve on-going efforts.

Expand the Research Base. This research is a case study which includes only the information from three organizations. Replicating the research with more organizations makes sense as a first step. Other proofs of reality (beyond perceptions) would add to the strength of the findings, especially since the concept of rapid developers is not common to current thinking. Using techniques similar to observation of exemplar performers (Gilbert, 1978), observations of both rapid and not-rapid developers would help to compare and contrast behaviors of thinking, doing, and reflecting. In addition, it would be helpful if future studies included some performance measurement to link learning and development to outcomes. Finally, this study is limited to exploring the work environment's role in how quickly people learn and develop in organizations undergoing significant change. Studies able to address both the work environment and the characteristics of the learner could shed light as to how these important variables work together.

Barriers to Transformation Change: High Performance Workplace Practices and Unionized Companies

Joseph A. Benkowski
University of Wisconsin-Stout

The purpose of this study was to identify which characteristics of high-performance workplaces as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) in the categories of training, participation, organization, and partnership are being practiced at unionized companies in Wisconsin. Also examined is the relationship between the implementation level of these high performance workplace practices and the level of labor-management cooperation. The study results provide both management and union officials with research regarding the influence of cooperation in achieving economic success, in part, through the implementation of high-performance work practices involving training, participation, organization, and partnership.

Keywords: High Performance Organizations, Transformation and Unions, Labor Management Cooperation

Many of the traditional work practices initiated by unions in the 1930s and 1940s are being challenged by corporate America in the form of high performance organizations. In this new structure workers have been given greater responsibilities in their jobs as a means of reducing the decision making process. Contrary to this belief, unions and management have carefully constructed contract language known as management rights that go against high performance initiatives.

Expounding on this issue, a barrier that has limited the transformation process of organizations in moving to high-performance is management's inability to make complementary changes in managerial practices and production practices. Without such changes in management practices, the needed changes in work practices or labor relations have limited payoffs (Kochan, Katz, and McKersie, 1994). No magic formula exists for creating successful employee involvement. Nonetheless, organizations striving to tap into the resources of their workforce must build support from employees, managers, unions, and business partners (Levine, 1995). In a unionized company, changes to a high performance workplace would appear to be dependent on cooperation between management and labor.

Research Questions

The following research questions were developed to explore the following issues:

1. To what extent have the 15 high performance workplace practices as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) been implemented at all or only selected manufacturing unionized companies in Wisconsin?
2. What is the relationship between the implementation level of the practices as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) for the categories of strategic planning, training and human resources and the level of cooperation between union and management?

Three preconditions are required to develop employee support and capacity for employee involvement to succeed. First, workers need to be involved and given some responsibility for organizational change and daily work planning. Employees need mechanisms through which their suggestions may be evaluated and implemented. If jobs are narrowly defined and rigid, workers have less opportunity to make suggestions. Second, employees must be motivated to make improvements. While the incentive mechanisms in high-performance organizations vary widely, the objectives are to share the rewards gained from new ideas. Third, workers must be capable of making improvements. Their knowledge and skills need to be developed through training and continuous learning, and their ideas and recommendations are given consideration through information exchanges (Levine, 1995). Recent evidence shows that there has been widespread experimentation with a variety of participatory techniques and substantial

Copyright © 1999 Joseph A. Benkowski

changes in work rules. The data also shows, however, that the extent of work restructuring is often limited and piecemeal (Kochan, Katz and McKersie, 1994).

Methodology

Survey Population and Sample

The researcher contacted several sources in an effort to obtain a published list of unionized companies in Wisconsin. The sources included the U.S. Department of Labor, Washington D.C.; the Department of Labor in Wisconsin; the AFL-CIO, Milwaukee, Wisconsin; and the state senator's office in Milwaukee, Wisconsin. The researcher was told by each source that a list of this nature was not developed. A list was finally developed on the advisement of Dr. Paula Voos, University of Wisconsin. In her 1987 study, *The influence of cooperative programs on union-management relations, flexibility, and other labor relations outcomes*, Dr. Voos was able to construct a list of unionized firms in Wisconsin through the Wisconsin Employee Relations Commission in Madison, Wisconsin. Unions are required by state law to file with the Wisconsin Employee Relations Commission for "Reopener Notices" at the expiration of a collective bargaining agreement. A reopener notice is a formal document that is sent to the Wisconsin Employment Relations Commission making them aware that union and management of a specific company has opened their renegotiation process.

The information provided in this document includes the company and contact person, plus the name of the union and their representative. It also includes the number of employees in the company and the number of employees covered by the contract. It also states the principle product or service of the company.

The same methodology was used for this study, with one exception. Since the length of contracts varies from 1 to 4 years, the researcher selected reopener notices with 50 or more employees for the years 1993-1996. A total of 995 reopener notices were obtained. The reopener notices represented union contracts with labor membership employed in the job cluster of manufacturing, construction, office workers, health care, trucking, banking, and warehousing. Based on the review of literature, only manufacturing organizations were surveyed for this study. A total of 388 manufacturing companies were identified from the obtained reopener notices.

During the selection of the manufacturing reopener notices, the process revealed that union officials often represented more than one organization. The researcher determined that sending more than one survey to the same union official could lead to confusion. A total of 152 individual union representatives were identified from the reopener notices. Selection of the manufacturing organizations was done by using a computer printout that was developed for the initial list of manufacturing firms. A random sampling process was used from the computer printout to obtain 152 companies. Union representatives were then selected to match the organization they represent. A survey population of 304 was based on this process. The reopener notices provided the names and addresses of the union and the company official responsible for the collective bargaining agreement.

Instrumentation and Data Collection

A survey instrument was used to collect the data pertaining to the research questions. The instrument was developed based on research done in two previous studies. The first research study was conducted by Work in America. In this study the research was conducted by analyzing organizations that have characteristics of a high performance workplace. These studies have repeatedly found that human resources, as it reflects in the skills and commitment of the workforce, are more effective through partnerships that are focused on common goals and equal involvement of all stakeholders in policy and other decision making. The study was conducted with the help of management executives, union leaders, and academic experts in human resource management. The selection was based on members' previous involvement and experiences in new relationships that made operations, labor, and human resources management full partners in achieving and sustaining competitive advantage. As a result of this study a list of 10 key features were established which complemented the study done by the U.S. Department of Labor.

In 1993 a growing number of U.S. companies recognized that today's business environment requires them to be innovative in the way they do work. To assist companies facing these challenges of change and to educate those companies in search of becoming a high-performance organization, the Office of the American Workplace (OAW) was created in 1993 under the Department of Labor. Its' mission is to encourage good workplace practices that lead to better jobs and better business results. The Office of the American Workplace used the experiences of a large number of companies to do the research. The main thrust of the research was to identify key indicators that

companies could use in gauging their effectiveness in becoming a high performance organization. The key indicators were similar to those of the Work in America study.

Following are the 15 key indicators used in this research:

1. Workers are actively involved in redefining their jobs.
2. Workers modify their work processes to correct quality problems or procedures.
3. Workers modify their work processes to correct production problems or procedures.
4. Workers modify their work processes to correct safety problems or procedures.
5. Workers are actively involved in meeting internal customers.
6. Workers are actively involved in the selection of new technology.
7. Individuals or teams receive feedback about the workers suggestions.
8. Workers are organized into teams with substantial authority.
9. Cross-functional teams or other mechanisms are used to increase innovation across organizational boundaries.
10. The plant organization has reduced the layers of management from previous organizational structures.
11. The company and the union engage in innovative collective bargaining agreements.
12. Current training programs are explicitly implemented to support strategic plans.
13. Current training programs are developed to support continuous learning.
14. Training expenditures are distributed across the company's entire workforce.
15. Training programs are evaluated for their effectiveness.

To develop the questionnaire the researcher used the 10 work practices identified in the Office of the American Workplace. The questions were modified, since several of the workplace practices statement related to multiple points. With the modification a total of 15 statements were used in the survey. The organizational characteristics used in the survey were from a previous study done by Dr. Paula Voos, which was titled *The influence of cooperative programs on union-management relations, flexibility, and labor relations outcomes*. The researcher received permission to use the organizational characteristics.

Dillman (1978) recommended a three-step approach to pretesting. The researcher followed Dillman's suggestions for improving the survey. The first step was to send the survey to a select group of five training professionals who have in-depth knowledge of high performance organizations. They were asked to review the survey for clarity of questions and directions, as well as the layout and flow of the survey. Modifications were made on their recommendations.

The second step was to have a group of potential users of the data examine the survey instrument. Here the researcher made a modification from Dillman's recommendation. Instead of potential users, six experts in the field of high performance were selected to evaluate the survey using the same criteria as in step 1. This was done so that personnel in the survey population would not be asked twice to provide information.

The third step as recommended by Dillman (1978) is to collect pretest information from subjects drawn from the population to be surveyed. A pilot study was conducted by mailing a cover letter, the survey, a return envelope and a return postcard, which was used to identify which firms returned the survey. The pilot study included 32 of the 304 study participants, approximately 10 percent of the population. The pilot study was conducted to estimate the rate of return and to determine if modifications to the survey were necessary. Of the 32 surveys mailed for the pilot test, 22 were returned, 12 from management and 10 from labor. This represented a response rate of 70 percent. No modifications to the survey were deemed necessary.

The adjusted study population included 272 unionized Wisconsin firms (pretest participants not included). Just as in the pilot survey, those not responding to the initial mailing were contacted by phone. A total of 137 surveys were returned. In addition to the 22 surveys returned from the pilot survey a total of 159 were received from the participants representing a 52.3 percent return rate. Of the 159 surveys returned 65 came from union representatives and 94 from management.

Findings

Parts 1 and 2 of the questionnaire consisted of questions relating *to organizational characteristics*. Respondents answered the first question of union responses that were based on plant, divisions, and/or departments. as a *corporation, business unit or a division and/or a department*. There were 58.5 percent, which accounted for the greatest number of single union responses. Management's greatest single response was as a corporation accounting

for 37.2 percent. In the category of *total number of employees*, union had the greatest frequency in the category of 100-249 employees, which accounted for 29.2 percent of the responses. This was also the most frequent response for management at 33 percent. The next largest category was 250-499 employees: 21.5 percent for union and 21.3 percent for management. *The type of organization for which they were completing the survey*: both union and management had the greatest response to 'other,' which included manufacturing of hydraulics components, metal fabrication and sheet metal, union having a response of 46.1 percent and management with a response of 51.1 percent. Assembly was next with union having a response of 15.1 percent and management with 12.8 percent.

Years your organization has been involved in building partnerships for high performance: one to three years was the greatest response for union and management; 32.3 for union and 30.9 for management. Four to six years was the second largest response for union and management. Union representatives had a response of 16.9 percent for zero years of being involved in high performance, and management had a response of 8.5 percent

In the category of reasons the company had to change from its present way of doing business: the percent given for each question was based on a separate response, since more than one response could be given. Union and management both gave a major change in production technology as the most frequent response with 53.3 percent for union and management with 47.9 percent. They also gave changes in the amount of skills required by workers as their second response for change with 46.2 percent for unions and 39.4 percent for management. Major change in industrial bargaining patterns, was the third most frequent response for both union and management, union had a response of 36.9 percent compared to 14.9 for management.

Since 1992 have any of the following changed for your company? The most frequent response was international competition followed by non-union domestic firms. The last statement, *which of the following best describes your organization's strategy for achieving competitive advantages*: forty percent of the union representatives indicated that service at a lower cost than competitors was the advantage, while management had a 35.1 percent for better quality or different product as their organizations strategy.

ResearchQuestion #1: To what extent have the 15 workplace practices as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) been implemented at all or only selected unionized companies in Wisconsin

Table 1 T-test was used to determine significance between union and management mean scores. Nine out of the fifteen workplace practices showed a difference existed at the .05 level. In all nine workplace practices management means were higher than the union means.

Table 1

Description of Implementation Practices in Unionized Companies in Wisconsin as Viewed by Management and Labor

Workplace Practices #	Management Mean	Union Mean	Management Standard Deviation	Union Standard Deviation	Management Median	Union Median	p
1	33.66	32.46	24.13	27.62	30	30	.08
2	53.72	44.15	26.15	27.27	60	40	.03
3	51.81	44.77	26.56	28.84	50	50	.14
4	60.53	54.31	25.58	28.34	65	60	.16
5	42.77	30.92	28.34	29.19	40	20	.01
6	38.62	30.15	26.34	26.37	40	30	.05
7	50.85	35.38	28.31	29.74	50	30	.00
8	33.09	28.46	28.06	26.47	30	20	.29
9	39.36	28.31	28.31	26.63	40	20	.01
10	49.68	28.77	33.00	27.75	50	30	.41
11	44.36	40.31	29.53	30.46	40	40	.41
12	42.87	29.85	26.87	24.65	50	30	.00
13	45.21	31.91	28.99	23.89	40	30	.00
14	50.22	29.38	31.62	27.94	50	20	.00
15	45.74	30.78	30.62	28.08	50	20	.00

Note. Management responses to all workplace practices were 45.5 percent, while labor responses were 30 percent to all workplace practices.

Research Question #2 - What is the relationship between the implementation level of the practices as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) for the categories of strategic planning, training and human resources and the level of cooperation between management and labor.

Table 2

Frequency Distribution of the Implementation Level of Strategic Planning as Reported by Management and Labor

Question: To what extent has your organization followed a business strategy to develop a partnership between union and management in the following?	Management (N = 91)		Union (N = 58)	
	M	S.D.	M	S.D.
Delegating decision-making authority to the lowest level of the organization.	2.98	1.14	2.31	1.16
Mutually agreeing on organizational goals.	2.48	1.14	2.40	1.26
Mutually agreeing on organizational structure redesign.	2.25	1.11	2.10	1.07
Mutually agreeing on improved communications.	3.08	1.10	2.79	1.20
Implementing strategic plans.	2.41	1.17	2.28	1.17
Creating a shared mission and vision.	2.80	1.34	2.57	1.23
Specifying business objectives to drive training.	2.58	1.21	2.43	1.17
Providing a sustainable competitive advantage through training.	2.71	1.16	3.20	1.02

Note. Response scale 1 = no extent 2 = very little extent 3 = some extent 4 = considerable extent 5 = very great extent

Three management personnel and seven union representatives indicated "does not apply."

Table 3

Frequency Distribution of the Implementation Level of Training as Reported by Management and Labor

To what extent do the following statements reflect your union's involvement in training?	Management (N = 89)		Union (N = 58)	
	M	S.D.	M	S.D.
Developing a formal, jointly written mission statement that outlines the role of training in supporting your overall business strategy.	2.03	1.13	2.40	1.30
Assisting in developing a plan for training.	2.55	1.23	2.55	1.24
Assisting in supporting and implementing of a plan for training.	2.72	1.25	2.76	1.27
Participating in developing a training curricula.	2.53	1.27	2.52	1.27
Participating in developing standards for training.	2.38	1.23	2.26	1.22
Participating as instructors in on the job peer training.	3.01	1.32	2.71	1.36
Establishing training budgets.	1.80	1.17	1.72	.98
Giving training to supervisors (team leaders) in their new roles as a coach.	2.14	1.22	2.05	1.14

Note. Response scale 1 = no extent 2 = very little extent 3 = some extent 4 = considerable extent 5 = very great extent

Seven management personnel and union representatives indicated "does not apply."

Table 4

Frequency Distribution of the Implementation Level of Human Resources as Reported by Management and Labor

To what extent do the following statements reflect the success of your Human Resources Department?	Management (N = 89) M	S.D.	Union (N = 54) M	S.D.
Modifying work rules to provide for greater worker flexibility.	3.02	1.13	2.63	1.69
Developing new compensation programs rewarding desired worker commitment and behavior.	2.63	1.13	2.06	1.02
Partnering with union, when possible, in business decisions.	2.79	1.21	2.26	1.29
Making changes in contractual agreements, when possible, to increase worker flexibility.	3.21	1.09	2.83	1.21
Basing partnerships on a foundation of mutual trust and respect between parties.	3.35	1.08	2.67	1.26
Recognizing the central role of collective bargaining but are committed to shifting issues into joint problem-solving forums.	3.11	1.15	2.35	1.22
Improving overall union relationship in collective bargaining process.	3.48	1.08	2.76	1.24

Note. Response scale 1 = no extent 2 = very little extent 3 = some extent 4 = considerable extent 5 = very great extent

Five management personnel and twelve union representatives indicated "does not apply."

Instead of doing a statistical analysis of each individual workplace practice in table 1 of the survey, the researcher matched each workplace practice to one of the three dependent variables—strategic planning, human resources, and training in tables 2-4. The match was based on the relevance of the workplace practice to the dependent variable. The sum average of strategic planning, human resources, and training was used as the dependent variable to calculate the regression analysis. The 15 workplace practices were the independent variables used in the regression analysis and were grouped as follows: strategic planning, questions 1-9: human resources, questions 10-11: and training, questions 12-15. A separate regression analysis was calculated for each independent variable.

The frequency response by management to workplace practices 1-9 in strategic planning, only workplace practice 6 (approached significance, $p = .083$) "workers are actively involved in the selection of new technology" and workplace practice 9 (approached significance, $p = .66$) "workers are organized into teams with substantial authority". The frequency response by the union did not show a relationship with workplace practices 1-9.

The frequency response by management to workplace practices 10-11 in human resources showed a significant relationship. Workplace practice 10 (significance, $p = .023$) "the plant organization has reduced the layers of management from previous organizational structures", and workplace practice 11 (significance, $p = .000$) "the company and the union engage in innovative collective bargaining agreements.

Conclusions and Implications

This research found that all 15 workplace practices as recommended by the U.S. Department of Labor's Office of the American Workplace (1994) are being implemented at various levels in unionized manufacturing companies in Wisconsin. This research found a positive relationship between the implementation levels of four workplace

practices: workers modify their work processes to correct safety problems or procedures; workers modify their work processes to correct production problems or procedures; and workers modify their work processes to correct quality problems or procedures. The company and union engage in innovative collective bargaining agreements.

On the other hand, three workplace practices that did not have a high level of relationship included: workers are actively involved in redefining their jobs; current training programs are developed to support continuous learning; and, workers are actively involved in selecting new technology. The research also found seven workplace practices where management and labor had a low relationship:

- Workers are actively involved in meeting internal customers
- Individuals or teams receive feedback about workers' suggestions
- Workers are organized into teams with substantial authority
- Cross functional teams or other mechanisms are used to increase innovation across organizational boundaries
- Plant organization had reduced the layers of management from previous organizational structures
- Training expenditures were distributed across the entire workforce
- Training programs were evaluated for their effectiveness

This study provided general information on how management and labor perceive their relationship in building high performance organizations. Although the findings of this study indicate that more work is needed to increase the partnership between labor and management, there were several elements that came from the general characteristics of this study that indicated both sides recognized the importance of building a partnership if unionized American industry is to survive. They recognized that production technology was changing and the skills of workers must be increased to meet these changes. Products and services have to be at a lower cost than those of their competitors and the quality has to be increased. They also agreed that different products were needed to stay competitive. In the past four years both agreed that domestic non-union firms had been their biggest competition.

For the implementation level of these 15 workplace practices to increase, management and labor have to take serious note of the Work in America study (1994) which suggests that "partnership is to exhibit the ability of both partners to balance business needs and the interests of employees. As increasing use of joint problem solving helps to break down old distinctions between labor and management thinking and behavior, both recognized that the economic and social levels are interdependent and began to share responsibility of both" (p. 6). Other findings in the study include elements critical to strong partnership, including leadership commitment, gradual building of trust at all levels; sharing power, responsibility, information, and economic gains; and sufficient investment in change.

Assessing Organizational Readiness for Learning Through Evaluative Inquiry

Hallie Preskill
University of New Mexico
Albuquerque, New Mexico

Rosalie T. Torres
Developmental Studies Center
Oakland, California

In this paper we first review the concept of organizational learning and how it can be facilitated by evaluative inquiry. We then describe the status of HRD evaluation and argue that HRD evaluation should be reconceptualized as a process for facilitating individual, team and organizational learning. Finally, we describe our efforts to develop an instrument that HRD professionals can use for assessing an organization's readiness to engage in learning through evaluative inquiry.

Keywords: Evaluation, Organizational Learning, Assessment

To say that times are changing seems trite today and terribly obvious. In just a few years we have seen major shifts in how organizations are meeting the challenges of a changing global economy, emerging technologies, and an evolving, ever-expanding, multi-cultural workforce. While writers on organizational change and management theory offer a plethora of recipes for achieving success in this dynamic environment, there is growing consensus that the organizations which survive will be flexible, adaptive, and quick to respond to changing conditions, and will use information to make decisions. These organizations understand the value of human capital and will develop systems and processes that maximize all employees' ability to contribute to the organization's success. Intellectual capital -- employees' knowledge, information, intellectual property, and experience will determine the organization's future (Stewart, 1997). As Davis (1996) explains, organizations that make the transition to the knowledge era will learn how to generate, use, and sell information, regardless of the business they are in.

Organizational Learning

Even before management experts started talking about intellectual capital and the coming knowledge era, Argyris and Schon (1978, 1996) were exploring the concept of organizational learning and its role in facilitating organizational change. Since then, many other researchers have contributed to our understanding of organizational learning principles and the characteristics of learning organizations (for example, see DiBella & Nevis, 1997; Dixon, 1994; Marquardt, 1996; Senge, 1990; Watkins & Marsick, 1993). While some researchers and theorists have focused on how organizations as whole systems adapt or change, others have focused on how individuals learn in organizations; that is, how they develop, adapt and update their cognitive models (Edmondson & Moingeon, 1998). However, based on their review of 22 case examples of organizational learning, Watkins and Marsick (1996, p. 10) conclude that most models share the following attributes:

- Learning organizations focus on organizational learning and transformation; it is not enough for individuals to learn.
- Structures and systems are created to ensure that knowledge is captured and shared for use in the organization's memory.
- Leaders and employees at all levels think systematically about the impact of their decisions and work within the total system.
- Learning is built into work structures, politics, and practices.
- Learning is transformative in some way, although it is likely that some new learning will also be adaptive.
- Learning has a greater impact when it involves a greater percentage of the employee population.
- Organizational systems and politics are structured to support, facilitate, and reward learning for individuals, teams, and the organization.

Copyright © 1999 Hallie Preskill & Rosalie T. Torres

- Measurement systems benchmark current knowledge and culture and monitor progress toward becoming a learning organization.

In sum, organizational learning can be viewed as, "a continuous process of organizational growth and improvement that: (a) is integrated with work activities, (b) invokes the alignment of values, attitudes, and perceptions among organizational members, and (c) uses information or feedback about both processes and outcomes to make changes" (Torres, Preskill & Piontek, 1996, p. 2). In this sense, organizational learning represents the organization's commitment to using all of its members' capabilities. It is different from individual and team learning in that organizational learning is dependent on individuals and teams sharing their learning in an ongoing, systemic way. Ultimately, organizational learning is about creating continuous processes and mechanisms for learning about how to do things better. In the next section, we discuss the relationship among traditional evaluation practice in HRD, evaluative inquiry, and organizational learning.

Linking Organizational Learning and Evaluative Inquiry

The term evaluation has traditionally been defined as a process of gathering information to make determinations about a program's value, merit or worth (Scriven, 1991 Patton, 1997). In the evaluation field there has been a recent shift from viewing evaluation as a summative activity conducted by external evaluators, to one that is more participatory, internal, and improvement-focused (Preskill & Caracelli, 1997). In the HRD field, evaluation has often been considered part of a program's design process (Andrews & Goodson, 1980; Banathy, 1968; Dick & Carey, 1985; Rothwell & Kazanas, 1998). In linear instructional design (ISD) models, evaluation is typically placed at the end-point of the model. For this reason, and for others, evaluation has been construed as a costly and time-consuming add-on activity that occurs more as an event than as a process (Hilbert, Preskill & Russ-Eft, 1997). As a result, the benefits of evaluation are often overlooked or ignored as a means for providing relevant and useful information for decision-making.

Given the changing nature of organizations and societies, we have come to believe that evaluation must also be reconceptualized to focus on how individuals, team, and organizations can learning from evaluative inquiry (Preskill & Torres, 1999). As a result of our research over the last five years, we have developed a framework for helping organizations engage in evaluative inquiry that results in individual, team and organizational learning. Our framework is based on the following assertions:

- Dialogue, reflection, asking questions and identifying and clarifying values, beliefs, assumptions and knowledge are critical to learning from evaluative inquiry.
- Learning occurs through the social construction of knowledge and can be transformative when stakeholders are able to alter their perceptions and understandings of that which is being evaluated.
- Learning from evaluation occurs within the context of the organization and is therefore mediated by the organization's internal systems and structures.
- Evaluation must be increasingly responsive to the evolving information and decision- making needs of organizations.
- Evaluative inquiry should be ongoing and integrated into all work practices.

Evaluative inquiry for organizational learning and change encompasses the following:

- A focus on program and organizational processes as well as outcomes;
- Shared individual, team and organizational learning;
- Education and training of organizational practitioners in inquiry skills;
- Modeling the behaviors of collaboration, cooperation, and participation;
- Establishing linkages between learning and performance;
- Searching for ways to create greater understanding of the variables that affect organizational success and failure; and,
- Using a diversity of perspectives to develop understanding about organizational issues.

While evaluation's primary focus has been on the "program" as the unit of analysis, evaluative inquiry addresses issues and concerns individuals may have about various processes and systems at the departmental or

organizational level as well. Thus, the unit of analysis is wherever the problem or concern is identified (Preskill & Torres, in press).

Phases of Evaluative Inquiry for Learning in Organizations

Evaluative inquiry for learning consists of three specific phases (see Figure 1). In the *Focusing the Inquiry* phase, evaluation team members determine what issues and concerns the evaluative effort will address, who the stakeholders are, and what questions will guide the evaluative inquiry. In the next phase, *Carrying Out the Inquiry*, organization members determine the most appropriate inquiry design, methods of data collection, analysis and interpretation, and communicating and reporting strategies. The third phase, *Applying Learning* , asks organization members to develop strategies that address the evaluative inquiry's outcomes, design and implement action plans based on these strategies, and monitor the progress of actions taken.

Evaluative Inquiry Learning Processes

As each of the inquiry phases (Focusing the Inquiry, Carrying Out the Inquiry, and Applying Learning) are implemented, organization members come together to engage in the learning processes of: (1) Dialogue, (2) Reflection, (3) Asking Questions, and (4) Identifying and Clarifying Values, Beliefs, Assumptions, and Knowledge (see Figure 1). By participating in these processes throughout evaluative inquiry efforts, greater insights and understandings about organizational issues are developed. Ultimately, these insights and understandings lead to informed decisions for organizational change. It is important to note that we do not view these processes as linear. For example, individuals do not necessarily first reflect, then ask questions and then identify their own values and beliefs. Rather, these learning processes occur through a dynamic, fluid, social interaction among organizational members.

Elements of Organizational Infrastructure

In large part, the success of evaluative inquiry is based on an organization's infrastructure; that is, the strength of the underlying foundation or framework for supporting learning within the organization. An organization's infrastructure can strongly influence the extent to which organization members learn from evaluative inquiry and use their learning to support personal and organizational goals. The elements of the organization's infrastructure include: culture, leadership, communication, systems and structures. The nature of these components provides the footing on which evaluative inquiry efforts can be undertaken and sustained. That is, these components will facilitate or inhibit organizational learning from evaluative inquiry to varying degrees, depending on how they operate within the organization.

The Need for a Readiness Instrument to Assess Learning Through Evaluative Inquiry

As we've worked with organizations interested in applying our framework, we've learned that organizations are often uncertain of where to start. They are unclear as to where their organization currently stands with regard to their readiness not only for organizational learning, but also for learning from evaluation, in particular. Most organizations have little experience with evaluation and even less with linking evaluation to organizational learning concepts and practices.

Assessing Organizational Learning

While the last twenty years have been devoted to developing theories about organizational learning, several researchers and consultants have recently begun developing related assessment instruments. The majority of these instruments are designed as diagnostic tools to determine the extent to which an organization possesses the characteristics of a learning organization (Redding, 1997). The questionnaires tend to ask individuals to think about their department/unit or organization as a whole, and to respond to items regarding the extent to which learning practices are supported at the individual, team and/or organizational levels. Specific dimensions, domains, subsystems, or practices that the authors believe are important to organizational learning generally form the item categories. These categories include vision, leadership/executive practices, culture/climate, organizational structure,

human resource systems, individual and team learning/practices, and work processes. The results of these assessments are used to help an organization improve its organizational learning capabilities. Though Yang, Watkins and Marsick (1998) suggest that "constructing a valid instrument is an on-going process," their preliminary results are showing an "underlying structure that represents patterns of learning activities in the organization"(p.3-3).

Assessing an Organization's Readiness for Evaluation

As organizations increasingly recognize the need to better understand how they can improve their systems and processes to compete in the new techno-global environment, they are expressing an interest in evaluating the effectiveness and impact of human resource development (HRD) efforts (Bassi, Benson & Chency, 1996; Industry Report, 1996). However, most organizations are uncertain about how to conduct rigorous, useful evaluations or how to find the resources and time to do them well (ASTD, 1997). Few trainers have any academic background in evaluation, or much practical experience conducting systematic evaluations. In addition, the models, frameworks, and taxonomies for conducting evaluation that are prevalent in the HRD scholarly and practitioner literature provide little information about the context, procedures, and issues inherent in conducting program evaluations (Hilbert, et al., 1997). Practitioners who understand the value of evaluative inquiry for addressing programmatic and organizational issues worry that their organizations are not "ready" to evaluate; that the organization's culture doesn't appear to support evaluation, or that there are few mechanisms to support evaluation activities. Yet, there remains a growing need and interest in how to effectively evaluate how well and in what ways, HRD programs are contributing to the organization's goals and mission.

In spite of evaluation being a topic in the HRD literature for the last 40 years, as well as 30 years of research on evaluation in the evaluation field, we were only able to locate one instrument on assessing an organization's readiness for evaluation (Mayer, 1976). In some ways, this finding is not terribly surprising. In the HRD field, evaluation has rarely been viewed as a strategic organizational activity. It has traditionally been treated as an after-thought or as a post-course reaction survey tacked on to the end of a training session. There is scant literature on the role evaluation can play in helping organizations achieve their goals, or how HRD evaluation can facilitate the organization's growth and development (Hilbert, et al.).

In terms of the evaluation field, where one might expect to see more interest in developing such diagnostic instruments, there are other possible explanations for its neglect. The field itself, and much of what we know about evaluation today, grew out of the social program legislation in the 1960's and has a history of focusing on large-scale social and educational programs (see House, 1993; Shadish, Cook & Leviton, 1995). Using an assessment instrument to measure an organization's readiness for evaluation would not have been seen as applicable or appropriate in many situations. However, given that organizations in every sector are recognizing the need for evaluating programs at an organizational level, it is perhaps timely to develop such measures. The need for a readiness for evaluation instrument is based on the idea that it would be a waste of resources to engage in evaluative inquiry if the organization is not ready, interested, or willing to use the results of an evaluation. Therefore, such an instrument would yield information that would help prepare and guide the organization in their efforts to evaluate various programs, processes, products, and services.

Developing an Instrument to Assess Learning from Evaluative Inquiry

In response to these needs, we are developing an instrument to assess an organization's readiness to learn from evaluative inquiry. While organizational learning assessment instruments do exist, and are being validated, as indicated earlier, none make any kind of link between evaluation and organizational learning. Thus, we believe there is a need for another instrument that specifically measures an organization's readiness to learn from evaluative inquiry.

By developing and using this instrument within organizations, organizations will be better prepared to use evaluative inquiry practices to address issues that challenge their success. As a result, organizations may benefit in a number of ways. Individuals and team members may: (a) better understand how their actions affect other areas of the organization, (b) ask more questions than give solutions/answers, (c) develop a greater sense of personal accountability and responsibility for the organization's outcomes, (d) act more consultative, (e) be more likely to ask for help, (f) use information to act, and (g) be more willing to share the work that needs to be done. These outcomes may result in an organization's enhanced ability to: (a) develop new products and services, (b) increase productivity, (c) improve morale, (d) experience less turnover, (e) experience less waste/sabotage/error, (f) experience improved

financial performance, (g) experience increased efficiency and less redundancy, (h) provide more effective service to clients/customers, and (i) change more quickly. (Preskill & Torres, 1999)

Research Questions

The following questions are guiding the development and validation of the readiness for learning through evaluative inquiry instrument:

1. What are the questions/items that effectively measure readiness for evaluative inquiry and organizational learning?
2. What is the content and construct validity of the assessment instrument?
3. What is the reliability of the assessment instrument?
4. How can the instrument be used within organizations?

Methodology

The instrument's development began by generating items from three sources: (a) a review of the organizational learning and program evaluation literatures, (b) a review of existing learning organization/organizational learning and readiness for evaluation instruments, and (c) interviews conducted with four organizations that are attempting to integrate organizational learning practices and systems within their organizations. This process first yielded 164 items. The items were then classified into twelve categories, or dimensions based on the *Evaluative Inquiry for Learning in Organizations* framework (Preskill & Torres, 1999).

Nine HRD graduate students were invited to participate in a modified Q-sort process. Each of the 164 items and dimension titles were printed onto cardstock and randomly placed in a stack. Participants were asked to read each potential item and to place it under one of the twelve dimensions. After this process was completed, each of the participant's classifications was matched to the authors' initial classification system. As a result, items that were sorted into different categories were reviewed and resorted by the authors. Based on the results of the modified Q-sort, the number of dimensions was reduced to six, and the items to 82.

The next step is to again have a group of graduate students classify the 82 items into the six dimensions. Based on their sorts, additional revisions will be made. In is anticipated, however, that the final version of the instrument will contain between 70-85 items in addition to some demographic items. The purpose of this activity will be to collect evidence of the items' content validity.

Following the second Q-sort, the next set of tasks will involve establishing the instrument's internal reliability and construct validity. Our intent is to pilot the instrument with approximately 200-300 individuals from various organizations. Item analyses will be conducted on the pilot data to determine the internal consistency of the dimensions established on the basis of the Q-sort data. Items with low discriminatory power will be reviewed for revision or deletion. To determine construct validity, we will examine the results of confirmatory factor analysis (CFA). This technique will be used to verify the adequacy of each item-to-factor association and the number of dimensions underlying the construct.

Results and Conclusions

Given the early phase of this research, we are unable at this time to report on the results of the pilot test (research questions 2 and 3). However, we believe that the instrument will provide HRD researchers, consultants, and practitioners with valuable information as they strive to integrate evaluative inquiry into an organization's learning practices. We see evaluative inquiry as a useful approach to helping organization members answer pressing questions that challenge their success and future. In so doing, it can provide critical information for making decisions that result in increased individual, team and organizational learning.

By developing and validating this readiness instrument, HRD professionals will be in a better position to help organizations know where their learning and evaluation strengths lie, and provide them with ideas and strategies about how to leverage these strengths in ways that maximize learning from evaluative inquiry activities. The readiness instrument will be a tool to begin the process of building evaluative inquiry into the learning systems and practices of organizations.

The Design and Development of an Evaluation System for Online Instruction

Tim L. Wentling
Scott D. Johnson
University of Illinois at Urbana-Champaign

With the growth in popularity of online instruction has also come the concern for accountability and the need to make adjustments and improvements in online programs. This paper describes the conceptualization and development of an evaluation system that can be used to judge online instructional efforts. The evaluation system addresses concerns of both program administrators and course instructors. Computer technology is used to provide partial automation to reduce respondent burden and to efficiently use evaluation resources.

Keywords: Program Evaluation, Evaluation System, Online Instruction

Online or web-based learning is an education and training phenomena that is growing rapidly around the globe. As with any innovation, there are questions about effectiveness, efficiency, and utility (McCollum, 1998). With online instruction, the issue of evaluation and accreditation is especially important due to various threats commonly perceived by educators and trainers. These threats include a change in student campus life and the roles of professors (McCollum, 1998), the fear that the push for distance learning comes from entrepreneurs and university "bean counters" rather than educators (Mendels, 1999), and whether virtual students feel more isolated than their traditional counterparts (Arenson, 1998). These concerns can only be addressed through systematic research and evaluation efforts.

Human resource development professionals are blessed with a rich history of evaluation thought, development, and research, primarily derived from the fields of education (Alkin, 1969; Patton, 1997; Scriven, 1967; Stake, 1967, 1978, 1981; Stufflebeam, 1967, 1985; Stufflebeam, Foley, Gaphart, Guba, Hammond, Merriman, & Provus, 1971; 1997) and human resource development (Holton, 1995; Kirkpatrick, 1976; 1996; 1998; Kaufman & Keller, 1994). From these foundations, specialized evaluation processes and systems have been designed and implemented for HRD interventions, including training programs (Raab, Swanson, Wentling, & Clark, 1992, Wentling, 1980, 1992, 1993).

The design of evaluation systems for online instruction has been attempted by a number of professionals, including instructional designers of CBT systems (Clark, 1994; Draper, 1996; Simonson, 1997) technology experts (Jackson, 1990; Kimball, 1998; Middleton, 1997), and HRD practitioners (Magalhaes & Schiel, Pisik, 1997). The work of these individuals demonstrates progress in applying intuitive principles and practices of evaluation to online environments. Other authors have provided practical applications of evaluation theory by offering suggestions and guidelines for the evaluation of online instruction (Khan, 1997; Nichols, 1997; Oakes, 1997; Ravitz, 1997; Thorpe, 1993).

Problem Statement

The evaluation of online instruction is an important part of the design and implementation process. Even though practitioners and academics currently evaluate online instruction, their attempts have been limited to the use of traditional research methods and intuitive approaches to evaluation. There appears to be a lack of systematic evaluation of online programs that is built on evaluation theory and practice. The activity described in this paper is an attempt to conceptualize and develop a transferable, adaptive evaluation system for online instruction.

Conceptualization and Development of the Evaluation System

The purpose of the project was to design, develop, and implement an evaluation system that would meet the needs of the developers and sponsors of online instructional programs. The activities of the project reflect major efforts to obtain information, design components of the evaluation system, and test and revise the evaluation system. The specific activities of the project were to (1) develop a conceptual model for online evaluation, (2) identify specific

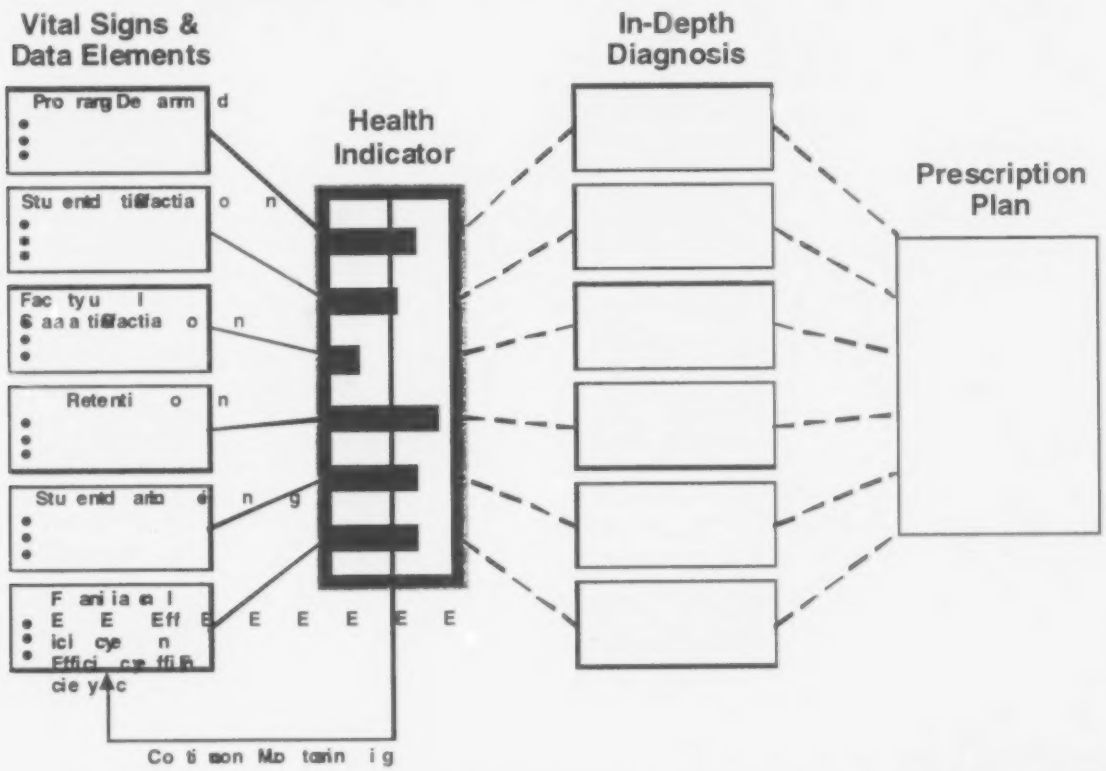
Copyright © 1999 Wentling & Johnson

vital signs of an online program and determine appropriate measures, (3) automate the collection and analysis of evaluation data through knowledge engineering approaches, (4) create an electronic performance support system to assist in program evaluation, and (5) conduct a field test of the evaluation system. The following sections describe each of the five major activities that are being accomplished in the formulation of the Illinois Online Evaluation System. At the time of this writing the evaluation system is evolving. Many of the tasks are complete, while some are underway.

Activity 1: Development of a Conceptual Model for Online Evaluation

This activity involved the conceptualization and design of the overall evaluation system, with the identification of major components and their functional relationships. The evaluation system, as currently designed, occurs in three stages: (1) vital sign assessment, (2) in-depth analysis, and (3) program improvement planning (see Figure 1). The evaluation system can best be explained using a medical analogy in which a physician examines a patient's vital signs to determine the patient's current state of health. Vital signs that are below acceptable standards are examined in more detail, utilizing more precise information and investigative techniques. As a result of the analysis, a plan is developed to facilitate improvement.

Figure 1. The Online Evaluation System.



Vital sign assessment (Stage 1) diagnoses the general health of the online program and individual online courses using data collected through routine activities. Example data include the number of inquiries about the program, the number of applications received, and the performance of students in the individual courses. The data are used to calculate a program's "health" rating in six areas: (1) student demand, (2) student retention, (3) student satisfaction, (4) faculty satisfaction, (5) student achievement, and (6) financial efficiency. The ratings help program personnel and sponsors monitor the overall performance of the program and individual courses to identify areas that may be problematic.

During the *in-depth analysis* (Stage 2), any vital signs that are identified as substandard are analyzed in detail. A thorough investigation is conducted to determine underlying problems or causes. Often this investigation

requires the collection of additional data, or the use of data from related vital signs. For example, a low rating in student satisfaction might lead to the further analysis of the individual items that comprise the student rating indicator. Additionally, a review of data related to student learning and faculty satisfaction might be done.

Program improvement planning (Stage 3) provides solutions to the problems that are investigated during the in-depth analysis. Alternative strategies for solving the problems are identified, along with resource requirements for implementing the solutions. Program personnel are able to select various courses of action and develop plans for addressing the identified problems.

Activity 2: Vital Sign Identification and Development of Measurement Instruments and Procedures

The major activity in the development of the evaluation system involved several inquiry endeavors to identify "quality indicators" for use as assessment criteria. Lists of quality indicators drawn from the literature on computer mediated education, outcomes of education, and evaluation were identified and prioritized. An initial list of 18 "vital signs," developed from the results of the literature was reviewed by a group consisting of HRD and evaluation experts. The list of vital signs was reduced to six by determining the relative importance of each to the stakeholders of the evaluation.

Instruments and procedures for gathering, summarizing, and analyzing vital sign data are being developed by project staff. Data used to calculate vital sign ratings are obtained through analysis of electronic archives, document review, surveys, student testing, and expert review. Sample data elements used to calculate each vital sign rating are described in Table 1. The actual vital sign ratings are calculated from student test scores, mean scores on survey instruments (i.e., student satisfaction and faculty satisfaction), and data comparisons (e.g., enrollment, retention, financial data). Standard transformations of the data are performed to provide a common scale for each vital sign to facilitate portrayal and comparison across the vital signs.

Table 1
Data Elements for Vital Sign Rating Calculation.

Vital Signs		Data Elements
Program Demand	8.	Number of applications requested per semester
	9.	Number of applications received per semester
	10.	Number of telephone contacts per semester
Student Satisfaction	11.	End of course student ratings of program content, quality of instruction, instructional resources, technology used, amount of interaction, instructional methods
	12.	Mid-semester student ratings
	13.	CISS data regarding perceptions of course interaction, course structure, and technical support
Faculty Satisfaction	14.	Faculty ratings of technology, technical support, interaction with students, quality of student work
Student Retention	15.	Percentage of dropouts from beginning to end
Student Learning	16.	Self-assessment of learning
	17.	Course project scores
	18.	Quiz and Test scores
	19.	Course grades
Financial Efficiency	20.	Course design cost
	21.	Course delivery cost
	22.	Publicity cost
	23.	Total unit cost, direct cost, overhead cost,
	24.	Tuition revenue

Activity 3: Knowledge Engineering

As work progressed in conceptualizing the evaluation system and identifying vital signs, alternatives for automating the system were explored. Literature on artificial intelligence, decision support software, electronic performance support systems (EPSS), and expert systems was reviewed by project staff. Due to the technology potential for the evaluation model, its focus on internal rather than external evaluation, and its purpose as a self-evaluation tool to be used by a variety of online personnel, including program administrators, instructors, and instructional designers, it was ultimately decided to utilize performance improvement technologies to automate much of the data collection and analysis functions. Performance improvement technologies make dynamic use of technology to facilitate data collection and analysis tasks and to improve individual performance by providing timely information, advice, coaching, and training. An electronic performance support system is an example of a performance improvement technology that "captures, stores, and distributes individual and corporate knowledge assets throughout an organization to enable an individual to achieve a required level of performance in the fastest possible time and with the minimum of support from other people" (Raybould, (1995), p. 11). EPSS technologies often include an information database, an expert advisor, customized tools and templates, and the potential to run simulations. Beyond a few efforts in corporate settings, this technology has not been widely applied in education and training for evaluation purposes.

Available literature on performance improvement technologies was reviewed. A key component to any expert system is the knowledge base of a recognized expert in the problem area (Hayes-Roth, et al., 1983). Focus groups of recognized online education experts from the University of Illinois were held to ascertain their perceptions of what constitutes effective online education and evaluation. These experts worked through simulated evaluation problems to test their ideas and were asked to develop specific guidelines and suggestions for improving the vital sign assessment and in-depth procedures. The framework for the expert system was based on the outcomes of this activity.

Activity 4: EPSS Development

The investigative framework gleaned from the knowledge engineering activity was developed into a series of If-Then rule process charts (one for each vital sign) by the developers. One partial example of a vital sign rule process chart is shown in Table 2 where a variety of "then" statements are provided in response to the low indication of student satisfaction.

Table 1
Sample EPSS Rule Process Chart for One Vital Sign

Vital Signs	Data Elements
IF: Student Satisfaction as indicated by Student Rating Form is Low,	THEN: 4. review subscores for student ratings results. 5. identify the subscores that reveal the area of problem. 6. review results to individual items in the problem subscore(s).
IF: If more information is needed to determine the problem,	THEN: 7. develop an interview questionnaire and contact a sample of students by phone. 8. develop an e-mail questionnaire with relevant questions and send to a sample of students. 9. summarize new student data. 10. present the summary of all results to the instructor and discuss potential causes of the problem.

The probable causes identified by the online instruction stakeholders were incorporated into the rule process charts to complete the exploration diagrams. Sample computer display screens were also developed that simulate what each screen on the finished performance system program should look like. Using the rule process charts and sample screens, project staff created the performance support system. Prototype system routines were reviewed and revised to correct programming errors, to improve interface inadequacies, and to ensure user friendliness.

Activity 5: Field Testing

The performance support system shell was reviewed by selected professionals as a preliminary step to pilot testing. Data were programmed into the system to allow users to explore all possible investigative paths in the in-depth analysis. Formal and informal feedback was provided, which resulted in minor revisions in the programming (elimination of "bugs" from the system) and content of the evaluation system. The evaluation system is currently being tested within an online masters degree program in HRD at a large Midwestern university. Following this initial testing, there are plans to expand the field testing to other university level online programs and in corporate settings.

Implications and Discussion

What truly separates the vital sign concept from traditional evaluation is its use of specific outcome measures with minimal data requirements to create a cursory picture of the general status of a program. The six vital signs are measured for each individual online course. Efficiency is maximized because initial data requirements are minimal, only specific programs are examined, and only problematic vital signs are subjected to further examination.

The most obvious technical feature of this new evaluation system is its use of the electronic performance support system. Used primarily in medicine, manufacturing, and engineering up to this point, this is the first attempt to adapt advanced technology to educational evaluation. This application, of course, has its limitations. Attempting to set limits on variables in social science research always causes consternation, for fear of eliminating some possible responses from consideration. In developing investigative paths for the expert system, limits had to be set. However, the data collection instruments and procedures were carefully developed and extensively field tested. The knowledge and skill of recognized evaluation and online experts were incorporated into the system. These factors, coupled with the extensive field testing still to be completed, result in an evaluation system that is as true to human expert evaluation as is possible. It is also important to remember that the system will be operated by human evaluators and all final judgments will be made by personnel of the program online. Thus, it should not be construed that the computer is replacing the human evaluator. It is only providing valuable assistance, which will facilitate self-evaluation of online programs.

The broad applicability of the vital signs gives this system utility for online program evaluation beyond the University of Illinois. Ultimately, the model developed for use in this system, along with the computer technologies that are applied, could be adapted for use in evaluating any online course or program in the public sector as well as in private sector training and human resource development programs.

The Mixed-Method Evaluation in HRD - A Description of Methods Applied in the Industrial Development Program

Ville Nurmi
Finnish Institute of Occupational Health, Finland

This study focused on the HRD program evaluation in a case from the Finnish paper industry. Both philosophical and practical foundations of the mixed-method evaluation were described. The empirical study included description and analyses of the evaluation procedures implemented in the target program. The conclusions consisted of suggestions for the HRD practitioners, i.e., for purposes the mixed-method evaluation is useful, and what are the advantages and the disadvantages of the mixed-methodology in HRD evaluation.

Keywords: Mixed-Methods, Evaluation, HRD Program

Introduction

This study aimed to answer two questions: (1) In the light of the case analyses, what types of evaluation needs in HRD could be best served by mixed-method evaluation procedures? And, (2) what are the advantages and the disadvantages of mixed-method evaluation in HRD programs?

Evaluation in human resource development (HRD) has relied strongly on Kirkpatrick's (Kirkpatrick, 1976; Preskill, 1997) model for evaluating training programs. Regularly the evaluations which apply this model employ quantitative methodology, and the data are gathered via survey questionnaires. HRD is a complex social phenomenon to evaluate. There is no single method or methodology by which the effectiveness of development actions could be evaluated in a superior and ultimate way in order to serve the multiple needs of stakeholders. Evaluation and its methodology should be adjusted into purposes which control evaluation process (Ravishankar et al., 1997). Thus mixed-method evaluation is a more useful and purposeful design for HRD evaluation than e.g. the naturalistic or the postpositivist evaluation paradigms alone.

Mixed-method Evaluation in the Light of Philosophy of Science

The method discussion has been dominated by the two paradigms mentioned. The debate between the naturalistic or constructivist paradigm (Guba & Lincoln, 1989; Guba, 1990; Lincoln & Guba, 1985; Lincoln, 1990) and the postpositivist paradigm (Phillips, 1990; Mathiason, 1988) has emphasized the bi-polar dimensions, such as quantitative-qualitative, realism-relativism, and objectivity-subjectivity. The contructivists, like Guba and Lincoln, are proponents of the purist stance toward mixed-method evaluation; they argue that different paradigms embody completely different assumptions about human nature and the world. According to their understanding, it is not possible to mix different inquiry paradigms within a single study. (Greene et al., 1989; Greene & Caracelli, 1997.)

The postpositivist school is not as rigid as the constructivist school. According to this paradigm, there are philosophical differences between the paradigms of social sciences. But the philosophical assumptions of different paradigms are logically independent, thus paradigms can be mixed. Quantitative methods are found useful in studying social phenomena, even though it is not believed that human behavior could be controlled and defined by a set of natural laws, as logical-positivists believe. The postpositivists try to identify consistencies affecting human behavior, but not by denying the usefulness of qualitative methodology. The third stance toward mixed-method evaluation is the dialectical position in the methodology toward the mixed-method debate. Its idea is that philosophical differences between paradigms exist, and that they are important. Differences should be honored and used both within and across studies in order to achieve enhanced understanding. (Greene et al., 1989; Greene & Caracelli, 1997.)

In this study these paradigms were seen as complementary choices rather than competing methodological schools. The empirical study part employed both the postpositivist and the constructivistic paradigms in the evaluation of the HRD program. The general methodological discourse has shifted its focus in the mixed-method direction, too.

The Mixed-Method Evaluation in Practice

Copyright © 1999 Ville Nurmi

The mixed-method in evaluation means that multiple data gathering or analyzing procedures are combined and used within the same study. Different procedures could be used to answer the same evaluation questions, or they could be employed in answering different evaluation questions. The mixed-methodology in HRD evaluation as in other social science evaluation fields too, is applied in order to generate deeper knowledge and broader insight into the phenomenon under analysis. All methods have limitations and biases, and multiple methods can be helpful in counteracting those biases. (Datta, 1997; Greene & Caracelli, 1997; Waysman & Savaya, 1997.)

Triangulation was the first well known attempt to mix methods in social sciences. Psychologists in the 1950s used multiple methods in studies on personal traits to strengthen the validity of their studies. In triangulation, two or more methods are used to assess the same phenomenon in order to strengthen validity, but also to seek convergence of the findings. ***Bracketing*** is the second multiple method design. It seeks estimates on the correct answer. *Complementarity* is the third type of mixed-method evaluation design. Its fundamental idea, is to reach a deeper understanding of the evaluation object. There are three kinds of complementarity evaluations: different methods are applied (1) to evaluate different study components or phenomena, (2) to assess the plausibility of validity threats, or (3) to enhance the interpretability of the assessments of a phenomenon. (Greene et al., 1989.)

In addition to mixing methods or methodologies within the same study, it is possible and in some cases purposeful to mix data sources, investigators, and theories. Data source triangulation means that multiple data sources are employed in a single evaluation. Investigator triangulation means that several, at least two, researchers analyze the same object either using different methods, or validating the findings produced by one method. Triangulating theories are also possible and acceptable in evaluation studies. The theoretical frame of reference of evaluation studies are eclectic in nature; thus not much attention is paid to theory triangulation. The most discussed type of triangulation is mixing methodologies or methods. (Denzin, 1978; Mathison, 1988.)

A Brief Description of the HRD Program

The present study was focused on a HRD program in the Finnish paper industry in 1995-1996. Metsä-Serla corporation invested USD 500 million into the world's biggest fine paper mill. That time Metsä-Serla was the fifth biggest pulp and paper producer in Europe. It has production units all around the European continent, and its products are sold in Asia, South America, and North America, besides Europe.

Within the technical paper mill construction project there was a HRD program; the new technology required modern and up-to-date vocational qualifications from the workers. Over 150 workers were hired to the new fine paper mill through careful recruitment procedures. The HRD program lasted 8 months including classroom courses, practical training periods, excursions, simulations, and some organized leisure time activities, too. One third of the trainees were without previous work experience in the paper industry. This made HRD one of the key factors in terms of the successful start-up of the new paper mill. (Nurmi, 1998.)

The HRD program was one of the biggest ever conducted in the Finnish private sector with its USD 10 million budget. In addition to its size, there were other innovative aspects, too. Behavioral scientists were hired to plan, implement, and evaluate the HRD activities, while the HRD personnel regularly include only technical experts. Stakeholder involvement in the planning and evaluation processes, the great emphasis given to the training in so called soft skills, high educational requirements for hired workers, and finally the multiple evaluation procedures implemented both during and after the HRD program, were crucial meaningful innovations in the HRD program of Metsä-Serla.

The HRD program was conducted simultaneously with the technical paper mill construction project. The final goal of both projects was the successful start-up of the new paper mill in August 1996 (Figure 1). There were also other objectives set for HRD, which were related to the start-up goal. In addition to training for the workers HRD included management training and training of the maintenance personnel. This study focused on the training of the operators, i.e. workers of the new paper production line (Nurmi, 1998).

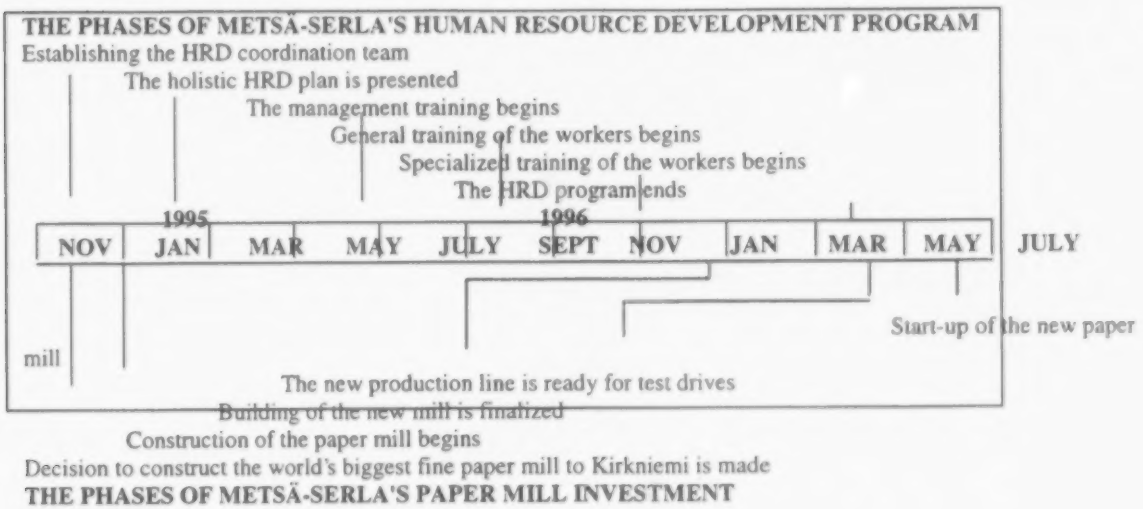

Figure 1. The chronological description of Metsä-Serla's paper mill investment including the human resource development program.

The Empirical Study

The empirical part of the study describes the evaluation methods that were used in the target program. The description focused on the following points: What were the evaluation questions? What was the purpose of the evaluation? What data gathering methods were applied? What data analysis procedures were applied? Was the evaluation formative or summative? The method description formed a basis for the analysis of the advantages and the disadvantages of the evaluation procedures.

The Mixed-Method Application in this Study

The postpositivist frame of reference was used in this study. However the evaluation procedures analyzed in this study contained naturalistically oriented elements, too. Postpositivism means that by applying quantitative surveys and multivariate analysis, it is possibile to identify general patterns which affect learning and satisfaction. This study represents complementarity in terms of the mixed-method design, rather than triangulation or bracketing. Different methods were used to assess different components of the phenomenon, which in this case was the effectiveness of the HRD program. The final purpose of mixing methods was to reach deeper understanding, than that gained via a single method.

Different data sources were used also in this study. This is evident always when the aim of the evaluation is to analyze the effectiveness of the whole program, instead of a single aspect. Data sources are described in the results section. Even though one researcher conducted further analyses on the effectiveness of the HRD program, other investigators conducted data gathering and analyzing of procedures during the program. Therefore this study also employed investigator triangulation.

The Description of Evaluation Procedures Applied in the HRD Program

The first evaluation question, i.e. "How did the trainees feel after each course?", represented the traditional first level evaluation of Kirkpatrick (1976) which emphasizes the reactions of the trainees. The purpose of this phase was to improve the program by revising course contents and other activities in a direction that would be most beneficial for the trainees. The data were gathered by a survey including numerical and open-ended questions. The names of the respondents were asked; this offered an opportunity to later discuss with the trainees their comments and suggestions. The data were analyzed immediately after each training period to get the formative evaluation information as quickly as possible. Means and standard deviations were produced. If the mean of the course with

most of the items was under 3.5 (the scale 1-5; 1 failure, 5 success), some improvements or further information was required. Qualitative data were not analyzed for research purposes, but information from the open-ended answers was used in practice (Table 1).

The second question, "How did the trainees progress and learn?", was based on Kirkpatrick's second level evaluation (Kirkpatrick, 1976), where the focus is on learning in terms of knowledge, skills, and attitudes. Attitudes were not assessed in this case, however. Learning was analyzed for both formative and summative purposes. The formative purpose was the same as with the first evaluation question. The summative evaluation was conducted for the needs of the formal educational system; trainees were offered an opportunity to pursue a vocational certification within the development program. The vocational system, controlled and coordinated by the Finnish National Board of Education, required documentation of the trainees' progress. Learning was evaluated by multiple-choice and open-ended questions. Besides these knowledge-oriented measurements, there were both manual and automated practical simulations which assessed the skills of the trainees in a specific competence area. (Brown, 1996; Knight, 1995.) The results of the learning assessments were coded into grades for the purposes of the certification system. Descriptive statistics were produced to evaluate the success of the trainees, and to compare different trainee populations (Table 1).

Based on the learning assessments, further data analyses were conducted to identify the latent factors effecting the trainees' success and behavior. This summative type of evaluation was done by multivariate data analysis. The results of the assessments were first summarized into a few groups by factor analysis; these factors were then predicted in multiple regression by demographics. The findings will be used when new HRD actions are planned and implemented in the future (Table 1).

The trainees' feelings and experiences were evaluated also more in depth than merely by reaction surveys. Ten trainees were asked to be informants, i.e. monitor persons. Their assignment was to keep a learning journal during the eight-month program, and to be interviewed three times: at the beginning, in the middle, and at the end of the program. The purpose of this evaluation was to obtain understanding of the trainees' behavior and actions in the program, but this naturalistic data could also be used in the planning process of future programs. The data analyses at this phase have not yet been completed. The data analyses will include case study analyses in which each monitor person represents one single case, and there will be also a phenomenological section for defining concepts, such as vocational competence in the paper industry (Table 1).

The experiences of the HRD personnel were gathered and analyzed for the same purposes as the trainees' experiences, but the data gathering methods were different. The HRD experts wrote their comments on a qualitative questionnaire, which was used instead of interviews to save time through avoiding time-consuming interview transcription. The management was interviewed to gather their beliefs and experiences from the program. Even though the top managers did not attend the development actions on a daily basis, their experiences of the merit of the program will be crucial, because future decisions to invest resources on HRD will be done by these managers. At the end of the program, future needs assessment was carried out. The supervisors discussed the program with every worker, and together they filled out a needs assessment form (Table 1).

The last evaluation question, "Were the organizational HRD goals attained?", included four subquestions, because there were four organizational goals set for HRD. The attainment of each goal was analyzed in order to evaluate the effectiveness of the program. Multiple data gathering and analyzing methods were employed at this phase of the evaluation. (Nurmi, 1998; Table 1.) This evaluation had a bottom-line orientation, thus representing Kirkpatrick's (1976) fourth evaluation stage, where the focus is on the training effects on an organization's results.

Trainees' reactions

This evaluation was beneficial, because the results were gathered and analyzed immediately after the training and the results were available a couple days after the course. The reaction questionnaire was easy to answer, and the open-ended questions offered an opportunity for the respondents to explain their reactions more deeply than in the numerical sections. The use of real names brought more validity; the respondents were responsible for their comments and stood behind their views. The mainly statistical evaluation data could be used as a source for generalizations about the reactions of the trainees, and different courses of the program could be compared in terms of trainee satisfaction.

On the other hand, some disadvantages were found, too. Because the program consisted of several courses, the trainees had to fill out the same questionnaire many times. This was perceived frustrating, and sometimes led the subjects to fill out forms mechanically, without reflecting their real feelings. Sometimes, a minor incident at a course, e.g. one negative comment by a trainer, received much more attention than would have been appropriate. And this can greatly affect the reaction evaluations, although there were not necessarily big problems in the course.

Finally, it is a costly investment to transfer reaction data into computer files, in such a format that they can be used in further statistical analyses.

Table 1

Evaluation Procedures of the HRD Program of Metsä-Serla Corporation

EVALUATION QUESTION	PURPOSE	DATA GATHERING	DATA ANALYSIS	SUMMATIVE/ FORMATIVE
How did the trainees feel after each course?	to clarify reactions of trainees, in order to improve the program	survey questionnaire after each course	descriptive statistics: means & standard deviations	formative
How did the trainees progress and learn?	to identify areas needing more emphasis	multiple-choice, open-ended questions; simulations	grades ⇒ descriptive statistics, mean comparisons	formative
--- " ---	to identify trainees who obtained a vocational certification	--- " ---	--- " ---	summative
Which demographics predicted the trainees' success?	to identify fundamental factors effecting the trainees success	--- " ---	multivariate data analysis	summative
What were the trainees' feelings and experiences in the program?	to understand the trainees actions, and to improve future HRD	interviews and learning journals	qualitative data analysis: case study & phenomenology	summative
What were the HRD personnel's experiences after the program?	to improve future programs	qualitative questionnaire	case study	summative
How did the management evaluate the HRD program?	to understand the management's attitudes, which affect future human investment decisions	interviews	case study	summative
What future development needs did trainees have?	to coordinate future HRD actions in the organization	questionnaires filled with supervisors	content analysis	formative
Were the organizational HRD goals attained?	to define the merit of the HRD program	production information, interviews, assessments	qualitative comparisons, content analysis, analysis of variance	summative

Advantages and Disadvantages of Evaluation Procedures

Assessments of learning

This evaluation phase offers an instrument for instructional designers and trainers to follow up the progress of the trainees. If there are problems, e.g. learning difficulties either within the whole trainee population or individually, HRD actions can be revised, and in addition, individual solutions could be produced to make learning and studying more meaningful and effective. Learning assessments are useful for trainees also because they give information about their own progress. The trainees can improve their study habits and put more emphasis on areas where they have learning difficulties. Quantitative assessment data can be used for further statistical analyses, which

have potential for generalizations within the population, but across to the other similar populations, too. Simulations can be used as one type of learning measurement, because the trainees can test their skills in a real-life setting, which is usually risk-free, unlike their job assignments in the production line.

It is difficult to find relevant learning assessments in industrial HRD. Most of the assessments have been developed case by case, and this is time-consuming. It requires also considerable resources to give grades in paper-and-pencil examinations. In the field, there is a lack of comparative assessment results. In the case of Metsä-Serla, there was one assessment of the conceptual mastery of paper production (Leppänen, 1993, Leppänen & al., 1996), in which the data had been gathered from other similar organizations. But all the other evaluation tools were developed in the program. If there are no control groups or comparative populations, the question arises, what is the purpose of learning assessment. Multivariate data analyses require large sample sizes, and their results are not necessarily useful for a single company. These types of analyses are rather conducted by research institutes for scientific purposes. The trainees may feel that learning assessment is used simply to control their actions, and as a result their focus may change from learning for work to learning for examinations, as in the case of many formal educational settings.

Evaluation of Experiences

Naturalistic evaluation procedures produced more depth data about the experiences, feelings and beliefs of stakeholders than reaction evaluation or learning assessments. This information is a necessary foundation for a deeper understanding of the HRD program. Qualitative data describes those nuances and thinking patterns which are regularly left out of surveys. It would be more meaningful for the respondents to explain and reflect upon their experiences, than simply fill out questionnaires.

The collection and analysis of naturalistically oriented, qualitative data from the participants of the HRD program and from other stakeholders is a huge investment in terms of time and money. The designing of data gathering procedures also requires more resources than the planning of questionnaire surveys, because the same interview structure can not be used in different cases. Like all qualitative research, also this kind of evaluation is not a valid base for generalizations. The definition of the final merit of the program does not often employ qualitative type of data as the major data source.

NeedsAssessment

It was felt that more detailed answers could be received, if the needs are assessed during the HRD program. If this evaluation had been conducted after the start-up of the paper mill, the workers as well as the supervisors, would have felt that they have more important things to think about and do than the HRD needs assessment. On the other hand, the needs assessment was conducted by questionnaire, and this might have led the supervisors and their subordinates to fill out the form more carefully. Thus the data gathering method might have caused lack of interaction and communication between the supervisors and the workers.

The Attainment Analysis of Organizational Goals

This evaluation was beneficial in defining the final merit of the program. It is relevant for the organization to receive information on how the organizational goals were attained, if the stakeholders, including the management, have been involved in the goal-setting process. Regularly organizational goals are related to bottom-line results, thus this type of evaluation could be used in assessing the financial effects of human investments.

A political orientation is inherent in this evaluation procedure; it is crucial importance to know whose goals are important and defined valuable. Even though an organizational perspective is needed for the bottom-line focus, in many cases the top-management, which has to set the goals, does not have any connection to the HRD practice. It is difficult to define and evaluate the effects of HRD on the financial results of organizations, but this is needed in order to legitimize the development actions and secure beneficial investment decisions in the future.

Conclusions

Mixed-methods in evaluating HRD programs is a purposeful design, when the aim is to assess a large program from multiple viewpoints. Conducting an evaluation according to Kirkpatrick's (1976) model requires both quantitative and qualitative procedures in order to be informative and satisfactory for every stakeholder group, and successful in

documenting the varying aspects of the program. Even the first level evaluation, i.e. reaction evaluation, produces deeper data, if also open-ended qualitative questions are applied.

The usefulness of the mixed-methods depends on the stakeholder group that is served by the evaluation. Sometimes purely quantitative evaluation procedures could produce the required information to analyze the financial effects of HRD, even though it is almost impossible, separately from other organizational effects to show unquestionable evidence of the economic benefits of successful HRD actions. Evaluation data on the experiences and feelings of stakeholders, such as the personnel, the management, HRD experts, external trainers, and even shareholders, could be presented within the organization in a way that is interesting and meaningful to the rest of the work community.

It should not be expected that mixed-method evaluation produces results that will automatically become an integrated whole. There may be inconsistencies, or even controversies between the results produced by different evaluation methods. This should be taken as evidence of the richness of social phenomena, and evaluators should try to understand why there are differences, and whether there is a reason for differences to appear on certain occasions. (Mathison, 1988.) The results of this study showed that there are several advantages and disadvantages in applying mixed-method evaluation. The mixed-method approach requires more expertise, more time, more money, and more implementers than evaluation conducted by a single method. Evaluation needs should be analyzed case by case, and possible benefits of mixed-methods should be weighed, before the final evaluation is designed (Waysman & Savaya, 1997).

This case study offered suggestions for HRD practitioners who are in the role of evaluator, too. Evaluation should be well planned before HRD implementation takes place. In this case, the evaluation was mainly planned during the training, thus preassessments could not be made. If financial effects of the HRD program are required as a result of the evaluation, then expected financial outcomes should be defined with the managers of the target organization (Swanson & Mattson, 1997). Otherwise it is quite difficult to isolate the effects of HRD after the program implementation has taken place. In gathering qualitative data, evaluators should be careful not to produce large amounts of information, which is neither needed nor useful. If the evaluation is conducted by a team of evaluators, instead of a single evaluator, there should be mutual agreement about the responsibilities and assignments of the team members. In the Metsä-Serla case, there was not a special evaluation expert; the personnel of the HRD team were also responsible on the evaluation procedures. Thus, there were no extra expenses from the program evaluation; HRD coordinators designed and implemented the evaluation, in addition to their main responsibilities in the program. But a HRD expert does not necessarily have the qualifications of an evaluator. A person who plans and implements evaluation in practice obviously is not an evaluator. The same difference exists between a laboratory technician and an analytical chemist, the former implements measurements, as does the latter, but only the latter designs research studies and interprets study findings (Scriven, 1996).

Finally, conclusions can be drawn on some ideas about the relationship between quantitative and qualitative paradigms in social sciences. Those paradigms are not alternatives for each other; qualitative can not replace quantitative, or vice versa. The paradigms seek answers for different questions. Therefore it is not recommendable to name some research areas or objects to be suitable just for one research design. There is always data between the researcher and the study object. It is not a piece of the object, even though some qualitatively oriented researchers assume so. For both survey and qualitative studies, data are based on human speech, and there is no base for an argument that qualitative data are somehow closer to the object than survey data. Quantity and quality are not the opposite, they are different concepts for organizing and understanding reality. (Töttö, 1997.) As mentioned at the beginning of this paper, the method debate and evaluation practices should have shifted their emphasis from the quantitative-qualitative contradiction to a more open, but at the same time analytical and critical way of mixing different methods in evaluation research.

The Effect of Two Training Systems on Trainee Satisfaction, Learning, Job Behavior, Retention and Organizational Performance

Maria Hruby Moore
The Ohio State University

The effect of two systems of training using the same course content with two different groups of trainees revealed there was no significant difference between trainee satisfaction, learning, or individual job performance outcomes. However there were significant differences between learning ratings assessed by the corporate instructor versus the manager, as well as the retention rate and organizational performance measures for each training system. Implications for HRD professionals and the use of distance technology are discussed.

Keywords: Training Systems, Learner Outcomes

This evaluation research study focused on the effectiveness of two training systems for delivering the same sales training content. Training System One (1) is described as a manager-led, self-paced videotape delivery system. Training System Two (2) was different in that it used the same corporate instructor with a group method over two-way interactive videoconferencing. This study focused on comparing training effectiveness outcomes for the two training systems using Kirpatrick's (1996) Four Level Evaluation Model as the general format. The same training goals and objectives were used by both systems. Objectives defined what the trainee was expected to do as a result of the training related to job performance. Within the three domains of learning: cognitive (thinking), affective (feeling) and psychomotor (task performance), the sales training was expected to help participants integrate these three domains and demonstrate their skills throughout the course. The primary instructional techniques used were structured discussions, videotapes to demonstrate behavior, role-plays, written exercises, and practice. A large amount of interaction is required by the training objectives.

The outcomes expected of the sales training was to help new representatives learn the job and become productive contributors earlier. By providing structured on-the-job training (Jacobs & Jones, 1995) at the office location, the context and conditions under which the trainee ultimately performed was an essential component of both training systems. The difference was that one system was conducted independently with the manager at a negotiated pace, while the other used a scheduled group method using distance technology with a corporate trainer. Acceptable standards of job performance were emphasized in both systems.

Theoretical Framework

Issues regarding interactivity, course structure and cognitive style were explored and measured in this study. Interactivity is the active participation in the instruction/training process. Wagner (1998) suggests that performance improvement specialists should look at the outcomes of interactions: Do they change the learner and move them toward action to the stated goal? Interactivity is also referred to as "dialog" which is described by Moore and Kearsley (1996) as any interplay of words, actions, ideas and other interactions between the teacher and the learner when one gives instruction and the other responds. It is measured in this study by the total number of hours recorded by the trainee based on their interaction with the manager or instructor throughout their training period. Research literature in cognitive and perceptual psychology supports the importance of interaction in the learning process (Neisser, 1976 and Gardner, 1985).

By taking a systems view, course structure (Moore & Kearsley, 1996) refers to the course design variables that consist of elements such as learning objectives, content themes, information presentation, case studies, pictures, illustrations, exercises, projects and tests. In this study, Training System 1 is less structured than Training System 2, since more variability and modification is tolerated in Training System 1. Moore identifies both dialog (interaction) and structure in his theory of transactional distance (Moore, 1973; 1983). He suggests that it is these two variables that can be manipulated to reduce the amount of psychological distance between a learner and the instructor when engaged in a distance learning-teaching process regarding interest in a common content. Distance technology can be used to increase or decrease the amount of structure and dialog in the teaching-learning transaction. In this case, distance technology was applied by the Training Department to Training System 1 to create Training System 2.

Copyright © 1999 Maria Hruby Moore

Cognitive style is a distinctive and habitual manner that an individual uses to organize and process information. According to Witkin and Goodenough (1981), there are two defined cognitive styles: field dependence and field independence. Field dependent people use a global, holistic approach to learning while field independents use an analytical, linear approach to learning and problem solving. Cognitive style is a psychological construct identified and validated by the work of Witkin and his colleagues (Goodenough, 1976). It was measured in this study by their instrument, the Group Embedded Figures Test (GEFT) (Witkin, et. al., 1971). Research on cognitive style suggests that field dependent learners tend to be socially oriented, prefer collaboration, are female, and are extrinsically motivated. Field independent learners tend to be analytical, rely on self-structured situations, prefer competition, are male, and intrinsically motivated (Witkin, et. al., Shih, et. al., 1998).

Research Problem and Questions

The major issue of concern in this evaluation research study was: *Which delivery system is more effective in achieving the training as well as the organization's objectives?* This is a difficult problem for any field research, were there is little experimental control over internal and external threats to validity. Likewise, the participants in this study were only those who were still one the job after one year of going through the training. It was important to see if these two groups differed significantly on certain characteristics. Only limited data was available on those that had exited the organization. The major research questions were:

1. What are the characteristics of the two groups on the following measures: age, gender, years of experience (work, sales and industry), education, amount of interaction, and cognitive style?
2. Is there a difference in the overall satisfaction with the content and quality of the training between the two groups?
3. Is there a difference in learning as rated by both the trainees and the instructor/manager between the two groups?
4. Is there a difference in the behavior or individual performance as a result of the training between the two groups?
5. Is there a difference in the total performance and retention rates between these two groups?

Research Design

The research design was a static group comparison, which is considered a pre-experimental design by Campbell and Stanley (1963). Again, the Kirpatrick's (1996) Four Levels of Evaluation format was adopted for this study.

Population

Participants who were trained in the first half of 1997 were the population selected. Managers were asked to secure participation from the trainee in their office for this study. 78 out of 119 trainees in the manager-led training and 136 out of 408 trained in the corporate instructor-led system actually participated in this study. This time frame was selected since it had the same corporate instructor across all classes; and little change in the instructional content was introduced into either system. The data collected were only from trainees still with the organization after one year of employment. Table 1 describes the characteristic differences between the two groups.

First, there were significantly more men than women trainees. Training Group 1 had 87 or 64% men compared to 49 or 36% women. Training Group 2 was more evenly distributed, but still had 45 or 58% men and 43 or 42% women. Second, the descriptive statistics noted in Table 1 above indicate there are some other differences between the groups. Training Group 1 appears to have less sales and industry experience, more education and lower GEFT scores than Training Group 2. Statistical significance at the .05 level would indicate the two groups differ on sales and industry experience, education, and GEFT scores even though they do not differ significantly on age or overall years of work experience. Overall, there was no significant difference in the hours of interaction recorded by either group. A score of 12 or higher tends toward field independence and the reliability coefficient of the GEFT is .82 (Witkin, Oltman, Raskin, Karp, 1971).

However, the following comparison group results suggest that there were no significant differences between the two groups of trainees on satisfaction with the training program, learning as perceived by the trainee, and job behavior. Differences between the two groups were statistically significant at the .05 level for learning as

perceived by the corporate instructor versus the managers' ratings. Also, there were differences between retention rates and overall performance for the two groups.

Description of the Trainee Population

Variable	Mean TS1	Std. Dev.	Mean TS2	Std.Dev.	T-test	Sig. (2-tailed)
Age (#years old)	41.8	9.1	39.4	10.4	1.56	.120
# Years Experience						
Work	16.8	8.1	14.7	10.4	1.51	.132
Sales	4.6	6.4	7.1	7.7	-2.43	.016 *
Industry	1.9	3.1	3.4	5.7	-2.03	.043 *
# Years Education	16.5	1.7	15.1	2.7	3.92	.000 *
# Hrs. Interaction	30.3	29.1	24.2	27.6	1.54	.126
GEFT Score	11.3	4.4	13.3	4.8	-2.91	.004 *

* Notes Significance at $\alpha = .05$

Table 1: Comparison of Means for Characteristics of the Two Groups Training Under System 1 versus 2

Results and Findings

Level One: Reaction => Satisfaction with Training Program

Reaction refers to the trainees' perception of the worth of the training activity (Kirkpatrick, 1996). Training participant reactions were recorded as their satisfaction with the content, quality, and delivery of the training. Reactions were measured in this evaluation as a total score on the BAET Evaluation form. The evaluation contained both quantitative and qualitative measures. The quantitative measures were 15 items, rated with a Likert scale of 1-5, which focused on the satisfaction. The reliability coefficient alpha for the BAET calculated by SPSS was .86.

Statistical results indicated at the .05 level that the two groups did not differ significantly on their overall reaction to their training experience. Those trained by managers using videotapes had a mean satisfaction score of 55.28 versus a 55.97 for those trained by the corporate instructor under videoconferencing. See Table 2 for the comparison.

Training Satisfaction Score

Training System	Mean	Std.Dev.	T-test	Sig. (2-tailed)
1. Manager-led, Videotape	55.28	10.31	-.381	.704
2. Corporate Instructor-led, Videoconferencing	55.97	11.31		

Table 2: Comparison of Trainees' Satisfaction Score in Training System 1 and 2

Level Two: Learning => Self and Manager vs. Instructor Ratings

Learning refers to the acquisition of the necessary knowledge and skills to perform the job. For the job of an account executive, conceptual and process knowledge has to be understood. Second, knowledge and demonstration of sales and computer skill has to be acquired. A variety of factors effect whether the trainee can or will learn the material presented in training. These factors include the learner's experience, motivation, aptitude and attitude toward what is to be learned. The work environment and the appropriate tools can also effect learning outcomes. Learning was measured using the trainee's self-rating on the BAET Evaluation and the instructor's or

managers' rating using the same scale. Both ratings are considered subjective measures. The BAET Likert rating scale was:

1=Poor *2=Fair* *3=Good* *4=Very Good* *5=Excellent*

Results indicated at the .05 level that there were no significant differences between the trainees' average learning rating of 3.81 versus 3.65 for Training System 1 compared to 2. Again, this average represents how the trainees' perceived and assessed their own learning. However, there was a significant difference at the .05 level in how the managers and the corporate instructor assessed their trainees' learning. The average rating by the managers in Training System 1 was 2.33 and the average rating by the corporate instructor was 1.72 for trainees in Training System 2. See Table 3 for the comparison. Speculation for the differences in manager and corporate instructor ratings is discussed in the Conclusion.

Trainees' and Manager vs. Instructor Measures of Learning Outcomes

Training System	Learning Rating by	Mean	Std.Dev.	T-test	Sig. (2-tailed)
1. Manager-led, Videotape	Trainee	3.81	.82	1.39	.167
	Manager	2.33	.63	5.81	.000*
2. Corporate, Video-conferencing	Trainee	3.65	.81		
	Instructor	1.72	.63		

* Notes Significance at $\alpha = .05$

Table 3: Comparison of Trainees' and Managers' vs. Corporate Instructor's Learning Ratings in System 1 and 2

Level Three: Job Behavior => Actual Performance on the Job After One Year

Job behavior refers to the degree to which the knowledge and skills learned in the training transferred to the job. In this study, performance on the job was measured as the total number of placements and dollar billings after one year on the job. These are the two individual job performance measures expected of an account executive.

Results again indicated that there was no significant difference at the .05 level between the average number of placements and the average dollars billed between the two groups. Those who went through Training System 1 had an average of 6.2 placements and billed an average of $71,635 while those in Training System 2 had an average of 5.5 placements and billed an average of $76,389. See Table 4 for the comparison.

Actual Job Behavior as Measured by Placements and Billings

Training System	Job Behavior	Mean	Std.Dev.	T-test	Sig.
1. Manager-led, Videotape	Placements #	6.19	5.19	.952	.342
	Billings $	$71,635	$ 59,037	-.306	.760
2. Corporate, Video-conferencing	Placements #	5.48	6.69		
	Billings $	$76,389	$152,405		

Table 4: Comparison of Trainees' Job Behavior in Training System 1 and 2

Level Four: Organization Results => Retention and Collective Organizational Impact

Organization results refer to the degree to which a training effort supports business objectives. Organization results are the reason for using training. Account executives perform a critical role for the

organization. Their collective competence as professionals has lead to the company being identified as the industry leader. Although difficult to isolate training as the critical factor, and to measure all organization performance outcomes, some effort to capture impact is important. In this study, results were measured by the total placements and billings over one year (1997-98) for Training System 1 and 2. Those trained by managers with video (n=119) produced 631 placements and billed $7,306,744.00. Those trained by the corporate instructor over videoconferencing (n=409) produced 1,370.5 placements and billed $19,097,316.

A per desk average, or PDA statistic, was also calculated to determine which training system performed better overall. PDA is a corporate, year-end statistic currently used by the company to measure and compare office performance. In this case, it was used to measure and compare training system performance. It is calculated as the total placements and dollars billed divided by those remaining with the organization at the end of the year. Those trained by the manager-led system had a PDA of 8.1 placements and $93,676.21 in billings. Those trained by the corporate system had a PDA of 10.1 placements and $140,421.44 in billings. In this study, Training System 2 performed 33% higher in comparing the PDAs of the two groups.

Retention is another measure used to assess impact on an organization. A retention rate for each training system was calculated. Retention was the total number of account executives who remained on the job after one year and participated in the study divided by the total number of participants that went through the training system. Results indicated a rate of 66% for Training System 1 and 33% for Training System 2. See Table 5 for a comparison of total placements, billings, per desk averages, and retention rates for the two groups.

Overall Organizational Results

Training System	n of N	Total # Placements and $ Billed	Per Desk Avg. (PDA)	% Retention
1. Manager-led, Videotape	78 of 138	631.0 - $ 7,306,744	8.1 - $ 93,676	66%
2. Corporate-led, Video Conferencing	136 of 409	1,370.5 - $19,097,316	10.1 - $140,421	33%

Table 5: Comparison of Trainees' Total Placements and Billings with Retention Rates in Training System 1 and 2

Conclusion

Both systems of training are effective in meeting the training and organizational goals of the company. The data suggests that both training systems are equally effective at achieving trainee reaction, learning, and job performance objectives from the perspectives of the trainees. However, in comparing the managers' and the corporate trainer's learning evaluation scores of the trainees, there was a significant difference. Likewise, at the organizational level we observe the two training systems contributing to organizational performance, but in different ways. Both are effective at eliciting different outcomes that are important to the organization. Training System 1 excels in retention and Training System 2 trains more people, produces more placements, higher dollar billings, and higher PDAs.

Which delivery system is <u>more</u> effective in achieving the training as well as the organization's objectives?

Based on the data collected from the first three levels of this evaluation, both groups of trainees' reactions or satisfaction, learning, and behavior measures all appear to support that trainees were satisfied with their training experience and understood and performed the training objectives. Although both training systems were able to meet the training objectives, differences in learning ratings by the managers versus the corporate instructor were observed. Also, overall organizational results and performance outcomes were different as noted in total placements and billings, per desk average results, and retention rates.

To address the difference in learning rating by the corporate instructor versus the managers, perhaps managers that have to train new hires are more careful in their selection process, and want to hold on to marginal or average performers for the long-run. It is also possible that these managers have a more difficult time letting a

trainee go who is at least producing something, due to the personal investment the manager made in training them. On the other hand, the corporate instructor is not able to develop a personal relationship with the trainer as the manager. Maybe the distance between the corporate instructor and trainee allows him to be more objective. Therefore, his average rating of trainees' could reflect why there is a lower retention rate. It is possible that managers who send their trainees through Training System 2 are not as careful in their selection process or as involved in the training as they should be. It should also be noted that the corporate instructor does not have control over the work environment.

On side of Training System 2, the production from those trained resulted collectively in more total placements and higher billings. Training System 2 is simply able to train more people. Although retention is lower, the training allows some participants to produce something before they exit the firm. Another speculation is that the lower retention rate may be a sign that any participant who is not a "good match" can make a decision to exit the business much more easily in Training System 2. Perhaps the training style, or distance of the instructor to the trainee, also effects retention. If the training style of the corporate instructor was not congruent with the cognitive style of the learners, then more trainees may leave. There are also a number of factors that can explain the retention rate that are not related to training. These include the individual owner's and/or manager's strategy, compensation structure, the management practices, the individual office environment and/or the trainees personal goals and motivation. Supervised feedback and personal involvement of the manager in training is critical in both systems.

Implications for HRD and Notes for Further Research

Evaluation contains the word "value" in it. Values stated in this organization's mission statement are: *to be a global network ... and the world's preferred and pre-eminent provider of....* Currently they are the industry leader. Both training systems support company's mission; however, Training System 2 may have more benefits. Since "value" can be defined as merit in both economic terms and character qualities, both training systems show no significant difference between trainees' average satisfaction, learning, dollar billings and number of placements. Economic value is achieved by account executives performing their jobs. The company's character can be measured by the trainees' satisfaction with the training and their learning outcomes that lead to professionalism in the field. Ultimately, individual performance is the outcome that leads to desired organization results. Both training systems support the development of account executives who can provide their customers with the solutions they desire.

In comparing the two training systems, effectiveness has been achieved by both systems without any significant difference at the first three levels. However, when looking at organizational impact, new questions are raised. *Is training more participants who don't stay, good for business in the long run? Which training system is more efficient in terms of actual costs and financial benefits?* The concept of efficiency could be explored further to find out which delivery system is less costly to the organization. This issue can also be looked at in terms of the actual costs of the manager's lost revenue generating time compared to the instructor's time training plus the cost of videoconferencing technology.

Another interesting outcome appeared in the trainees' qualitative evaluation comments. From those involved in the videoconferencing system, almost all trainees' responded positively to the question "Do you feel the videoconferencing technology helped or hindered your learning?" In addition, of the 136 responses, 56 mentioned the ability for "more interactions" with other offices and 42 described the ability to better develop a "network". This issue should be explored further as part of the company's mission is to be a "Global Network". *Which system better supports building customer and office relationships - and a global network?*

Likewise, given the overall gender and cognitive style of trainee participants that are retained by both systems tends toward males and field independence. Perhaps a sales job, such as this, is male dominated and requires field independence to be successful in the training and the job. Research suggests that the greater the fit between the training system and the learner's style, the more effective training is likely to be (O'Conner, Bronner, & Delaney, 1996). Currently, most trainees do not have the choice as to which system they are trained under. The issue of cognitive style matched to training system will be explored further.

With respect to distance technology, more needs to be understood about interaction, course structure and cognitive style for HRD practitioners and researchers to understand how individual and organizational performance can be improved with training and other organizational development interventions. The development of distance and communication technologies spurred by the Internet and videoconferencing are taking off (Imel, 1998; Schlosser and Anderson, 1994). Weinstein (1997) suggests that the appeal of these technologies is the interactivity of the teacher and students and their ability to share text, graphics, audio, video, and virtual reality experiences despite physical separation. In this study, interaction was required by the training objective and the amount of

interactivity was not statistically different for either system. There was a difference in the way the training was structured and the cognitive styles of the two groups. Finally, further exploration of the qualitative comments from this study may shed light on the concept of network and relationship building and the impact of these on a sales job. The important issue is how distance technology can support individual performance on the job and organizational outcomes. This study begins to suggests that with careful attention to training objectives, interaction, course structure, and cognitive style, that distance technology can be employed to deliver individual and organizational performance.

Developing an Instrument to Measure the Use of Play-Based Training Methods in Healthcare Education

Rebecca J. Adams
Karen E. Watkins
Tom Valentine
University of Georgia

This paper reports preliminary findings from an ongoing instrument development and validation study of the use of play-based training methods. The research project involved the use of the survey with healthcare educators to establish reliability and validity and the development of emerging norms for each scale.

Keywords: Play Theory, Flow Theory, Training Methods

The healthcare industry requires an overwhelming amount of mandatory training and this list continually grows longer. Many workers are experiencing what Rowell and Spielvogle (1996) call "educational overload." Enthusiasm for learning new skills or updating old ones has decreased and people are basically tired of boring presentation methods. However, information and technology change quickly and competency must be maintained.(Resko and Chorba, 1992). Classic classroom teaching methods have been used in the past to meet this objective, but frequently make the learning process tedious, monotonous, and boring.

Healthcare educators are similar to educators in other industries -- they have often used lecture based instructional methods. Since its inception from the Germanic tradition in the mid-19th century, lecture has been the principle means of transmitting knowledge from scholar to student (Waggoner, 1984). This method has been dubbed the "chalk and talk" approach by Bassi, Cheney, and Van Buren (1997). Despite changes in technologies and recent advances, educators still cling to the perpetuation of the lecture technique (McAlpine, 1996; Bassi, et al., 1997). However, as healthcare educators and other professionals find themselves faced with changing demographics in the classroom (younger and older participants) and increasing responsibilities for assuring competency (JCAHO, 1997), they must seek alternatives to the traditional lecture method if they are to both hold learner's interest and also motivate learning.

The use of play-based instructional methods, such as games or toys or characters, is an emerging interest among participants and trainers alike. However, it appears that their use among educators is limited. Training's 1997 Industry Report indicates that 94 percent of respondents are using traditional classroom programs with a live presenter.

In meeting the changing educational needs of healthcare workers, educators must be motivated to seek more creative ways to teach participants. In describing creative people, Csikszentmihalyi (1996) points out that creative people differ in many ways but they are unanimous in one respect: "They all love what they do" (p.107). It is not money or fame that drives the creative person; it is doing the work they enjoy. He goes on to describe creative individuals as most enjoying activities that allow them to design or discover something new.

Robinson and Stern (1997) state that corporate creativity is often limited by organizations that do not recognize the preconceptions "about who will be creative, what they will do, and when and how they will do it" (p.20). Many healthcare educators often do not use play-based training methods because of underlying organizational and personal constraints. These constraints may cause educators to miss the opportunity to be creative. Thus, they miss giving participants exciting and challenging learning experiences.

Designing and delivering training that will invoke a flow experience, as described and defined by Csikszentmihalyi (1990), requires creativity by the educator. By stifling creativity healthcare organizations may actually be preventing educators from reaching a state of flow. The flow experience is described as having nine main elements: 1) there are clear goals every step of the way; 2) there is immediate feedback to one's action; 3) there is balance between challenges and skills; 4) action and awareness are merged; 5) distractions are excluded from consciousness; 6) there is no worry of failure; 7) self-consciousness disappears; 8) the sense of time becomes distorted; and 9) the activity becomes autotelic (Csikszentmihalyi and Rathunde, 1993). A state of flow in educators may lead to the use of more involving and creative teaching techniques and thereby enhance learning.

The theoretical framework for this study is a result of a thorough review of the literature related to adult education, training and development, healthcare education, business education, flow theory, and play theory. The review of the literature revealed numerous positive reasons, benefits, for educators to use play-based instructional

Copyright© 1999 Rebecca J. Adams, Karen E. Watkins, Tom Valentine

methods in their classroom presentations. It is agreed among trainers that adding fun and humor to presentations helps to promote motivation, cooperation, interaction, competition, involvement and communication (Ramanos, 1978). Using play in training has also been documented to reduce stress and tension, foster learning and creativity, encourage success, and enhance communication among co-workers (Halmo, 1985; Williamson, 1993).

However, educators do not use play-based instructional methods because they are sometimes limited by organizational and individual constraints. We are socialized to believe that play for adults is inappropriate (Rieber, 1996). The attitudes in the organization often reflect that adults should not play because play is for children and work is for adults (Bowen, 1987; Csikszentmihalyi, 1975; Rieber, 1996). In addition to negative beliefs about adult play many educators believe they do not have the resources, such as computer skills, graphic skills, time, or money, to develop and use play-based instructional methods (Coppard, 1976; Jacobs and Baum, 1987).

Identifying perceived benefits and constraints will be helpful to promote the use of play-based instructional methods. Including experience of flow adds another dimension that explores the educator's satisfaction and intrinsic motivation to use play-based training methods. The literature on flow theory suggests that individuals engaged in challenging and intrinsically motivated activities are more likely to enjoy and gain greater rewards from their work.

Research has shown that those who engage in activities that result in flow experiences tend to be more creative (Csikszentmihalyi, 1996). Creative individuals have been described as being playful people who are often uninhibited in their thinking and behavior (Lyman, 1989; Slesinski, 1991). This playful attitude often stimulates the creative ideas that improve performance, productivity, and profits in organizations (Berg, 1995). Educators in the classroom are also striving to improve performance, productivity, and profits but they must do it directly by their own work and indirectly by the work of those they teach and train. The effectiveness of training is vital to increasing performance, productivity, and profits. It is not suggested that training be "trivialized" with play but it should be recognized that play is an essential part of our continued intellectual and emotional growth that can be stimulated in the classroom (Jacobs and Baum, 1987).

Drawing from the literature review, an exploratory model of the use of play-based training methods is proposed. This model includes two use factors (constraints and benefits) and one factor for flow experience. Several personal and organizational background variables are also included.

Research Questions

1. What play-based instructional methods are healthcare educators most frequently using?
2. What are the most frequently cited constraints that prohibit healthcare educators from using play-based instructional methods?
3. What are the most frequently cited benefits that encourage healthcare educators to use play-based instructional methods?
4. To what extent do constraints to using play-based training methods, benefits to using play-based training methods, flow experience, and selected background variables separately explain the observed variance in healthcare educators' use of play-based training methods?
5. To what extent do constraints to using play-based training methods, benefits to using play-based training methods, flow experience, and selected background variables jointly explain the observed variance in healthcare educators' use of play-based training methods?

Methodology

Because there is little empirical research on the use of play-based training methods, no suitable existing instrument was found to use in this study. The items to measure the variables "use of play-based training methods", "perceived constraints to the use of play-based training methods", and "perceived benefits to the use of play-based training methods" were developed by reviewing the literature, holding a group interview with healthcare educators, and conducting individual interviews with healthcare educators to a point of saturation. The dependent variable, "use of play-based training methods", in this study was defined as any playful, fun, or experiential instructional strategy that contributes to the development of learners through active involvement and enhanced motivation. The variable, "perceived constraints to using play-based training methods", was defined as barriers from within the organizational culture and/or personal beliefs of educators that do not support the use of play-based training methods (reasons why educators do not use play-based training methods). The "perceived benefits to using play-based training methods" variable was defined as benefits and motivations that encourage the use of play-based training methods (reasons why educators use play-based training methods).

The variable "flow experience" was measured using a variation of the Flow Scales, based on Csikszentmihalyi's research. These scales derived from the flow model ask participants to rate their last training session along 12 dimensions related to the flow experience. The ratings were made on a 6-point Likert scale. In theory, the person who is in the state of flow will describe the experience of designing and delivering training in terms of being very involved, having clear feedback, wanting to do the activity, not being bored, not making an effort to concentrate, and so on.

The pilot study was conducted by administering the survey instrument to the Georgia Society for Healthcare Education and Training (GSHET) members who are not members of the national organization, Health Care Education Association. According to a 1994 survey of national healthcare educators (Stein & Glazer, 1994) the healthcare educator tends to be "female, middle-aged, working in an acute care, urban setting, residing in a department of hospital wide education and training, and reporting to a vice president level" (p. 7). The 1994 survey indicates that most educators work in departments labeled hospital wide education and training and report either to a nursing or human resources administrative function. Titles include director of education, director of hospital education, director of nursing education, staff development coordinator, instructional specialist, nursing educator, hospital educator.

Results, Conclusions, and Limitations

The pilot study was used to fulfill 2 broad goals: 1) test data collection procedures and 2) test the instrument adequacy.

The mailed survey was sent to 120 GSHET members. Fifty surveys were received and 2 were returned from the post office for a 40% response rate with only one mailing. Only one survey was unusable. This individual left most of the survey blank and indicated that he/she was not yet doing this type of training. Overall, we were pleased with the collection process and believe it is working adequately. Our target return rate for the pilot study was 30 to 35 percent with only one mailing.

In terms of instrument adequacy, we conducted 3 separate sets of tests. First we examined the item frequency on all items. We did this to ascertain if the items were exhibiting sufficient variance. In our judgment, no item exhibited inadequate variance. In most cases all points on the scale were used. In a few cases this was not true but in no case did more than 80% of the variance fall on any 2 values. We considered it sufficient variance to discriminate across the sample. Second, we examined for possible redundancy within 3 of the 4 constructs that were relevant. We did correlation among all the items and examined the intercorrelations. We identified all pairs that had correlation in excess of .75 and then examined them for possible redundancy. In only one case on the construct constraints did we find redundancy. As a consequence we wrote one item to replace 2 items in the constraints variable. Thirdly, we ran coefficient alpha reliabilities on the 3 scales. All cases are considered adequate. Although, the constraints alpha may reduce slightly after removing the redundant item. Table 1 below reports the alpha coefficients for each scale.

Table 1. Scale Reliability Scores

Variable Name	Alpha
Flow Experience	.89
Constraints	.86
Benefits	.95

All alpha scores were acceptable, ranging from .86 to .95.

The pilot study revealed interesting information about the respondents and their organizations. The mean age for respondents was 46.6 and the median was 47. The mean years worked in healthcare was 23 and the median was 23.5. The mean years worked in healthcare education was 10.2 and the median was 10. The mean number of employees was 1455 and the median was 1000. Twenty-two percent of the respondents reported to nursing, 50% reported to human resources, and 28% indicated they reported to other areas. Fifty-two percent reported a bachelor's degree as their highest degree, 33% reported having a master's degree, 7% reported having a doctorate, and 7% reported having an associate degree. Respondents reported 61% having a degree in nursing, 15% having a degree in education, 2% having a degree in business, 9% having a degree in healthcare administration, and 11% other degrees.

According to survey responses many healthcare educators are using play-based training methods. The methods reported most often were icebreakers to introduce participants (43.5%), icebreakers to introduce content (45.7%), and joke or humorous stories (54.3%). No respondents indicated using magic tricks.

A more in-depth look at high and low scoring items helps to clarify how educators see the constraints and benefits to using play-based training methods and how they reported flow experience. Table 2 below presents these data

Table 2. High and Low Scoring Items by Variable

Variable	Mean	Highest Item	Lowest Item
Flow	4.60	"I clearly knew what I was supposed to do." [5.23]	"I was anxious." [3.74]
Constraints	2.84	"some healthcare topics are not suitable for play-based training methods." [4.46]	"play-based training methods are for children but not adults." and "play-based training methods are inappropriate for adult learners." [1.59]
Benefits	4.91	"play-based training methods actively involved learners." [5.30]	"play-based training methods enhance relationships outside the classroom." [4.49]

One limitation to this research is that it is being conducted with a very specific audience, healthcare educators in one state. Thus, the results cannot be generalized to all training and development professionals nor to all healthcare educators. Further studies should look at a more national sample of healthcare educators as well as other training populations. For example, do internal HRD professionals report more use of play-based training methods than do external trainers?

How This Research Contributes to New Knowledge in HRD

Numerous authors have published manuals and articles on how to create and use fun methods of training (Cohen and Jurkovis, 1997; Hemsath and Yerkes, 1997; Leeds, 1995; Newstrom and Scannell, 1980; Sugar, 1991; Steinwachs and Sugar, 1984; Walter, 1995) and some instruction has been given on how to incorporate these into healthcare settings (Deck, 1995; Fuszard, 1989). However, little empirical research has focused on educator's use of play-based teaching methods and the nature of play that is used in training and development.

A link between motivation and the need to play in the workplace is not well studied. So this study fills a gap in the literature by clarifying what healthcare educators do and what experiences lead them to experience a state of flow. Knowledge about playful activities and flow experience will help individuals identify which practices promote a state of flow and better utilize play in their training in order to enhance their own flow experience.

HRD and Economic Development: A Mega Level Research Agenda

Suhail S. Zidan
The Ohio State University

Much of the HRD research is conducted at the micro (individual) or macro (organization) levels. It is seldomly conducted at the mega (societal) level. This paper presents an initial conceptual framework for a research agenda at the mega level with particular emphasis on the role of the state and the multinational enterprise in the national economic development process in developing countries.

Keywords: Economic Development, Human Capital, Multinational Enterprise

Scholars & researchers have attempted to categorize the various levels or targets of human resource development intervention and impact (Gilbert, 1978; Rummler & Brache, 1995; Kaufman & Watters, 1992). I found the use of the following three levels to be very helpful in conceptualizing the impact of HRD intervention. These are: the individual, the organization, and the society at large (see Figure 1). While most HRD literature focuses on the first two levels, it is the third level that is at the heart of this paper. What is the impact of HRD on the whole society? Does HRD intervention have a role at the mega level? Or, is this beyond the scope of HRD as an applied field of study?

Because of the enormity of this topic, I chose to limit my initial exploration to the context of developing countries (a.k.a., less developed countries, or LDCs) as they struggle for economic development and prosperity. Further, I chose to focus this exploration on only two aspects of the economic development effort. The economic literature indicates that there are six causes of economic development. These are: foreign trade, technological transfer, resource allocation, structural transformation, human capital formation, and savings and investment (Hagen, 1986; Loehr & Powelson, 1981). In this paper, the focus will be on examining the role of HRD in the relationship between the last two causes of economic development—that is, human capital and investment. This paper presents the theoretical foundations for exploring the HRD role in social and economic development as they are linked to individual expertise and organizational performance improvement efforts.

Statement of the Problem and Research Questions

The literature suggests that the successful and dominant companies of the future will be those who are able to capitalize on the knowledge and skills of the global workforce (Ashton and Green, 1996; Thurow, 1996). Thus, multinational enterprises (MNEs) will be competing among themselves [and between them and the domestic companies of a given country] for the recruitment and retention of highly skilled employees. However, will the MNEs be competing for this global workforce in the developing countries? Perhaps!

The international business literature shows that the majority of the MNEs operating in the world originate in the developed nations (Dunning, 1993). While some developing nations are more successful than others in bringing foreign investment into the country, the bulk of MNE investment remains in the developed world. Therefore, additional knowledge is needed in order to inform the LDCs—who are interested in MNE investment—in creating and implementing a strategy conducive to economic development through the appropriate approach toward educating and skilling their own workforce. This research agenda attempts to identify MNE attitudes toward LDCs, desired workforce characteristics, and emphasis placed on these characteristics in the process of selecting a particular country for possible investment in a new business venture. LDCs interested in attracting MNEs into their economies have to ensure that they have a workforce that is skilled and ready to meet the job performance requirements of these companies. So, what kinds of programs are developed and implemented by LDCs for the purpose of skilling the workforce to meet the domestic and international employment challenges of the 21st century?

The following are preliminary research questions:

1. What are the attitudes of MNEs toward the workforce in developing countries?
2. What are the characteristics of the labor force in LDCs that MNEs are looking for in the next century?
3. How much emphasis is placed on workforce characteristics within the MNE system when deciding on new investment ventures in a developing country?
4. Are LDCs planning and implementing *high skill formation* programs for the development of their workforce?
5. What are the characteristics of LDCs that choose the *high skill formation* as opposed to those who choose the *low skill formation* approach?
6. How are LDCs addressing the concerns of the non-traditional labor-force [women, older workers, people with disabilities, etc.]?

The following is a delineation of the conceptual framework and the theoretical underpinnings of the proposed research agenda.

Human Capital and HRD

The economic development literature identifies human capital formation as one of the critical causes of development. Human capital is defined as the productive investments in humans which include their skills and health that are the outcomes of education, healthcare, and on-the-job training (Todaro, 1994). The relationship between human capital theory and human resource development stems from their focus on the utilization of the labor force in the process of economic productivity in the broader sense of the term. Human capital theory is an economic theory that addresses the macroeconomics of production and economic development. It views humans—their knowledge, skills, health, and effort—as an integral part of the capital of a country which includes financial and natural resources. The basic premise of this theory is that investments made at the front end in educating and skilling the labor force (among other services such as nourishment and health) would pay dividends for a country in its effort toward economic development and viability and contribute to an increase in output per each unit of input (Hogendorn, 1996). The human capitalist approach studies the cost-benefit of such investment in terms of its efficiency in reaching equilibrium in the amount of investment in education as opposed to investment in other factors of production for the purpose of maximizing the magnitude of return-on-investment.

Similarly, HRD views humans as resources to be trained, educated and developed within the system of an organization for the purpose of enhancing the productivity of the organization through the expertise of its workforce. Jacobs (1990), Swanson (1995), and others have characterized HRD as a multidisciplinary field of study. They identified economics as an important discipline that contributes to the theoretical basis of HRD (see Figure 2). Economics in general and human capital theory in particular becomes important foundational ingredients for HRD theory and practice. In his first editorial for the commencement of the *Human Resource Development Quarterly*

journal (HRDQ), Swanson (1990) divided the contents of HRD into two camps: human development (psychology and education), and human capital (economics and management). This perspective also led to the financial forecasting and return-on-investment studies in HRD.

Carnevalle, Gainer and Villet (1990), taking a human capital approach, place HRD at the strategic level within the organization. They view employees as a resource that must be trained in order to maintain the competitive advantage of the corporation and increase its value. In this perspective, HRD activities, and specifically training becomes utilitarian in the organizational strategy to keep up with economic and technological changes. Therefore, linking training with specific job functions becomes the strategy for maximizing the return on investment. It is the economic potential and the economic rationale that provides the impetus for training in the workplace. Training is an integral part of the economic system whether we speak of organizational macro system or a national mega system. Here comes the confluence of the corporate strategy and the government economic development plan where the decisions for investments in the training and development effort and the educational system are based on considerations of the efficiency and cost-effectiveness of the proposition (see Figure 3). Hence, governments, in addition to their public educational systems, may provide corporations and other private institutions with investment and tax incentives for training and developing their workforces.

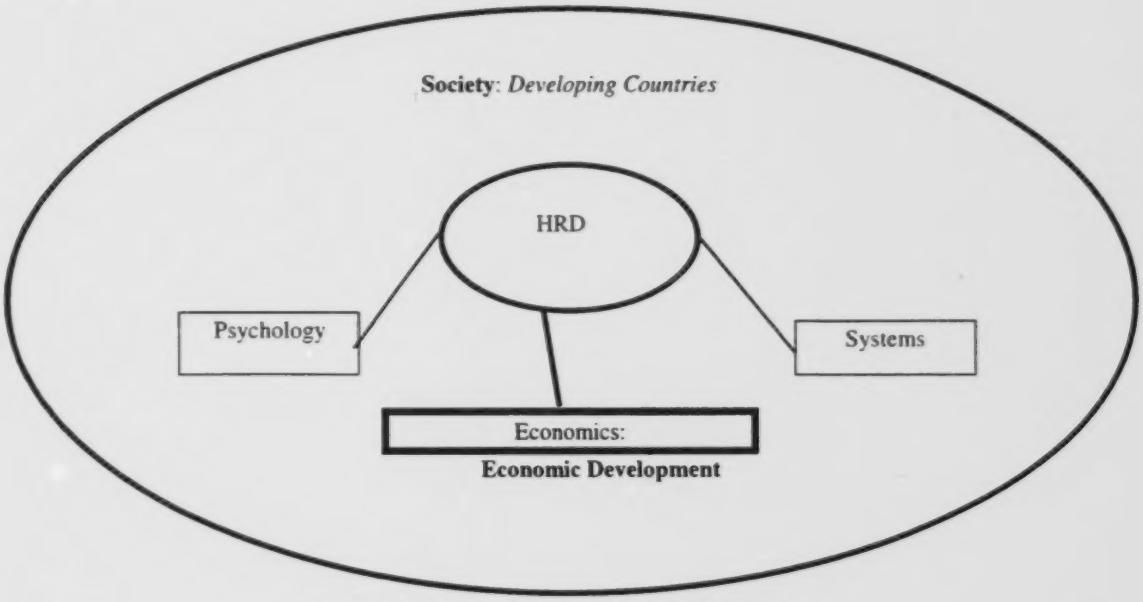

Figure 2: The role of economics in HRD Intervention.
Adapted from Swanson, 1995.

Multinational Enterprises and Developing Countries

Throughout history, capitalism has made its advances in human productivity on the basis of the exploitation of human labor, technological innovation, and the appropriation of vast material wealth; rarely through the education and training of the large majority of the workforce (Ashton & Green, 1996). However, as the twentieth century draws to a close, there seems to be "a consensus that the salience of a nation's education and training system is becoming the key item in the struggle for competitive [economic] superiority (Ashton & Green, 1996; p. 1). All the countries around the world, both developed and developing countries, seem to realize that the road to economic growth and development is tied to the skill formation of their human capital in order to improve the productivity of the labor force and thus raising the living standards of the population. Further, Thurow (1996) posits that countries who wish to develop and succeed in the future must begin to make long-term plans and commit major resources as investments in the education and the high skill formation of their society.

Marshal and Tucker (1992) assert that "The future now belongs to societies that organize themselves for learning. What we know and can do holds the key to economic progress just as command of natural resources once did ... The prize will go to those countries that are organized as national learning systems, and where all institutions are organized to learn and to act on what they learn" (p. xiii). According to Thurow (1996), in the past two centuries, the economic theory of comparative advantage directed companies to locate new business ventures in the world where natural resources and labor forces were abundant. Today, however, and for the next century, the comparative advantage rests with the knowledge and skills of the workforce. In fact, Thurow (1996) asserts that the successful companies in the next century will be those who can create, organize, and capitalize on the brainpower of the global workforce. Multinational enterprises play a major role in the global human resource development area both directly and indirectly (Dunning, 1993). Dunning (1993) suggests that multinational enterprises (MNEs) play an indirect role in the development of the workforce in that the countries will attempt to develop their domestic human resources to meet the potential needs of MNEs who may be prospecting for a new foreign direct investment (FDI) location. Also, MNEs, once established in a new country, become involved directly in further developing the skills of the foreign workforce they hire. However, Dunning (1993) concludes that the effects of the MNE activity on the eventual skill mix and quality of the workforce in a particular country are not clear.

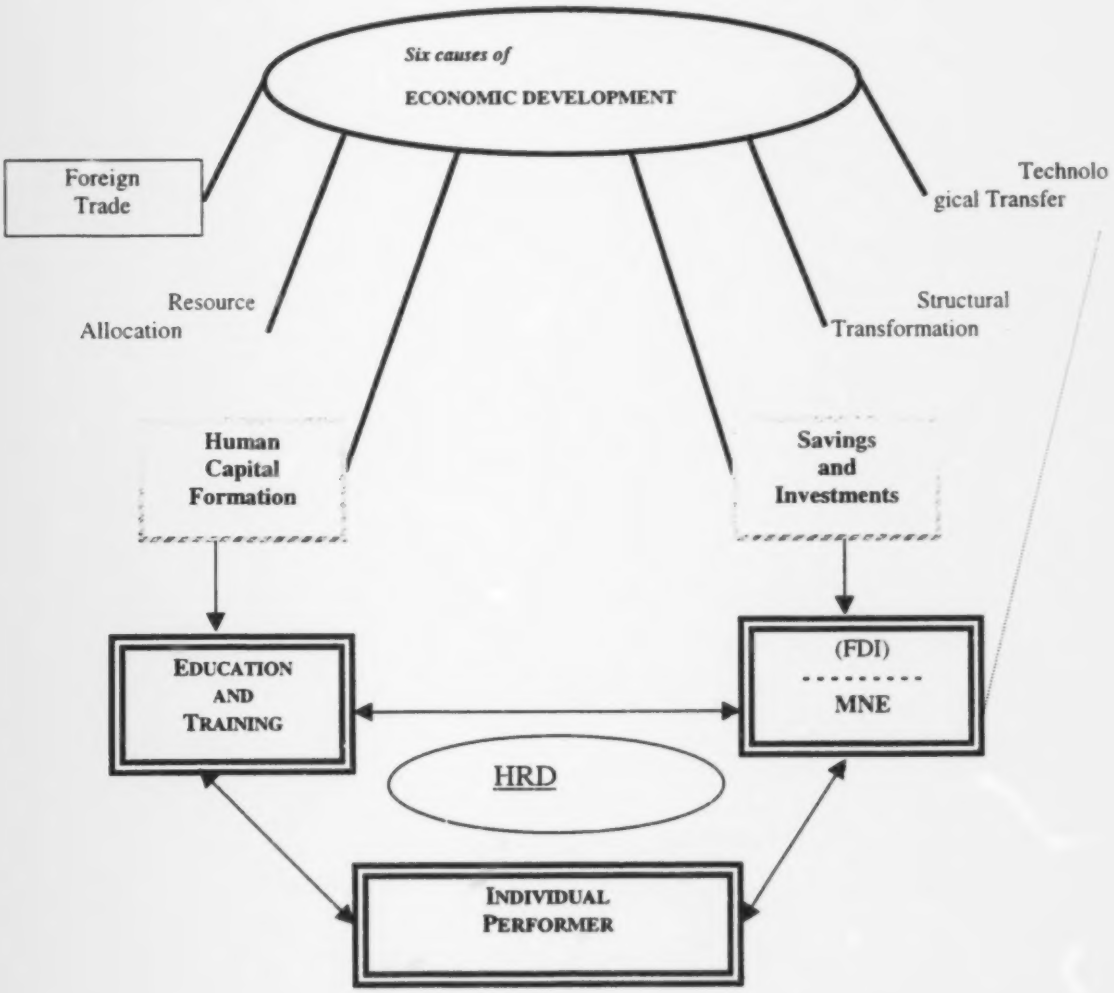

Figure 3: The role of HRD in economic development at the confluence of societal, organizational and individual levels.

Generally speaking, the literature suggests that, in its strategy for economic development, any developing country will need to develop, educate and train its human resources. A segment of these human resources will be prepared to meet the needs of prospective MNE investments. Also, MNEs will be searching the global market for new locations as prospects for their investment in production and service ventures. MNE decisions concerning their new venture locations will be affected in part by the availability of skilled human resources that will meet their needs (Bailey, Parisotto, & Renshaw, 1993). However, these LDCs can only guess what are the skill formation needs of the potential MNE ventures that may be seeking to start operation within their borders. Therefore, to be more effective in their educational and training programs, and to enhance their potential return on their investment in their human capital, LDCs [those who are interested in attracting MNE investments] need to have better information about the criteria that MNEs use in determining the readiness of the labor force in a particular country in terms of their skill formation.

Conclusion

I see this research as foundational in nature for the HRD field. In my view, human capital theory at the mega (societal) level complements HRD at the macro (organizational) level. In my attempt to develop a research agenda concerning the economic development prospects of LDCs, I believe that LDC governments must take a proactive approach toward creating an educational system that prepares the labor force for the global economy of the 21st century. This labor force then, in the systems view of the organization articulated by Rummler and Brache (1995), becomes one of the critical inputs for any organization (read economic entity) functioning within the boundaries of the respective LDC. At that point, HRD practitioners, in their focus on training and development, organization development, and career development, take the responsibility for enhancing the performance of the organization through the assessment of needs and the identification of gaps in performance at the organizational, workflow, and individual levels.

While I strongly believe in the viability of aforementioned perspectives, my philosophical views, influenced in part by my personal values and professional experience, compel me to keep in mind that the labor force we are discussing here is not merely an abstract concept or simply a form of capital or resource to be utilized for the planned and targeted ends of countries and organizations. This labor force is comprised of individual human beings who have their own goals, desires and aspirations. Therefore, because the human capital is different than physical or financial capital, and unique in that it has a will of its own, I believe that it becomes more difficult to determine the causal relationship between the actions of the HRD practitioners and the effects on the organizational outcomes, not to mention the ethical ramifications with regard to the individual employee.

Improving Technical Training: The Effectiveness of Technical Subject Matter Experts as Trainers

Saundra Wall Williams
North Carolina State University

Technical subject matter experts (SMEs) are considered experts in technical subject matter; however, they may not possess the required level of proficiency for certain competencies to deliver effective training. This study investigated the issue surrounding the effectiveness of technical SMEs in the delivery of training. Three variables, experience, formal education, and professional preparation, were found as germane to trainer effectiveness. The findings suggest that all the indicated variables do not have a perceived impact on trainer effectiveness.

Keywords: Subject Matter Experts, Technical Trainers, Trainer Effectiveness

Technical training has emerged as an essential component within the organizational training structure and within educational practice. Technical training is defined as the most common type of skill improvement instruction, which is designed to increase the technological capabilities of workers (Sugar & Schwen, 1995). Research shows that an average of 91 percent of all training delivered in the workplace involves technical training (Lakewood Publications, 1997).

Due to the vast amount of technical training being delivered in the workplace, there is an obvious need for effective technical trainers. Unlike many of the generalist trainers working within human resource departments, technical trainers are often technical specialists who, the majority of the time, have been recruited from the technical ranks of the company. Rather than hiring individuals with a training background, organizations tend to recruit their resident technical experts and turn them into trainers (Kelly, 1995). Notwithstanding, as employers and employees face the challenge of new technologies in high performance work organizations, the need for cutting edge technical training is clear (Kelly, 1995, Segall, 1995).

Problem Statement

Utilizing subject matter experts (SMEs) as trainers has become a common practice in technology industries. Although these SMEs are knowledgeable in the technical subject matter content, it is likely that some do not possess the appropriate level of proficiency for required instructor competencies to deliver effective technical training to adult learners.

A major study in training and development (McLagan, 1989) identified the role of the instructor/facilitator and the required competencies for this role. The instructor/facilitator role consists of "presenting information, directing structured learning experiences, and managing group discussion and group process" (McLagan, 1989, p. 55). The competencies associated with the role are defined as "an area of knowledge or skill that is critical for producing key outputs" (p. 77). Specifically, the study identified that the instructor/facilitator should be able to exhibit an advanced level of expertise in adult learning methods and training and development theories and techniques methods in order to be effective. Hence, possessing the required level of proficiency for these competencies is a means to determine the effectiveness of technical trainers.

The possible lack of knowledge in adult education principles and training and development methods and techniques for SMEs in technical training can present problems for organizations. First, ineffective training delivery wastes dollars invested in instructors, training materials, and employee time. The costs of employees who have not been given the skills they need to utilize the technologies required by their jobs wastes additional dollars. Technical trainers who are not given adequate support in the delivery of technical training may cause employees to feel demoralized because they cannot apply the skills on the job (Clark, 1994). If technical trainers do not possess the competencies required to deliver effective technical training, then the result of the training could lead to negative consequences for the learner as well as the organization.

Copyright © 1999 Saundra Wall Williams

The adult education literature validates the idea that the principles of effective practice and their implementation should characterize an adult educator (Galbraith, 1991; Knowles, 1984; Knowles & Hartl, 1995; Brookfield, 1986). Although the competencies have been clearly defined in the research literature (McLagan, 1989), many technical SMEs who deliver training are not required as part of their job description to possess these competencies. Some may actually perform the identified work of a technical trainer; however, they may not possess the required level of proficiency necessary to produce the work effectively. Hence, in order to improve the delivery of technical training, SMEs should be proficient in both technical subject matter expertise and the instructor/facilitator competencies. Thus, it was hypothesized that SME effectiveness will be positively related to the proficiency level of the identified instructor/facilitator competencies.

The purpose of this study was to determine if SMEs who deliver technical training perceive that they possess the required level of proficiency for the instructor/facilitator competencies. The framework for this study was the findings of McLagan (1989), a perception study which focused on competencies and role outputs. The study determined role competencies – the knowledge, skills, and abilities – individuals must possess to produce HRD work outputs (McLagan & Suhadolnik, 1989). Similar to the research design of the McLagan (1989) study, this current study measured instructor effectiveness by utilizing survey research of competency self-perception.

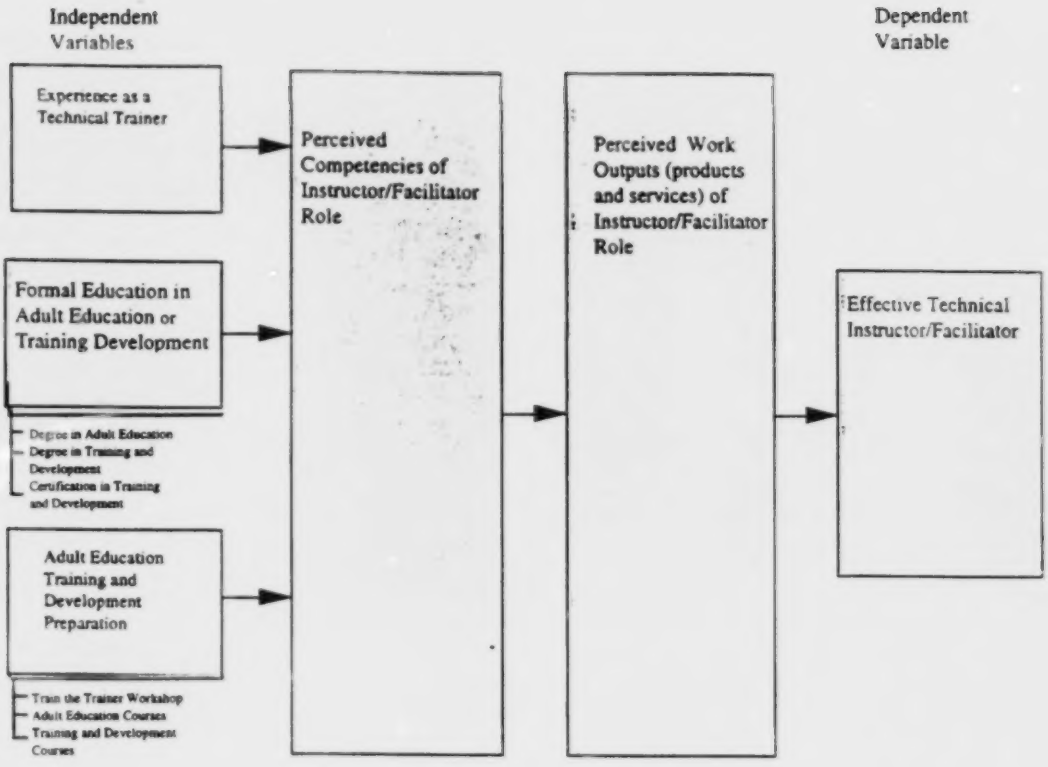
The Search for the Criteria of Trainer Effectiveness

An important part of this study was the identification of the criteria associated with trainer effectiveness. The literature indicates that a trainer plays different roles and that these roles must be clearly identified in order to conprehend effectiveness. Two studies were identified that focused on the characteristics of effectiveness based on the specific roles of a trainer: McLagan & Suhadolnik (1989) and IBSTPI (1988). The research findings given in *Instructor Competencies: The Standards* (IBSTPI, 1988) provided a set of core competencies that an instructor should demonstrate to successfully complete an instructional assignment. Likewise, the research findings presented in *The Research Report* (McLagan & Suhadolnik, 1989) define the competencies one must possess in order to be considered effective in the role. Therefore, this research clearly gives a framework of assessing the different roles of a trainer by utilizing the competencies for each role.

In the formation of a conceptual framework, the concept of SME in the role of technical instructor/facilitator effectiveness was designated as the dependent variable. As factors that might be significantly related to the development of a SME in the role of technical instructor/facilitator, the independent variables of (1) formal education, (2), adult education or training and development professional preparation and (3) experience were identified to be most germane to this study. In order to determine whether or not a subject matter expert can be effective in the role of technical instructor/facilitator, a conceptual model was developed that consists of the work outputs (products and services) and the competencies of the subject matter expert in the instructor/facilitator role (Figure 1).

The literature search identified several criteria for effective trainers. However, no study indicated a direct relationship between trainer effectiveness and experience, academic degree or certification, or instructor preparation. While there are no studies that indicate a relationship between the effectiveness of a SME in technical training delivery and the indicated variables, the literature suggests that both professional development in adult education or training and development would assist technical SMEs in becoming effective instructors (Chance, 1995; Castner & Jordan, 1989; Kaeter, 1995; Marsh, 1995; Trautman & Klein, 1993). Although these variables may contribute to the effectiveness of an instructor, the literature did not advocate them as requirements. When the scope of the literature review was narrowed to SMEs as technical trainers and technical training delivery, the review of the literature identified no studies and a paucity of articles on the subject. This information provided the rationale for identifying formal education in adult education or training and development, and instructor professional preparation (train-the-trainer workshops or adult education and training and development courses), as independent variables in this study.

In consideration of the possible relationship between the effectiveness of SMEs in the delivery of technical training and the amount of experience in the instructor role, little research could be found to support or deny this relationship. One study (Falkman, 1990), identified a possible relationship in these variables. This study determined that more experienced trainers were better able to deal with adults as learners than those with less experience. The results of the Falkman (1990) study seemed to give evidence in the literature to support instructor experience in the instructor role as a variable for study.



Independent Variables
Dependent Variable
Experience as a Technical Trainer
Formal Education in Adult Education or Training Development
Degree in Adult Education
Degree in Training and Development
Certification in Training and Development
Adult Education Training and Development Preparation
Train the Trainer Workshop
Adult Education Courses
Training and Development Courses
Perceived Competencies of Instructor/Facilitator Role
Perceived Work Outputs (products and services) of Instructor/Facilitator Role
Effective Technical Instructor/Facilitator

Figure 1. A conceptualization of variables and relationships depicting the effectiveness of Technical Subject Matter Experts as Technical Instructors/Facilitators.

Research Questions

From the review of the related literature, three components were established. They were (1) the criteria for trainer effectiveness in the instructor/facilitator role; (2) a conceptual framework for analyzing effectiveness; and (3) a conceptualization of variables and relationships defining the effectiveness of SMEs as technical instructors/facilitators. Based on the problem, purpose, and the review of the related literature, the following questions guided this study:

1. What self-reported level of proficiency do technical trainers possess for the competencies that define the instructor/facilitator role?
2. Is there a significant relationship in the reported level of proficiency and the respondent's academic degrees in education, certification, or other professional preparation in training and development?
3. Is there a significant relationship in the perceived level of proficiency needed for the required competencies and the number of years of experience in the role of technical trainer?

Methodology

BEST COPY AVAILABLE

To evaluate the effectiveness of the SME in the technical instructor/facilitator role, a survey instrument was designed which followed the design of the McLagan (1989) study. The survey instrument was developed utilizing the work outputs and competencies for the instructor/facilitator role as defined in *The Models* (McLagan, 1989). The instrument, *Technical Trainer Practices Survey*, was a four-page questionnaire consisting of three parts. Part one collected data relative to the outputs produced by SMEs in technical training. In this section, there were seven categories of questions, each representing one of the work outputs of the instructor/facilitator role as defined by *The Models* (McLagan, 1989).

Part two collected data on the perceived proficiency of the instructor/facilitators relative to the identified competencies. A rating scale was used to gather these responses, beginning with zero being equated with having no perceived proficiency in the competency. A response of one or two indicated a perceived basic proficiency level for the competency; three and four represented a perception of intermediate proficiency level for the competency; five and six were equated with having an advanced level of proficiency for the competency. The competencies assessed were the fourteen competencies (the definition of each competency was provided) associated with the instructor/facilitator role identified in *The Research Report* (McLagan & Suhadolnik, 1989).

Part three of the survey collected demographic information for the technical trainer. The responses were used to categorize the respondents in terms of job title, number of years as a technical trainer, educational background, type of adult education or training and development preparation received, and previous job position.

Population and Sample

The study population consisted of 4,732 trainers who were members of the international American Society for Training and Development (ASTD) organization and identified their Professional Practice Area (PPA) as Technical and Skills Training and their job title as Specialist/Coordinator/Trainer. Systematic random selection of 500 names was conducted electronically by ASTD. The survey was mailed with a business reply envelope on three separate occasions to increase the response rate. A total of 165 surveys were returned, which yielded a sample response rate of 33%.

Measurement of Variables

The dependent variable in this research was SMEs perceived effectiveness in the delivery of technical training as measured by the total score received from the responses to the level of proficiency related to each competency. The three independent variables used were (1) number of years as a technical trainer; (2) formal education background; and (3) adult education or training and development preparation.

Respondents were asked to indicate the number of years they have been a technical trainer. The information provided was categorized into five groups: 0 - 1 year, 2 - 4 years, 5 - 10 years, 11 - 24 years, and 25 or more years. Level and type of formal education was determined from responses relating to educational background. The respondents were asked to indicate the year he or she received advanced degrees and their major course of study. To determine the type of adult education or training and development preparation received, each respondent was asked to indicate any relevant workshops, classes, or seminars in these areas. Data analysis processes included calculation of descriptive statistics on the demographic data, calculation of the frequencies and mean scores for each competency, and test for significant relationships between the variables.

Findings

Research question one was analyzed from the respondents' responses to their perceived level of proficiency in part two of the *Technical Trainer Practices Survey*. Respondents were asked to assess their perceived level of expertise in each competency for the instructor/facilitator role. As previously described, expertise categories were none, basic, intermediate, and advanced. With the exception of Objectives Preparation Skill and Questioning Skill, all respondents assessed themselves at the basic level or above for each competency (Table 1).

The mean score for each competency (Table 2) falls into the intermediate level of expertise range. Ranking the competencies according to mean score shows that the respondents assessed their presentation skills expertise ($\underline{M}$ = 4.90) higher than any other of the competencies. Conversely, the respondents' expertise in group process skill ($\underline{M}$ = 4.05) was ranked lowest of the competencies.

The analysis of research question two categorized the responses to the perceived level of expertise into three (3) categories for scoring purposes. The rating scales for perceived proficiency were 0 (no perceived proficiency), 1

and 2 (basic proficiency level), 3 and 4 (intermediate proficiency level) and 5 and 6 (advanced proficiency level). The statistical analysis (Table 3) indicated that there were no significant relationship in the perceived competency levels for the technical instructors/facilitators based on degrees in education, certification, or other preparation in training and development. The results from the data analysis (Table 4) of research question three revealed significant relationships in the competence level based on the number of years in technical training delivery. Hence, the data indicated a relationship in the level of perceived proficiency of technical instructors/facilitators based on the number of years in the instructor/facilitator role.

Contributions to New Knowledge and Future Research Directions In HRD

The purpose of this study was to determine if SMEs who deliver technical training perceive that they possess the required proficiency levels for effectiveness in the role of technical instructor/facilitator. There are five key findings from this study.

First, based on the mean score for each competency, the extent to which the work outputs are produced by SMEs does not advance further than the intermediate level on average. Second, technical trainers with five or more years experience in the area of technical training delivery report a higher level of proficiency in the competencies for the instructor/facilitator role. Based on these findings, practical application of the competencies may increase perceived expertise level. Third, technical trainers perceive themselves to have the highest level of proficiency in presentation skills and subject matter expertise. Additionally, technical trainers perceive their level of proficiency in training and development methods and techniques and adult learning methods to be at an intermediate level of proficiency. Fourth, although the literature in training and development states the importance of instructor preparation through formal education in adult education or training and development, these factors have no perceived impact on the level of proficiency in relation to instructor/facilitator competencies. Finally, preparation in adult education or training and development has no perceived impact on the level of expertise in relation to instructor/facilitator competencies.

The findings of this study has contributed to new knowledge in HRD, specifically technical training in numerous ways. First, the findings demonstrate a relationship between the competency level rating and the amount of experience in technical training delivery. For instance, technical trainers with five or more years experience in the area of technical training delivery report a higher level of proficiency in the competencies for the instructor/facilitator role than those with lesser years of experience. These findings agree with the Falkman (1990) study that found that novice trainers have a difficult time in relating to adults as learners. Accordingly, practical application of the competencies appears to increase the perceived proficiency level.

Second, the training and development literature and the findings of this study agree that presentation skills are a critical competency for the subject matter expert acting in the role of instructor/facilitator in the delivery of technical training. However, effective presentation skills alone do not constitute effective technical training delivery. Effective technical training delivery is dependent upon the SME possessing an advanced level of expertise in the competencies for the instructor/facilitator role. Hence, an advanced level proficiency for all competencies can be regarded as an enhancement to the technical training efforts.

Third, this study provides evidence to support the position that SMEs in the role of instructor/facilitator who possess an advanced level of expertise in the competencies may also provide a higher level of technical training. This conclusion has direct implications for the workplace since efficient workplace practice and expertise is paramount in today's dynamic technological environment making effective training crucial to the continued success of an organization. Although the standard practice of recruiting resident technical experts and developing them as technical trainers should be addressed by organizations if they are to remain viable in today's marketplace, the more significant issue is one of degree. That is, if the technical trainer does not possess an advanced proficiency level defined by the McLagan (1989) research results, not only will the training suffer, but also, the organization will not be as competitive in the marketplace.

These issues demonstrate that the area of instructor recruitment is also vital in maintaining an organization's position in the marketplace. Since this study found that the number of years of experience is related to performance effectiveness, it stands to reason that employing SMEs with a minimum of five years of training and an advanced level of proficiency in the competencies would benefit an organization and improve technical training overall.

Future Research

This study was designed as an introductory exploration of technical SMEs leading to further research in instructor effectiveness. The findings of this study indicate issues that should be directed to future research. First, further exploration into measuring effectiveness of SMEs as technical trainers should be investigated. An examination of effectiveness by gathering actual performance data would further confirm the effectiveness of SMEs as technical trainers. Manager assessment, student perceptions, student achievement, or classroom audits are several options to obtain this effectiveness data. In addition, other contributors to effectiveness could also be examined.

An examination of the effectiveness of SMEs with no education or training degrees or preparation, before and after they have completed a training and development certificate program should be undertaken. The findings of this type of study could yield implications for the establishment of required certification programs for technical trainers in conjunction with other required technical and technology-based certifications.

Another area that requires further exploration in instructor/facilitator competencies are the values that an advanced level of proficiency adds to the learner and to the organization. Future research should examine the impact on the transfer of training based on the proficiency level. For example, the Falkman (1990) study determined that more experienced trainers were better able to deal with adults as learners than those with less experience. Although this current study found a relationship between experience and level of proficiency, the impact of proficiency on training transfer is an important topic for future study.

A final issue worthy of further research is the determination of whether or not the McLagan (1989) competencies are also applicable for technology-based training delivery. If the delivery methods are moving from instructor-led to technology based then what will be the competencies required of those practitioners in the instructor/facilitator role?

In sum, this research determined the variables which affect the effectiveness of the technical SME in the delivery of technical training. Effective technical SMEs can be identified in organizations as those who possess an intermediate level of proficiency in presentation skills and possess five or more years of experience in the delivery of technical training. Hence, the findings of this study indicate that in order to improve technical training, business and industry must consider factors other than technical subject matter expertise when recruiting technical trainers.

Identifying the Skill Requirements and Performance Needs of Small Manufacturers

Julie A. Furst-Bowe
University of Wisconsin-Stout

Little is known about the employee skill requirements and performance improvement needs of small manufacturers in Northwestern Wisconsin. A survey was conducted to provide information on the needs of these manufacturers and to determine if a university-based performance improvement center would be of assistance to these companies in meeting the identified needs. The results of the survey are summarized and discussed in this manuscript. Conclusions are drawn, and recommendations for research and practice are provided.

Keywords: Performance Improvement, Performance Needs, Skill Requirements

Throughout the past two decades, numerous changes have occurred in manufacturing technology and production processes. In many companies, these changes have forced workers to obtain higher skill levels. According to a national survey, manufacturing employees now require greater skills in computer use, teamwork, decision making, problem solving and systems thinking to perform in the current work environment (Bassi, Cheney & Van Buren, 1997). This increased emphasis on technology, teamwork and knowledge management is expected to continue into the next century (Bassi, Cheney & Van Buren, 1997).

In many parts of the country, finding skilled workers for the manufacturing sector is extremely difficult, and providing employees with the skills they need can be costly to employers. In 1998, approximately 17 million production workers received an average of 30 hours of training, costing employers an estimated 19 billion dollars (Industry Report, 1998). Most of this funding was used to pay the wages of internal trainers or human resource development professionals. Technical colleges, community colleges and universities may also provide education and training to employees. Partnerships between manufacturers and educational institutions are becoming increasingly popular. In a recent survey by the Wisconsin Manufacturers and Commerce association, the technical college system was listed as the most important external resource for in-state employers and 24 percent of the respondents relied on four-year universities.

In Northwestern Wisconsin, where only 10 percent of the 371 manufacturers have more than 100 employees, few companies have internal training or human resource development departments (Franklin, 1998). In rural areas such as this, it would be logical for companies to utilize the services of the local technical colleges and university campuses to provide education and training for employees. However, highly skilled employees are just one component of performance. A comprehensive performance improvement system includes three levels of performance, individual, process and organizational, each with its own measurements and variables (Swanson, 1995).

In many small companies, owners and managers are busy maintaining their operations in a very competitive economy. They may lack insight as to how to implement a systematic approach to performance improvement that would encompass all levels and advance the organization beyond its current position. A university-based performance improvement center, led by faculty and staff with experience and expertise in performance improvement and human resource development, could assist small manufacturers in understanding performance and designing and implementing performance improvement initiatives. Currently, such centers are in existence in several universities with well-established academic programs in performance improvement and human resource development.

Research Questions

Little is known about the employee skill requirements and performance improvement needs of small manufacturers in Northwestern Wisconsin. This study sought to provide information on the following questions:

1. What are the employee skill areas that are perceived to have importance by small manufacturers?
2. What are the employee skill areas that are perceived to be in need of improvement by small manufacturers?

Copyright ©1999 Julie A. Furst-Bowe

3. What types of performance improvement initiatives are currently taking place in small manufacturing companies?
4. Is there a need for a university-based center that would assist small manufacturers in improving performance at the individual, process and organizational levels?

Methodology

Following a review of the existing research in this area, a questionnaire was developed and initially reviewed by a panel of faculty and staff members with expertise in performance improvement. The questionnaire contained demographic items such as size of company and job title of respondent. The main body of the questionnaire was divided into two sections. One section required respondents to rate various types of supervisory and employee skills as to their level of importance and the level of improvement desired. Skill lists were adapted from the *National Skill Standards for Advanced High Performance Manufacturing*, standards that were developed during a project that was commissioned by the U.S. Department of Education in 1997. In the second section, respondents were asked to describe current performance improvement initiatives in their organization. This section was designed in an open-ended format. The respondents could list and describe any current practice in their organization that was implemented to improve performance at the individual, process or organizational level. A final draft of the questionnaire was reviewed by small group of trainers and human resource directors in manufacturing companies.

A cover letter was developed and was then mailed with the questionnaire to a random sample of 200 small (fewer than 500 employees) manufacturers in the fall of 1997. Companies were randomly selected from a database maintained by the Northwest Wisconsin Manufacturing Outreach Center (NWMOC). Mailing labels and cover letters were addressed to the owners or presidents of the companies. By November 1997, following the initial mailing and a follow-up mailing, 49 companies, or 24.5 percent of the manufacturers, had responded to the questionnaire.

The data were analyzed by a staff member in the Technology and Information Services unit at the University of Wisconsin-Stout. Using SPSS-X software, frequencies and percentages were calculated for each item included on the survey. T-tests were conducted to determine if there were significance differences in the mean ratings of the two skill groups in importance or in need for improvement. The responses to the open-ended questions were summarized and categorized by the researcher.

There were limitations associated with this methodology. The population was limited to small manufacturers in Northwestern Wisconsin who were included in the NWMOC database. This is a largely rural area with a very homogeneous population and few cities that have a population more than 10,000. Therefore, the results may not be generalizable to manufacturers located in other parts of the state or other areas of the country. The 24.5 percent response rate also makes it difficult to generalize the results of the study. However, it was thought that additional follow-up mailings would do little to improve the response rate. Although the survey was targeted toward small companies, several of the respondents wrote unsolicited comments on their surveys such as "although I answered the questions, I believe our company is too small to do much in this area" or "with only 30 employees, most of this doesn't seem to apply to us." It was hypothesized that many of the companies did not respond to the questionnaire because they held similar beliefs.

Results and Discussion

In this section, the responses to each of the questionnaire items will be presented and discussed, beginning with the two demographic items: job title of respondent and size of company. Nearly half of the respondents were company presidents (47 percent). Other job titles of respondents included owners (14 percent); general, plant or operations managers (22 percent); vice presidents (1 percent); or other/multiple titles (16 percent). Many of the those in the "other" category held multiple titles, such as President/General Manager. The majority of respondents were from very small companies with fewer than 100 employees (84 percent). The remainder of the respondents were from companies with 100 to 250 employees (12 percent) or companies with 251 to 500 employees (4 percent).

Respondents were asked to rate the importance of 24 skills (12 supervisory/managerial skills and 12 employee skills) on a scale of 1 to 4 according to their perceived importance and the perceived need for improvement in each skill area (1 = little importance or little need for improvement and 4 = extremely important or great need for improvement). Table 1 presents the results of the supervisory/managerial skill ratings:

Table 1

Supervisory/Managerial Skills Ranked by Perceived Importance (N = 49)

Skill Area	Importance	Need for Improvement
Orienting new employees	3.36	1.92
Motivating employees	3.14	2.21
Appraising employee performance	3.12	2.23
Delegating responsibility	3.05	2.14
Solving problems	3.04	2.19
Managing operations	3.02	2.22
Providing feedback	3.00	2.24
Managing time	2.93	2.34
Managing diversity	2.83	1.37
Resolving conflicts	2.83	2.00
Managing projects	2.70	1.89
Training employees	2.48	2.08
	Mean = 2.70	Mean = 2.07

All of the supervisory/managerial skills were rated at least "somewhat" important by the respondents (2.0 or higher), and more than half of the skills (58 percent) were rated "very important" (3.0 or higher). Orientation of new employees receiving the highest importance rating (3.36) while training employees received the lowest importance rating (2.48.). Respondents indicated there was need for "little" to "some" improvement in all of the skill areas, with little variation across categories. There were similar patterns in the ratings of the importance and need for improvement in the 12 employee skills (see Table 2).

Table 2

Employee Skills Ranked by Perceived Importance (N = 49)

Skills Area	Importance	Need for Improvement
Working as part of a team	3.19	2.19
Making ethical decisions	3.09	1.70
Listening	3.07	2.18
Setting goals	2.95	2.30
Understanding quality	2.92	2.24
Writing	2.69	2.00
Managing stress	2.66	2.32
Using computer technology	2.62	2.00
Reading	2.50	1.66
Serving customers	2.40	2.22
Developing a career plan	2.07	1.65
Understanding of systems	1.88	1.88
	Mean = 2.67	Mean = 2.03

All but one of the employee skills were rated at least "somewhat" important by the respondents (2.0 or higher), yet only three of the skills (25 percent) were rated "very important" (3.0 or higher). Again, respondents indicated there was at least a "slight" need for improvement in all of the skill areas, with little variation across

categories. There were no significant differences in the mean ratings of the two skill groups, supervisory/managerial and employee, in importance or in need for improvement.

Thus, the respondents of this study were consistent with the current literature and with state and national research in this area as they rated 23 or the 24 skills area somewhat to very important for their employees. However, in contrast to the literature and national reports of low-skill employees unable to cope in today's high-tech manufacturing environments, the respondents in this study reported relatively little need for improvement in the skills of their employees. None of the 24 skills areas received a rating of 2.5 or higher indicating that there were no perceived needs for great improvement in any of the skill areas.

Approximately one-third of the respondents (32.7%) indicated they had implemented one or more performance improvement initiatives. Respondents were asked to describe these interventions in their own words. The responses include interventions directed at the individual, process and organizational levels and can be broadly categorized into six areas: strategic planning, physical infrastructure, quality improvement, training and development, individual performance management and other types of initiatives. Respondents could list multiple interventions (see Table 3).

Table 3

Performance Improvement Initiatives as Identified by Respondents

Organizational Level
Strategic planning
Establishing business objectives
Organizational goal setting by managers (2 companies)
New addition to facility - increase total space
Improvements in plant layout (3 companies)
Implementation of new computer system (2 companies)
Process Level
Continuous quality improvement program
Process improvement
Compliance with ISO Quality Standards (2 companies)
Quality control program
Standardized manufacturing criteria
Work flow improvements
Problem solving teams
Value-added manufacturing
Individual Level
Supervisory skills training program
Safety training (2 companies)
Training courses and seminars (3 companies)
Mentoring program
On-the-job training
Pay for performance
Performance evaluations (2 companies)
Annual performance agreements
Alcohol/drug testing
Other
Employee suggestion program, "Job Boss" Program, "5 Pillars of the Visual Workplace"

Although the 16 companies that considered themselves to have implemented performance improvement initiatives described a total of 35 activities, this list should not be considered an all-inclusive description of the initiatives that are occurring in these companies. It appears likely that individual perceptions of that could be considered a

"performance improvement initiative" varied widely. For example, it is widely accepted that on-the-job training (OJT) is a standard practice among small manufacturers although only one respondent included OJT in his response (Barron, 1997). The same observation could be made regarding safety training, performance evaluations and quality control processes. Finally, although only one-third of the respondents listed current performance improvement initiatives, more than half (51 percent) indicated they would consider using assistance from a local university in meeting their performance improvement needs.

Conclusions

Several conclusions may be drawn from the data that were collected in this study. The respondents of this study, primarily presidents and owners of small companies in Northwestern Wisconsin, indicated that the skills needed for supervisors and employees to be effective in the current manufacturing environment are somewhat important to very important for employees in their own organizations. Unlike employers in other parts of the state or other states in the country, there does not appear to be a shortage of needed skills or a perceived need for major improvement in any of the skill areas included in the survey given their current performance requirements.

However, the performance requirements for today's workplace can often be separated into two categories (Swanson, 1995). One category of skills deals with maintaining the existing organization. The second category of skills deals with improving the organization. It may be that employers are content with existing skill levels because current skill levels are adequate to maintain the existing company. In contrast, companies with aggressive performance improvement programs may find that employee skills need continual upgrading to deal with advances in systems and processes or to create new methods and products.

Two thirds of the respondents indicated that they did not have current performance improvement initiatives in place. Of the respondents who reported performance improvement initiatives, most provided only one or two examples of largely unrelated types of activities. There was no evidence of a systematic performance improvement program that included initiatives at the organizational, process and individual level at any of the responding companies. Thus it may be concluded that the respondents had a limited understanding of performance improvement and how performance improvement initiatives may be used strategically in their companies to improve productivity, quality or other areas.

Finally, more than half of the respondents indicated that they would consider using assistance provided by a local university to improve performance in their organizations. However, given the apparent match between employee skills and current performance requirements and the limited knowledge of performance improvement processes among the respondents, traditional approaches offered by technical colleges and universities, such as offering a series of employee training seminars, may be not be the most effective method to provide services to these organizations. Based on the data collected in this study, customized services, beginning with performance needs assessments and analyses, would appear to be a more effective approach.

Contribution to New Knowledge in HRD

Unlike large companies that often have resources for internal human resource development departments and external performance consultants, small manufacturers may have more limited knowledge and restricted access to individuals with formal expertise in performance improvement. Although the respondents, as presidents, owners and managers of companies, probably discuss performance issues on a regular basis, it is clear from the results that they share no common definition of the concept and no methodological approaches to improving performance in their organizations. Performance remains a mystery or even a threat to many individuals when they are asked to think about, explain, substantiate or improve performance in their organizations (Swanson, 1998).

Therefore, university-based centers that can assist small manufacturers with these issues may be providing valuable services, provided the organization is sincerely interested in initiating change. University consultants can best help small manufacturers by first facilitating strategic planning and challenging manufacturers to think systematically about improving performance before suggesting a number of interventions (Thompson, 1997). When the relationship has been established and trust has been built, the consultant may recommend a performance need analysis and, based on the results of the analysis, design appropriate interventions, including those related to training and human resource development. Continued assistance may be needed during the implementation and evaluation of interventions as small mangers may lack the knowledge and sophistication needed to effectively support the process (Brauchle & Wright, 1998).

The process described above, analysis, design, implementation and evaluation, has been used successfully with many organizations, both large and small. However, it is not a "one size fits all" approach. Many of the respondents clearly believed that their organization was "too small" to benefit from performance improvement theory or techniques, or they thought that there was little need for improvement in the skills of their employees. Research has proven that organizational design factors, including the size of the organization, may affect the success of performance improvement initiatives (Torraco, 1998). It may be that current models need to be adapted, or new models created, for very small companies.

Although respondents in this study saw relatively little need for improvement in the skills of their employees, probing questions from a skilled consultant may determine if the organization is operating at a "maintenance level" and if the performance could be enhanced through changes to the system. Through careful planning and analysis, employers may realize that skill levels they once believed adequate are no longer acceptable if they are to move beyond the maintenance level and require employees to become innovators and provide them with opportunities to improve their own individual skills, processes and work environment.

The Relationship of Learning and Performance Improvement at Different System Levels

Richard J. Torraco
University of Nebraska

The importance of learning to organizational effectiveness is no longer questioned. Research in the last decade has identified the central role of learning for enhancing individual development, team effectiveness, leadership, innovation, and competitive advantage. However, this acknowledgement of learning's importance has been accompanied by the lack of conceptual clarity when learning, change, innovation, and performance, all desirable states and covariants of each other, are necessarily studied together. Because learning and performance strongly influence each other, we are often left confused by which is the phenomenon of interest. This confusion is compounded when levels of analysis are considered. This paper examines learning and performance improvement, first as separate constructs, then, as complimentary elements in organization systems. Using a four-level systems model, changes in the relationship between learning and performance improvement are examined at different levels of the model.

Keywords: Organizational Learning, Performance Improvement, Systems Model

Several models exist to aid our understanding of systems and, in particular, the dynamics of organizations. Rashford and Coghlan (1994) frame strategies for change within a model with four levels—individual, team, interdepartmental, and organizational. Nadler, Gerstein, and Shaw (1992) provide a framework for organizational change with three levels—individual, unit/group, and system. Rummler and Brache (1995) argue that system-wide performance improvement requires attention to performance variables at three levels—individual, process, and organization. Each of these models specify an individual and an organizational level. However, inconsistency at the intermediate level(s) often results in confusion. What exists between the individual and organizational levels? Is this level best represented by *group*, *process*, or one or more other terms?

Holton (1999) proposed a four-level systems model that offers an important, new dimension not present in other models that appears to resolve this inconsistency and confusion. Holton's model, created as a framework for performance improvement research, is composed of four levels—individual, critical performance sub-system, process, and organization. This model makes an important distinction between a *process*—a structural component common to all systems, and what Holton calls a *critical performance sub-system*—a concept that can be used to designate a work group, department, center, division, or other structural unit specific to the system. This paper adopts Holton's model, with a minor modification described later in the paper, as the systems framework for examining the relationship between learning and performance improvement.

Individual level. The individual level is important because of the centrality of the job in studies of work and occupations where the individual is the job incumbent. Regardless of the model one uses, any human system must acknowledge the individual as its basic building block. In the following sections, learning and performance improvement are discussed as separate constructs. Then, the relationship between learning and performance improvement is examined to determine the conditions under which a closer relationship between these two phenomena might exist.

Learning at the individual level. Experiential learning occurs through reflection about concrete experience in which a pre-existing mental representation of a situation is reconciled with current experience (Kolb, 1984; Schon, 1983). The learner is able to construct new knowledge on the basis of existing knowledge. In novel situations for which no prior experience exists, the learner's burden to construct understanding increases. The learner must be resourceful in using materials, local conditions, and social circumstances to construct a conception of the new situation that is intelligible to the learner.

What is learned, both with and without prior experience, is intimately connected to the conditions in which it is learned. Even in familiar situations for which mental representations exist, learners will first try to deploy useful aspects of the task and their understanding of the context in order to limit the representational and computational load. This aspect of cognition was demonstrated by Scribner (1984) as "mental effort saving," in which dairy workers devised computational short cuts learned from practical experience. In developing a theory of

Copyright © 1999 Richard J. Torraco

situated learning, Brown, Collins, and Duguid, (1989) acknowledged that, when a situated approach does not facilitate learning, people may, step by step, fall back on abstract algorithms. However, the authors stated, "we still need to understand the initial impulse to try a situated approach. And if this approach indeed succeeds, reflecting on and justifying that success is a productive learning experience" (p. 11). If one accepts a view of learning consistent with the theory of situated cognition, then the following line of reasoning defines the learning experience.

- Context is crucial to learning. What is learned cannot be separated from the context in which it is learned.
- Context can include experience, but learning can proceed without direct experience.
- To compensate for lack of experience and as a supplement to the context of learning, the learner relies on heuristics and abstract algorithms as a way of forming a mental representation of what is learned.

When people lack experience with a situation or are introduced to a new concept, providing them with a model or description of the new situation is a useful catalyst for forming mental representations of what is learned. While inexperienced people may accept such a model, they will try to integrate it with new activities and perceptions, and any past experiences that may be related. The model will become part of the present context for learning, in which the learner's activity and perceptions precede mental representation.

Performance improvement at the individual level. Without engaging in a futile effort to pin down a concept that will likely always demand multiple interpretations, performance improvement is characterized in a particular way to serve as a conceptual anchor for the rest of this paper. In every organization the concrete determinants of performance are reflected in people, their ideas, and the material resources through which their ideas reach the marketplace. Performance improvement cannot be fully understood without specifying its determinants, accounting for the sophisticated processes through which performance is expressed, and making some judgment about whether or not performance has, in fact, improved. Performance improvement can only be manifest through outputs, and change in outputs can only be assessed through some form of measurement. Thus, performance is a systems concept that can be operationalized in any system as one sets out to demonstrate whether or not it has improved. The dynamic nature of performance improvement allows empirical inquiry into its determinants, dynamics, and consequences. Simply stated, performance improvement can be demonstrated through research.

Learning—performance improvement relationship. Learning can occur without performance improvement. Even in the workplace where behavior is expected to be goal-directed, most learning is informal and occurs through *noncanonical practices*—the improvisations and short cuts learned from actual experience (Brown and Duguid, 1991). People routinely share stories and work experiences with each other for a variety of reasons that include learning. An insight into one's work, whether it arises from formal or informal learning, may never be translated into a demonstrable improvement in performance. The value of workplace learning is not measured exclusively in the currency of performance outcomes.

Conversely, individual performance can be improved without learning. For example, take the situation of an employee who needs his/her job, and, for any number of reasons, is unlikely to leave it for another job. The supervisor requires this employee to spend more time on a particular task. Under the threat of punishment or dismissal by the supervisor, the employee does so. More work is accomplished and, subsequently, the employee's task-related performance improves. If "learning" has occurred at all, the employee has learned only to comply with the demands of the supervisor. This is not learning as it has been defined here.

Thus, learning and performance improvement are independent constructs; learning occurs without performance improvement and performance improvement occurs without learning. Moreover, there is no evidence that greater learning necessarily leads to better performance. However, features of the learning experience may predispose participants to better performance. Research that promises to strengthen this relationship examines the development of a climate for the transfer of learning to performance (Rouiller and Goldstein, 1993; Holton, Bates, Seyler, and Carvalho, 1997). The relationship between learning and performance improvement at the individual level is summarized in Table 1 (see Table 1, *Learning and Performance Improvement at Different System Levels).*

Function level. These are work groups, teams, departments, functional areas, centers, institutes, divisions, or other structural units designated by the organization system. Whenever two or more individuals come together for a common purpose, the structural unit created is a *function*. A function is different than a process (the next level of the model to be discussed) because processes integrate the contributions of several functions (thus, the term *cross-functional process*), and functions usually contribute to more than one process. While acknowledging the variety of configurations at the function level, the term "group" will be used to designate this level for consistency.

Learning at the function level. Learning at the function level is conceptualized as a phenomenon that is consistent with Simon's observation that "all learning takes place inside individual human heads; an organization learns in only two ways: (a) by the learning of its members, or (b) by ingesting new members who have knowledge

the organization didn't previously have" (1991, p. 125). Learning is strongly influenced by context and occurs in ways that are unique to the individual. When we move to the function level, learning still occurs through individuals. Two or more people constituting a group are expected to be familiar with a common body of knowledge and the resources that are available to achieve the group's purpose. Members must also observe basic rules of group interaction. Presumably because all members of the group increase their learning about these common elements, we refer to this type of learning as "team learning" or, in larger systems, as "organizational learning." However, this is really individual learning of content that is common to other members of the group. Group learning occurs as individuals learn more about this content and about each other.

If learning only occurs "inside individual human heads," what characteristics distinguish individual learning from learning at the functional level? Individuals enter the group experience bringing with them the responsibility for continuing their learning related to the job or role they hold. However, what learning responsibilities are incurred by group members beyond what is already expected of the individual?

Research has identified two distinctions between individual learning and learning at the function level. First, each member of the group must know how his/her role or task fits into the group's overall purpose. This may involve the development of a *transactive memory system*, in which members simply know the locations rather than the details of common events and rely on one another to contribute the missing expertise (Wegner, Erber, and Raymond, 1991). An alternative suggested by Hutchins' (1991) work on distributed cognition, is that a senior practitioner, who has previously held the roles of subordinates, coordinates members' contributions and assures the proper amount of overlapping expertise. A second distinguishing feature of learning at this level is, to the extent that some knowledge resides exclusively in the group, members must learn from each other (Hackman, 1990; Katzenbach and Smith, 1993). Weick and Roberts (1993) have described the heedful comprehension that occurs among group members as they learn from each other as the development of "collective mind."

Performance improvement at the function level. Improving work performance at the function level is not simply a matter of applying the factors used to improve job performance to more than one person. Groups face challenges to achieving performance goals not encountered by individuals. A model of performance is presented next that requires the systematic consideration of five determinants of group performance.

- *Performance goal.* Performance in most businesses is driven by the need to deliver value to customers in ways that are better, faster, and cheaper (Kaplan and Norton, 1992).
- *Consequences.* The alignment of consequences across organizational levels remains a challenge for managers (Kerr, 1973). Corporate credos espousing customer service are frequently contradicted by employees rewarded for customer volume, not customer satisfaction.
- *Communication and feedback.* The moment we move from the individual level to the group level, communication becomes essential for performance improvement. Communication is the vehicle through which group members determine how their role or task fits into the group's overall purpose, and meets the needs of the larger system (Schein, 1990). Communication includes feedback on progress toward goal attainment, a crucial component of performance improvement. Research indicates that performance improvement may be impossible without it (Ilgen, Fisher and Taylor, 1979; Locke and Latham, 1990).
- *Materials and equipment.* Rarely can performance be improved without the use of materials and equipment (Deterline and Rosenberg, 1992). Information technology has recently had such a dominant role in improving the performance of organizations that we tend to take this technology for granted. Yet, we can't expect better products or more satisfied customers if employees lack the tools they need to accomplish these goals (Rummler and Brache, 1995).
- *Learning.* Learning is a crucial determinant of performance improvement. Individuals must know how their roles and tasks contribute to the group's overall purpose. To the extent that some knowledge resides exclusively in the group, members must also learn from each other.

Beyond acknowledging that performance cannot be improved in the absence of one or more of these determinants, no judgement can be made about the relative importance of the determinants to performance improvement. The centrality of a particular determinant is a function of the type of work performance to be improved. Performance in one situation may be enhanced primarily through information technology (materials and equipment). Performance in another situation may be improved as sales personnel gain insights into optimizing the match between customer needs and product capabilities (learning). Next, we examine the relationship of one factor, learning, to the other determinants of performance improvement to gain more insight into the relationship of learning and performance improvement.

Learning—performance improvement relationship. While learning is crucial to performance improvement, by itself, learning is not sufficient to improve performance. The following example, in which an organization introduces new computer-based technology to improve its most profitable product, illustrates this relationship between learning and performance improvement. The goal of the organization is to deliver value to the customers in ways that are better, faster, and cheaper. A small work group composed of a customer service representative, a product designer, and a production supervisor have come together to develop ways to integrate the new technology into their existing operations.

An immediate obstacle to this group's performance is the current system of rewards. For example, the customer service representative is compensated based on the number of customer orders processed, yet there is little incentive for concern about overall work quality. Similarly, the production supervisor's compensation reflects the number of units produced per work shift. The quality of the units produced is considered to be the responsibility of the design department from which production receives its work. These consequences are too easily interpreted as meaning, "quality is someone else's job, not mine!" Properly aligned *consequences* would include compensation for the customer service representative based on the percentage of repeat customers (reflecting the quality of prior work) and compensation for the production supervisor that reflects production quality, not just volume.

Feedback is especially important to this group because their goal requires true innovation—the new technology has never been used with existing operations. Because there is no precedent for what they are doing, the absence of feedback could result in poor progress or costly mistakes. *Communication* within the group is especially important because of the diversity of the expertise of each group member. Frequent communication partially compensates for their lack of overlapping skills. New technology *(materials and equipment),* which allows greater production efficiency without sacrificing quality, is the catalyst of this performance improvement opportunity.

Learning occurs within the group as each individual learns more about the new technology and about how it is integrated in a cross-functional way. If the group's experience is characterized by continuous learning, then it is quite likely that the project will be successful. Ultimately, customers would receive a better product at a lower price in less time. The performance goals will be achieved.

In this example, performance is improved through the contribution of all five determinants, including learning. However, learning alone is not sufficient to improve performance. Learning alone cannot reduce production cycle time caused by slow, out-dated equipment. Most employees have learned about the importance of quality. Yet, they routinely behave in ways that maximize their rewards, often regardless of customer perceptions. Without a group performance goal that is also important to the rest of the organization, learning for other purposes (for examples, personal or group development) is too easily dismissed as peripheral.

Poor performance resulting in delays, low quality, and additional costs can be measured in almost every work environment. In these situations, initial measures can be compared with subsequent measures to determine if performance has improved. If so, as in the case described here, it is likely that learning has made a significant contribution to performance improvement. However, rarely does learning play an exclusive role; performance improvement at all levels of the system has multiple determinants, including learning. The relationship between learning and performance improvement at the function level is summarized in Table 1 (see Table 1, *Learning and Performance Improvement at Different System Levels).*

Process level. A process is a sequence of interrelated tasks, activities, and functions that produce a given output. A process typically integrates the contributions of several functions. Because a process spans significant portions of the system, it is likely to connect with the external environment.

Learning at the process level. At this level, two or more groups are needed to pool their expertise for purposes that cannot be achieved by a single group. However, learning at this level takes on an additional dimension—the integration of the expertise of several functional groups working together. For example, in a project involving three groups, group A needs to be familiar with the expertise and contributions expected of group B, which, in turn, needs to communicate with group C. Each group needs to know something about what the other groups are doing. Yet, this overlapping knowledge presents an additional challenge—the trade-off between diversity and commonality of knowledge across groups. How much overlapping knowledge should each group possess?

The risks assumed by cross-functional groups that have no overlapping knowledge are obvious—errors occur. Each group focuses on its own agenda while not developing the "peripheral vision" needed for the awareness of what other groups are doing. Numerous other accidents have resulted from the failure of groups to share their expertise and expectations (Perrow, 1984). On the other hand, too much overlap in the knowledge shared by groups creates redundancy that is costly. Too much commonality of knowledge may also hinder the innovation that arises from diversity of ideas. Common backgrounds can lead to low levels of attention and the absence of the diverse stimuli (Robinson and Stern, 1997) and motivation (Amabile, 1997) for innovation. Successful cross-functional groups develop methods to determine the proper balance between the diversity and commonality of knowledge.

Performance improvement at the process level. At the process level the success achieved by a particular group is no longer enough for performance improvement. Performance improvement is now dependent on the collective contributions of each group supporting the process. The key determinants of performance (performance goals, consequences, communication and feedback, materials and equipment, and learning) are still at work within each group. However, at the process level an additional requirement exists for performance improvement—that each group contributes its expertise to a broader outcome that cannot be achieved by any group alone.

The Manhattan Project, the interdisciplinary effort that produced the first atomic bomb, illustrates the necessity of bringing together the achievements of each group for the overall success of the project. Although physicists at the Los Alamos laboratory were rightfully credited with developing the nuclear fission technology for the atomic bomb, the performance of other groups was also vital to the success of the Manhattan Project. The group responsible for uranium and plutonium processing had to develop and deliver this material quickly to keep the project on schedule. In addition, political and military leaders had to develop a strategy for using the bomb that was politically acceptable. Each group had to achieve success in their own area of the project (designing the atomic device, providing enriched uranium, and developing a targeting strategy). While each of these accomplishments was an innovation in its own right, these outcomes had to be integrated for the overall success of the project. Success within each function was not sufficient; performance improvement at the process level requires the integration of performance enhancements across functional units.

Learning—performance improvement relationship. How much overlapping knowledge should groups possess? The challenge of distributing overlapping knowledge among functional groups can be reduced by reflecting on the learning—performance improvement relationship. Groups that come together for the first time, particularly for innovative purposes, likely have little overlapping knowledge. As they begin to work together toward a common purpose, each group gradually learns more about the expertise of the other groups. This occurs as they trade interim products of their knowledge, such as draft reports, blueprints, proposals, and other work that reflects the specialized expertise of each group. As each round of refinements is shared among the groups, their overlapping knowledge increases as it approaches the point of complete overlap—the state in which each group possesses all the knowledge of the other groups. Yet, at what point is this gradual increase in overlapping knowledge optimized? In most business contexts, the cost of increasing knowledge among groups to the point of complete overlap is not justified.

Regardless of cost, overlapping knowledge is neither necessary nor desirable in most situations. Instead, the learning of each group about domains beyond its specialty increases to the point at which a collective product that meets established performance criteria is produced. At this point, all the learning necessary for contributing to the project has taken place. While additional learning may be beneficial to a group or individual members, the ultimate recipient of the product, the customer, will likely not see the value of this additional learning. In fact, when the purpose of cross-functional collaboration is new product development, the time needed for additional learning beyond this point may delay goal achievement, such as the release of a new product in the marketplace. Performance criteria, then, can determine the optimum degree of overlap of cross-functional learning. The relationship between learning and performance improvement at the process level is summarized in Table 1 (see Table 1, *Learning and Performance Improvement at Different System Levels).*

Mission level. The top level of the systems model addresses the relationship of the system to its external environment. In proposing the four-level systems model, Holton (1999) states that "every purposefully organized system operates with a mission, either explicitly or implicitly, and the role of the mission is to reflect its relationship with its external environment" (p. 25). Business organizations use mission statements to capture the core relationship they have with customers, their industry, or society. A government organization may define its mission in terms of providing certain benefits to the community. Other systems that are organized around a common purpose include trade associations, professional groups, economic coalitions organized at the local, regional, national and international levels, non-profit groups organized for environmental and humanitarian purposes, and other groups. As these examples demonstrate, the concept of mission can encompass one or more organizations, and thus, is a more meaningful and universal term than "organization" for this level of the systems model.

Learning at the mission level. Learning at the mission level includes a strategic dimension not usually considered at lower levels. For example, take the mission common to all hospitals—providing high quality health care to those who need it. There are different kinds of hospitals, including large academic medical centers, smaller community hospitals, and hospitals that provide rehabilitation, mental health and other specialty services. Yet, all of these institutions are organized around the purpose of providing high quality health care. Health care cost containment—a challenge issued by insurance companies, government regulators, and employers—currently poses a threat to the viability of most hospitals. Like other organizations, each hospital operates according to its own strategic plan for meeting the needs of its constituents in cost-effective ways. A large medical center follows a

different health care delivery strategy than a community hospital, even though the two institutions may be located in the same region. Yet, the mission level adds a dimension that transcends how two or more hospitals operate in a given market. All hospitals must respond to a broader concern for cost containment. This concern shapes the strategy of each hospital, regardless of its size or services. At the mission level, each hospital must learn not only how to develop its own strategy for cost containment, but one that is consistent with other institutions and responsive to the concerns of insurers, regulators, and employers. In this sense, organizations across the hospital industry must learn together how to address this concern in ways that are consistent with their mission.

Performance improvement at the mission level. The same strategic perspective applies to performance improvement at the mission level. Efforts to improve performance must be integrated and span the boundaries of the system so that they can be recognized by customers or other external stakeholders. An example from the airline industry illustrates performance improvement at the mission level.

The perennial concern for air traffic safety underlies the industry-wide practice of sharing data on weather patterns, airports, aircraft, and other equipment and facilities. Industry level associations like the Air Traffic Association, Airline Pilots Association, and the Federal Aviation Administration regularly share information with all air carriers for the purpose of improving safety. This mission-level effort to improve performance transcends the strategic interests of a particular airline. Each airline has learned that only through industry-wide efforts to improve safety performance can claims be made that air travel is safer than highway travel in terms of accidents and deaths per passenger mile traveled. Thus, regardless of whether the system is defined as an organization or an industry, performance improvement at the mission-level must span the system to reach the external environment.

Learning—performance improvement relationship. A paradox is apparent in the learning–performance improvement relationship. Measurement is necessary to demonstrate performance improvement. As we have seen at each level of the system, learning is also necessary for performance improvement. Yet, the most meaningful learning often is not amenable to measurement (Kolb, 1984; Brown, Collins, and Duguid, 1989). It is even more difficult to measure the contribution of learning to performance improvement, especially at the mission level where, at a minimum, the performance of several processes must be integrated for systemic results. Thus, performance improvement requires both measurement and learning, yet the contribution of learning to performance improvement is rarely measurable.

This challenge is further complicated by the dynamic nature of performance measurement. Meyer and Gupta (1994) observed that the number of performance measures continues to grow. As performance measures change, often dramatically, they tend to be less correlated with one another. As organizations improve their capabilities for reaching performance goals, performance measures tend to lose their ability to discriminate good from bad performance. This triggers the creation of new performance measures different from and, therefore, poorly correlated with existing measures. Thus, a state of multiple, uncorrelated, and changing performance measures exists. In this environment, organizations must support the key determinants of performance, including learning, and attempt to achieve performance goals that appear to be moving targets.

Several studies have attempted to clarify the relationship between learning and performance at the mission level. Learning, although not explicitly measured in these studies, was at the core of the human resource practices examined by this research. Authors used measures of developmental practices that included formal job training and employee development (Kalleberg and Moody, 1994), team-based work systems and training for new and experienced employees (MacDuffie, 1995), transformational relationships between managers and employees (Cutcher-Gershenfeld, 1991), and quality improvement teams, employee training, and the linkage of performance with rewards (Huselid, 1995). In each study, learning, whether individual or collective, was not explicitly measured. Yet, learning was central to the achievement of mission-level performance goals. Learning was the basis for several of the human resource practices supporting Huselid's (1995) assertion "that human resource management practices can affect individual employee performance through their influence over employees' skills and motivation and through organizational structures that allow employees to improve how their jobs are performed" (p. 638). MacDuffie (1995) found support for the hypothesis that, "*bundles* of interrelated and internally consistent HR practices, rather than individual practices, are the appropriate unit of analysis for studying the link to performance because they create the multiple, mutually reinforcing conditions that support employee motivation and skill acquisition" [italics in original] (p. 198).

Thus, learning was embedded in larger systems of human resource practices that included work skills development, performance-based compensation, participatory decision making, team-based work design, and other human resource innovations. While the centrality of learning to performance improvement in each study was undeniable, learning's contribution was difficult, if not impossible, to isolate. The relationship between learning and performance improvement at the mission level is summarized in Table 1.

Several conclusions can be drawn from this analysis of learning and performance improvement.

1. Learning and performance improvement are independent concepts. Learning can occur without performance improvement; performance improvement can occur without learning.
2. The scope of learning increases as we ascend the model from the individual level to the mission level. The responsibilities for learning are cumulative—those at lower levels are carried to each higher level of the model. The cumulative nature of learning also enhances its role in performance improvement. That is, the role of learning in performance improvement also appears more prominent at higher levels of the model.
3. Performance criteria can help determine the scope and depth of learning needed to achieve system goals. This is especially important when the value of learning must be balanced against its costs.
4. While measurement is necessary to demonstrate that performance has improved, measurement is not necessary to demonstrate the value of learning. This presents a paradox—performance improvement requires both measurement and learning; yet, rarely is learning's contribution to performance improvement measurable.

Implications for Future Research

This study raises several issues that warrant further research. An unresolved issue is the role of experience in learning and performance improvement. The influence of experience on the learning process has been extensively studied (Kolb, 1984; Lave and Wenger, 1991; Schon, 1983). The role that experience plays in the development of expertise has also been demonstrated by Bereiter and Scardamalia (1993), who identified characteristics that distinguish the expert from the experienced non-expert. As studies of innovation seem to show, experience is also not a prerequisite for entrepreneurial performance (Amabile, 1997; Robinson and Stern, 1997). If so, how does the role of experience change as we move from learning to performance improvement? If both learning and performance improvement can proceed in the absence of experience, why has experience commanded so much attention from learning theorists?

Learning was described as an experiential process that is strongly influenced by context, and that occurs in ways that are unique to the individual. Performance improvement was described as a systemic phenomenon that is manifested through a change in outputs. A situation was described in which performance was improved without learning in which an employee, under pressure from a supervisor, improved performance by spending more time on a particular task. However, contrary to the point illustrated by this example, it is likely that performance cannot be improved without some form of learning. Research, drawing on richer descriptions of how performance improvement and learning occur, is needed to examine whether performance can ever be improved without learning.

The role of measurement in relating learning to performance improvement also warrants further research. This paper concludes that, while measurement is necessary to demonstrate performance improvement, the value of learning is not dependent on what can be measured. Previous studies have identified the importance of learning to the achievement of mission-level performance outcomes, yet the contribution of learning has been difficult, if not impossible, to isolate. Further research is needed to clarify when and how measurement should be used to relate learning to performance improvement.

	Learning	Performance Improvement	Relationship of Learning to Performance Improvement
Mission	• Learning transcends organizational boundaries. • Learning must balance needs that are both internal and external to the system.	• Performance improvement must be recognized by the external environment. • Mission-level performance measures must be aligned with measures at lower levels of the system.	• The paradox—Performance improvement requires both measurement and learning. Yet, rarely is learning's contribution to performance improvement measurable.
Process	• Learning addresses the integration of expertise across functional units. • The degree of learning overlap must be determined.	• Process-level performance improvement requires success within each functional unit and integration across functional units.	• Performance criteria can determine the optimum degree of overlap of cross-functional learning.
Function	• Groups learn as their members learn. • Members must learn role/task integration. • Members must learn to learn from each other.	Performance improvement is determined by five factors: • Performance goal(s) • Consequences • Communication and feedback • Materials and equipment • Learning	• The five determinants must be addressed individually and collectively for performance improvement. • Learning is necessary, though not sufficient, for performance improvement.
Individual	• Experiential learning • Importance of context • Heuristics compensate for lack of experience.	• Performance improvement is a systems concept. • Performance improvement cannot be demonstrated without outputs and measurement.	• Learning can occur without performance improvement. • Performance improvement can occur without learning. • Attention to learning transfer can strengthen the learning—performance improvement relationship.

Table 1. Learning and Performance Improvement at Different System Levels

Historical Antecedents Shaping The Terms Of Performance And Learning And Their Relationship In Human Resource Development: An Exploratory Study

John A. Henschke
University of Missouri-St. Louis

This study explores the gap that exists in the Human Resources Development (HRD) Field regarding whether its key ingredient is either "performance" or "learning." It investigates through ancient and modern lexical, dictionary and common use sources how the meanings of these two and other related terms evolved historically and how their meanings are interpreted. The results indicate that the two distinct terms together and their relationship within the HRD context are key to HRD.

Keywords: Performance, Learning, Human Resource Development Key

Purpose of the Study

The purpose of this study is to address a gap that exists in the Human Resources Development (HRD) Field regarding its perceived key ingredient as being either performance or learning (Watkins & Marsick, 1995; Swanson, 1995). Focus will be placed on understanding how the meanings of these and some other key HRD terms have evolved historically, how their meanings are interpreted, and how they relate to each other. This study suggests that probing into some of the historical background of the terms "learning" and "performance," as well as some other related terms,which have similar meanings to these two, and their mutual relationships, could help to deepen understanding of the HRD Field as well as clarify the discussion and use of these terms in the HRD Literature.

Problem Statement and Theoretical Framework

Performance has become a "byword" in the lexicon of HRD. Performance has been hailed as the key ingredient to HRD (Swanson, 1995). Improved performance has also been hailed as being the purpose of HRD (Lynham & Swanson, 1997; Swanson & Arnold, 1997), and the outcome of HRD (Knowles, Holton & Swanson, 1998). The design of performance has been acclaimed as the means for HRD making copporate organizaational success happen (Taylor & Felton, 1993). Performance has also been included in various current HRD definitions (Swanson, 1995; Knowles, Holton & Swanson, 1998). Knowles, Holton & Swanson, (1998) define it as the organizational system outputs that have value to the customer in the form of productivity attributable to the orgaqnization, work process, and/or individual contributor level. It is the means to measure organizational goals which include rate of return, cycle time, and quality of output. It is further defined structurally (Swanson, 1995; Arnold & Swanson, 1996) as having: variables such as mission/goal, system design, capacity, motivation, and expertise; and levels such as organization, process, and individual. Ruona & Lyford-Nojuma (1997) support this structural definition of performance with references from thirty different research studies. Nevertheless, Lynham & Swanson (1997) do not indicate how performance is developed, nor how one becomes prepared for performance in HRD.

Watkins & Marsick (1995), on the other hand, make a strong argument for learning as the key ingredient in HRD. Although they do not mention the word "performance," they exspress a vision for HRD and its definition as the field of study and practice which is responsible for the fostering of a long term, work-related capacity at the individual, group and organizational levels. As such, it includes -- but is not limited to -- training, career development, and organizational development. Hatcher, Hinton and Swartz (1995) emphasize the importance of continuous learning in preparing people to go into and remain in the HRD Field. In making the case for learning being the key ingredient of HRD, Watkins & Marsick (1995) do not emphasize just individual learning. They propose that a unique niche for HRD that is distinctive is the concept of the learning organization -- one that brings together two major components: learning, and the workplace context in which learning occurs. Delors (1997) argues that one of the pillars of the heartbeat of the twenty-first century society is learning to do/perform a job of work. Belanger (1997) proposes that learning take place continuously not only on the individual level, but also on the istitutional/organizational level and the systemic level. Knowles (1989) expressed how he would like to be helped in his learning by a human resource developer in the twenty-first century. This certainly implies that lifelong

Copyright© 1999 John A. Henschke

learning is and will continue to be a central component of life and work. This has lead Watkins & Marsick (1995) to propose the learning organization as central to the HRD function. There are strong arguments on both sides of this discussion for the key ingredient in HRD to be performance as well as learning.

Research Questions

In order to understand the discussion more fully, the nature of the separation between learning and performance in HRD parlance, and to explore the possibility of closing the gap between the two terms (and other related terms), the following questions may be appropriate to further guide this study: how have the meanings of key HRD terms evolved historically? and, how are their meanings interpreted?

Methodology

An investigation was conducted into how the words "performance" and "learning" evolved historically in the HRD literature, especially in the Academy of Human Resource Development (AHRD) Research Conference Proceedings and related literature in the HRD Field. In addition, an inquiry was conducted into the words "performance," "learning," (and any other related terms such as doing, teach, guiding, instructing, leading, training, learning organization, hearkening, wisdom, and modeling), as defined by English language dictionaries (Webster, 1828; Russell et. al., 1939) , and the historic standard lexicons of the ancient Greek and Hebrew languages (Thayer, 1979, 1981; Brown et. al., 1979; Zodhiates, 1984, 1990). One of the reasons these two ancient languages were chosen is that Hebrew has remained virtually unchanged for more than twenty centuries, and the Greek (Koine) referred to is a translation from the ancient Hebrew. Another reason is that the author has language background in both Hebrew and Greek, and has interest in this kind of study. After the data obtained from the dictionaries and lexicons were analyzed, the data are presented and outlined in accordance with the definitions of the various words and their relationships (or lack of it) with the "performance" and "learning" terms and definitions within the Field of HRD.

Historical Background

Pace et. al. (1991) trace the history of HRD efforts through four eras: employee skillfulness--to 1800; employee efficiency--1800/1920; employee satisfaction--1920/1945; and, employee enhancemant--1945/present. Nadler & Nadler (1990) suggest that the history of HRD (under a variety of names) dates back to the dawn of recorded history when the first caveman took his son aside and taught him how to tie a sharpened piece of obsidian to a piece of straight wood to make a spear. However, it was not until the 1940s, that he thinks there was sufficient concern to produce written material directly related to the HRD Field. However, Houle (1992) discovered evidence that somewhat earlier, Peffer (1932) concluded that programs of the HRD sort in industry and commerce were the largest component of adult education at that time, and that Rowden (1937) assessed the educational work in trade associations for their own staffs and those of their member agencies. In addition, Henschke (1991) observed that prior to the 1940s, Lindeman (1938) laid the initial foundation for HRD professional competencey development. Furthermore, Nadler & Nadler (1990) provide a sketchy history of the emergence and development of HRD. They suggest that among the predecessor terms to HRD were training, vocational education, apprenticeship, sensitivity training, applied behavioral science, and organization development. The HRD term was first introduced to the American Society for Training and Development (ASTD) in Miami in 1969.

Since 1970, a definition of HRD has been in print. There are four presented here which find some acceptance in the Field. Nadler & Nadler (1989) defined it this way, "HRD is organized learning experience provided by employers within a specified period of time to bring about the possibility of performance improvrement and/or personal growth." Nadler & Nadler (1990) kept their definition almost unchnaged, "HRD is defined as organized learning experiences in a definite time period to increase the possibility of improving job performance growth." Pace, et. al., (1991), define HRD as "the integration of individual development, career development, and organization development roles to achieve maximum productivity, quality, opportunity, and fulfillment for organization members as they work to accomplish the goals of the organization." Marquardt (1993) presents the definition given by the ASTD, "HRD is the integreted use of training and development (planned learning) organization development, and career development to improve individual, group, and organizational effectiveness." All of these definitions have "learning" as a central component. Two of them also have "performance" as a central component. The third one focuses on "accomplishing the organization's goals," which could imply the necessity of both performance or learning, without mentioning either. The fourth one has "planned learning" but does not have

"performance," although it includes effectiveness, which could and most likely does mean the same thing as "performance" in this context.

As time moved on, the HRD Field began to grow and develop. By 1942, the many active local state organizations involved in job related skill development, came together to form the American Society of Ttraining Directors (ASTD -- in its first form) (Nadler & Nadler, 1990). Training and/or learning was the focus of their efforts, and these terms were used interchangeably, with training being the term most often used. Some years later the ASTD changed its name to the American Society for Training and Development, but kept the same acronym. Beginning in 1938 and continuing through 1989, twenty-seven HRD Competency studies were conducted to continue clarifying the competencies necessary for professionals to learn in order to perform the HRD function (Henschke, 1991). ASTD was centrally involved in conducting five of these studies in 1959, 1974, 1978, 1983, and 1989. There was an active University HRD Professors' group, which met annualy in conjunction with the ASTD conference, concerned with the learning aspects of developing competencies. They became involved in the development of the 1989 ASTD competency study. Subsequent to that study being completed, those professors focused their 1990 conference in Orlando, Florida, on developing *The Academic Guide* for using the 1989 competency study in university academic programs. This guide was published by ASTD, and the definition of competency included in it is: Competency is a cluster of knowledges, understandings, skills, attitudes, values, and interests that are necessary for the performance of a function -- in this case it would be the human resource developer function (Henschke,. 1991). Thus, both "learning" and "performance" were included in the definition. This group of professors was the nucleus of the group that in 1993 launched The Academy of Human Resource Development (AHRD).

Taylor & Felton (1993) in their HRD book entitled *Performance by Design* emphasize the centrality of learning in designing performance within sociotechnical systems, underscoring the fact that performance is a dynamic process and not a static one. Thus it may be conjectured that whether one is just entering the HRD Field or is a veteran in it, learning is always a central component (while not the only one) of improving our performance in the work/corporate/organizational context; and one is continuously progressing, improving, and seeking to arrive, but never quite arriving at the finish line, even of performance. Almost without exception, it could be done better.

The gap and separation between performance and learning seems to come into the most pronounced visibility in the Field at the 1995 AHRD Conference in St. Louis, Missouri. At the opening town meeting, Watkins stated the case for learning being the key to HRD, and Swanson stated the case for performance being the key to HRD. One the one hand, the Watkins & Marsick (1995) paper presses for a focus on not only individual learning, but also a focus on a learning organization with the essential elements of: increasing the overall learning threshold; assessing and enhnacing current capacity for learning; creating an ongoing adaptive capacity by embedding systematic linkages between needs, work and rewards; and, building autonomy and empowerment, "space of free movement." On the other hand, the Swanson (1995) paper vies for a focus almost exclusively on performance, with his perspective on learning being only one of the components leading to expertise; expertise being only one of the components of worthy performance on the individual, process, and organizational levels.

At the AHRD Conferences subsequent to that debate by Watkins and Swanson, additional viewpoints have been expressed. Various researchers provide evidence of training (which some may possibly view this term as synonomous with learning -- though others may doubt it) as contributory toward: solving organizational performance problems (Palmer & Crepas, 1998); improving performance in a car rental company (Sleezer, Hixon, Green & Mudgett, 1997), high performnace within an organizational systyem (Bassi & Van Buren, 1997). Training is also mentioned as one of twenty-one ingredients of effective team performance (Struemer, Hendreks & Vermeulen, 1998). Others also assert that there is a close link between learning and performance in HRD. Leimbach & Baldwin (1997) claimed that learning research definitely is one ingredient in performance research within the HRD value chain, but make a weak case by suggesting that very little research has been conducted on learning. Swanson & Arnold (1997) seek to emphasize the importance of adult learning and its relationship to performance, but weaken their argument by diagraming Adult Education (AE) and HRD as being discrete entities within an organizational and environmental context, with AE being in the larger environment but almost totally removed from the organization, and HRD being totally in the organization which is set within the larger environment. Van Zoligen & Nifhof (1998) strongly support the inseparable connection between the process of lifelong learning and performance, expressing the view that the key qualifications for performance are acquired through lifelong learning. Pace, Smith & Mills (1991) use the terms training, development and learning interchangeably to describe a crucial element and tool needed in HRD for integrating individual development (with workers performance of current jobs more effectively), career development (with workers assuming a variety of different jobs in the organizaation), and organization development (with workers moving into jobs yet to be identified and defined), to achieve maximum productivity, quality, opportunity, and fulfillment for organization members as they work to accomplish the goals of the organization.

Holton (1998), in a recent attempt to link learning and performance in HRD, says that performance is a multidimensional and poorly defined construct. Adapting Swanson's (1995) three levels of performance -- organization, process, individual -- Holton (1998) identifies four domains of performance as mission, process, critical performance subsystems, and individual. He makes an attempt at a strong case for adult learning, setting the stage for a closer alliance between performance and learning. He moves forward to craft a definition and connection between the two for the future. With today's changing world of technological innovation, volatile national economies, roller coaster stock markets, the daily birth and death of numerous business organizations, and corporate "right-sizings," lifelong learning appears to be a crucial necessity. More importantly, the need for lifelong learning is especially true for everyone, everywhere if human resources are to perform effectively, now and in the future.

Sources and Roots of Terms

For some of the words which are included for analysis, there are numerous Hebrew and/or Greek words which are equivalent to the English words. For instance, performance has eight equivalent Hebrew words and there are seven in Greek. Learning has seven Hebrew and five Greek equivalent words. Other words would have similar numbers. Hence, to keep this paper from expanding beyond the eight page scope allowed here, only the most appropriate Hebrew and Greek words will be selected for inclusion. Now, to the selected words from Hebrew, Koine Greek, and Webster's original English Dictionary, which include: performance, do, learning, teach, instruct, guide, lead, train, learning organization, hearken wisdom and model. The definition of the term "learning organization" will only be garnered from the HRD literature since it has no antecedents as a term combined of two other words.

Performance

The Hebrew word is "asah." This root means to do a work, labor, toil, make, create, construct, build, accomplish, earn, procure, prepare, sacrifice. It has the connotation of ethical obligation. I deals with refinements fashioning the object created. Another Hebrew word is "pala." This means remarkable, surpassing, extraordinary, distinguished, and singular in causing wonderful things to happen. A final Hebrew word is "shalam." The principal meaning is completion, fulfillment, wholeness in which relationships are restored. (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word is "poieo." The word means quality, to make, to endow a person with a certain quality. It is fashioning and bringing forth something which, when produced has an independent existence of its own. Another Greek word is "teleo." It means to bring anything to perfection or to its destined goal, to carry it through. (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "performance" means execution, completion, fulfillment, or carrying out of any work or undertaking (Webster, 1828; Russell, et. al., 1939).

Do

The Hebrew word is "hayah." It means to come to pass, to be done, to turn out, to happen, to be finished in a dynamic sense, not a static one (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word is "energeo." It means to be active and energetic, to effect, prove oneself strong (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "do" means to perform, to execute, to carry into effect, to exert labor or power upon, to bring anything to the state desired or to completion, to bring to pass (Webster, 1828; Russell, et. al., 1939).

Learning

The Hebrew word is "lamadh." It has the idea of learning, studying, becoming accustomed to, exercised in, instructing, training, educating, practicing, being taught and trained. This one Hebrew word had wrapped up in it what it took two Greek words to express: "manthang," to learn, and "didasko," to teach. Another Hebrew word is "alaph," which means being accustomed to something or having close association with an object; hence, the idea of learning from association. A final Hebrew word is "leqach," which has the meaning of persuasiveness in a good sense (Zodhiates, 1984, 1990; Brown, et. al., 1979). The Greek word is "manthano," meaning to endeavor, desire, seek to learn, experience, or bring to experience. Another Greek word is "gramma," meaning learning and knowledge gained from books and writings (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "learning," means to acquire knowledge of something before unknown; in popular use, learn has both senses to teach and to learn (Webster, 1828); to acquire information concerning, by instruction, by study, by observation, by experience, or in any other way; formerly, it meant to teach--but this use is now obselete among careful writers and speakers (Russell, et. al., 1939. In one HRD definition, "learning is a shift of mind, and is what goes on inside learners as they undertake to gain or acquire new knowledge, understanding, skill, attitudes, values, and interests."

The "what goes on" could be described as: perceiving--sensing and feeling concrete reality, thinking or reasoning abstractly; and internalizing or processing-- making it a part of oneself by actively jumping in and trying it, or reflecting on and watching what's happening, so the HRD professional, whom it would be safe to assume is an adult learner, would have going on inside of her/him the perceiving and internalizing of new knowledges, understandings, skills, attitudes, values, and interests (Henschke, 1995).

Teach

The Hebrew word is "yarah." It has the idea of shooting arrows, pouring rain, casting, laying a foundation, erecting, establishing, irrigating and giving water, putting out words, the connotation of aiming for something (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word is "didasko," having inherent in it the calculation of the increase of understanding of the pupil (Gthayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "teach," means to communicate to another the knowledge of that of which he was before ignorant (Webster, 1828; Russell, et. al., 1939).

Instruct

The Hebrew word is "sakhal," with the idea of showing oneself attentive to, understand, consider, circumspect, desirable to look upon, cause to make wise, to have intellectual comprehension, insight, expertise and skill, knowing the reason for something (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word "matheteuo," means not only to learn but to become attached to ones teacher and to become his follower (a disciple) in teaching and conduct (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "instruct," is to inform the mind, to impart knowledge to one who is destitute of it (Webster, 1828; Russell, et. al., 1939).

Guide

The Hebrew word is "yaats." It has the idea of counseling together, consulting with one another, to devise, decide, plan, propose, and advise, to exchange counsel as a king with his advisors (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word "kateuthuno," means to make straight, direct, remove the hindrances to coming to one (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "guide," means one who leads another in his way or course, who goes before or accompanies to point out the way (Webster, 1828; Russell, et. al., 1939).

Lead

The Hebrew word is "nachah." It has the notion of guiding, going in the direction of, turning eyes toward, bringing, just as the pillars of cloud and fire indicated the way to go for the Children of Israel, treating kindly, moving on a path to benefit (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word is "ago," meaning to bring, carry, to bring gently and without violence (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The english word "lead," often includes the sense of drawing as well as directing (Webster, 1828; Russell, et. al., 1939).

Train

The Hebrew word is "chanakh," meaning to initiate, to dedicate, consecrate, to inaugurate (Brown, et. al., 1979; Zodhiates, 1984, 1990). There is no Koine Greek word for "train." The English word "train, is to draw along from act to act by persuasion or promise, with discipline, exercise, and formed by practice (Webster, 1828; Russell, et. al., 1939).

Learning Organization

The HRD literature defines this as "one that learns continuously and transforms itself. This means learning: takes place in individuals, teams, organizations and society; is a continuous, strategically used process--integrated with, and running parallel to, work; results in changes in knowledge, beliefs, and behaviors; enhances organizational capacity for innovation and growth; and has embedded systems to capture and share the learning" (Henschke, 1995).

Hearken

The Hebrew word is "shama," meaning to hear with undivided listening attention and obedience (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word is "adouo," meaning to hear with the ear of the mind effectually, or so as to perform or grant what is spoken (Theyer, 1979, 1981; Zodhiates, 1984, 1990). The English word "hearken," is to attend to what is uttered, as to words of advise or admonition (Webster, 1828; Russell, et. al., 1939).

Wisdom

The Hebrew word is "chokhmah." It is intelligence, experience, insight, prudence and judgment in a positive sense (Brown, et. al., 1979). The Greek word is "sophia." It means one knows how to regulate ones relationship to goodness and circumstances (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English word "wisdom," means the right use or exercise of knowledge; the choice of laudable ends, and of the best means to accomplish them (Webster, 1828; Russell, et. al., 1939).

Example/Way/Model

The Hebrew word is "derekh." It means a going, way, journey, walk, road, manner, path, way of life. It refers to the actions and behavior of humans. The word is used to denote some wonderful things which leave no trace that is externally visible to the physical eye, but are as they are because of their nature. The wonderful things are: the way of an eagle in the air, the way of a serpent upon a rock, the way of a ship in the heart of the sea, and the way of a man with a maid. Looking to the heavens, one cannot say that an eagle has passed there. Looking to the rock, one cannot say that a serpent has wound its way around it. Looking to the high sea, one cannot say that a ship has been steered through it. Looking to the maid, one cannot say that a man has had sexual intercourse with her (Brown, et. al., 1979; Zodhiates, 1984, 1990). The Greek word "tupos," carries with it the idea of a constitutent element of a model of some current reality, or that which is yet to be developed, a pattern to be imitated or copied (Thayer, 1979, 1981; Zodhiates, 1984, 1990). The English work "example," means pattern, a copy, a model, a way of very comprehensive signification, which is proposed or proper to be imitated (Webster, 1828; Russell, et. al., 1939). In one HRD definition it means "walking the talk," not a mentality of "do as I say, not as I do," but with the notion that " if we model the thing we are talking about, we will get it right yet" (Henschke, 1998b).

Results, Conclusions, and Limitations

On the one hand, as one looks at the words presented, the first two words -- performance and do -- are synonyms. In HRD, they carry the importance of accomplishing the things crucial to the organization levels of organization, process, and individual; and the organization outcomes and drivers performance domains within the mission, process, critical performance systems, and individual. However, it seems that one does not become able to perform at any level of competence or within any context without some process of learning taking place to prepare the person for performing within the organization's levels and domains to accomplish the organizations goals, and even the mechanical aspects of the organization to perform.

On the other hand, the subsequent ten words -- learning, teach, instruct, guide, lead, train, learning organization, hearken, wisdon, and model -- have somewhat synonymous definitions. In HRD, they carry their meaning not in a vacuum, but only in relationship to preparing people through learning processes, as well as the mechanical aspects (which are also implemented by people), to learn, not for their own individual purposes, but to learn in order to perform the purposes of the organization. It seems that the two groups of terms, although separate and distinct, in the HRD context they are both key ingredients.

Moreover, the English word combination -- example/way/model -- which is encompassed in the Hebrew word "derekh," and the Greek word "tupos," offer an additional insight into the nature of the four wonderful things which are reflected in the use of the Hebrew word. It appears that "learning" and "performance" in this setting are two sides of the same coin. It is the worthy performance of the eagle to fly in the air, but it does not come by that automatically; and the young eagle needs to learn to fly and to be taught by parent or more experienced eagles to fly, which is the nature of eagles. It is the worthy performance of the serpent to wind its way around a rock, but it does not come by that automatically; and the young serpent needs to learn to wind and to be taught by parent or more experienced serpents to wind, which is the nature of serpents. It is the worthy performance of a ship to pass through the sea, and it does not do that automatically; but comes by that when it has a rudder giving it direction and a captain who has learned and been taught by veteran captains what one does to guide a ship successfully through the heart of the sea. Finally, it is the worthy performance/way of a man with a maid to have sexual intercourse with her, and he does not come by that automatically; but he must grow mature enough biologically, and learn and be taught by parents, others more experienced, written materials and/or trial and error to accomplish that sucessfully.

Consequently, it seems that we can conclude that the terms "performance" and "learning" and the related terms from Hebrew, Koine Greek, English, and HRD sources are all mixed together in this comprehensive term -- example/way/model. This term has a much broader definition and meaning that any one of the terms separately, and may give coherence to the overall importance of both ingredients, performance and learning, as being key ingredients within HRD.

One limitation of research into this area is that it has practical validity only for those who acknowledge that word definitions and meanings, from both ancient and modern sources, are important sources of data for shaping the HRD Field, and helpful in sculpting its future course of action in accomplishing the purpose of HRD within organizations. Another limitation is that the value of this research will partially be determined by the extent to which further studies in the future are conducted in this area of inquiry.

How This Research Contributes to New Knowledge in HRD

This research contributes to insight that "performance" and "learning" are not mutually exclusive terms as had been implied or espoused in some of the literature cited within this paper, and some quarters of the HRD Field and the AHRD. This research further contributes the idea that the two terms are both complementary parts of a comprehensive whole perspective which gives direction to and drives the HRD Field. In addition, this research could provide for the HRD Field a much richer, fuller, and deeper understanding of the meaning and importance of HRD as a worthwhile scientific endeavor. Finally, those who have found themselves on either side of this discussion up until now, may be able to join forces and unite their energies in a new way for collaborative efforts to mutually benefit the AHRD, the HRD Field and the constituencies served by HRD.

Developing Managerial Competence: Does It Improve Performance?

Jonathan Winterton
Ruth Winterton
Napier University, Edinburgh

The level of training and qualification of UK managers lags that of competitor nations, so it is important to focus management training and development where it will be most effective. This study found evidence that management development improved performance at the level of individuals and businesses. Moreover, development was shown to be more effective when linked to organizational strategy and when based on the occupational standards for managers established by the Management Charter Initiative.

Keywords: Management Development, Competence, Performance

It is a recurrent theme that UK managers are inadequately trained and qualified in comparison with those of competitor nations. As post-war demand for trained managers increased (Clements, 1958: 158), British industry was seen to be handicapped by a shortage of suitably qualified managers (McGivering, Matthews and Scott, 1960: 79). The general lack of qualifications among senior managers in the UK has been repeatedly noted over the years (Legatt, 1972; CBI, 1989). In 1987 two reports were produced as part of a review of management education and training, prompted by the recognition that the UK lagged behind other industrialised nations in terms of its formal management education, and the belief that developing managers would improve the competitive advantage of UK industries (Handy et al., 1987; Constable and McCormick, 1987).

An increase in the amount of management development (MD) is widely viewed as neccesary to remedy these deficiencies and has been linked with the attainment of competitive advantage in recent public policy documents. The Cannon and Taylor Working Party Reports (IoM, 1994) arising out of the 1992 Institute of Management review of MD, confirmed the need for the effective development of existing managers in order to raise the competitiveness of British industry. These reports noted that the challenges of organizational changes, especially contracting out, de-layering and empowerment, make the need for MD particularly acute. The situation was seen to be exacerbated by persistent structural unemployment, competitive pressures from low-wage economies, rapid technological change and standards in education which are inappropriate to the needs of employers. The recognition in European Commission White Papers (1994) that skills must be raised at all levels if European enterprises are to compete in global markets, re-surfaced in successive Competitiveness White Papers in the UK (DTI, 1994; 1995).

Following the adoption of a competence-based approach to vocational education and training, the Management Charter Initiative (MCI) developed Occupational Standards describing the competences which managers need. With renewed concern over developing the UK managerial workforce, the Employment Department (now the Department for Education and Employment, DfEE) decided to appraise the use of the Management Standards developed by MCI. The study subsequently undertaken on behalf of the DfEE, investigated the business benefits that could be attributed to competence-based management development (CBMD) in a range of organizations. The research addressed five hypotheses:

- CBMD improves individual performance (IP)
- CBMD improves organizational performance (OP)
- CBMD improves business performance (BP)
- improvements in IP, OP and BP are more likely if CBMD is linked to organizational strategy (OS)
- improvements in IP, OP and BP are more likely if HRD processes are based on a common, coherent integrated set of competence statements (i.e. the MCI Standards).

This paper reporting on the study is organized into three sections dealing with, respectively, the methodological approach, the empirical evidence relating to the hypotheses outlined above and the overall conclusions and policy implications of the findings.

Methodology

Despite an established literature supporting the crucial role of HR in improving organizational performance and sustaining competitive advantage (Arthur, 1994; Carter and Lumsden, 1988; Coopers and Lybrand, 1992; Cutcher-Gershenfeld, 1991; Downham, Noel and Prendergast, 1992; Huselid, 1995; MacDuffie, 1995), there is a paucity of robust evidence capable of building a 'cumulative body of knowledge' (Becker and Gerhart, 1996: 790). In the absence of a common, coherent conceptual framework, there is little scope for comparison between the different studies until theory has been advanced by developing 'specific, testable propositions' (Becker and Gerhart, 1996: 791) and elaborating 'more complete structural models' (p.793). Given the 'causal ambiguity' concerning the mechanisms by which HR practices translate into improved business performance (Barney, 1991), more rigorous methods of analysis are also required, with studies reporting regression coefficients reflecting 'the *magnitude* of the effect of HR on organizational performance' (Becker and Gerhart, 1996: 791).

In practice, however, there are difficulties in measuring the effects of developing people (Harrison, 1993), and the reported benefits of MD are often anecdotal and confined to a single aspect of performance. The literature (see summary in Winterton and Winterton, 1997) nevertheless provides some indication of the nature of benefits which are anticipated from MD in relation to each of the hypotheses outlined above. In the case of individual performance, the literature demonstrates above all else the difficulties of measurement and attribution associated with identifying performance improvements arising from MD. In relation to organizational performance, the key message is the importance of developing collective knowledge so that organizational capacity is not adversely affected by individuals moving jobs (Brooks, 1994). With business performance, much of the literature links the achievement of critical success factors to the management capability of organizations (Berry, 1990). There is much emphasis on the need to link MD with organizational strategy (Taylor and Thackwray, 1995) and that the benefits to the organization should be identifiable (Mitrani, Dalziel and Fitt, 1992). Finally, recent literature contains claims that MD is more effective where HRD systems and procedures have adopted the MCI Standards (King, 1993).

Case Study Design and Fieldwork

Methodological difficulty is undoubtedly a major reason why systematic investigation of the effect of MD on performance is rarely attempted. In recognition of these difficulties, the Employment Department established an expert study group in advance of commissioning the research to identify an appropriate methodology for tracing and measuring the business impact of CBMD (Leman et al, 1994). The study group considered a variety of methodologies and recommended an embedded, multiple-case study approach to investigate the impact of CBMD and the adoption of the Management Standards. The study group offered a tentative case study design including the data collection protocol that specified the written evidence required and recommended detailed interviews with key respondents in each organization.

The initial case study protocol from the study group report was operationalised, piloted and refined by the authors once the research was commissioned. The protocol defined the written evidence which was to be examined in relation to each hypothesis, the range of measures of performance to be considered and the interview schedules which were to be used for in-depth, semi-structured interviews with senior strategic managers (chief executive, finance director and head of human resources), line managers and junior managers. The protocol is contained in the official report of the study (Winterton and Winterton, 1996).

In order adequately to test the conditional hypotheses, it was necessary to include organizations that did not use the Management Standards as well as users, and to include organizations in which MD was not linked with OS as well as those where there was a clear link. For each of the four categories so defined, the objective was to identify five organizations suitable for case study. Information had to be gathered from potential case organizations *before* any fieldwork took place in order tentatively to allocate them to one of the four categories. Contenders for study were identified from discussions with MCI, the DfEE steering group, and from previous research. The organizations were to be drawn from a range of different economic sectors, and it was intended that one third of the organizations studied should be SMEs (fewer than 200 employees).

The MCI supplied details of 25 organizations known to have adopted the Management Standards and a second tranche of 18 organizations, known to practise CBMD but not thought to be users of the occupational standards, was also identified. Each organization was approached by the DfEE and the researchers by mail initially and then by telephone and meetings were held with senior management to negotiate access. Difficulties in achieving access, particularly to SMEs, made it necessary to approach further organizations and out of a total of 126 organizations approached, 16 cases were selected for detailed study from those that agreed to collaborate. The cases were slightly

biased in favour of users of the Management Standards, and in favour of those claiming that MD was closely linked with OS.

As a minimum in each case, face-to-face interviews were conducted with the three senior strategic managers, four line managers and four team members. Multiple sources of evidence were collected to increase the reliability of data through triangulation and interlocking questions in the interview schedules were designed to test for consistency between the views of managers at different levels. Details of improvements in performance and of HRD systems and processes were collected through an extensive range of written evidence. Managers' job specifications gave an indication of the extent to which responsibility for MD was a feature of their role, while company accounts were examined as evidence of improvements in BP.

Evaluation and Ranking of Case Reports

A dossier was compiled of written evidence and interviews for each organization studied, and a case report was written in accordance with the protocol. The case reports provided background details of the organization, details of the organizational strategy, the HRD systems and processes, and the evidence of the improvements in IP, OP and BP which were attributed to MD by respondents. The case reports were validated with two senior managers in the organization and revised before being evaluated and used in the cross case analysis.

To test the five hypotheses, a team of independent experts was asked to rank the cases according to the extent of improvements in IP, OP and BP attributable to MD, the degree to which MD was linked to OS and the extent to which the Management Standards had been adopted in HRD systems and processes, against the criteria outlined in the report of the study group. The evaluation was co-ordinated by an expert on the Management Standards who had participated in the original study group but had not been involved in the case studies; she was therefore familair with the protocol but was not biased by knowledge of particular cases.

The rank order of the cases according to the three performance measures and the two defining characteristics was used to structure the cross-case analysis. The rankings made it possible to test for any correlation between the defining characteristics and performance improvements measured at the three levels, as well as correlation and concordance between the three performance measures themselves. In addition to the case study evidence, therefore, the hypotheses were examined using robust non-parametric techniques. The results of the statistical tests are reported in the concluding section.

Empirical evidence

The dossiers for each case study were too extensive to be included in the official report of the research (Winterton and Winterton, 1996) although abbreviated case reports are included in the extended account of the study (Winterton and Winterton, 1999). A selection of the evidence is considered below in relation to the hypotheses outlined in the introduction.

Individual Performance

In the cases demonstrating the most robust evidence of improvements in IP, the central importance of MD was demonstrated through written evidence and corroborated interviews. The improvements included increased personal confidence, awareness of potential and continuous development of general managerial skills and competences. Managers reported having a better understanding of both organizational objectives and their individual responsibilities. A range of efficiency gains were attributed to MD, such as better planning and time management, more effectiveness in running meetings, and improvements in project management, change management and problem solving. Increased competence in managing people was also cited, especially through raising skills in communications, presentation, leadership and motivation. Middle management mentioned empowerment, faster individual career advancement and a more methodical approach to developing others.

Improvements in IP were clearly associated with the use of the Management Standards and the implementation of NVQs, which provided criteria for performance, facilitated best practice benchmarking and promoted new ways of conceptualising work tasks. With the Standards, individuals take responsibility for, and can track, their own development, and this is associated with increased commitment and motivation.

In the organizations which provided less robust evidence that IP had improved, there were nonetheless examples of specific changes in IP arising out of MD activities. In other organizations, isolated examples of IP gains were cited, but these were more a consequence of ad hoc initiatives than the result of operating a coherent MD

framework. Towards the lower end of the ranking, there was ambiguity in relation to reported improvements in IP, difficulties of measurement and of attributing improvements to MD. In particular, there were difficulties in separating IP from OP measures, and systematic measurement and evaluation was thought to be too costly. It was also noted that the outcomes of development vary between individuals and that the effects are difficult to isolate when other major changes are taking place.

Organizational Performance

Where there was most evidence of improvements in OP attributed to MD, these typically related to process issues such as quality of service, better focus on customer needs, reduced queues, better telephone standards and improved customer relations. Managers in some organizations cited evidence of more strategic behaviour and identified better procedures and monitoring of actions. Cost reductions, efficiency gains and more effective debt control were also reported. Other examples of improved OP arising from MD included improved procedures for controlling and handling materials as well as the identification of potential areas for improvement in the future such as new information systems.

Improvements in OP attributed to MD initiatives designed to promote team working included greater flexibility, awareness of team responsibilities and more effective team working. Both inter-personal and inter-departmental relations improved as a result of better communications, and individuals were also said to demonstrate increased commitment and motivation. In one case, managers identified improved team performance, such as more 'flexibility and commitment', as a result of MD introduced to support business process re-engineering. In another case, improvements in OP as a result of MD initiatives were visible in the changes in team behaviour, including performance and the dynamics of work groups.

Major difficulties of measurement of OP and of attributing improvements to MD were encountered, especially where the same measures were used for OP and IP, and where OP was regarded as a function of a manager's performance. Equally, OP was difficult to separate from BP and was seen to be affected by extraneous factors.

Business Performance

The organizations which were ranked highest displayed quantified, written and corroborated evidence of improvements in BP, and respondents were unequivocal that MD had contributed to all prime measures of business efficiency. In such organizations, managers emphasised increased turnover and profit, sales and revenue growth, increased market share and competitiveness. Productivity, efficiency and quality gains were important factors, as was decreased unit costs. Other benefits reported were reductions in arrears and stock holding, shorter waiting times and queues, and reduced staff turnover.

In cases which were ranked lower than the best, evidence was provided of specific business benefits, which were largely attributable to MD activities. Where improvements in BP were identified, the extent to which these were attributed to MD initiatives varied from the unequivocal cases where they would have been impossible without MD, to cases where the contribution of MD was implicit. Other cases showed how MD was the major, but not the only, contribution to success, or how MD was a necessary factor, in conjunction with other changes.

Problems of measurement of BP were most serious in the weaker cases, and largely arose from the interaction of other factors affecting BP, while difficulties of attribution were a consequence of being unable to produce counter-factual evidence of what would have been the BP outcome in the absence of MD initiatives. In cases where improvements could not be attributed unambiguously to MD, few attempts had been made to measure its impact.

Organizational Strategy

In the cases where written evidence and corroborated interviews showed how OS and MD were inter-related, the links between the two were pervasive and demonstrated in a variety of ways. Typically, MD was shown to be an intrinsic part of the business plan, and to support strategic priorities. Business objectives were shown to be linked to OS through defined competences, strategic objectives were mapped onto performance standards, and personal development plans related to business plans. Roles and responsibilities for MD were devolved to individuals and their line managers, with only limited HR intervention, thereby embedding MD within OS.

Major changes provided both the opportunity and necessity of linking MD to OS, and MD initiatives responded to changes in the organization's environment. Extensive restructuring or business process re-engineering (BPR) provided opportunities for linking MD to OS and focused attention on the competences required to achieve the

organizational transformation. Throughout, the MCI Standards and NVQs were seen to provide a structure for the links.

Even where the links between MD and OS were less clear, there was some evidence of MD initiatives to support specific aspects of OS. In other cases, problems were identified in establishing the link, for example difficulty in identifying which competences would improve BP. Also, MD was found invariably to lag OS where this was dynamic, and immediate priorities inevitably took precedence over longer-term strategic MD. An apparent paradox was also highlighted between devolving responsibility for MD and linking it to OS, since much MD is focused on the needs of the individual, not the organization.

HRD Systems and Processes

In four organizations, the Management Standards were comprehensively adopted in HRD systems and processes. In these organizations, all or most MD activities were competence-based. The Management Standards were central to appraisal, training and development, although they were used less extensively in job descriptions, recruitment and remuneration.

Written evidence and corroborated interviews demonstrated the ways in which the Standards were adopted and the benefits of building MD initiatives around the MCI Framework. The major benefit identified from adopting the Management Standards was the coherent structure which they provided for training, MD and personal development. Gaps in competence, for example, are more readily identified through appraisal, training and development needs are specified more precisely in relation to the competences required for individuals to meet the needs of the organization, and there are clear criteria for human resource planning and career succession. In addition, MD is linked to a qualifications framework.

In three cases, the Management Standards had been partially adopted, and were used to a limited extent in some HRD systems and processes. The remaining nine organizations had either not attempted to adopt the Management Standards or had only made limited progress in this direction, so that they were regarded as non-users. The research identified some limitations to the adoption of the Management Standards both in the extent to which they have percolated through an organization and in the range of HRD systems and processes involved. The main limitations were that the Standards are not extensively used in recruitment and selection, other than in relation to job profiles, and reward and remuneration systems are rarely linked to the achievement of competences defined in the Standards. Additional criteria are sometimes used alongside the Standards, especially in relation to specific technical competences, and familiarity with the Management Standards is less extensive outside the HR specialists.

Conclusions

The sixteen organizations provided very positive and highly significant results demonstrating performance improvements as a result of MD. Despite the difficulty of measuring performance, and especially OP, the three measures of performance are significantly correlated. The overall coefficient of concordance between the rank orders of IP, OP and BP is significant at the 1 per cent level (Kendall's $w = 0.796$), showing that the rank position of an organization in terms of one performance measure is similar to its rank position for another performance measure. Moreover, as Table 1 shows, each pair of performance measures correlates at the 5 per cent level or better, especially in the case of IP and BP (Spearman $R_S = 0.797$). Of the three performance measures, OP was the most problematic, but the significant rank correlation coefficients suggest that OP can be 'captured' adequately by IP and BP measures.

Significantly, the results of the rank correlation also provide support for the conditional hypothesis that MD is more likely to improve performance when it is linked with OS. The Spearman rank correlation coefficients between OS and both IP and BP are significant at the 1 per cent level. Paradoxically, there is no significant correlation between OS and OP, which may reflect the difficulties of measurement and attribution already identified. In the case of IP and BP, these results offer unambiguous support for the importance of linking MD to OS in order to realise business benefits.

The rank correlations also provide support for the conditional hypothesis that MD is more likely to improve performance when HRD systems and processes are based on the competence statements in the MCI Standards. The Spearman rank correlation coefficients between HRD and both IP and BP are significant at the 5 per cent level, although again there is no significant correlation between HRD and OP. In the case of IP and BP, these results again offer support for the importance of developing MD around the Management Standards in order to realise business benefits.

Table1

Spearman rank correlation coefficients

factor	OP	BP	OS	HRD
IP	0.635	*0.797*	*0.863*	0.611
OP		*0.650*	(0.411)	(0.170)
BP			*0.658*	0.548
OS				0.575

Key:
IP = rank in terms of evidence of individual performance improvements attributed to MD
OP = rank in terms of evidence of organizational performance improvements attributed to MD
BP = rank in terms of evidence of business performance improvements attributed to MD
OS = rank in terms of evidence of link between organizational strategy and MD
HRD = rank in terms of evidence that HRD systems and processes are based on the Management Standards.
Statistical note:
For 14 degrees of freedom, $R_{S\,(0.01)} = 0.645$; $R_{S\,(0.05)} = 0.456$
In the table, *correlation coefficients in italics are significant at 1 per cent*, others are significant at 5 per cent, (results in brackets are not significant at the 5 per cent level).

Three policy implications follow from the above conclusions, relating to the performance measures which should be used to monitor the business benefits of CBMD, linking CBMD to organizational strategy, and adopting the Management Standards.

First, the performance measures which are most reliable for monitoring the business benefits of CBMD are individual and business performance, which correlate with, and therefore probably also incorporate, the less tangible organizational performance measures. The strength of the link between CBMD and both individual and business performance suggests that CBMD should be promoted with the message that *developing people contributes to business success*.

Second, performance benefits are more likely to arise from CBMD where this is strongly linked with organizational strategy. The link between CBMD and organizational strategy should be seen as complementary to the value of developing people since this is the mechanism through which the development of individuals contributes to business performance. In policy terms, these findings provide further support for the *Investors in People* approach, through which development is linked to business strategy.

Third, performance is improved additionally where organizations adopt the Management Standards as a framework for development within HRD systems and processes. The additionality is important and provides support for further promoting the *MCI Standards*, encouraging their adoption by organizations to provide coherence in CBMD and to support mobility within the managerial work force.

Volume 1

From the Editor ix
Call for Papers-AHRD 2000 xi
Conference Overview xiii
Conference Program xv

Proceedings

Town Forum

Certification of HRD Professionals, Products, and Academic Programs-The Role of AHRD 1
Human Resource Development Certification: 7

Sypmposium 1: Adult Learning in the workplace

The Relationship Between Workplace Learning and Employee Satisfaction in Small Businesses 15
Reframing the Andragogical Model of Adult Learning 20
A Holistic Model of Knowledge and Adult Learning 29
The Nature of Adult Workplace Curiosity 37

Symposium 2: Advances in Distance Learning

The Adoption of Computer Technology and Telecommunications: A Case Study 43
Distance Education: Examining Emerging Standards and Instructional Practice via Videotaped Content Analysis 52
Critical Components of Distance Education Partnerships between Two-year Colleges and Business and Industry 61
Comparative Analysis of Online vs. Face-to-Face Instruction 68

Symposium 3: Learning and Working in Groups

Collaborating in Public with the Opposition": A Study of the Complex Meaning of Learning in A Cross Boundary Work Group 77
Designing Dispute Management Systems 85
What's New in Teams 92
Application and Test of a Model of Team Effectiveness to Self-Managing 96

Symposium 4: Workplace Diversity Issues

Expanding Theories of Career Development: Adding the Voices of African American Women in the White Academy 104
The Role of Human Resource Development in the Successful Transition of Minority Youth into the Workplace 113
The Relationship Between Selected Variables on Diversity and the Implementation of Diversity as Successful Corporate Culture Change Programs 118
Diversity Practitioners—Learning From Experience! Defining the Role and Related Competencies in an Emerging Field of Practice. 125

Symposium 5: Learning Organization Issues

How Action Learning Builds the Learning Organization: A Conceptual Analysis 136
Enhancing Individual and Organizational Learning: A Sociological Model 143
Predictors of Learning Organizations: A Human Resource Development Practitioners Perspective 151
Action Learning and Systems-level Continuous Learning 159

Symposium 6: Managers and Learning

Expatriate Managers and HRD: The Missing Link 166
Managerial Practices to Facilitate Learning Within Learning Organizations 172
Operationalizing the Organizational Model of Managerial Employee Persistence 179
Critical Thinking, Developmental Learning, and Adaptive Flexibility in Organizational Leaders 187

Innovative Session 1:
Vital Work: Spirit and Development Within the Natural Workplace 193

Symposium 7: Linking HRD Theory and Practice
Reorienting the Theoretical Foundations of Human Resource Development: Building a Sustainable Profession and Society 202
Towards a Philosophical Framework for Thought and Practice 209
The Need for Theoretical Model Building in HRD 217
Bridging the Gap With a Multidimensional Performance Model 221

Symposium 8: Workforce Issues Facing HRD
Contributing Factors to the Success of Women and People of Color in Leadership Roles: 230
A Qualitative Assessment of Office Design Perceived by Older and Younger Workers to Impact Work 239
Consequences of Part-time Work for the Full-time Co-workers 247
Disability Disclosure, Recruitment Interviews, and the Employment Process 255

Symposium 9: Enhancing Employee Skills
The Effect Of Study Skills Training Intervention On United States Air Force Aeromedical Apprentices. 263
Helping Employees Develop Computer Skills While at Work: An Exploratory Study 272
Defining Core Problems for on the Job Training: An Example in the Car Repair Trade 282
How Can Firms Improve Sales Performance? 289

Symposium 10: Instructional Technology
Performance- and Learning Support With On-line Help Systems: An Effectiveness Study 292
Using Participatory Action Research to Investigate the Process of Designing and Developing Web-based Instruction (WBI) 298
Readiness of HRD Instructors to Engage in On-line Instruction 307
Motivating Community College Instructors to Teach On-line: An Exploration of Selected Motivators... 313

Symposium 11: International HRD Perspectives
Towards a Meaningful HRD Function in the Post-Command Economies of Central and Eastern Europe 318
The Impact of Human Resource Development on the Winter War Between Finland and the Soviet Union, 1939-1940 327
Designing Effective Training Program for International Transfer 331
Cross Cultural Effectiveness: A Case Study of Cultural Conflict Incidents 340

Symposium 12: Informal Workplace Learning
Re-conceptualizing Marsick and Watkins' Model of Informal and Incidental Learning in the Workplace 349
Creativity and Design 357
Contradictory Practices: Critical Feminist Perspectives on HRD and Workplace Learning 365
Self and Team Development in Practice (STP) Walk Rally 373

Symposium 13: Organization Structure and Strategy
Human Resource Development's Contribution to Strategic Service Quality Performance in Radisson Hotels Worldwide 380
Mastering Turbulent Growth: A Growth Audit at a Major Pharmaceutical Research Center 386
A Study of the Role of HRD in Response to External Environmental Change in Public Service Organizations. 396
Operationalizing Alignment: Testing Alignment Theory 401

Symposium 14: University HRD Programs
Case: Developing A Competency-Based Exam for an HRD Graduate Program 410
Scaling the Walls of Academic Silos: The Birth of a Cross-disciplinary Academic HRD Program 418
An Examination of Teaching Pedagogies in Entrepreneurial Education, a Historical Examination 427
Examination of Critical Issues for Development and Implementation of Online Instruction 434

Symposium 15: HRD Issues in Asia

The History of Human Resource Development in Taiwan from 1949 to 1999 443
Expatriate Development for the Asia-Pacific Region: A Comparative Analysis of Expatriates from Five Countries Across Three Continents 452
Development Of A Framework For Emerging Asian MNCs And A Model For Promising Local Enterprises To Migrate Onto The 'MNC Curve': An International HRD Perspective 465
The Framework and Practices of Cross-Cultural Training of Taiwanese Corporations 474

Symposium 16: Knowledge Management

Knowledge Management and Knowledge Dissemination 479
A Theory Of Knowledge Management 488
Signposts On The Road To Knowledge Management 496
The Relationship Between Human Resource Development And Business Strategy In 1998 Fortune 500 Companies 504

Symposium 17: Facilitating Organizational Change

Conflicts that Arise in Small Group Facilitation 512
A Test of a Rapid Developer Model 520
Barriers to Transformational Change 529
Pew Sitters or Church Pillars: A Case Study 536

Symposium 18: Evaluation in HRD

Assessing Organizational Readiness for Learning Through Evaluative Inquiry 542
Design and Development of an Evaluation System for Online Instruction 548
The Mixed-Method Evaluation in HRD--A Description of Methods Applied in the Industrial Development Program 554
The Effects of Two Training Systems on Trainee Satisfaction, Learning, Job Behavior, Retention and Organizational Performance 562

Symposium 19: New Perspectives in HRD

Developing an Instrument to Measure the Use of Play-Based Training Methods in Healthcare Education 569
An Approach to HRD Based on Acceptance of Responsibility, Dedication to Truth, Delaying Gratification, and Love: A Case for Kenyan Students 574
HRD and Economic Development: A Mega Level Research Agenda 582
Improving Technical Training: The Effectiveness of Technical Subject Matter Experts as Trainers 588

Symposium 20: Integrating Learning and Performance

Identifying the Skill Requirements and Performance Needs of Small Manufacturers 596
The Relationship of Learning and Performance Improvement at Different System Levels 602
Historical Antecedents Shaping The Terms Of Performance And Learning And Their Relationship In Human Resource Development: An Exploratory Study 611
Developing Managerial Competence: Does It Improve Performance? 620

Volume 2

Conference Overview

Symposium 21: Individual Learning Issues

A Quantitative Examination of the Feelings and Cognitive Processes of a Group of Adults Undertaking a Tertiary HRD Program 627
The Cycle of Awareness Development: A Cognitive and Psychosocial Theory of Adult Development .. 634
Components of Effective Business Based Diversity Training Programs 641
Personality Traits, Affect, and Values: A Model of Dispositional Effects 649

Symposium 22: Evaluating the Impact of HRD

Pre-Job Training and the Earnings of High-Tech Employees in Taiwan 658
Training Effectiveness And Employee Output - A Regression Model Based On Training Transfer And Organization Development Variables 665
Only Time Will Tell: Strengthening the Link Between HRD and Firm Performance 674
Contemporary Approaches to Return on Investment from Training 681

Symposium 23: HRD in the United Kingdom

HRD and Psychological Contracts: A Case Study of Lifelong Learning 689
Comparing International HRD Practices and Experiences With Cross-cultural Theories and Research: A Case Study of the Office for National Statistics 697
Management and Career Development in the UK in Practice 704
Information and Feedback Seeking in U.S. and British Human Resources Development and Training Settings 713

Symposium 24: HRD Professional Development

Mentoring as a Tool for Faculty Development: Predicting Positive Outcomes for Mentors 722
The Evolving Role of Trainers and the Consulting Component in Corporate Universities 730
A Corporate-University Partnership For The Development Of HRD Professionals: 739
Employed Adults in a B.S. Ed HRD Program Option: Who Are These Students and Why Are They Here? 747

Symposium 25: Changing Workplace

A Quantitative Examination of the Feelings and Cognitive Processes of a Group of Adults Undertaking a Tertiary HRD Program

Bryan W. Smith
Edith Cowan University, Western Australia

Mature adults who enter university late in life bring with them a variety of mental and emotional states. This paper examines the states of a group of adults in a tertiary HRD learning situation. Stimulated recall methodology was used in order to categorize the scope and extent of these aspects of the informants' covert behavior. Results indicated that the majority of thoughts and feelings were concerned with the behavioral moves of other students and their own self-performance.

Keywords: Adult Learning, Cognitive Processes, Feelings

This paper is a report upon one aspect of a broader study that researched the cognitive processes and feelings experienced by a number of adult learners undertaking a tertiary Human Resource Development (HRD) program. The broader study examined both the qualitative attributional analysis of adult learner covert behavior and the quantitative analysis of that behavior. This paper is only concerned with the quantitative analysis.

Adults entering tertiary study after years of work and a variety of formal educational experiences bring with them a range of mental states and affective situations. They differ markedly from younger students entering university directly from school who tend to be more homogeneous in their mental and emotional life. There is a need therefore to understand the myriad of cognitive processes and thoughts that these mature adults bring to the tertiary learning situation. By understanding these situations facilitators of adult learning can better structure learning experiences so that the needs of these adults are more effectively met.

Problem Statement and Theoretical Framework

The study is grounded in the humanistic, or phenomenological, tradition that postulates the individual, while learning, seeks greater personal adequacy, self esteem and self actualisation. Rogers (1965) indicates: "It (self actualising) has a quality of personal involvement – the whole person in both his feeling and cognitive aspects being in the learning event" (p. 5). In this tradition adult learners respond to the environment as each of them as individuals experiences it. Self becomes an important element in determining behavior to maintain and enhance self. Consequently, a phenomenological approach to the study as advocated by theorists such as Denzin and Lincoln (1994) seemed the most appropriate to access the phenomena of adult student life.

In accepting the stance that adult learners respond to a learning situation in their own idiosyncratic way it seemed logical to try and discover how adults actually did this. A search of the literature yielded little for adult learners. However, the literature is more revealing with children in classrooms. For instance, Wittrock (1986) indicated that research on children's thought processes:

> "studies the effects of teachers and instruction upon the student perceptions, expectations, attentional processes, motivations, attributions, memories, generations, understandings, beliefs, attitudes, learning strategies and metacognitive processes that mediate achievement" (p 297).

There have been studies of the thought processes of children while learning science (Eggin & Main,1990; Nakleh & Krajcik,1991; Jenkins,1995 and Shepardson & Jackson, 1997) and mathematics (Macmillan, 1990; Shannon & Curtin,1992; King. 1993 and Muth, 1993). However, apart from Verloop (1989), who examined the changes in cognition of student teachers while undergoing tertiary study, there appears to be little in the literature

Copyright © 1999 Bryan W. Smith

concerning the covert behavior of adult learners. This paper reports on a part of the research that attempts to fill that gap.

Research Questions

According to Denzin and Lincoln (1994), the type of research questions that fit the phenomenological paradigm are "meaning questions" or questions that elicit the "essence of experience" (p224). Consequently, because of the need to investigate the nature of adult students' thoughts and feelings as they enter tertiary study following workplace experience, and in order to better provide them with appropriate learning strategies, this paper is interested in exploring the following broad questions: What are the idiosyncratic thoughts and feelings that flow through the minds of adults while they are in a learning situation? What sorts of ideas, beliefs, views, emotions and lines of reasoning make up the learner's conception of self-performance? In what ways can these thoughts and feelings be categorized and counted?

Methodology

The study design involved stimulated recall methodology (King and Tuckwell,1983) which enabled both quantitative and qualitative data to be derived from interviews with the adult students. This paper reports the quantitative analysis of their thoughts and feelings. Each adult student was treated as a case study and the quantitative data contributed to the description and interpretations of the phenomena being analysed.

Four adults undertaking learning in a semester unit within a university HRD program were interviewed over a six month period about their thoughts and feelings concerning their conceptions of self-performance. The students were video-taped for the duration of a three hour training session on each of three occasions. Immediately on completion of each session the students were interviewed using the videotape for stimulated recall. Their responses were audiotaped and transcriptions created. The transcriptions were later examined for all statements that contained thoughts and feelings that the students reported as having occurred during the sessions. These thoughts and feelings were classified as interactive data and were distinguished from the non-interactive data, that is, those thoughts and feelings that occurred before or after the sessions. Non-interactive data were not coded.

Before each interview the student was reminded that the researcher was seeking recall of only those thoughts and feelings that occurred during the sessions. Clues to interactive data in the transcripts include statements beginning: "I was just thinking about..." and "I was feeling..."

The next stage of analysis involved unitization or segmentation. This means the data were divided into units of single thoughts or feelings. These units were sometimes contained in a few words, sometimes in a sentence, or even an entire paragraph.

Once this had occurred each thought and feeling was categorized. The category system used was CASSIT (Content Analysis of Students' Interactive Thoughts) developed by King (1979) and modified by this researcher to reflect the adult nature of the analysis. The nine categories of CASSIT used were:

Subject Matter – thoughts and feelings dealing with the content of the sessions.
Cognitive processes – thoughts dealing with the student's cognitions such as perception, knowing, remembering.
Behavioral Moves-Self – thoughts and feelings about any action the student was performing such as avoiding, seeking, attending.
Behavioral Moves-Student – thoughts and feelings concerning the actions, perceptions of other students.
Behavioral Moves-Facilitator – thoughts and feelings on actions concerning the facilitator.
Self-Performance-Thoughts – thinking about own performance, behavior, self attributions, self expectations.
Self-Performance-Feelings – emotions about own performance.
Feelings-(Positive & Negative) – emotions during the sessions other than those about self-performance.
Non Task-Related – any thought or feeling about off task behavior.

Intercoder and intracoder reliability statistics were calculated using Pearson's product-moment correlation coefficient. The researcher trained a colleague in the use of CASSIT and the colleague applied CASSIT to a sample of transcripts. The researcher revisited the data six months after the researcher's first coding. Both coefficients were sufficiently high enough for the researcher to conclude that the informants' thoughts and feelings were being correctly categorized.

Discussion of the Results

The results of the categorization for each of the four adult learners (real names not used) appear below.

Table 1

Percentage Distribution of Student Thoughts Over CASSIT Categories for Each Session: Gail

Categories of student covert behaviour	Session 1	Session 2	Session 3	Percentage of total
Subject matter	-	13.3	1.7	5.1
Cognitive processes	20.0	16.7	19.0	18.6
Behavioural moves – Self	1.7	5.0	8.8	5.1
Behavioural moves – Student	18.3	13.3	28.3	19.8
Behavioural moves – Facilitator	15.0	11.7	5.3	11.3
Self performance – Thoughts	18.3	20.0	5.3	14.1
Self performance – Feelings	26.7	20.0	31.6	26.0
Feelings – Positive	-	-	-	-
Feelings – Negative	-	-	-	-
Non task related	-	-	-	-

Gail reported the largest number of feelings about her own performance. These were particularly high in Session 1, dipped a little in Session 2 and dominated Session 3. She reported numerous feelings of anxiety, concern and worry alongside feelings of happiness and cheeriness.

She also reported a large number of thoughts concerning learning the subject matter: perceiving or being aware, knowing and remembering, justifying and reasoning. These remained relatively constant over the three sessions.

Gail's quantity of self performance-thoughts was high in the first two sessions but dipped markedly in the third. This could be accounted for by a significant increase in self performance-feelings. It was during this session that Gail reported feeling more comfortable with her own performance and was becoming increasingly aware of her own behavioural moves and those of her fellow students.

A comparison across sessions showed a significant dip in thoughts concerning other students in the middle session. This may be explained by a corresponding rise in self performance-thoughts that peaked during the middle session.

The decline in the number of thought units over the three sessions indicates a decreasing interest in the facilitator. This may be explained by the fact the facilitator had established a pattern of behaviour that became so

automatic Gail was no longer aware of his instructional moves. Similarly, there may have been more emphasis upon group and paired work to the extent the facilitator appeared to be redundant in her own mind.

The trend over the three sessions shows an interesting increase in the quantity of behavioral moves-self thought units. This trend indicated that Gail became increasingly introspective and self-analytical about her own performance and in the last session she reported above average quantities of thought units. Perhaps the experiences of the classroom were such that Gail became increasingly aware of her need to participate publicly.

Table 2

Percentage Distribution of Student Thoughts Over CASSIT Categories for Each Session: Sam

Categories of student covert behaviour	Session 1	Session 2	Session 3	Percentage of total
Subject matter	14.0	4.8	1.9	6.3
Cognitive processes	25.6	11.3	24.5	19.6
Behavioural moves – Self	2.3	1.6	-	1.2
Behavioural moves – Student	14.0	12.9	41.5	22.8
Behavioural moves – Facilitator	11.6	16.1	1.9	10.1
Self performance – Thoughts	11.6	17.7	20.8	17.1
Self performance – Feelings	16.3	22.6	9.4	16.5
Feelings – Positive	-	12.9	-	5.1
Feelings – Negative	-	-	-	-
Non task related	4.7	-	-	1.3

In Session 1 analysis indicated more than one quarter of all Sam's covert behavior was concerned with thought processes involved in learning the subject matter. This means he spent a lot of time involved in perceiving or being aware, to knowing or remembering, or reasoning about the content of the sessions. He was very much involved in intellectual activity that would assist his learning. While this dropped away in Session 2 it climbed back to a similar level for Session 3.

Self-performance feelings rank highly in Session 1. Sam demonstrated a large number of feelings concerned with a range of emotions subsumed under this category: anxiety, happiness, disappointment, worry. These climb dramatically to dominate Session 2 before fading in Session 3.

Sam reported a significant number of thoughts and feelings about other students: perceptions of their performances, inferences of their thoughts and perceptions about their behavior. Many such thoughts were concerned with observations of others' demonstrated intellect and manifestations of experience with the subject matter. Such thoughts totally dominated the third session where over 40% were concerned with others' behavior.

Interestingly, Sam reported no emotions at all that were negative such as annoyance, frustration and apprehension, and reported a significant number of positive emotions such as excitement, surprise and happiness in Session 2.

Overall, Sam appeared to be most concerned with his fellow students and the intellectual requirements of the program. In addition, he reported covert behavior that dealt with his thoughts and feelings about his own performance. He appeared to be aware of how he was coping with both learning the content and the actions of his colleagues.

Table 3

Percentage Distribution of Student Thoughts Over CASSIT Categories for Each Session: Dee

Categories of student covert behaviour	Session 1	Session 2	Session 3	Percentage of total
Subject matter	2.7	9.4	2.9	4.6
Cognitive processes	10.7	17.0	11.8	12.8
Behavioural moves – Self	10.7	1.9	2.9	5.6
Behavioural moves – Student	25.3	7.5	35.3	24.0
Behavioural moves – Facilitator	13.3	9.4	10.3	11.2
Self performance – Thoughts	18.7	35.8	10.3	20.4
Self performance feelings	18.7	18.8	23.5	19.9
Feelings – Positive	-	-	-	-
Feelings – Negative	-	-	4.4	1.5
Non task related	-	-	-	-

Dee, in Session 1, reported a high percentage of thought units dealing with perceptions of other students. This is understandable considering that when entering any new situation people show a lot of interest in those around them. While this concern dropped away in Session 2 it dominated Session 3. In this latter session, Dee reported concern with the domination of a number of students who were "grandstanding" in front of the group.

Thoughts and feelings about self-performance ranked highly in the first session and these continued to predominate throughout. There were no positive feelings reported but in the final session some negative feelings were generated.

Dee indicated minimal thoughts about cognition and even less about the subject matter. There were no off task thoughts reported at all.

In summary, Dee, like Sam, reported more thoughts about other students than any other category, though when self-performance thoughts and feelings, and feelings not associated with self-performance, are aggregated, these comprise nearly half of her covert behavior.

Table 4

Percentage Distribution of Student Thoughts Over CASSIT Categories for Each Session: Pat

Categories of student covert behaviour	Session 1	Session 2	Session 3	Percentage of total
Subject matter	36.1	1.25	2.6	13.3
Cognitive processes	-	13.8	23.1	11.1
Behavioural moves – Self	18.0	-	-	6.1
Behavioural moves – Student	8.2	3.8	12.9	7.2
Behavioural moves – Facilitator	14.8	-	2.6	5.6
Self performance – Thoughts	6.6	3.8	2.6	4.4
Self performance –Feelings	16.4	12.5	28.2	17.2
Feelings positive	-	37.5	28.2	22.8
Feelings negative	-	15.0	-	6.7
Non task related	-	12.5	-	5.6

Pat's first session is dominated by reports of thoughts about the subject matter – its concepts, operations and applications. There is an amazing drop off in reports of this in the following sessions that might have indicated a decline in interest or an increasing familiarity with the content. This decline is off set by a large increase in positive and negative feelings outside of those associated with self-performance and a large quantity of non-task related thought units in Session 2.

Session 2 also indicated no reported thoughts at all concerning his own behavior and the behavior of the facilitator. This trend is repeated to a lesser extent in Session 3.

Unlike the other subjects of this study Pat shows only minimal concern with the behavior and actions of his fellow students and for that matter, the facilitator. His large scores in categories dealing with his own feelings, mostly outside of his self-performance, indicate a tendency towards intrinsic learning – perhaps an interest in his self actualisation.

Conclusions

The conclusions that can be drawn from the study suggest the kind of mental and emotional life that adult students entering university seem to experience. Four case study subjects preclude generalizations about adult learners but, from a heuristic sense, the plausibility of the phenomena analyzed indicates some validity of the wider population. The analysis of four adult learners' covert behavior goes some way into indicating the type and extent of the thoughts and feelings that other such adults may experience during a university learning experience. These thoughts and feelings are mostly about other students – interactions with them, perceptions of their behavior and performance and inferences of their thoughts. Such a finding supports the belief that adults, in a learning situation, are keenly interested in their fellow students and are quick to measure their own experience and learning against their perceptions of what others have already achieved or are currently demonstrating.

Feelings about self-performance also rank highly. Adult learners are anxious about not coping, excited when they achieve, get disappointed with low grades and worry about how their performance is affected by outside pressures. As well, it is logical that thoughts about self-performance also predominate. Adults constantly monitor their success and failures, spend energy in causal explanations of self-performance and are forever contemplating future success or failure.

Contrastingly, the results indicated these adults spent little time pondering about actions they performed, or considered performing, in relation to the learning process. They did not report many motives, desires or intentions to either seek or avoid public participation or to attend or not attend. They also reported limited interest in the behavioral moves of the facilitator – his instructional moves, reactions, interactions and overt behavior. The reasons for this could be that each session was group-based and there was little direction from the facilitator. What interest was shown by the research group concerned comparisons between their own instructional style and that of the facilitator. Perhaps a group of non-trainers would have downgraded this interest even further.

Limitations

This paper only reported the quantitative analysis that was applied to the four adult learners and therefore only tells part of the story. The rest of the story looked into the attributional analysis of self-performance covert behavior. For example, how did the adults explain their behavior? How consistent were those explanations to profiles of explanatory styles and conceptions of learning that they previously reported? The limitations normally applied to any phenomenological research can also be applied to this: subjectivity, researcher bias (despite the reliability and validity checks), reliance upon the memory of the informants and the lack of generalizability.

Contribution to New Knowledge

However, as a microanalysis of the reported thoughts and feelings of four adult learners, and despite the above limitations, there is some contribution to the understanding of the adult in the learning situation. Thoughts and emotions play an important part in the learning process for adults. The research literature would suggest that high frequency and wide diversity of self-oriented thoughts and feelings are likely to mediate the effectiveness of student learning (Wittrock, 1986). The adults in this study reported a huge range and extent of such thoughts and emotions.

This has implications for facilitators that seem to have been insufficiently emphasised in adult learning. Therefore, facilitators of adult learning neglect this information and probable consequence at their peril. Facilitators need to view the student as a whole person and restructure learning experiences for adults accordingly. They need to be open minded, less dogmatic, warm and more encouraging of student self-directedness. They should be seen as helpers who provide a learning climate in which the adult can feel free to develop emotionally as well as intellectually – be that in a training room or in the workplace.

The Cycle of Awareness Development: A Cognitive and Psychosocial Theory of Adult Development

Martin B. Kormanik
The George Washington University

An individual's perspective is a function of awareness development around life events, affecting the individual's attitude and behavior. This phenomenon inhibits communication, understanding, and the ability to move beyond reaction to the event. A framework is needed to help individuals understand themselves and others in reaction to life events and to assist in moving beyond dysfunctional reaction. Qualitative data suggest a five-stage cycle of awareness development. Implications for HRD practitioners are discussed.

Keywords: Development, Diversity, Critical Life Events

Problem Statement

When four people on different corners of an intersection see an altercation between two vehicles in the middle of the intersection, the individuals will likely differ in their description of what happened based on their perspective of the altercation. Similarly, when two individuals are confronted by a life event or issue, they will differ in their reaction to the issue based on their perspective or meaning schema (Schon, 1987). The individual who has successfully weathered a downsizing in his or her organization is at a different stage of awareness development than the individual who is in the middle of dealing with the anger and frustration of the restructuring.

The phenomenon that individuals view the same life event from their own perspective is problematic because it obstructs communication and understanding about the event and the individual's subsequent attitude and behavior. This in turn inhibits the ability to move beyond the reaction to the event to a position for effectively dealing with it. In the literature, much is said about the need to understand where another individual is coming from in order to lead, manage, or work effectively with them (Bennis & Nanus, 1985; Covey, 1989; Katzenbach & Smith, 1993; Roberts, 1985). A framework is needed to help individuals understand themselves and others in reaction to life events. The framework should enhance understanding, as well as assist in moving beyond any dysfunctional reaction to an event.

Theoretical Framework

Nothing in the literature is said about a repeating pattern or cycle of awareness development around life events transitions, and other issues. Theories on life-span development traditionally focus on life stages, or the changes that occur as the individual ages (Erikson, 1950; Levinson, 1978). These theories associate adult development with the sequence of life events—a linear approach. Other work has examined the rhythm of life events in a cyclical approach (Neugarten, 1979; Neugarten & Neugarten, 1987; Schlossberg, 1984). Numerous issues affecting adult development confront individuals during their lifetime. Some of these issues are closely tied to significant life events, such as entering school, starting work, a change in marital status, and the death of a family member. Other issues may not be directly tied to significant life events, yet still affect adult development (e.g., violence, terminal illness, substance abuse, harassment, discrimination, oppression).

Hypothesis

This paper focuses on understanding the repeating pattern or cycle of development, rather than attempting to use life events, transitions, or issues themselves as demarcations of development. The hypothesis is that an individual's perspective is a function of his or her awareness development around life events. The individual's perspective affects the individual's attitude and behavior. The theory proposed in this paper attempts to address several questions, including: Why are some individuals are more sensitive than others to the issue/event at hand? Why do

Copyright © 1999 Martin B. Kormanik

some individuals not even recognize an issue/event at hand? How can practitioners explain, interpret, and predict an individual's attitude and behavior based on the individual's stage of awareness development?

Research Design

This paper proposes a theory of adult awareness development. While no formal study has been undertaken to date, qualitative data obtained over the last five years from participants in executive training programs, career counseling sessions, and management consultation work provide the data yielding the phenomenon of adult awareness development under study. A structured interview protocol to obtain data on the phenomenon and theory was developed in December 1998. The interview protocol will be used to validate the theory through formal qualitative research in 1999.

Results and Findings

The data suggest a five stage cycle of awareness development repeating around the life events and issues confronting the individual. The theory addresses cognitive and psychosocial development, linking the data to the psychology, sociology, education, and anthropology literature. The five stages in the cycle of awareness development are pre-encounter, intellectualization, encounter, empowerment, and integration.

Pre-encounter

When an individual has no experience with the issue, the individual is at the *pre-encounter* stage of awareness development. The individual has no perception of the issue in terms of self or others (e.g., the man gives a cursory glance at the newspaper headline reporting that a woman was assaulted and raped in the neighborhood). The individual has not actually experienced it personally or recognized it in relation to others (e.g., "I don't do drugs and I don't associate with people who do"). They do not understand it because it is not a part of their world view (e.g., the white male who has no concept—knowledge or experience—of discrimination).

Given this state of development, the individual would not recognize the issue even if it were thrust upon them. The pre-encounter stage shown in the older gentleman who doesn't see the need for going to mandatory sexual harassment prevention training because, "I don't harass and there aren't any women in my shop." Sexual harassment is not an issue in his world. The man or woman in pre-encounter who knows nothing about marital discord because, "I'm in a good marriage and everyone I know is also." Marital discord is not an issue for them.

In describing the eight ages of man, Erikson (1950) describes the evolution of individual identity. Based on this evolution, the awareness development stage of pre-encounter would likely precede the early stages of identity development, during childhood and adolescence. This is, however, not the case. Although the issue may be in the individual's unconscious, individuals may move well into adulthood before having cognition or experience with any of the issues or life events discussed in this paper.

Intellectualization

As the individual starts learning about an issue, they move into the second stage of awareness development, *intellectualization*. This stage focuses on cognitive development around the issue, or encounter from the neck up. The individual begins to recognize the issue, yet there is little or no emotional involvement (e.g., "Yeah, I guess finding a cure for AIDS is important, but that doesn't affect me."). Intellectualization creates a sense of invulnerability. The spouse in intellectualization about the makings of a solid marriage despite the high divorce rate in her occupation, says, "We take care of things in our marriage, so that won't happen to us." The white male moving into the intellectualization stage begins to understand that workplace discrimination occurs, yet thinks that if he works hard and keeps his nose clean he will steadily advance up the corporate ladder. The older gentleman intellectualizes that sexual harassment might become an issue if a woman were to enter his work group, but thinks he doesn't need to worry about it till then.

The intellectualization stage of awareness development includes recognition of the issue as a function of what happens to others. The parent in intellectualization thinks, "I've brought my kids up right. I know nobody in *this* family is going to use drugs. The people down the street, on the other hand, let their kids run wild. It's no wonder they've turned out the way they have." Frequently, individuals in intellectualization rationalize the occurrence of an issue as warranted. The individual intellectualizing about sexual harassment or assault thinks, "She was wearing a

short, tight skirt. What did she expect?" After reading the newspaper article about the woman being raped, the man in intellectualization wonders why the woman was stupid enough to go out at a late hour by herself, then turns to thinking about the neighborhood property values going down because of the increase in crime.

Bronfenbrenner's (1979) work on the effect of social and cultural factors on adult development suggests that those closest to the individual are going to have the most impact. The role of context literally forms you. Schon (1987) further suggests that the situation frames the learning. In a situation that does not present, focus on, or involve the individual with the issue, their stage of awareness development would be pre-encounter. Cognitive development starts as the situation begins reflecting the issue. In the cycle of adult awareness development, as the individual's situation reflects the issue, the individual moves from pre-encounter into intellectualization.

Argyris' (1982) description of single loop learning focuses on cognitive development using existing routines and mental models, causing self-reinforcing patterns rather than developing new solutions. The individual in intellectualization spends a great deal of time on mental gymnastics, repeating a pattern of single loop learning. Miller (1980) suggests that intellectualizing is a "blunting" strategy, enabling an individual to avoid cognition of an unacceptable event. In the intellectualization stage of adult awareness development, the individual is not avoiding cognition. Rather, they are enjoying the intellectual discourse on an issue that does not really affect them.

The intellectualization stage of awareness is emblematic of Sternberg's (1985) definition of the mechanics of intelligence, where intelligence focuses on conceptual and theoretical (i.e., school book intelligence) as opposed to competence for everyday living. The intellectualization stage of adult awareness development is a hypothetical world where the issue remains at a distance and can be addressed in concepts and generalities, rather than a concrete world where the issue is a reality.

Encounter

Encounter, the third stage of awareness development, begins when the individual has the primary experience with the issue. This may be a "big zap." The man who worried about property values declining moved into encounter in a rush when his wife was forced to go out at night to get milk for their colic baby and was raped in the poorly lighted store parking lot. The spouse coming home after yet another extended business trip quickly entered encounter upon finding that her husband had filed divorce papers. The homeopathic, naturalistic, non-smoker found herself in encounter when she was diagnosed with lung cancer in a routine physical.

An individual might slide into encounter after an extended, low-level exposure to the issue. One woman, the first female engineer in the organization for which she worked, suggested, "It's not the big things in life that get you down. It's the constant barrage of little things that erode your confidence and make you wonder if it's all worth it." Pearlin, Lieberman, Menaghan, and Mullan (1981) stipulate:

> "Hardships that are an enduring testimony to one's lack of success or to the inadequacy of one's efforts to avoid problems would seem to pose the most sustained affront to one's conceptions of self-worth and of being in control over personal destiny....It is the abiding problems to which people can see no end, those that seem to become fixtures of their existence, that are intrinsically uncongenial with positive self-concept" (p. 346).

Experience with the issue generates two phases in the encounter stage of awareness development. Initially, behavior focuses on *implosion* (i.e., "Why me?!") due to the shattering of the perception of invulnerability created during the intellectualization stage. This stage of awareness development may include self-doubt (i.e., "What's wrong with me?!") and foster a sense of self-blame (i.e., "I must have done something to bring this upon myself."). The second phase of the encounter stage of awareness development is *explosion*, giving encounter the subtitle of rage stage. The individual feels, "I'm mad as hell and I'm not going to take it anymore," yet the individual also has the perception of lack of control and a sense of powerlessness to do anything about the issue.

Building on the precepts of social learning theory, Rotter (1966) provided grounded theory on the locus of control construct in a discussion of generalized expectancies for internal versus external control of reinforcement. Rotter conceptualized locus of control as a predisposition in the perception of what causes reinforcement (i.e., reward, favorable outcome, goal accomplishment). A predisposition for internal locus of control (i.e., internality) results from perception that reinforcement is contingent on one's own behavior or one's own relatively permanent characteristics or traits. Perception that reinforcement is due to luck, chance, fate, or factors beyond one's control indicate an external locus of control (i.e., externality). Individuals experiencing the encounter stage of the cycle of awareness development perceive a shift in locus of control toward externality.

A slightly different perspective on the concept of internal versus external control of reinforcement was provided by Lefcourt (1976). "In being forced to hear predictable noise we may stop work and wait until it ceases, or steel ourselves for the onset, minimizing our own responses to the noise. We are not as helpless as we might otherwise be since we can do something to minimize the impact of the predictable noise. It is this perception of the ability 'to do something' that gives rise to the concept of perceived control" (p. 5). Perceived control is a generalized expectancy for internal control of reinforcement. Reactions to unpleasant stimuli are shaped by the individual's perceptions of the stimuli and by the individual's perceptions of ability to cope with the stimuli. Individuals in encounter have diminished coping ability.

Encounter occurs when an individual perceives their social power has been threatened, eroded, or taken away. Gurin and Brim (1984) suggest the need for control is basic to self and describe research showing depressed individuals as hyper-realistic about their lack of personal efficacy. Personal efficacy means "judging the self as capable, as a person able to produce acts that should lead to desirable outcomes" (p. 283). Rotter's (1954) study on locus of control The husband in encounter wanted to turn back time and feared he was going to lose control and kill someone, yet he perceived there was absolutely nothing he could do about his feelings. The female engineer felt there was nothing she could do to change the situation—feeling certain that everything always had been and always would be controlled by an old-boys-network.

The individual may experience the issue firsthand or the individual may "live" the issue through the experience of others. The female engineer directly encountered gender inequity and harassment. On the other hand, the husband was not raped but entered the encounter stage of awareness development around the issue of rape due to his wife's experience. The older gentleman who intellectualized that sexual harassment did not affect him entered encounter when, over the dinner table, his daughter tells him about sexual harassment she experienced at work.

The individual in encounter has total and extended immersion in the issues, resulting in intense personal involvement. Being in encounter does not mean having a bad day or week, but having a bad life. Depression may be symptomatic of the implosion phase of encounter. The female engineer suggested she had been in encounter for at least nine years. The husband suggested it was nearly a year before he was able to move beyond the rage stage of awareness development and reconcile his anger. The total immersion in the issue creates a blindness that inhibits further progression in the cycle of awareness development. This immersion often leads to erroneous assumptions and paranoia. Everyone else's motives are seen as maligned. The white male who intellectualized that he would advance in his job if he did the right things does not get the promotions he expected and finds no headroom. He attributes this to women and minorities getting promoted because of "unfair quota programs" rather than the flattening of the corporate structure or his own deficient work output.

Erikson (1950) suggests that individuals having a psychosocial crisis in one stage of development must resolve the crisis. If the individual is unable to resolve the crisis, the individual is destined to repeat the crisis in later life stages. The individual revisits the crisis issue again and again until they are effectively able to resolve it. The encounter stage of adult awareness development is emblematic of this recurring crisis.

Ironically, individuals in rage stage may begin to find comfort in the encounter stage of awareness development. The individual sees himself or herself as having a difficult or bad life and, consciously or unconsciously, pulls others into their world. It is no surprise that being around the individual in rage stage is difficult. Attempting to help the individual in rage stage is described as, "like trying to hug a porcupine." The individual in encounter takes family, friends, and colleagues "from east hell to west hell and back" on a daily basis. One individual described a coworker as "carrying a bucket of doom and gloom" everywhere in the workplace. Consciously or unconsciously, others' may avoid the individual. Unfortunately, it is during the encounter stage that the individual needs the support of others the most.

The issue precipitating entry into the encounter stage of awareness development may result from comparison to one's peers. Neugarten and Neugarten (1987) identify social time in relation to one's contemporaries as:

> "a set of anticipations of the normal, expectable life cycle: expectations of what the major life events and turning points will be and when they should occur. People internalize a social clock that tells them if they are on time or not" (p. 33).

Life crises occur when the rhythm and timing of life events is out of sync with one's peers. The disorienting dilemma created by out-of-sync social time is akin to the encounter stage of awareness development.

> "It is the events that upset the expected sequence and rhythm of the life cycle that cause problems—as when the death of a parent comes during one's adolescence rather than in middle age; when marriage is delayed too long; when the birth of a child comes too early; when occupational achievement is slowed;

when the empty nest, grandparenthood, retirement, major illness or widowhood occurs" (Neugarten & Neugarten; p. 33).

In studying the attitudes of individuals confronted with terminal illness, Kubler-Ross (1969) identifies five stages: denial and isolation, anger, bargaining, depression, and acceptance. The encounter stage of awareness development is a reflection of the first four of these stages. Isolation and depression closely align with the implosion phase of encounter, while anger corresponds to the explosion phase. Acceptance relates to moving out of encounter to the next stage in the cycle of awareness development.

Empowerment

The fourth stage of awareness development is *empowerment*. This stage includes seeking and finding strategies for securing enough power to make necessary changes while managing risk to self and others. Empowerment requires reflection, where negative judgment is suspended. The individual begins to use their discretion in a more rational manner. The empowerment stage encompasses a resurgence in the individual's perception of personal and position power. During empowerment, the feelings of powerlessness and loss of control generated during the encounter stage are reconciled. Personal efficacy is regained during the empowerment stage. Individuals begin to recognize the extent of power they have within their span of control and, even if that power is limited, use that power to regain a sense of control.

A significant part of empowerment comes from enlisting the aid of others through the development and maintenance of support systems (e.g., mentors, confidants, networks). The feedback learning loop support systems provide fulfills the need for coaching the individual in the empowerment stage of awareness development. Feedback as a strategy for empowerment requires a discourse or dialogue. This serves as the making-meaning piece—for enabling the individual to move beyond the frustration, anger, and misperception of encounter. Mezirow (1985) suggests this tends to be done socially. Gurin and Brim (1984) identify "attention and processing of social information as the first step in change" (p. 312). Kram (1988) also notes the importance of workplace social systems for supporting individual development and reconnecting an individual experiencing the isolation of encounter.

Participants in a diversity training initiative suggested several strategies for moving through the empowerment stage of awareness development around the issues attendant to diversity in the workplace (Kormanik & Geffner, 1995). Strategies included working the problem out internally, getting outside help, putting the problem on hold, and taking training. The strategies shed light on how individuals might provide assistance to, or seek assistance from others, to enable them to get beyond the rage stage of encounter. The data reinforce individual responsibility and accountability for moving out of encounter, through empowerment, to the next stage of awareness development.

Integration

Integration, the fifth stage of awareness development, is the state of "being whole"—synergy, synthesis. The individual regains a sense of control. The effects of the issue that precipitated encounter dissipate easily. The female engineer stating, "Like rain off a duck's back, I don't let the pettiness bother me anymore." The individual knows *what* they do and *why* they do it as a result of the cognitive and psychosocial development during the empowerment stage. The individual who went through a divorce suggested that if the encounter stage of awareness development was "when you are pissed," then the integration stage was "when you get creatively pissed"—functionally rather than dysfunctionally. The individual is capable of helping himself or herself, as well as others, be effective and successful in their efforts. This may occur in both professional and personal endeavors.

Anthropologists suggest that "with evolution, the self becomes more distinct and it also assumes more responsibility for its own deeds" (Peacock & Kirsch, 1970, p. 288). The individual moves toward rationality in order to better manage irrational drives. The progression through empowerment to the integration stage of awareness development represents regaining control of the irrationality created during the encounter stage.

The cognitive and psychosocial development represented by moving through the empowerment stage into integration represents the growth piece. As the individual moves through empowerment to integration, the individual finds new and more effective ways to resolve or at least cope with the issue that precipitated encounter. In integration there is practical application of strategies for moving beyond the crisis of encounter. Sternberg (1985) defines pragmatic intelligence that emphasizes experience and real-world context where problem solving in everyday life occurs naturally. The development through empowerment to integration is similar to the double loop

learning suggested by Argyris (1982). In Levinson's (1978) terms, moving to the integration stage represents becoming your own man or woman. The integration stage correlates to the Jungian (1983) concept of individuation, as well as the concept of individual time identified by Neugarten (1979). Schon (1987) describes perspective transformation as a fundamental change in the way the individual views the world, revolution rather than evolution. Movement through the cycle of development to the stage of integration around a particular issue embodies the concept of perspective transformation.

Movement to the integration stage in the cycle of awareness development does not mean the individual's psychosocial and cognitive development are complete. Perry's (1981) work on cognitive development shows higher level thinking in later developmental stages, where the individual understands:

> "This is how life will be. I must be wholehearted while tentative, fight for my values, yet respect others, believe my deepest values right yet be ready to learn. I see that I shall be retracing this whole journey over and over—but, I hope, more wisely" (p. 79).

The process of awareness development is not static. It is a dynamic, repeating cycle. The individual will remain at integration only until the next issue comes along. The individual may have already reentered the cycle of awareness development around another life event or issue. Let us hope more wisely.

Conclusions

Individuals go through a cycle of awareness development around life events, transitions, and other issues. The cycle includes five stages: pre-encounter, intellectualization, encounter, empowerment, and integration. The various stages of the cycle embody cognitive, psychological, and social development. The cycle repeats for each life event, transition, and other issue. Individuals generally progress through the stages of awareness in sequence, but progression varies significantly. Depending on the specific issue, some individuals may progress rapidly and some might stagnate at an early stage.

Contribution to New HRD Knowledge

Glaser and Strauss (1967) suggest that the discovery of grounded theory from social research data is of particular importance when it provides "relevant predictions, explanations, interpretations and applications" (p. 1). The cycle of awareness development theory enhances understanding of why some individuals are more sensitive than others to the issue at hand. The theory provides a useful framework that helps both practitioners and laypeople predict, explain, and interpret an individual's attitudes and behaviors based on the individual's stage of awareness development. There are several implications for HRD.

While this paper focused on awareness development at the individual level, application to the organization is appropriate. For example, the work group that goes into encounter when there is a critical incident of violence in the workplace, or the work force that goes into encounter after. The HRD practitioner can develop programs for increasing awareness about workplace violence to move people out of pre-encounter and assist in proactive intellectualization. Critical incident teams can be set up to assist employees in encounter. A plan can be put in place with strategies for moving employees out of encounter, through empowerment, to integration.

Other events that could precipitate individuals and organizations moving through the cycle of awareness development include: a clash in corporate cultures after an organizational merger, a new boss or change in organizational leadership, a series of reorganizations and downsizing, or the stress of dealing with constant organizational change. HRD practitioners must be ready to assist employees and management move through the cycle, while recognizing that some employees will need additional help in moving beyond encounter.

Training and development programs are another area for application of the cycle of awareness development. Diversity training programs, for instance, should focus on moving employees out of pre-encounter with diversity issues to enhance understanding of what coworkers might be going through as a result of their diversity. HRD practitioners must recognize that confrontational diversity training forces people into encounter. While this training methodology may be appropriate, the training design must also move the employees beyond encounter, through empowerment, to integration via skills building and development of organizational support systems.

Personality Traits, Affect, and Values: A Model of Dispositional Effects On Motivation to Learn

Elwood F. Holton III
Sharon S. Naquin
Louisiana State University

HRD research has largely ignored non-situational influences on outcomes. One particularly promising area of individual difference research is the dispositional perspective. This paper reviews the literature on potential dispositional effects in HRD and proposes a model of dispositional effects on motivation to learn.

Keywords: Personality Traits, Affect, Values, Motivation to Learn

In order to develop and implement effective training program, various aspects of the learning situation must be carefully and thoroughly considered. Examples of these aspects requiring attention include: the developmental goals and objectives; the individual and situational differences; and, the core principles of adult learning (Knowles, Holton, and Swanson, 1998). Facilitators must fully understand and appreciate the complexities of: the nature of the intended outcomes; the training activities and experiences that can lead to these outcomes; internal and external influences that potentially affect these outcomes; and the ways learners vary as individuals and in groups (Tomlinson, et al., 1992).

To date, much of the related research has largely ignored non-situational components. That is, much less emphasis has been focused on the way learners vary as individuals. Because these individual differences may affect key outcomes and are virtually ignored, this is a potentially crucial oversight. Variations among individuals, specifically variance in dispositional characteristics, and its relationship to HRD outcomes such as motivation to learn must be considered. Such a comprehension will aid in recognizing and employing strategies and methodologies that fit the learners, the desired outcomes, and the learning context.

This paper serves to introduce dispositional effects into HRD and proposes one specific application, motivation to learn. More specifically, this paper will review the literature on dispositional domains of traits, affect and values, and propose defend a model of dispositional effects on one HRD construct, motivation to learn.

Dispositional Approach Defined

Industrial, organizational, and psychological researchers have a long history of interest in individual differences and dispositional characteristics. Applications of related investigations are found in assessment activities, vocational counseling, and personnel selection procedures (Murphy, 1996). Murphy identifies four separate individual difference domains: cognitive ability, personality, orientation (values, interests, etc), and affective disposition (i.e., mood, affect, and temperament). These areas do not exhaust the set of individual differences that might substantially influence job performance or other organizationally relevant criteria (i.e., physical or psychomotor differences might be important in certain situations), but they do represent the most frequent concerns of related theory and research (Murphy, 1996). As Murphy (1996) indicated, individual differences influence behavior in organizations; however, their influence extends past behavior to organizational outcomes. They can affect long-term performance improvement or a permanent decline in productivity, increased personal growth or intellectual stagnation.

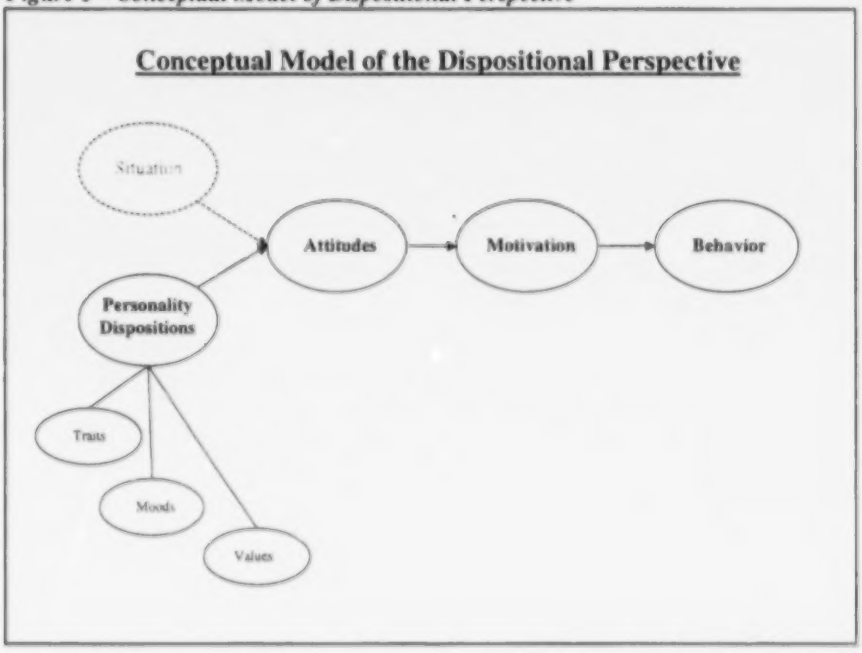
These individual differences have given rise to a stream of research known as the dispositional approach, which has been the focus of much empirical research in recent years. While other organizational research perspectives focus on situational and interactional perspectives (an interaction between the situation and the individual), this approach primarily focuses on the individual. Dispositional theorists posit that individuals possess certain characteristics that are enduring – consistent across situations and over time. Thus, dispositional effects are a subset of the individual differences domain which refers to all aspects of individual differences, not just those that are enduring. These relatively stable individual characteristics affect an individual's attitudes and behavior (Davis-Blake & Pfeffer, 1989), or cause an individual to perceive different contexts in consistent ways (Schaubroek et al.,

Copyright © 1999 Elwood F. Holton III and Sharon S. Naquin

1996).

Dispositional characteristics include three major domains: personality traits, affect, and values. By measuring these personal characteristics, individual attitudes and behaviors can be more accurately explained (Staw & Ross, 1985). Figure 1 below illustrates the conceptual framework for understanding the dispositional perspective. As shown, situational and dispositional factors (traits, affect, values) interact to influence attitudes, which in turn influence motivation, and finally behavior.

Figure 1 – Conceptual Model of Dispositional Perspective



Among the empirical studies focused on the dispositional approach to job attitudes and behaviors are studies of its effect on job performance (Barrick & Mount, 1991), and examinations of test-retest correlations of job attitudes (Staw & Ross, 1985). Research suggests that there are dispositional underpinnings of work values, attitudes and moods (c.f., Arvey, et al., 1989; George, 1989; Staw, Bell, & Clausen, 1986). Because each of the three aspects of the work experience is affected by an individual's dispositional traits, these dispositional foundations suggest that there is an element of stability associated with job attitudes and behavior (George & Jones, 1997, Staw & Ross, 1985). The relationship between dispositional factors and work-related strain has also been investigated (Brief, et al., 1988; McCrae & Costa, 1991). And, George (1989) has investigated the relationship between dispositional affectivity and employee absences. Further supporting evidence will be discussed in the next sections.

Personality: The Five-Factor or Big Five Taxonomy

The Five-Factor Model (FFM) dominates the current view of personality and provides a unifying structure to its study. This model has, in fact, garnered so much support, that the FFM "has now become an almost universal template for understanding the structure of personality" (Ferguson & Patterson, 1998, p. 789). As the name implies, this model suggests that there are five broad categories of traits at the top of the personality trait hierarchy. The relatively orthogonal five-factor taxonomy resulted from decades of research on the structure of human personality (Costa & McCrae, 1992), and has gained the support of numerous researchers (e.g., Costa & McCrae, 1995a; Digman, 1990; Goldberg, 1990). As highlighted by Costa and McCrae (1992), the five dimensions of the Five Factor model of personality are: Neuroticism, Extraversion, Openness to Experience, Agreeableness, and

Conscientiousness.

Barrick and Mount's (1991) meta-analytic study showed that personality validly predicted training proficiency across all occupational groups studied, with correlations ranging from r = .26 for Extroversion, r = .25 for Openness to Experience, r = .23 for Conscientiousness, r = .10 for Agreeableness, and r = .07 for Emotional Stability. They attributed the relationship between Extraversion and training to the fact that many training programs are highly interactive and require a considerable energy level among participants – characteristics that are highly compatible with traits associated with Extroverts.

There is some evidence of consistent correlations between Conscientiousness scores and educational achievement (Barrick & Mount, 1991). These researchers asserted that Conscientiousness is the most consistent predictor of academic achievement and job performance among the personality traits (Mount & Barrick, 1995). A possible explanation for this finding relates to an individual's attitude upon entering a training program (Barrick & Mount, 1991). Individuals who rate high on the Conscientiousness factor, because of attributes such as intelligence, curiosity, and broad-mindedness, are more likely to have positive attitudes toward learning experiences in general (Barrick & Mount, 1991). Ryman and Biersner (1975) found a link between individuals' attitudes prior to participation in a training program and graduation from a Navy School for divers; and Sanders and Vanouzas (1983) revealed that attitudes and trainee expectations influence the likelihood of positive training outcomes (Barrick & Mount, 1991). Salgado (1997) found that Agreeableness and Openness were predictors for training criterion (r = .31 and r = .26, respectively).

Affect: Positive and Negative Affectivity

Watson and Clark (1984) conducted extensive reviews of research studies in personality and subjective emotional experience, and theorized that the tendency to experience positive or negative affect represents a stable dispositional trait. They discovered consistently high inter-correlations between measures of negative emotions such as anxiety, irritability, neuroticism, and self-deprecation (Levin & Stokes, 1989). They asserted that the various scales, though diverse, were measuring components of a more global trait – negative affectivity. Subsequently, the concepts of positive affectivity (PA) and negative affectivity (NA) have been widely researched with respect to work-related behaviors and attitudes (c.f., George & Brief, 1992; Watson, Clark, & Tellegen, 1988). Researchers have concluded that neuroticism tends to be more strongly associated with NA and extraversion tends to be more strongly associated with PA (McFatter, 1994).

Negative affectivity (NA) is fundamentally an emotion-based trait dimension (Watson & Clark & Tellegen, 1988). Individuals with higher levels of NA tend to focus more on negative aspects of themselves, others, and the world in general. Individuals with higher levels of positive affectivity exhibit a more positive focus. High levels of NA are related to a type of cognitive bias or a lens through which individuals approach and understand their life experiences, which may affect how people experience and evaluate their jobs (Levin & Stokes, 1989).

Individuals with high levels of PA typically demonstrate a general enthusiasm for life and are often described as energetic, joyous, eager, sociable, zestful, and exhilarated. Tellegen (1985) characterized individuals high on the PA dimension as having a general sense of interpersonal relation and achievement (George & Brief, 1992). Low PA scorers are often considered to be apathetic and indifferent. They do not see themselves as pleasurably engaged, have a weak overall sense of well-being, and do not consider themselves to be self-efficious (Tellegen, 1985). PA has also been found to influence an individual's responsiveness to incentives (Gouaux & Gouaux, 1971), heighten the level of generosity extended to others (Isen & Levin, 1972), and enhance learning speed (Masters, Barden & Ford, 1979). Wright and Mischel (1982) found that positive affectivity also results in heightened expectations, greater estimates of past successes, and more favorable self-assessments.

Work Ethic and Values

Researchers have amassed considerable evidence to suggest that values influence work-related decisions (Dawis & Lofquist, 1984; Judge & Bretz 1992; Ravlin & Meglino, 1987). Values relating to work have been defined as work values, occupational values, and career values (Pine & Innis, 1987). Employers frequently mention work ethic, also termed Protestant Work Ethic (PWE), as a desirable work value of employees. Coupled with employability skills, work ethic is often cited as an attribute that is desirable or necessary for employment success (Custer & Claiborne, 1991; Hill, 1992). Work ethic is a multi-dimensional construct that has social, economic, and political implications (Furnham, 1990a), and because work ethic is an abstract concept, there exists a multitude of both definitions and

measurement techniques. It is important to discuss several of these definitions as each adds an important dimension to the construct and helps clarify its significance. Greenberg (1977), for instance, identified work ethic as a personality construct, and Morrow (1983) defined the term as the extent to which one intrinsically values work as an end in and of itself. Other researchers extend their conceptualizations of the work ethic past the notion of intrinsic value and introduced personal accountability and responsibility for the work that an individual performs into the definition of work ethic (Cherrington, 1980;Yankelovich & Immerwahr, 1984). The concept of work ethic has also been defined for "an individual (or for a more or less homogeneous group of individuals) as a value or belief (or a set of values or beliefs) concerning the place of work in one's life that either (a) serves as a conscious guide to conduct or (b) is simply implied in manifested attitudes and behavior" (Siegel, 1983, p. 28). This definition is an important one because it applies to a wide variety of groups; it is culture-free; and neutral to a historical context, to location, to non-work interests.

The most fundamental argument supporting the dispositional nature of work ethic focuses on the fact that work ethic is considered a value. The stability of values (i.e., values are enduring beliefs) and the fact that values are generally "not specifically linked to situations" (Furnham, 1990, p. 35), supports the dispositional underpinnings of values. The dispositional nature of work ethic is also evident in Morrow's (1993) conceptual model of work commitment that uses concentric circles to depict a multifaceted approach to defining and measuring the construct. As Blau (1997) wrote, Morrow indicated that work ethic was the innermost circle, followed by career commitment, continuance then affective organizational commitment, and job involvement as the outermost circle. Furthermore, she says that work ethic is linked to personality because of evidence that it covaries with other stable personality traits such as locus of control and authoritarianism (Morrow, 1983).

Furnham and Koritsas (1990) stated that much of the research efforts relating to work ethic have been focused on devising psychometrically assessed measures of the PWE, examining the relationship between PWE beliefs and other work and non-work behavior, and investigating the relationship between the PWE beliefs and other individual difference measures of personality, values and social attitudes (Furnham, 1982). Merrens and Garrett (1975) predicted and found that individuals with high PWE scores performed better and longer on tasks designed to provide low motivation and interest levels. Greenberg (1977) found that negative performance evaluations resulted in performance improvement among individuals with high PWE scores and a decrease in performance levels among individuals with low PWE scores.

Dispositional Effects on Motivation to Learn

Because dispositional effects have not been prevalent in HRD research, there is no theory to draw upon in order to construct a model of dispositional effects on motivation to learn. There are however multiple studies that suggest such a model is appropriate and worth testing. This section reviews those studies.

Personality While the direct relationship between personality variables and training proficiency has not been extensively studied, the findings of Barrick and Mount (1991) are particularly meaningful. Using the Big Five taxonomy, they found that training proficiency could be predicted for individuals falling within the following personality dimensions -- Conscientiousness, Extraversion and Openness to Experience. Colquitt and Simmering (1998) investigated the relationship between personality variables and motivation to learn, and found a positive relationship between motivation to learn and Conscientiousness with learning after orientation, both initially and after performance feedback was given. "Personality variables explained an incremental 28% of the variance in prefeedback motivation to learn ($p < .001$), with both conscientiousness ($r = .33$, $p < .001$) and learning orientation ($r = .38$, $p < .001$) having significant independent relationships. Personality variables explained an incremental 27% of the variance in postfeedback motivation to learn ($p < .001$), again with both conscientiousness ($r = .28$, $p < .001$) and learning orientation ($r = .40$, $p < .001$) having significant independent relationships" (1998, p. 661)."

Affect George and Brief (1992) argued that affective characteristics can serve as information that guides and directs an individual's motivational attention. They also argued that affective characteristics impact the nature of motivation. They cite Clark (1982) and Morris and Reilly (1987) as support for this contention. The pervasiveness and nonspecific nature of moods are part of the reason that moods appear to have such extensive effects on cognitions and development (Morris & Reilly, 1987).

George and Brief (1996) have recently proposed a model of work motivation in which moods - particularly positive moods - play a pivotal role. In their model, positive moods are proposed to influence distal motivation (for example, choice of behaviors or effort levels) by causing workers to have higher expectancies, instrumentalities, and valence due to the effects that positive moods are likely to have on the cognitive processes underlying these judgements.. Positive moods are also proposed to influence proximal motivation (for example, ongoing behavior when actually engaged on a task) by causing workers to maintain higher standards for themselves. While negative

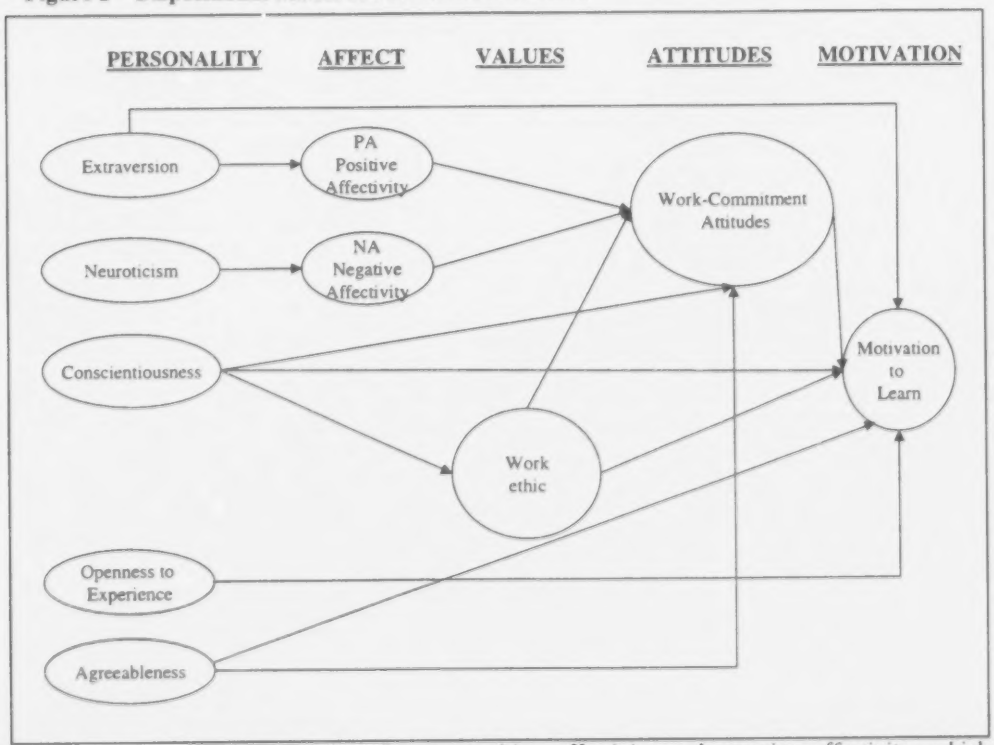
moods are also likely to influence work motivation, their potential effects are more difficult to tease out (George, 1996).

Values The antecedents and consequences of values have been extensively studied and work ethic is one of the most widely examined work values. Its effect on both work commitment attitudes and achievement (a motivational component) has been well documented. Such studies include: 1)Values influence job satisfaction, organizational commitment, and job involvement (Lei & Mowday, 1987); 2) Individuals with high PWE scores performed better and longer on tasks designed to provide low motivation and interest levels (Merrens & Garrett, 1975); 3) Work ethic is related to achievement (Murray, 1938; Furnham, 1990); 4) Work values are more associated with organizational commitment than instrumental values (Putti et al., 1989); 5) Organizational commitment is positively related to cognitive work value items (Koslwosky & Elizur, 1990); and, 6)Researchers have found a potential relationship between PWE and job involvement (c.f., Brief & Aldag, 1977; Mayer & Schoorman, 1998; Rabinowitz & Hall, 1977).

Attitudes Because dispositional variables have been found to be related to attitudes, and attitudes are related to motivation, it is logical to hypothesize that attitudes serve as a mediator to motivation to learn. In fact, Noe established a link between job attitudes and motivation to train (1986). He suggested that training programs are "more salient to individuals who are highly involved with their jobs" (1986, p. 739). Participation in job-related training programs could increase skill levels, improve job performance, and increase an individual's sense of self-worth (Noe & Schmitt, 1986). These are outcomes that are valued by highly involved, conscientious employees. Facteau et al. (1995) and Tannebaum et al. (1991) examined the association between commitment and motivation to train, and Facteau et al. (1995) studied the extent to which trainees' attitudes and beliefs influenced their pretraining motivation. Their findings indicated that individuals who were committed to the values and goals of the organization had higher levels of pretraining motivation. In a study conducted at a U.S. Naval Recruit Training facility, they found a high correlation (r = .53) between commitment and motivation to learn.

Proposed Model Research about dispositional effects on learning and motivation to learn is clearly in its infancy so any proposed model must be considered exploratory at this stage. The model shown in Figure 2 hypothesizes the following relationships, based on available research and theory.

Figure 2 – Dispositional Model of Motivation to Learn



1. Extraversion and Neuroticism will influence positive affectivity and negative affectivity, which in turn

influence work attitudes, which then influences motivation to learn
2. Extraversion will also have a direct effect on motivation to learn.
3. Work Ethic will have a direct effect on motivation to learn, and an indirect effect through its influence on work attitudes.
4. Conscientiousness will influence motivation to learn in three ways: through its influence on work attitudes; through its influence on work ethic; and a direct effect.
5. Openness to experience will directly affect motivation to learn.
6. Agreeableness will directly affect both work attitudes and motivation to learn.

Consistent with the conceptual model shown earlier, Figure 2 shows that work attitudes are a key mediator for some dispositional effects. Two key work attitudes, job involvement and organizational commitment, are expected to exert the most influence on motivation to learn. It is important to note that this model does not capture all influences on motivation to learn, which would include situational effects. Rather, it hypothesizes what are believed to be the key dispositional influences on motivation to learn.

Pre-Job Training and the Earnings of High-Tech Employees in Taiwan

Tung-Chun Huang
National Central University

The principal aim of this paper is to measure the impact of pre-job training programs on the subsequent earnings of trainees, with special attention given to engineers employed by high-tech firms in Taiwan. With the effects of educational attainment, age, and seniority controlled for, this study concludes that public training programs have no impact on the earnings of participants in later jobs. However, it finds that participation in private training programs does have a significantly positive effect on post-job earnings. A comparison between this study and others is made, and implications are briefly discussed.

Keywords: Pre-Job Training, Earnings, Taiwan

It is commonly believed that education and job training have a profound impact on worker productivity and the quality of work produced, and that both must be strengthened in order to improve the economic status of workers and their firms' competitive positions in the global marketplace. Moreover, with external pressures generated by the expansion of international trade and technological change showing no sign of abating, education and training are expected to play an even more critical role in raising productivity and improving living standards in the future.

Vocational training and its impact on earnings have increasingly attracted the attention of policy makers in recent years, with governments citing public and private training as a key element in developing the type of skilled work force necessary for economic growth in the 21st century. Despite this heightened concern with training, however, surprisingly little empirical work has been done to measure the actual impact of training programs on worker earnings. This leads us to raise such questions as: How does training affect worker earnings? Are there certain forms of training that are more successful in boosting productivity and income than others? And do the effects of training received on one job carry over to performance and compensation in other jobs? To our understanding, full and explicit answers to questions such as these have not yet been provided.

Previous studies on the effects of training generally fall into two broad categories. The first type investigates the effects of public vocational training programs on the employment and income of disadvantaged groups. As one example, Dolton (1993), studying the experience of the British Youth Training Scheme (YTS) in the United Kingdom, concluded that this program had a negligible effect on wages and a possibly negative impact on employment. Meanwhile, Green, Hoskins, and Montgomery found that not only did YTS fail to raise the wages of trainees but that it actually lowered them relative to those who had not received such training. Their conclusion: It is better to stay in school than to participate in YTS.

On the other hand, Mains (1991) shows that participation in YTS results in a quantitatively and statistically significant improvement in the probability of being employed. Similarly, Whitfield and Bourlakes (1991) conclude that YTS has helped school-leavers to obtain full-time employment and to improve their positions in the labor market. However, the results of their wage analysis suggest that YTS participants earned slightly less, *ceteris paribus*, than non-participants.

In the United States, Friedlander, Greenberg, and Robins (1997) found that government programs for the disadvantaged have had modest effects on employment and earnings for adult men and women. Jantzen (1987), using survey data to analyze the short-term impact of classroom training under the Comprehensive Employment and Training Act (CETA) in Boston, shows that Boston's programs have produced large increases in earnings for both male and female trainees. However, this finding is not consistent with those of other studies. For example, Dickinson, Johnson, and West (1986), using data from the 1976 Continuous Longitudinal Manpower Survey, found that CETA participation exerted a significant negative impact on the post-program earnings of males, and an insignificant positive impact on the post-program earnings of females.

The previous studies suggest that, on the whole, the outcomes of public training schemes have often fallen short of expectations. The fact that most of the trainees participating in such programs tend to come from disadvantaged social groups leads us to question whether such studies suffered from a self-selection bias. In other words, if participants had come from more randomly distributed backgrounds, would the outcomes have been different? Or, since bureaucracy and inflexibility seem to be commonly criticized features of public institutions, have deficiencies been built into the programs themselves? And if this is the case, would privately managed programs produce more

successful results for trainees?

The second major category of research has focused on the effects of on-the-job-training (OJT) on trainee earnings. As one example, Bartel (1995), using a unique set of data collected from the personnel records of a large company, found that OJT had had a positive and significant impact on both wage growth and job performance scores, thereby confirming the robustness of the relationship between training and productivity. Groot and Mekkelholt (1995) concluded that workers who receive OJT have lower initial wages than those who do not, but that their wages grow more rapidly in the future. In addition, the marginal rate of return on OJT is high and increases with level of education. Vijerberg (1993), investigating returns to human capital in Cote d'Ivoire, found that technical training had generated handsome returns in the form of higher wages.

The only exception to the findings presented above is a study conducted by Hotchkiss (1993), who evaluated the relationship between training and occupation on the one hand and wages on the other, using data from a cohort of highschool graduates. Hotchkiss found a strong and positive relationship to exist between training and wages. However, when type of occupation was included in the analysis, the wage effects were almost entirely diluted, implying that occupational category, and not training, explained the increase in wages.

In spite of Hotchkiss's contrary finding it is reasonable to expect that training, provided as a premium to raise productivity and reduce turnover, will have some effect on a worker's wage. However, the benefit may be limited to only the current job and may not carry over into future employment with other firms. Only a few studies address the question of whether the effects of training are portable across jobs. One by Booth (1993) finds that female workers who receive training for one job substantially increase their wages in subsequent jobs within the same firm. For males, training received during the last job was seen to have little effect on wages from the current job, although training in earlier job assignments had a more significant impact.

A study conducted by Lynch (1992) shows that OJT received before the current job has no impact on current earnings, but that off-the-job training before current employment has a significant and positive impact. The reason for this may be that OJT is too firm-specific to benefit subsequent employers, who therefore are unwilling to pay workers extra for such training. On the other hand, off-the-job training may be sufficiently generic to make wage effects portable. If that is the case, pre-job training may be expected to have a significant effect on trainee wages.

Instead of examining the earnings effect of training provided by previous employers, this study seeks to determine whether pre-job training (obtained from either public or private training organizations) enhances the growth of trainee earnings. In order to avoid the problem of self-selection (i.e., to exclude members of socially disadvantaged groups), a group of engineers randomly selected from high-tech firms were chosen as the research subjects. Section II of the paper describes the model to be estimated and provides further information about the data source. A discussion of the findings is presented in section III. Some conclusions are drawn in the final section.

Methodology

The following functional relationship was applied to evaluate the effects of pre-job training on trainee earnings:

$$Y = f(AGE, EDU, GENDER, SENIORITY, PRITRA, GOVTRA, IC, COM, LSIZE),$$

where Y, the dependent variable, represents the monthly salary of trainees.

Most studies (Booth, 1991 and 1993; Groot and Mekkelholt, 1995; Lynch, 1992) use logarithmic values in place of actual earnings. This study employs the original values to estimate the real earnings effect. However, the results of both forms of estimation were double-checked in order to ensure consistency.

Two broad classes of variables affect earnings. The first type, associated with human capital accumulation, is represented by the number of years of formal education completed (EDU), job tenure in years (TENURE), AGE, and GENDER. The second type comprises the log of the firm size (LSIZE) and industrial classification (IC, COM). These are included to represent characteristics of the workplace and to serve as controlling variables.

To test the effects of pre-job training programs, dummy variables were constructed indicating whether the respondent had received any form of training before being hired by the current employer. More specifically, a dummy variable of 1 was assigned if the respondent had participated in a training program provided by a government (GOVTRA) or private organization, and a dummy variable of 0 in the opposite case.

Data for the study were obtained from the *Survey on the Source of High-Tech Employees' Skills* (Lee, Huang, and Jehng, 1998). The respondents were production and R&D engineers employed by integrated circuit (IC), communications, and electronics firms at the Science-based Industrial Park in Hsinchu, Taiwan. Of the 1,448

questionnaires mailed out, 344 were returned. The data were organized into a stratified sample on the basis of industry and firm size. After adjustment for missing values, the data set was found to contain a total of 309 observations.

Table 1 presents the means and standard deviations of the variables. The average age of the respondents was 30 years and average seniority 2.56 years. The major reason for these relatively low values is that the three industries surveyed are newly established in Taiwan. Length of formal schooling averaged 16.44 years. Twenty-five percent of the respondents had graduated from college, with 29 percent holding a bachelor's degree, 43 percent a master's, and 3 percent a Ph.D. Only 14 percent of the engineering staff were female. Respondents earned an average monthly salary of NT$42,942 (US$1,245 at the current exchange rate), slightly higher than the average wage of workers in Taiwan. Nineteen percent of the respondents reported that they had participated in private training programs, while only 8 percent had taken part in public training programs.

Table 1
Means and Standard Deviation for Variables in the Model

Variables	Mean	Standard Deviation
AGE	30.10	4.26
EDU (Formal schooling years)	16.44	1.80
GENDER (Male = 0, Female = 1)	0.141	0.348
PRITRA (No = 0, Yes = 1)	0.193	0.395
GOVTRA (No = 0, Yes = 1)	0.085	0.279
SENIOR (Seniority in the current company)	2.56	2.79
WAGE	NT$ 42,942 (US$ 1,245)	NT$ 14,836 (US$ 430)
FIRM SIZE (Number of employees)	731	865

Results and Discussion

Partial correlation coefficients between the wage level and independent variables, obtained by controlling for industry and firm size, are presented in Table 2. As can be seen, there is a positive relationship between age on the one hand and both public and private training on the other, implying that the greater a worker's age the more likely that he or she has received pre-job training. Though gender and pre-job training are negatively related, the relationship is not significant. Educational attainment and pre-job training are also negatively associated. The implication here is that females and highly educated engineers are somewhat less likely to have received pre-job training than other workers are, though their training experience does not differ significantly from that of less-well-educated males. All of the independent variables except gender are significantly related to the wage level. This shows that females are paid lower salaries than males even though the effects of firm size, industry, and occupation have been controlled.

Table 2
Partial Correlation Coefficient for Key Variables by Controlling for Industry and Firm Size

Variables	AGE WAGE	EDU	GENDER	PRITRA	GOVTRA	SENIORITY
AGE	-					
EDU	.133*	-				
GENDER	-.240**	-.113	-			
PRITRA	.208**	-.104	-.004	-		
GOVTRA	.283**	-.088	-.047	.399**	-	
SENIORITY	.602**	-.333**	-.027	.157*	.184*	-
WAGE	.770**	.303**	-.218**	.263**	.220**	.448** -

*: p<.05 **: p<.01

The regression results for the wage equation, in which the respondent's monthly wage is the dependent variable, are presented in Table 3. Like other researchers (Booth, 1991 and 1993; Groot and Mekkelholt, 1995; Lynch, 1992), I estimated the equations with both logarithms and the actual values of individual wages without obtaining any difference in results. However, since actual wages are easier to understand, I have presented them instead of logarithms in Table 3.

The F-value for the whole model, 52.84, is significant at the $p < .000$ level. This value shows that the model provides a meaningful prediction of individual earnings. Both R^2 and adjusted R^2 are remarkably high, with the model explaining 67 percent of the variation in individual earnings.

Of the organizational features that I included as controlling variables, such as firm size and categories of industry, none had a coefficient showing significant difference from zero. This may be due to the fact that the three industries surveyed (IC, communications, and electronics) all compete for labor in the same market. Therefore, assuming uniform labor quality, those industries may offer compensation packages that are quite similar. At the same time, given that the profitability of high-tech firms is derived from their business strategy and innovative ability and not from their size, it is understandable how the logarithm of firm size could have an insignificant impact on employee wages.

Since the organizational variables did not improve understanding of the determinants of individual earnings, I deleted them and adopted the parsimony model. As shown in Table 3, removing the organizational variables resulted in a negative, though insignificant, relationship between gender and wage. This negative association may be due to the fact that female engineers tend to be younger and less well-educated, and to accumulate less seniority than their male counterparts. After the effects of age, education, and seniority were controlled, the negative impact of gender on wages became negligible.

I am not about to claim that sex discrimination does not exist in Taiwan. In fact, another study (Huang, 1994) found that the earnings of female workers in Taiwan are indeed markedly lower than those of males, even when human capital variables are introduced. The difference between that study and this one may lie in the different natures of the research subjects. Participants in this study, engineers in high-tech firms, were more likely to be compensated on the basis of their knowledge, technical skill, and problem-solving ability than participants in the earlier study, for whom physical strength and manual dexterity were also important concerns. The negligible impact that gender was found to have on wages in this study is an exciting finding because it implies that if we wish to reduce gender-based wage discrimination, increasing female employment in professional and technical occupations may be a good way to do it.

As human capital theory would lead us to expect, educational attainment and seniority were both found to have very strong positive effects on individual earnings in this study. The effect of education on earnings (Beta = .334) was somewhat greater than that of seniority (Beta = .272), with every additional year of education generating NT$

2,711 (US$ 79) more in monthly wages, vs. NT$ 1,400 (US $41) more for each additional year of seniority. This differs from Huang's 1994 study, in which length of service with the current employer was found to have a stronger impact on worker earnings than education. Once again, the difference may be explained by the different categories of workers participating in the two studies. The earlier research focused on workers in general while this study deals with the employees of high-tech firms, where educational attainment is of crucial importance in determining the level of compensation.

As predicted, age was seen to have a strongly positive effect on earnings in this study. With its Beta estimated at .503, the age variable was the most powerful predictor of the individual wage level, and workers were found to earn NT$ 1,696 (US$ 49) more per month on average than other workers only one year younger. Also interesting is that when the square of the age variable was included in the equation, no significant effect was detected. The implication is that there is a linear relationship between wage and age (there was no indication of a curvilinear relationship).

As can be seen in Table 2, both public and private training programs are significantly correlated with wages when the effects of industry and firm size are excluded. However, public training programs (GOVTRA) had a negligible impact on wage in the regression model, regardless of whether the organizational variables were included or not. The reason for this may be that the variable GOVTRA is strongly correlated with AGE and SENIORITY, and when the effects of the last two variables are removed the pseudo relationship between GOVTRA and WAGE disappears. We may therefore conclude that the training programs offered by public institutions in Taiwan do not improve the economic status of trainees later in their careers. Even though the research subjects in this study did not belong to a disadvantaged group, the result is similar to those obtained by Dolton (1993); Green, Hoskins, and Montgomery (1996); and Whitfield and Bourlakes (1991) in England, and that of Dickinson, Johnson, and West (1986) in the United States.

While training provided by government showed little impact on wages, the effect of private training programs (PRITRA) on post-job earnings was significant and positive. The Beta of PRITRA (.128) was considerably greater than that of gender (-.061). And when the effects of years of formal schooling, age, seniority, and gender were controlled, those who had received private training could expect to earn NT$ 4,978 (US$ 144) more each month than those who had not. One implication of this finding is that females can overcome the disadvantage of gender-based wage discrimination by participating in private training programs. And although Booth (1993) concluded that females were less likely to receive such training than otherwise identical males, this study found that male and female workers in Taiwan had equal access to private training programs.

There is a significantly positive relationship between PRITRA and GOVTRA, indicating that private and public training programs have complementary and not mutually exclusive effects. Another implication is that people who participate in pre-job private training programs are also more likely to take part in public training programs. However, the economic returns of private training programs are markedly greater than those of public training programs. One reason for this may be that private programs, whose existence must be justified by their effects on the bottom line, are more oriented toward immediate payback than public programs. For public institutions, which face no direct threat to their survival from rivals, trainee earnings are only one of the factors considered. Indeed, political considerations (such as providing opportunities for minorities, the disadvantaged, and the unemployed) may well take precedence over concerns about wages. In addition, administrative red tape and bureaucratic inflexibility, conditions for which public institutions are commonly noted, also may limit the effectiveness of public training programs.

Previous studies (Booth, 1993; Lynch, 1992) concluded that job training obtained from former employers can be expected to increase trainee earnings in subsequent employment. This study finds that pre-job training provided by private training institutions will help improve the future earnings of participants. One explanation for this is that training provided by private institutions is likely to be generic in nature, and skill and knowledge acquired from such training are easily transferable across jobs. The result is that future employers are willing to pay higher compensation to employees who have received this type of training.

Conclusion

The principal aim of this paper has been to measure the impact of pre-job training programs on trainee wages later in their careers, with a special focus on engineers employed by high-tech firms in Taiwan. When the effects of educational attainment, age, and seniority were controlled for, this study found that public training programs have no impact on the later job earnings of participants. However, since only a few of the respondents participating in the study had taken part in public training programs before their current employment, this conclusion must be only a tentative one. More extensive data collection and further research are necessary for a fuller understanding of the relationship between public training programs and wages.

By contrast, this study finds that participation in private training programs does have a significantly positive effect on post-job earnings. Specifically, those who had participated in pre-job private training programs were seen to earn NT$4,978 (US$144) more per month on average than those who had not, a result consistent with that of Booth's study in England. The only difference is that Booth focused on the effects of training provided by former employers. The implication is that the earnings effect of previous training can be carried over from one job to another, regardless of whether that training has been provided by a former employer or by a private training institution.

Training Effectiveness And Employee Output - A Regression Model Based On Training Transfer And Organization Development Variables

Constantine Kontoghiorghes
Oakland University

Despite the considerable amount of money organizations spend on their training investments, it has yet to be determined to what extent such investments benefit the organization. This study attempted to address this issue by describing the relationship between training effectiveness and employee output through regression analysis. Stakeholder involvement, person analysis, and the training transfer climate were found to be the most important predictors of employee output.

Keywords: Training, Transfer, Productivity

Many Human Resource Development (HRD) textbooks and theorists define HRD as a profession for which the main purpose is to assist the organization achieve higher levels of performance. In particular, Broad and Newstrom (1992) define HRD as "the profession that helps organizations to enhance workforce effectiveness and productivity through learning and other performance improvement activities" (p. 4). Similarly, Pace, Smith, and Mills (1991), define HRD as "the integration of individual development, career development, and organization development roles to achieve maximum productivity, quality, opportunity, and fulfillment for organization members as they work to accomplish the goals of the organization" (p. 7).

According to Broad and Newstrom (1992), HRD professionals facilitate performance improvement in the organization in several ways. First, they may help determine the requirements for performance improvement. These requirements, the authors continue, might be for new skills arising from new technologies, products, services, or a changing work environment, or for improvement of skills used in current jobs. Once the requirements for performance improvement are identified and analyzed, then the HRD professionals propose changes in the work environment to support improved performance.

In terms of training, which is "the most commonly recognized HRD strategy to improve performance" (Broad & Newstrom, 1992; p. 5), different estimates project that the annual investment on training by US organizations is somewhere between $50 and $100 billion(Baldwin & Ford, 1988; Industry report, 1994). According to the "ASTD Benchmarking Forum" (1997), these training expenditures account for about 2.88% of the total payroll.

Despite the considerable amount of money organizations spend on their training investments, it has yet to be determined to what extent such investments benefit the organization. Researchers have indicated that only a fraction (10-20%) of the skills and knowledge learned during training are really transferred back to the job (Baldwin & Ford, 1988; Broad & Newstrom, 1992). Further, very little research has been conducted to examine the impact of training on such bottom-line organizational performance as productivity and quality. In addition, very limited research has been conducted to identify which organizational variables may have an effect on the training intervention.

Purpose of the Study

Given the existing lack of knowledge with regard to the relationship of training effectiveness and organizational performance, the purpose of this study was to describe the association of training effectiveness and productivity as well as work quality improvement after new technologies are introduced in the organization. In this study productivity and work quality were measured at the individual level, and each was based on a set of three and five indicators respectively. In this paper, only the relationship between training effectiveness and the productivity indicator of "employee output per unit time" will be discussed. Since no other studies of this kind had been previously conducted, a secondary objective of this study was to develop an instrument with which all the relevant training transfer and organizational variables and constructs could be assessed.

Copyright © 1999 Constantine Kontoghiorghes

Theoretical Framework

The theoretical framework of the study was based on the instructional system design (ISD), sociotechnical systems (STS), and training transfer theories, which in turn furnished the training and organizational variables projected to have an influence on trainee performance.

Training Transfer

For the purposes of this study, training transfer is defined as "the degree to which trainees effectively apply the knowledge, skills, and attitudes gained in a training context to the job" (Baldwin & Ford, 1988, p. 63). Although in many respects research on training transfer is still limited (Clark, Dobbins, & Ladd 1993; Hanover & Cellar, 1998; Holton, 1996; Rouiller & Goldstein, 1993; Tracey, Tannenbaum, & Kavanagh, 1995) researchers have identified a number of factors or characteristics that can facilitate or inhibit the application of newly learned skills, knowledge, and attitudes on the job. In particular, a research review by Baldwin and Ford (1988) suggested that training transfer is contingent upon many variables some of which fall outside the training program. Training design, trainee characteristics, and work-environment characteristics were cited as the most important sets of variables. Based on the findings of their research review Baldwin and Ford (1988) also suggested that the expectancy model could assist us in identifying the factors that can influence the motivation with which a trainee will apply the new skills and knowledge back on the job. Baldwin and Ford (1988) further stated that training research cannot continue to ignore that job relevance of training content is a critical factor which affects what is learned, retained, and transferred back to the job.

Some of the training research deficiencies identified by Baldwin and Ford (1988) were investigated further by Clark et al. (1993). Clark et al. (1993) conducted a structural equations modeling study in which 245 participants from 12 training groups responded to a survey questionnaire. The purpose of the study was to explore the effects of several contextual factors on training motivation. The survey instrument was designed to measure training motivation, expected job and career utility of training, peer and supervisor training transfer climate, involvement in decision to be trained, and decision-maker credibility. In this study, career utility was defined as "the perceived usefulness of training for attainment of career goals, such as getting a raise or promotion, or taking a more fulfilling job" (p. 294). Job utility was defined as "the perceived usefulness of the training course to facilitate goals associated with the current job, such as increased productivity, reduced errors, or better problem-solving skills" (p. 294).

In short, the Clark et al. (1993) study revealed the following important findings: (a) perceived job and career utility of training significantly predicts training motivation, (b) involvement in the decision to be trained results in higher perceptions of job and career utility, (c) the credibility of the individual recommending or requesting training affects job and career utility, and (d) perceived supervisory support for training transfer affects anticipated job utility and thus motivation to learn during training.

Another study that examined the relationship between organizational transfer climate and positive transfer of training was conducted by Rouiller and Goldstein (1993). In this study, organizational transfer climate was defined as the "situations and consequences that either inhibit or help to facilitate the transfer of what has been learned in training into the job situation" (Rouiller & Goldstein, 1993; p. 379). In all, 41 situation cues and 22 consequences that were thought to influence training transfer were selected from a previously developed databank consisting of 298 critical incidents. Situation cues were defined as those cues which reminded the trainees of their training or provided them with opportunity to use their training upon returning to their job and they were divided into four categories: goal cues - the type of cues that remind the trainees to use the newly learned skills; social cues - the behaviors and influence processes exhibited by peers, supervisors, and/or subordinates; task cues - the cues that concern the design and nature of the job itself; and, self-control cues - self-control processes that allow the trainee to use what has been learned. Consequences were defined as those actions in the work environment which could affect the further use of what the trainees learned in training. As in the case of situation cues, consequences fell into four categories: positive feedback - trainees are given positive information about their use of learned behaviors; negative feedback - trainees are informed of the negative consequences for not using learned behaviors in training; punishment - trainees are punished for using trained behaviors; and, no feedback - the trainees are not given information with regard to the use or importance of learned behaviors.

After analyzing the data, Rouiller and Goldstein (1993) observed that in organizational units where the transfer climate was more positive (i.e., climates in which situation cues influenced trainees to use what was learned in training and in which trainees were rewarded for doing so), trainees demonstrated more transfer behavior. Furthermore, the analysis of data indicated that trainees who learned more in training performed better on the job, but the interaction between transfer climate and learning was not significant. In concluding their study, the authors

stressed that the field is in need of further research that investigates the relationship between organizational climate, training transfer, and job performance. If such a relationship proves to be robust, the authors continue, then organizational analysis assessing transfer climate should be a requirement in determining whether the organization is indeed ready to support its training program.

Based partly on the work of Rouiller and Goldstein (1993), Tracey et al. (1995) conducted a study examining the influence of the work environment on the transfer of newly learned supervisory skills. The work environment in this study was operationalized in terms of training transfer climate as well as continuous-learning culture which in turn through a principal component analysis were defined in terms of six (social and goal cues; task cues; no-feedback consequences; punishment consequences; extrinsic reinforcement consequences; intrinsic reinforcement consequences) and three (social support; continuous innovation; competitiveness) scales respectively. In all, through a LISREL analysis Tracey et al. (1995) confirmed that the constructs of training transfer climate and continuous-learning culture have a direct effect on post-training behaviors. Furthermore, each of the six training transfer climate scales as well as all continuous-learning culture scales were found to significantly contribute to their respective constructs. However, the authors pointed out that the scale that exhibited the highest path coefficient for both constructs was the one most closely related to the social support system (0.90 for training transfer climate and 0.91 for continuous-learning culture). As Tracey et al. (1995) put it "these findings are consistent with sociotechnical theory and highlight the central role of social factors in establishing supportive training and learning environments" (p. 249). Finally, the authors recommended that future studies should continue to examine the role of the work environment given its influence on training transfer.

In summary, with their study, Tracey et al. (1995) have extended and verified the results of Rouiller's and Goldstein's (1993) findings by indicating that the work environment indeed plays a crucial role in determining training effectiveness. This study also exemplified the importance and the influence of the social system (supervisors, coworkers, and other people who interact with trainees) and thus how sociotechnical systems theory can assist us in designing more effective training programs and organizations in general.

Sociotechnical Systems Theory

Since the early experiments conducted by Trist and Bamford (1951) in the coal mines of England, sociotechnical systems theory (STS), as an OD intervention, has experienced tremendous popularity. As the terms imply, the two basic premises of STS theory are: a) an organization is comprised of two systems: the social system and the technical system; and (b) the organization is an open system greatly dependent on the external environment. The social system is comprised of people performing the organizational tasks. The technical system is comprised of tools, techniques, and methods that people use to perform their tasks. What distinguishes an STS designed organization from traditional organizations is that it places equal emphasis on both the technical and social systems, rather than just the technical system, and tries to achieve high levels of performance through the joint optimization of these two systems. At the same time, the social and technical systems of an STS organization are required to effectively manage their boundaries with the external environment so that any disruptions caused by the latter are kept to a minimum (Cummings & Huse, 1985; French & Bell, 1995; Pasmore, 1988).

Under the STS theory, the organization is also viewed as an open system composed of many subsystems which through differentiation and integration transform inputs into outputs. Another feature of STS organizations is that they are highly participative in nature and thus involve all relevant stakeholders in the decision making process. Furthermore, sociotechnical organizations invest heavily in the development of their human resources. Their goal is to develop multifunctional and well trained employees who in turn through continuous learning become highly flexible and adaptable to changing conditions. Being trained in multiple skills and expertise and having all necessary information and autonomy, STS employees also have the opportunity to perform whole and meaningful tasks with minimal supervision and specification, control variances at their source, and at the same time release management to deal with boundary problems. Lastly, by placing equal importance on the well-being of employees as well as organizational productivity, STS organizations through innovative reward systems and enriched jobs, manage to create high performance environments in which workers pursue organizational goals with higher levels of energy and commitment (Cummings & Huse, 1985; French & Bell, 1995; Pasmore, 1988).

Research Questions

As it was stated earlier, the main purpose of this paper is to describe the relationship between training effectiveness and the productivity indicator of "employee output per unit time". Furthermore, a secondary objective of this study

was to develop a questionnaire with which all relevant constructs and variables could be assessed. In short, the following training transfer variables that were found by the Rouiller and Goldstein (1993) as well as the Tracey et al. (1995) studies to have a direct effect on post-training behaviors were incorporated in the survey instrument of the study:

1. The degree to which characteristics of a trainee's job prompted or reminded him or her to use new skills and knowledge acquired in training (task cues).
2. The degree to which trainees were openly discouraged from using new skills and knowledge acquired in training (punishment consequences).
3. The degree to which supervisors supported and encouraged the application of new skills and knowledge acquired in training (supervisory support for new skills).
4. The degree to which trainees received extrinsic rewards for using newly learned skills and knowledge acquired in training (extrinsic reinforcement consequences).
5. The degree to which trainees received intrinsic rewards, such as praise and recognition, for using newly learned skills and knowledge acquired in training (intrinsic reinforcement consequences).
6. The degree to which the users of the new technology functioned in a work environment which emphasized innovation and competition (innovative-competitive organization).
7. The degree to which the users of the new technology functioned in an environment in which supervisors and coworkers strongly encouraged the acquisition and use of any new relevant skills and behaviors (social support for new skills).

The following 10 variables were also incorporated in the survey instrument and they dealt with the work environment within which the training and new technology interventions were introduced. They were based on Pasmore's (1988) STS assessment survey, the properties of motivating jobs as defined by Hackman and Oldham (1980), and the comprehensive seven year meta-analysis study by Macy and Izumi (1993) in which the d-effects of 60 sociotechnical action-levers on organizational outcomes were examined. The purpose of these questions was to determine the degree to which the new technology was introduced in an organization whose design was consistent with sociotechnical systems principles, which in turn "have been demonstrated to produce high levels of commitment and performance" (Pasmore, 1988, p. 157).

8. The degree to which the users of the new technology functioned in a very participative organization characterized by a high degree of employee involvement (Participative organization).
9. The degree to which the users of the new technology were members of self-directed teams (self-directed teams).
10. The degree to which the users of the new technology were intimately involved in communications and decisions regarding the design and development of the new technology (employee involvement). 11. The degree to which the users of the new technology functioned in a multiskill work environment characterized by a common job classification system (multiskill work environment).
12. The degree to which the users of the new technology worked in a flat and decentralized organization, composed of mini-enterprises functioning within the firm (flat organization).
13. The degree to which the users of the new technology frequently participated in multiskill training and retraining programs and were rewarded for doing so (multiskill training environment).
14. The degree to which the users of the new technology were involved in enriched jobs that required a variety and higher level skills which in turn took a long time to master (skill variety).
15. The degree to which the users of the new technology did a whole and complete piece of work and had the authority to make all important decisions about it throughout the process (task identity).
16. The degree to which in carrying out their work activities required by the job, the users of the new technology received clear information about the effectiveness of their performance from the job itself and their supervisors (job/supervisory feedback).
17. The degree to which the users of the new technology functioned in an environment in which a great deal of information about business was shared with employees (information sharing).

This paper will address the following research questions:

1. If training is used during the introduction of new technologies in the organization, to what extent are the following instructional system components associated with the productivity indicator of "employee output per unit time"?
    a) Needs assessment (person analysis, task analysis, organizational analysis);
    b) goals and objectives;
    c) audience analysis;
    d) d) learning task analysis and/or procedural analysis;
    e) evaluation results (pretest score, posttest score, training retention score).

2. If training is used as a coping strategy during the introduction of the new technology in the organization, what is the degree of association between the productivity indicator of employee output and training performance as well as the identified training transfer and work environment variables?

Methodology

Subjects

The sampling frame of this study consisted of 4097 training, human resource, quality, and organization development professionals who were national members of the American Society of Training and Development (ASTD) and were listed under the Total Quality Management section of the 1995 directory. Out of these 4097 national members, 971 were randomly selected to participate in the study through the circular systematic sampling procedure. Of the returned surveys, 264 had usable data. The response rate for this study was calculated at 27.19%. The average age of the respondents was 43.35 years (SD = 8.32). Fifty-eight percent of the respondents were male and each participant had held his or her present job for an average of 4.65 years (SD = 3.70). Collectively, 96.4% of the respondents had a college degree and represented 46 states. Furthermore, the respondents worked in all sectors of the industry with manufacturing (33.19%), health care (10.54%), and financial services (10.14%) being the majority. Finally, the participants of this study worked in organizations that on the average employed 7,595 employees (SD = 19,244).

In terms of the new technology introduced in the organization, representing 77.2% of valid responses, information technology was the type of technology most respondents introduced in their organization during the last five years. On the other hand, computer-aided manufacturing technologies, materials technologies, and biotechnologies were introduced by only 9.5%, 1.1% and 0.4% of the respondents respectively. The remaining 11.8% of the respondents indicated that they introduced a variety of other technologies, such as new equipment or machinery, production systems, and process operations.

Instrument

The instrument for this study consisted of a mail questionnaire which was custom-designed for the purposes of this study. The questionnaire was comprised of 39 questions and was pilot-tested on a group of 50 participants before the main study.

Results

After the data from the 264 participants was collected, both descriptive and inferential statistics were used to analyze it. The instrument was construct validated through a principal components analysis that utilized a varimax rotation (Table 1). Coefficient alpha was measured at 0.87. Correlational analyses as well as a stepwise regression model (Tables 2, 3, 4) were used to determine how the instructional system components in conjunction with the identified training transfer and organizational moderator variables and factors related to the productivity indicator of employee output.

Construct Validation of Instrument

As shown in Table 1, the principal components analysis that used a varimax rotation produced a four factor solution which accounted for 55.1% of the total variance. The sample size utilized for the principal components analysis was 242 for which the critical value for significant loadings was calculated at |0.33|. The criterion used in order to determine how many components to retain was that of Kaiser (i.e., only components whose eigenvalues are greater than 1 were retained).

Briefly, the first factor which accounted for 33.7% of the total variance had the highest loadings from the following eight variables: innovative-competitive organization; social support for new skills; participative organization; self-directed teams; employee involvement; flat organization; multiskill training environment; and, information sharing.

From the above variable descriptions, it becomes evident that the first rotated factor deals with the general organizational

environment within which the new technology was introduced.Given that the variables that highly correlate with this

Table 1. Varimax Rotated Factor Matrix

Variable Description	STS Org	Job Design	Training Transfer Climate	Rewards For New Skills
1 Task cues	- .07	.33	.74	- .18
2 Punishment consequences	.17	- .10	.53	.12

13 Multiskill training env	.62	.18	.20	.31
14 Skill variety	.22	.68	- .01	.18
15 Task identity	.31	.69	.06	.08
16 Job/suprv feedback	.35	.44	.35	.28
17 Information sharing	.79	.14	.15	- .05

N = 242

factor are those that were incorporated in the questionnaire in order to determine the degree to which the new technology was introduced in an organization whose design was consisted with sociotechnical systems (STS) principles, this factor was interpreted as the "STS organization" factor.

The second rotated factor, which accounted for 8.2% of the total variance, highly correlated with the following variables: multiskill work environment; skill variety; task identity; and, job/supervisory feedback. In all, the second rotated factor was successful in grouping the variables that were incorporated in the instrument in order to describe the job dimensions of the work performed by the users of the new technology. This factor was defined as the "job design" factor.

The third factor of the varimax rotated factor matrix accounted for 7.1% of the total variance and drew the highest loadings from the following three variables: task cues; punishment consequences; and, supervisory support for new skills. Unlike the first two factors which dealt with the organizational and job environment in general, the third factor dealt with the training transfer climate in which the application of new skills and knowledge took place. This factor was therefore interpreted as the "training transfer climate" factor.

The fourth and final rotated factor accounted for 6.1% of the total variance and had the highest loadings from the following two variables: extrinsic reinforcement consequences; and intrinsic reinforcement consequences. The last factor can thus be interpreted as the "rewards for new skills" factor.

Correlational and Regression Analysis

The variables and the factor that were found to be significantly correlated with the "employee output per unit of time" productivity indicator are shown in Table 2. Although not significant because of the small sample size (n=27) associated with the training retention variable, the correlation between employee output and training retention is also included in the table in order to highlight the relatively high correlation between these two variables. The correlation between employee output and the posttest score was included in the table for comparison purposes.

As shown in Table 2, the productivity indicator of employee output per unit time was found to be significantly correlated with five variables (task cues; intrinsic reinforcement; multiskill work environment; person analysis; stakeholder involvement in the decision with regard to the need of the new technology) and the training transfer climate factor. Moreover, employee output was found to exhibit the highest correlation with the training retention variable. The correlation between employee output and the posttest score was found to be relatively small and non-significant.

The results of the multiple regression analysis for the employee output indicator are depicted in Tables 3 and 4. The independent variables included in the regression analysis were the four factors as well as the variables of stakeholder involvement (the extent to which relevant stakeholders were involved in the decision with regard to the need for the new technology), and person analysis (the extent to which the training program involved the conduction of a person analysis in order to determine who in the organization needed training in order to use the new technology). As stated earlier, the retention of training material variable was not incorporated in the regression analysis due to the small sample size associated with it. An attempt to include it even on a pairwise case basis resulted in a failure to produce a regression model.

Table 2. Significant Correlations of the "Employee Output Per Unit Time" Productivity Indicator

Posttest	Task Cues	Intrinsic Reinf	Multiskill Work Env	Training Transfer Climate Factor	Person Analysis	New Techn Stakeholder Involvement	Training Retention Score	
Employee Output	.169*	.180*	.182*	.236**	.276**	.282**	.329	.134
(N)	(152)	(154)	(162)	(147)	(155)	(155)	(27)	(75)

**. Correlation is significant at the 0.001 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

Table 3. Stepwise Regression Model for Employee Output Per Unit Time[a,b]

Model	Variables Entered	Variables Removed	R	R^2	Adjusted R^2	Std. Error Of the Estimate
1	New Technology Stakeholder Inv.		.277	.077	.070	22.07
2	Person Analysis	.	.372	.139	.126	21.40
3	Training transfer climate factor	.	.410	.168	.150	21.10

[a]. Dependent Variable: Employee Output Per Unit Time; N = 144

[b]. Method: Stepwise (Criteria: Probability-of-F-to-enter <= .050, Probability-of-F-to-remove >= .100).

Table 4. Beta Coefficients for Employee Output Per Unit Time Regression Model

Model	Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.	Collinearity Statistics Tolerance	Collinearity Statistics VIF
(Constant)	3.919	5.772		1.658	.100		
New Technology Stakeholder Inv.	14.334	4.985	.225	2.875	.005	.960	1.041
Person Analysis	10.577	3.551	.231	2.979	.003	.982	1.018
Training transfer climate factor	3.919	1.757	.176	2.231	.027	.952	1.050

As it is shown in Tables 3 and 4, the produced stepwise regression model accounted for 15.0% of the total variance of the employee output per unit time productivity indicator. Stakeholder involvement in the decision with regard to the need for the new technology accounted for 7.0% of the total variance (b = 0.225, p = 0.005), while person analysis for 5.6% (b = 0.231, p = 0.003). The training transfer climate factor accounted for 2.4% of the total variance (b = 0.176, p = 0.027). From Table 3 one also observes that at 10.7% the shrinkage of R square is relatively small. The very high tolerance values of 0.960, 0.982, and 0.952 in Table 4 indicate that multicollinearity was not a problem for this regression model.

Summary andConclusions

In the aggregate, what the regression model of this study suggests is that when introducing new technologies in the organization employee productivity will be more likely to increase when a) the relevant stakeholders are involved in the decision with regard to its need; b) a person analysis is conducted in order to determine who in the organization actually needs training in order to use the new technology; and c) a positive training transfer climate prevails in the organization.

Based on the data depicted in Table 2, one may also conclude that knowledge of training material immediately after training (posttest score) has a relatively weak association with the productivity indicator of employee output per unit time (r =.134). On the contrary, the retention score, or knowledge of training material three to nine months after completion of training, was found to exhibit a relatively much higher correlation with employee output (r = .329). What this finding suggests is that training retention is a better predictor for employee performance than the posttest score. It should also be noted that of all the correlations depicted in Table 2, the correlation between the retention score and employee output was found to be the highest one. This again exemplifies the importance of the training retention variable when predicting or measuring employee performance after training.

Other variables that were found to be significantly and positively correlated with employee output were: task cues - the degree to which characteristics of a trainee's job prompt or remind him or her to use new skills and knowledge acquired in training; intrinsic reinforcement - the degree to which trainees receive intrinsic rewards, such as praise and recognition, for using newly learned skills and knowledge acquired in training; and multiskill work environment - the degree to which the users of the new technology function in a multiskill work environment characterized by a common job classification system. In short, what these correlations imply is that when a new technology is introduced in the organization the corresponding training program will have a better chance of being successful when a) it is designed to reflect the actual tasks performed on the job; and b) it is implemented in a multiskill work environment which in turn is designed to recognize those who apply the newly learned skills and knowledge.

Only Time Will Tell: Strengthening the Link Between HRD and Firm Performance

Laurie J. Bassi
American Society for Training and Development

Mark E. Van Buren
American Society for Training and Development

We report on results from a second round of data on training investments, practices, and outcomes in the United States. Our cross-sectional analyses once again point to a definite link between investments in human capital and organizational measures of performance. Longitudinal analyses strengthen this finding by demonstrating that 1996 human capital investments predict 1997 organizational performance. The evidence, however, also suggests that this relationship may not be unidirectional, but one of mutual reinforcement.

Keywords: Training, Performance, Survey Data

In today's competitive environment where countless organizations have either downsized and outsourced their training and development functions, HRD practitioners in all kinds of organizations and settings are increasingly being asked to justify their existence. Indeed, recent surveys reveal that HRD professionals are feeling enormous pressures to demonstrate the results of the services they provide (Hackett, 1995). Never before have their training and development efforts been under such tremendous scrutiny.

The response by many practitioners has not been surprising. We have witnessed a growing interest in tying investments in human resources to actual business results and organizational performance (Boudreau and Ramstad, 1996; Lam & White, 1998). Numerous organizations have worked out complex formulas to determine the precise return-on-investment (ROI) they are getting on their HRD investments. Unfortunately, such one-off, company-based efforts do not lend themselves well to a primary interest of researchers and scholars in the field of HRD: making systematic comparisons across organizations of the link between HRD investments and organizational performance. Such rigorous analyses require data on a large set of organizations that can only come from survey-based research methods.

Understanding the link between HRD investments and performance is further complicated by issues of time and causality. The case that firm performance influences HRD investments can be argued as strongly as the case in the reverse decision. Certainly, a circular or feedback relationship is also clearly possible. Cross-sectional survey research, however, is limited in its ability to demonstrate the connections between HRD and performance over time, even with the best retrospective questions. Only by gathering information on investments and performance over time can the link between the two begin to be unraveled.

This paper provides an update of the results from our ongoing research into the measurement of the impact and value of human capital investments. Over the last few years, we have been engaged in efforts to develop methods for collecting data on investments in workplace training and development, measuring that investment, and relating these measures to performance outcomes. We report on the findings from the second round of data collected through an ongoing national survey of training and development practices. In particular, we focus on findings from analyses of 85 firms that reported in both rounds of our survey to examine linkages between their human capital investments and firm performance.

Research Questions

To help organizations make wise decisions about their investments in employee training and development, the primary question addressed by our study is the extent to which a relationship exists between firms' expenditures on the education and training of their workforce and measures of performance. We investigate not only the *level* of investments and performance, but also *changes* in both sets of measures using data from two points in time. The results from our first round of data hinted at a strong correlation between these investments and the performance of the organizations (Bassi and Van Buren, 1998a). Furthermore, for a subset of 40 publicly-traded firms, we were able

Copyright © 1999 Laurie J. Bassi and Mark E. Van Buren

to use publicly-reported data to demonstrate an association between the level of HRD investments and *financial* measures of performance (Bassi and Van Buren, 1998b).

In the current study, we address several secondary questions about this link. For instance, we assess whether some types of investments generate greater returns than others. Specifically, we examine whether investments in certain training content (e.g., technical skills versus basis skills) are connected to organizational performance. We also look at the effects of the relative distribution of training investments between internal and external expenditures (i.e., outsourcing) on performance.

The final question addressed by our study is whether investments in different categories of employees generate greater returns than others. In particular, we look at relative investments in the training of low-skill vs. high-skill, low-wage versus high-wage, and exempt versus non-exempt employees, and how such investments may be connected to organizational performance.

Data and Measures

In 1997, we began an effort to collect information on the nature and extent of employer-provided training and development investments and practices in the United States on an annual basis. The survey focuses primarily on measuring firms' investments in education and training, but also collects data on work practices, compensation policies, and subjective measures of organizational performance. From a random sample of 10,000 establishments, we were able to obtain information on the training and development investments and practices of 500 organizations (for the 1996 calendar year).

In 1998, we repeated the data collection process. Rather than a random sampling technique, we used a variety of convenience samples to increase the sample size from the previous round. The samples included the readership of a leading practitioner-oriented journal in the field of HRD, attendees of a large conference on training and development, and readers of a public website devoted to the field. As a result, the number of respondents in the second increased to 800 organizations from the United States. Only the organizations that provided usable data were included in the analyses (754). These data from 1997 calendar-year investments and practices permit us to take another cross-sectional snapshot of investments in training and development and their connections to firm performance.

A subset of 85 organizations reported data in both rounds. Data from these organizations for the 1996 and 1997 calendar years, respectively, allow us to begin to unravel the direction of the relationship between HRD investments and performance. In particular, we examine the effects between 1996 investments and 1997 organizational performance.

Investments in education and training were measured in a number of ways. We collected three measures the level of training expenditures: total training expenditures, training expenditures as a percent of payroll and training expenditure per employee. We also measured investments in terms of the percent of employees trained each year.

In addition to point estimates of these investments, we include several change measures in our analyses. First, we use estimates respondents to the second round reported to us of the percent change in these investments from the previous year. (We subsequently refer to these as "reported" change measures.) Then, using data from the 85 organizations that reported in both rounds, we calculated measures of the actual change in expenditures from 1996 to 1997. (We subsequently refer to these as "calculated" change measures. They are used only in our longitudinal analyses.)

Finally, our data on investments included measures of the percent of training expenditures going to outside providers and the distribution of training expenditures across more than a dozen course types. For the latter, we do not have change measures because of a change in which these data were collected between the two rounds. For the former, however, we include both reported and calculated change measures in the analyses.

The outcome measures used for the analyses in this report were self-reported measures of perceived organizational performance. Respondents were asked to assess whether their organization's performance in 1997 was: (1) better, worse, or no different from 1996, and (2) better, worse, or no different from other organizations that do the same kind of work. Within each of these two categories, respondents were asked to assess five specific aspects of performance, including: ability to retain essential employees, employee satisfaction, quality of product/services, customer satisfaction, and overall profitability. Factor analyses of these performance measures were used to construct two corresponding indices of organizational performance (one for change in performance between 1996 and 1997, and the other for the level of performance in 1997 versus peer organizations)

In addition to measures of investments and performance, our data allowed us to control for the presence of a number of other factors that could potentially affect performance. We assess the extent to which the organizations

used: (a) high performance work practices such as employee involvement with management in business decisions, employee access to key business information, and self-directed work teams; (b) training practices such as train-the-trainer programs, line-on-loan or rotational training staff, training resource center, mentoring or coaching practices, individual development plans, peer review of performance/360 feedback, and training information systems; and (c) innovative compensation practices, including profit sharing or gain sharing, group or team-based compensation, individual incentive compensation, and employee stock ownership plans.

Research Results

We performed two primary sets of analyses: cross-sectional and longitudinal. We focus first on the cross-sectional results from the 754 respondents to the second round.

Cross-Sectional Analysis

For our cross-sectional analysis, we ran correlations to examine the zero-order relationships between measures of investments in training and other human resource practices in 1997, and our measures of performance in 1997. Table 1 reports the significant Pearson correlations we uncovered.

Table 1

Cross-Sectional Correlations, 1997 Data

	Performance Versus Others 1997	Change in Performance 1997
% of Employees Trained 1997	.140**	–
Reported Change in Training Expenditures 1996-7	–	.095*
Reported Change in % of Employees Trained 1996-7	–	.159**
High Performance Work Practices Scale 1997	.191**	.148**
Innovative Compensation Practices Scale 1997	.081*	–
Innovative Training Practices Scale 1997	.104**	–

* $p < .05$; ** $p < .01$.

As we found in our analyses of the first round of data, organizations that trained a higher percentage of employees in 1997 reported a higher level of performance versus peers (Bassi and Van Buren, 1998b). None of the three monetary measures of training investment, however, were correlated with the level of performance. Also, as we witnessed with the first round data, changes in performance were positively correlated with changes in total training expenditures and changes in the percentage of employees receiving training.

These results are consistent with *a priori* expectations. The *level* of training should be expected to be correlated with the *level* of performance, but not the change in performance. Similarly, *a change* in training investments should be expected to be correlated with *a change* in performance, but not with the level of performance.

There are also significant, positive correlations between both measures of overall performance and companies' use of high performance work practices. The use of innovative training practices and compensation practices were only associated with change in overall performance from 1996 to 1997.

The results in Table 1 are also notable for what is missing. None of the measures of investments by course type or by internal versus external were associated with either measure of overall performance. Likewise, the extent to which expenditures are allocated to the training of non-exempt, low-skill, or low-wage employees appears to have no relationship with performance.

Longitudinal Analysis

The longitudinal analyses help us determine whether the relationships we find with the cross-sectional data are spurious or real. Before conducting our longitudinal analyses, we assessed whether firms that reported data for both rounds were meaningfully different from those that reported only in the second round. A logistic regression (with participation in the both rounds as the dependent variable) revealed no significant predictors of participation with the exception of industry. (Results not shown.) Repeat participants were more likely to be located in the Finance/Insurance/Real Estate sector and less likely to come from the Services sector.

First, we examined zero-order correlations between 1996 investments and 1997 performance to see what impact a one-year lag between investments and performance has on the bivariate relationships found in the cross-sectional analysis. Columns 1 and 2 of Table 2 display the Pearson correlation coefficients that were significant. The results display the same general pattern that we observed with the cross-sectional data. That is, the level of investment was associated with the level of performance and the change in investment was associated with the change in performance.

Table 2

Longitudinal Correlations

	1 Performance Versus Others 1997	2 Change in Performance 1996-97	3 Performance Versus Others 1996	4 Change in Performance 1995-96
Training Expenditure Per Employee 1996	.367**	–	.290**	–
Training as % of Payroll 1996	.285*	–	.181	–
Innovative Training Practices Scale 1996	.298**	–	.460**	.484**
Computed Change in Training Expenditures 1996-97	–	.313**	–	N/A
Computed Change in Expenditures per Employee 1996-97	–	.298**	–	N/A
Reported Change in % of Employees Trained 1996-97	–	.296**	–	.063
Orientation Training 1996	-.226*	–	-.049	–

+ < p 10; * p < .05; ** p<.01.

The exact measures that exhibited significant relationships with performance, however, were slightly different. Unlike the cross-sectional analysis, monetary measures of investment were clearly associated both the subsequent level of and change in performance. In other words, organizations that made heavy investments in training in 1996 reported substantially greater improvements in overall performance in 1997 as well as a significantly higher level of overall performance in 1997.

The use of innovative training practices also continued to be a significant correlate, while the use of high performance work practices and innovative compensation practices were not significantly related to performance. One possible interpretation is that the latter types of practices have impacts on performance over a different time frame, either shorter or longer. Other studies of these types of practices have shown strong evidence of their impact on organizational performance (Arthur, 1994; Huselid, 1995; MacDuffie, 1995)

We also find that computed changes in expenditures were significant correlates of change in performance, whereas reported changes were not. It may be that respondents retrospective estimates of these changes were not entirely accurate. On the other hand, respondents' reported changes (but not computed changes) in the percent of employees trained—perhaps an easier measure to for respondents to estimate accurately—remained significant.

Much like the cross-sectional results we found very little evidence that where organizations place their human capital investments affects performance. The only exception was that firms that spent more on new employee orientation training in 1996 tended to report lower performance versus peers in 1997. It may be a statistical anomaly or it is possible that such organizations experienced a large influx of new employees without much previous work experience, the effect of which was a slight drop in performance while they became fully functional.

Columns 3 and 4 of Table 2 shed further light on the causal direction of these relationships. These columns provide the comparable correlation coefficients for our longitudinal panel between 1996 investments and 1996 performance. With the exception of the use of innovative training practices, 1996 investment measures were more strongly related to *1997* performance than 1996 performance. This finding suggests that 1996 human capital investments were more likely to be determinants of 1997 performance than co-determined with 1996 performance.

To more precisely assess the strength of these relationships, we performed several Ordinary Least Squares regressions of firm performance in 1997 on human capital investments in 1996. Table 3 displays the results of these regressions. Only predictors with significant coefficients are displayed. We also included controls for industry sector and size of organization.

Table 3

Regressions of 1997 Performance on 1996 Investments[a]

	1 Performance Versus Others 1997	2 Performance Versus Others 1997	3 Change in Performance 1996-97	4 Change in Performance 1996-97
Training Expenditures per Employee 1996	.279*	.144	–	–
Innovative Training Practices Scale 1996	.278*	.039	–	–
Performance Versus Others 1996	–	.503**	–	–
Computed Change in Training Expenditures 1996-97	–	–	.309**	.201+
Change in Performance 1995-96	–	–	–	.393**
Adjusted R-Square	.166	.319	.074	.191
F	5.720**	7.925**	3.989*	6.502**

+ $p < .10$; * $p < .05$; ** $p < .01$.

[a]Standardized coefficients shown.

The results in columns 1 and 3 of Table 3 reveal that 1996 investments were key predictors of 1997 performance even with appropriate controls. Because of the high level of collinearity among investment measures we dropped all but the strongest predictors of performance from the analyses. In addition, we find that the use of innovative training practices in 1996 remained highly related to the level of performance in 1997. This suggests that it matters not only how much firms spend on training, but also how they apply those expenditures.

Columns 2 and 4 repeat the regressions but with a control for the first round level of, or change in, performance. These regressions illustrate a great deal of endogeneity. Performance at time 1 is a much stronger predictor of performance at time 2 than investments in training at time 1. This is not surprising as serial correlation of performance measures is not uncommon. Furthermore, the training investment measures only account for a small part of the total variation in performance (7 to 17 percent).

As a final step in our analyses, we examined the nature of the relationship between training investments and firm performance more closely. Figure 1 displays two sets of correlations: 1) correlations between 1996 investments

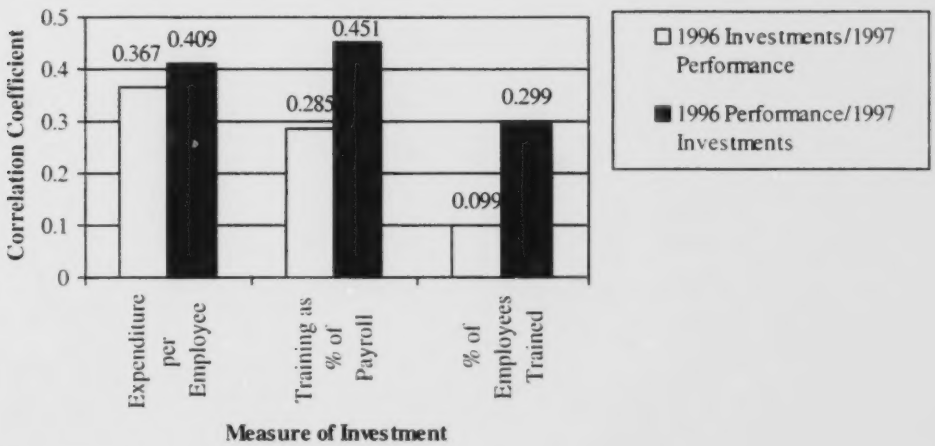
and 1997 performance, and 2) correlations between 1996 performance and 1997 investments. Although two of the three correlations in the former were significant, all three coefficients were smaller than the coefficients in the latter. That is, 1996 performance tended to be a stronger correlate of 1997 training investments, than 1996 training investments were of 1997 performance.

This evidence suggests that, with only two years of data, we are unable to rule out several possibilities. First, performance may be a leading indicator of training expenditures, and not visa versa. Second, and more likely, the link between firm performance and training expenditures may go both ways. High performance leads to greater investments in the training in the following year, which in turn leads to higher performance the next year. In other words, a set of mutually-reinforcing relationships is at work.

Summary

The results of our analyses are highly encouraging. Not only do our cross-sectional data analyses reinforce the association we uncovered previously between training investments and organizational performance, but our longitudinal analyses reveal an especially strong connection between investments in one period and performance in the next period. Furthermore, we find that this relationship holds even when a number of contextual factors are held constant. However, we find relatively little indication that where those dollars are allocated has a significant impact on performance. Rather, it is ensuring a level of spending that benefits everyone that has the strongest effect on organizational-level performance.

Figure 1: Direction of Relationships



Our results, however, must remain tentative as there are also indications that a one-year period may not be the appropriate lag between training investments and firm performance. We find evidence, that the relationship between investments is not unidirectional, and may actually be best portrayed as a set of cumulative, mutually reinforcing effects over time. With each subsequent year of data collection, we intend to examine the length of this lag and the direction of the effects more precisely and definitively.

Ascertaining the link between investments in HRD and firm performance is a difficult, but not necessarily impossible task. Only by doing so will HRD practitioners be able to determine which investments have high payoffs and should be continued, and which have poor results and should either be revised or eliminated. Unfortunately, currently most organizations know very little about what they receive from those investments or how to make those investments wisely. Nor do many organizations have the luxury to experiment with different allocations of their investments to determine for themselves which investments are most productive. Our research provides HRD practitioners with the empirical foundation to demonstrate to others in their organizations that higher levels of wisely-placed investments in HRD will provide valuable results to their organizations—not only in terms of employee learning and development, but also as seen in their bottom lines.

Contemporary Approaches to Return on Investment from Training

Paul E. Brauchle
William H. Koenecke
Illinois State University

This paper investigates several approaches that are often used to estimate return on investment (ROI) for training enterprises. It describes various methods of assessing behavior change and the value of that change, and also describes several methods of calculating and using ROI. Some of these methods are benefit/cost ratio, return on investment, the time value of money, formula driven analysis, benefit forecasting, the relative aggregate scores approach, the Stolovitch/Maurice Model and others

Keywords: Return on Investment, Training, Evaluation

Trainers are often plagued by the lack of simple and effective methods for showing the benefits of training. They often resort to "smile sheets" or just assume that if the training is based on a needs analysis it probably is effective. However, these methods cannot tie training activities to the dollar values considered important by most organizations. This puts trainers at a disadvantage when dealing with their more financially literate colleagues. The "bean-counters" in the organization are likely to know exactly how much training "costs" but they may have little idea of its value. We must be able to supply that information.

Several methods have been used to try to show the monetary benefits of training. Some look at the consequences of not training. Others involve analyzing performance records, or costing the training curve under training and non-training conditions. Probably the best known method is cost/benefit analysis. Usually a lengthy and tiresome process, cost/benefit analysis calculates training costs, assesses some performance value that occurred as a result of training, and computes an index of benefits. Performance values are derived from productivity measures such as the number of items produced per shift. If more items are produced after training, the "gain" can be calculated by subtracting training cost to show benefit. However, there seems to be no universally accepted method of doing this. Whichever methods are used to calculate the benefit of training, they are probably tacit admissions that performance improvement efforts are big business and the improvements they make ---or don't make---should be considered seriously.

According to a June 1996 article in *Across the Board* magazine, "American business invested an estimated $30 billion in training in 1996" (Bachler, 1997, p. 98). Bassi (1996) Reported even larger totals for 1995, indicating that employers' total expenditures on training were $55.3 billion. Whichever number you believe, it seems clear that training and development efforts are big business in America. In light of these large expenditures, managers of both private and public organizations are beginning to more seriously question their return on investment in training. Holton (1995) believed that "increasing global competition has led to intense pressure on HRD to demonstrate that programs are directly contributing to the 'bottom-line' of the organization". Phillips, (1995) said, "in any direction one chooses to take in the HRD field, the pressure to measure the return on investment (ROI) is increasing". Employers "especially want to know what benefits they can expect from it" (Dionne, 1996, p.280). They want to analyze the financial costs and benefits of human resource development (HRD) programs" (Parsons, 1995, 17-4). Of the estimated $30 billion (or $52.5 billion) invested in training, are there benchmarks that indicate how much is wasted on inefficient training? The answer to this question is dependent upon another: "What does management want from its training investment and can management's expectations be met in other than traditional bottom-line terms?" (Blickstein, 1996). This manuscript seeks to identify and describe relatively recent "state-of-the-art"approaches to showing the benefits of training. It focuses on various approaches to return on investment (ROI) and describes a number of ways to analyze the costs and benefits of training.

Kirkpatrick's Model

A brief review of, and comment upon, Kirkpatrick's four-level evaluation system is useful. In 1959, while teaching at the University of Wisconsin, Kirkpatrick proposed a model that classified training outcomes into four levels. The model was developed to "clarify the elusive term 'evaluation'"(Brown and Seidner, 1998, p.95). These often-cited levels describe a rubric that is often used to evaluate programs. The first level is the *reaction* level. Reaction may be

Copyright© 1999 Paul Brauchle & William Koenecke

described as how well the trainees like a particular program (Kirkpatrick, 1996). This level can be called a measure of customer satisfaction. Evaluations at this level measure how those who participate in the program react to it. "If training is going to be effective, it is important that trainees react favorably to it. Otherwise, they will not be motivated to learn" (Brown and Seidner, 1998, p.10). The second level of the model is *learning* evaluation. It "can be described as the extent to which participants change attitudes, improve knowledge, and/or increase skill as a result of attending the program" (Brown and Seidner, 1998, p.101). Pine and Tingley (1993) defined level 2 evaluation in terms of measuring the content of the training. The third level is behavior. Behavior can be defined as the extent to which behavior is changed by a training intervention. The final level, results, can be defined as the effect of the training intervention on the bottom line of the enterprise. Results is usually described as a return-on-investment calculation that shows the dollar value of the benefits of training over the cost of the training. Results analysis can include increased production, improved quality, decreased costs, reduced frequency and/or severity of accidents, increased sales, reduced turnover, and higher profits and return on investment (Parry, 1976, p.74). Kirkpatrick is quoted as stating: "It has long been thought important to recognize that the most desirable approaches to delivering instruction (training) are those that are the most effective in terms of results and the most efficient in terms of cost" (Parry, 1976, p.74). Blank, (1982) agreed. He believed that "we need to strike a balance between effectiveness (does it work?) and efficiency (how much does it cost?)" (p.192). What we want to do, then, is to consider costs versus benefits at the results level of evaluation. But where do we start?

Measuring the Change in Behavior

The first thing that must be done is to measure somehow the change in behavior we think the training intervention has produced. Several methods have been proposed to do this.

360-Degree Appraisal Feedback Process

Antonioni (1996) defined 360-degree feedback as a process whereby "individuals appraise themselves and also receive appraisal feedback from their appraisers; immediate supervisor, peers, and from direct contributors if they are managers" (p. 72). Charney and Conway (1998, p. 196) defined 360 degree feedback as "a performance evaluation system that uses input from all employee levels to assess performance. Training is an important factor in helping employees use the process effectively". An effective 360-degree feedback process "offers a major opportunity for organizational members to improve the quality of their work relationships, helps appraisers and appraises effectively define the quality requirements in their work relationships, teaches individuals how to give and receive constructive feedback, and provides a structure for discussing the undiscussables" (Antonioni, 1996, p. 79). An effective 360-degree feedback process not only improves work behaviors, but increases worker performance which in turn, improves return on investment for the organization. In this way, it can be a method for helping to describe the benefits of training.

Performance-Learning-Satisfaction Evaluation System

This evaluation model embraces the domains of performance, learning, and satisfaction. "The *PLS Evaluation System* purports to be a rigorous, yet flexible, evaluation system. It is flexible enough to accommodate almost all situations. It is rigorous enough to consistently honor core questions, techniques, and reporting results as part of every evaluation. In addition to the *PLS Evaluation system* conceptual components, job aids, tools, and references, there is an auxiliary data processing system consisting of a computer, software, a data scanner, and a printer" (Swanson and McClernon, 1996, p. 719). "Performance can be thought of as (a) business results at the organizational, process or individual levels and/or)b) financial results or benefits in terms of money or monetary ratios. Most, but not all, business results can be monatized and turned into financial results" (Swanson and McClernon, 1996, 719). According to Swanson and McClernon, the general financial results goal of the model is to have benefits exceed the costs by a 2:1 ratio. "If the 2:1 return on investment goal is achieved, it can be said that the program achieved 100% of its goal" (Swanson and McClernon, 1996, 719).

The Balanced Scorecard

"The financial- and strategic-planning world is starting to look seriously at a performance measure called the balanced scorecard" (Willyerd, 1997, p. 53). This method tracks the key elements of a company's strategy using both financial and operational measures. "Building a scorecard enables a company to link its financial budgets with its strategic goals" (Kaplan and Norton, 1996, p. 78). The balanced scorecard looks at four key areas of performance and provides answers to the following questions: "(1) How do we look to our shareholders? (Financial perspective.); (2) How do customers see us? (Customer perspective.); (3) What must we excel at? (Internal perspective.); and (4) Can we continue to improve and create value? (Innovation and learning perspective.)" (Willyerd, 1997, p. 53).

This approach helps ensure that all the critical performance measures are evaluated in addition to return on investment issues. "It provides a check and balance so that one area isn't overemphasized at the expense of another" (Willyerd, 1997, p. 53).

Current Status of ROI

Return on investment has been a critical issue for trainers and top executives in recent years and one listed on meeting agendas and discussed in the literature." (Phillips, 1996, p.42). On one hand, "some professionals argue that it is not possible to calculate the ROI in HRD, while others quietly and deliberately proceed to develop measures and ROI calculations" (Phillips, 1997). This leads us to question of what *is* the current status of ROI in the field of performance improvement?

Even that is not really clear. "Currently, it's difficult to pinpoint the state of ROI within the field" (Phillips, 1996, 42). Some HR managers are reluctant to discuss internal practices and it is difficult to find case studies that specifically list the strategies used by training departments in determining ROI. However, a recent study of more than 40 organizations found that the best companies are measuring customer requirements, testing participants, measuring what the client can and will pay for, and moving away from justification (Dixon, 1996, p.82). Dixon stated, (p.84),"One of the most striking findings of this study was that none of the best practice organizations was evaluating primarily to justify training or to maintain the training budget". In addition, the study found that "all the best-practice companies were conducting Level 3 and 4 evaluations selectively rather than consistently"(p. 84). Geber (1995) was consistent with Dixon and believed that "with all the effort that's involved, it would be impractical for most companies to do level 3 and level 4 evaluations on every single course". (p.30).

Calculating ROI

Calculating ROI is not so simple, either. Consider Phillips (1996, 44) "Organizations calculating ROI for the first time should select only one course to measure". It is not practical for most organizations to calculate the ROI on all training programs because the result would be too many calculations and too time-consuming. "Most organizations, for the sake of practicality, decide to evaluate just one or two of their most popular training programs". The respondents participating in Phillips" study were not just content to show that training can result in such improvements as increased productivity and decreased turnover. An additional step was taken to convert these improvements to monetary values that could be compared to costs for a ROI calculation. For hard-data items, such as producuvity, quality, and time, the ROI calculation was easier than those calculations for soft-data items, such as customer satisfaction, employee turnover, and job satisfaction (Phillips, 1966). But consider that he also said, "One approach to ROI is to add a fifth level to the four-level evaluation developed by Donald Kirkpatrick" (1996, 42). In addition to the reaction level, learning level, behavior level, and the results level, a <u>return on investment level</u> is added that compares the training's monetary benefits with the costs. A model has been developed that "tracks the steps in measuring ROI — from collecting post-program data to calculating the actual return" (Phillips, 1996, 43). The model can compare training costs to monetary benefits, assuming that all training programs have reportable results as well as intangible benefits.

Basic Model For Calculating ROI

The basic paradigm for calculating ROI is as follows: "Collect level-4 evaluation data. Ask the question "Did on-the-job application produce measurable results?" Isolate the effects of training from other factors that may have contributed to the results. Convert the results to monetary benefits. Total the costs of training. Compare the

monetary benefits with the costs" (Phillips, 1996, 20). Several approaches currently being used to calculate return on investment by individuals and organizations. The following sections will identify and discuss some of these approaches.

Benefit/Cost Ratio and Return on Investment

Two common formulas used to calculate ROI, according to Phillips, are benefit/cost ratio (BCR) and the return on investment (ROI). "To find the BCR, you divide the total benefits by the cost. In the ROI formula, the costs are subtracted from the total benefits to produce the net benefits, which are then divided by the costs" (Phillips, 1996, 43). "For example, if a training program produces benefits of $321,600 with a cost of $38,233. The BCR is 8.4. For every $1 invested, $8.4 in benefits were returned. The net benefits are $321,600 - $38,233 = $283,367. ROI is $283,367 / $38,233 = 741 percent. Using the ROI formula, for every $1 invested in the program, there was a return of $7.4 in net benefits."(Phillips, 1996, 43).

"Compact" Cost-Benefit Analysis

This method measures job performance after training and is based upon a method used by Godkewitsch (1987) that was later published by ASTD in INFO-LINE publication # 007, entitled "How to Conduct a Cost-Benefit Analysis" (1990). Brauchle (1995) described this as a "compact method" because it uses a formula, not a spread sheet, to calculate ROI. The result is a dollar amount that describes what the training is worth to the organization in terms of the performance of the workers who have participated in the training" (Brauchle, 1995, 17-2). The following five steps are calculated to determine the benefits of training using this method: "(1) Determine the effect of the training; (2) Determine the dollar value of the effect; (3) Find out how many people have been trained; (4) Determine the training cost per person; and (5) Put the information together in the formula and turn the crank." (Brauchle, 1995, 17-2).

There are advantages and disadvantages concerning the use of this method, which seems to be unique in that it assesses the improvement of trainees in standard deviation units and uses as a rule of thumb a 40% increase in performance value for each standard deviation of improvement. The advantages of this method are several: (1) It uses dollars as the unit of measure for the analysis. This unit of measurement is usually acceptable to managers because they understand it; (2) The method is relatively simple to use; (3) It does not require extensive computer capability or number crunching power; and (4) It provides results fairly quickly (you don't have to wait for a one-year budget report). However, it suffers because "(1) It is a norm referenced method, with several attendant problems: (2) It relies on supervisor evaluations which may be of doubtful validity and even more questionable reliability: (3) The value of one standard deviation improvement (40 percent of annual salary, based on other studies) is questionable and should not be used if you have local benchmarks against which to compare it: (4) The dollars calculated as benefits are not real dollars unless you have your own validated benchmarks: (5) It may be difficult to tie the benefits to long term business results if the measures of productivity gain are taken shortly after training: and (6) The results do not answer the question 'Did you train for the RIGHT skills?' ". This method is "...probably worth using if you can establish your own benchmarks for the value of one standard deviation of productivity gain. (It) is less complicated than many others and may provide useful justifications for the training enterprise" (Brauchle, 1995, 17-2).

HRD Benefit-Forecasting Model

"The basic HRD benefit-forecasting model includes methods for determining monetary values for the following components: (1) the performance value to result from the HRD program, (2) the cost of the HRD program, and (3) the benefit resulting from the HRD program" (Swanson and Gradous, 1988, 21). The model, according to Swanson and Gradous, defines benefits as performance value minus cost. "Performance value is the financial worth of the number of performance units that result from an HRD program" (Swanson and Gradous, 1988, 31). This is calculated by multiplying the total number of units expected to result from the program times the dollar amount of one unit. "Cost," according to Swanson and Gradous, is "an item of outlay that is incurred in the operation of HRD programs." These costs may include such items as direct and indirect costs, fixed and variable costs, and amortization. "An HRD cost is any expenditure that the organization chooses to attribute to an HRD programs. What is an HRD cost in one organization may not necessarily be considered an HRD cost is another" (Swanson and Gradous, 1988, p. 91).

The Relative-Aggregate-Scores Approach

This approach, like the time-value-of-money method discussed above, is borrowed from production operations management (POM). As described by (Gaither, 1996, p. 265), this approach might help compare alternative locations for a production facility. We can use it to compare the relative value of training for different tasks or duties within a job, and for assessing the gain in value for that job after training. When we use it to assess the benefits of training (Brauchle, 1992), the difficulty, importance, and frequency of various job tasks is assessed. For each of these, weights are derived. Then, actual performance data are used to show a value for each task, performance value before and after training, and a performance gain for each task, as well as for the job as a whole. The results of this approach can be used to monitor the results of training and also to plan training so limited resources are invested in the most important areas.

Stolovitch/Maurice Model

This model is a combination of numerous ROI models and "draws primarily from the work of Schneider and Wright (1990), Schneider, Monetta and Wright (1992), Robinson (1990), Robinson an Robinson (1989), Spencer (1984), and Stolovitch and Keeps (1995) (Stolovitch & Maurice, 1998, p. 130). It consists of seven steps. *Step 1* Calculate potential for improved performance. A front end analysis is conducted to determine the purpose of the training request, identify the desired and actual performance of training, and identify the appropriate solutions that are relevant, feasible, and acceptable to the organization and the targeted performers. *Step 2* Calculate estimated training costs. These costs include development costs, implementation costs, and maintenance costs. The total cost of all training development, implementation, and maintenance costs is an estimate of the total costs. *Step 3* Calculate the worth analysis. This step verifies the worth of training by comparing the cost of training to potential outcomes. First, estimate the highest number and the lowest number of annual deficiencies or improvements. Second, estimate the high and low cost of each deficiency or improvement. Third, calculate the current annual cost of both the high and low deficiencies or improvements. Fourth, estimate the range of expected deficiencies corrected or improvements obtained from training. Fifth, estimate the high and low annual value of training. Sixth, multiply the high and low annual amounts of training by the length of time the training will last and divide the estimated training costs to obtain the potential worth of the training efffort. *Step 4*. This step includes design, development, implementation, support, and monitoring/evaluation of training. *Step 5*. Calculate the true costs of training. This step is similar to step 2, but new actual figures are used in place of estimated values. *Step 6*. Calculate the organizational ROI. This step involves estimating the percentage of impact likely due from training and calculating the value of results against training costs only on projects where training has been the major performance intervention. *Step 7*. Calculate individual increased value of human capital.

Critical Outcome Technique

"This technique was developed as a means of assessing program effectiveness in a systematic, post-hoc manner" (Mattson, Quartana, and Swnson, 1998, p. 45). The process model contains five steps that make up the model. Outcome definition is the first step in the model and the key question here is "What are we trying to do?" The second step is outcome inquiry and involves identifying the actual outcomes of the program. Outcome verification is the next step in the process. "Did the outcomes really occur as reported by the participant?" and "Would the outcomes have occurred without the program?" are questions asked during this phase of the process. The fourth step is outcome valuation and the primary question is,"How much are these outcomes worth?" The fifth and last step is outcome report. This step summarizes the outcomes in an abbreviated and narrative forms.

Core Financial Analysis Method

"This model and method for analyzing actual and forecasted financial benefits are relatively simple and straight forward" (Swanson, 1998, p. 60). The basic model is comprised of three components that consist of the performance value resulting from the training program, the cost of the training program, and the benefit resulting from the training program. The training benefits are calculated by subtracting the cost of the training program from the performance value of the program. Swanson and Gradous have developed detailed instruction worksheets that explain this model in more detail.

Other Factors to Consider

After benefits have been calculated, we may think the job is done, but two things still need to be considered.

Isolating the Effects of Training

Most of the time, improvements in job-performance are only partially due to training programs. Variables other than the training, such as the trainees' age and work experience, seasonal sales patterns, economic changes, shifts in managerial styles, equipment breakdowns, customer attitudes, etc. may influence the data making it difficult to determine the actual effect of the training upon the ROI results (Shelton and Alliger, 1993). "One way to measure the effects of extraneous factors is to compare the results of a control group with the results of the trainee group" (Shelton and Alliger, 1993, 44). "The experimental group receives training; the control group does not" (Phillips, 1996, 30). Trend-line analysis, forecasting, participant estimation, supervisor estimation, management estimation, customer input, expert estimation, subordinate input, and others factors are additional ways to isolate training's effect on performance (Phillips, 1996).

The Time Value of Money

A thorough consideration of a training or performance improvement initiative should also include an appreciation of the time-value of the money that is saved (or made). This concept has been used for years by production operations managers (Riggs, 1987), and considers two different things: the present value of future dollars and the future value of present dollars. For example, if your ROI calculations indicate that after three years your training intervention will have made (or saved) the company $100,000, you would want to know the present value of those future dollars. The general formula for the present value of future money is $P=F/(1+i)^n$ (Riggs, 1987, p. 132). If we plug in the above value and inflation is running at 10% per year, we get $P=100,000/(1+.10)^3$, or $75,131.48. So we can see that the $100,000 that will be saved in the future is not worth nearly so much in present value. In fact, it is worth considerably *less* than the face value. This fact should be taken into consideration when calculating the value of training. For a different kind of example, suppose you know you have to invest the same $100,000 now for a program that will break even in three years. You want to know the future value of those present dollars that you are spending. Riggs (1987, p.132) gives this formula as: $F=(1+i)^n$, which is $F=(1+.10)^3$, which works out to $133,100. If we had not invested those dollars, in three years they would have been worth $133,100, so the value of the training program after three years must exceed $133,100, or we haven't really shown any gain!.

Many HR practitioners believe that the ultimate level of organization, return on investment, shows the true contribution of training. (Phillips, 1996) The process is not complete "until the results have been converted to monetary values and compared with the cost of the program" (Phillips, 1996, p. 20). Four distinct and important benefits can be derived from the implementation of ROI in an organization. (Phillips, 1997) First, return on investment will measure the contribution the program made to the organization and will determine if it was a good investment. Second, this calculation will determine which programs contribute the most to the organization and allow priorities to be established for high-impact training programs. Third, the ROI calculation brings a focus upon the results of all programs, not just those targeted for the financial evaluation. Fourth, this process can help convince management that training is an investment and not an expense. (Phillips, 1997)

Conclusion

"One of the most common criticisms of trainers is that they don't measure the organization's return on investment in training" (Mendosa, 1995, p. 66). Millions of dollars are expended by both public and private organizations to train new employees as well as present employees. However, "The statistics everyone wants, those that would tell us the return on training dollars spent, has proven to be stubbornly elusive" (Fagiano, 1995, p. 12). We have described in this manuscript several models that help organizations evaluate the benefits of training through return-on-investment. These range from Kirkpatrick's four level model to more complex models that are being used to determine the ROI for both public and private organizations. Most HRD professionals agree that "training doesn't cost .--- it pays and that HRD is an investment, not an expense" (Parry, 1996, p. 72). Laird had stated as early as 1985 that "client-managers need measurement as an indication that they're solving or eliminating performance problems . . . getting something back on the training investment" (Laird, 1985, 241). In today's economy with

down-sizing and world-wide global competition among public and private organizations, it is very important to be able to justify training expenses as well as all expenses of these organizations. All these expenses must relate to organizational performance - growth, profit, market share, etc., and they must also contribute to the "bottom-line".

HRD and Psychological Contracts: A Case Study of Lifelong Learning

Graeme Martin,
Judy Pate
Jim McGoldrick
University of Abertay Dundee

This paper explores the influence of a programme of "life-long learning" on employee perceptions of their psychological contracts in a longitudinal case study of a major employer in the UK. The aim of the research is to contribute to the debate on the role of HRD and career development in shaping psychological contracts. The case study data show how the programme helped maintain positive employee relations even during a period of insecurity and retrenchments.

Keywords: Life long learning, Psychological Contracts, Career Development

The context for the research is the recent upsurge in interest in lifelong learning at the political level (Lewis, 1997) and the high profile organizations offering "new deals" in psychological contracting, based the rhetoric of *employability* (Herriot & Pemberton, 1996; Martin, Staines & Pate, 1998). There is, however, a fundamental tension between the attempts to offer new deals in psychological contracts (which are often characterised by low trust relationships) and initiatives such as lifelong learning (which are based on high trust relationships) (Cappelli, 1998; Rousseau, 1995). Consequently, it is sometimes argued that few companies have progressed beyond the level of rhetoric of employability (Herriot, Hirsh & Reilly, 1998; Tregaskis & Brewster, 1998).

Arguably, one company that has gone beyond the rhetoric is NCR in Dundee, Scotland. This company has had a major programme of lifelong learning in operation since 1990 and has received considerable external attention in academic and UK government circles (Martin & Riddell, 1996; Tayeb, 1998; Wheatley & New, 1997). The current strategic and financial situation in the corporation, however, has focused attention on costs and benefits of career development and this internal "soul-searching" has provided the impetus for our investigation.

Accordingly, the paper proceeds as follows. First we briefly bring together diverse strands of existing literature on the psychological contract, career development and the new deal of employability to shed light on the potential relationships between programmes like EFA and organizational change. These bodies of literature are used to inform our research questions. In the second section of the paper, we briefly outline the nature and context of NCR's programme of lifelong learning (EFA). In the third section, we examine the results of our case study data to show how the programme has shaped the psychological contracts of employees in the plant over the period 1993-98. In the final section, we discuss the results of our investigation and their implications for researchers and practitioners.

The Literature on HRD, the Psychological Contract and Trust Relations

At the heart of our discussion of the relationship between HRD, career development and trust relations is the concept of the psychological contract, which has become increasingly important in explaining many aspects of current employee relations and performance (Cully, O' Reilly, Millward, Forth, Woodland, Dix & Bryson, 1998; Guest, 1997). We do not propose to review the extensive literature on psychological contract breach here. It is sufficient to point out that recent US research has shown how transactional and relational contracts (Rousseau, 1995) have had different implications for employee behaviour. These studies have mapped out the connections between contract breach, violation, trust relations and important HR attitudinal and behavioural outcomes. First, the extent to which employees are likely to define employer breaches of the contract as violation appears to be moderated by the quality of *trust relations* (Morrison & Robinson, 1997). Second perceived contract violation has been shown to lead to a deterioration in trust relations (Robinson, 1996) and increased levels of *employee cynicism* (Andersson, 1996; Dean, Brandes & Dharwadkar, 1998). In turn, deteriorating trust relations and increased cynicism towards management and the organization are associated with *lower work motivation, job satisfaction and commitment* (Reichers, Wanous & Austin, 1997).

In the UK, Guest and Conway (1997) have examined the antecedents of psychological contracts, their content and their consequences and have provided some important insights into changing nature of UK employment

Copyright © 1999 Graeme Martin, Judy Pate and Jim McGoldrick

relations. They have identified the nature of the *organizational climate* and the *involvement climate* as significant causes of positive psychological contracts. These contracts, in turn, were defined by the extent to which employees perceived their employers to be *fair*, whether or not employees *trusted* their employers, and the extent to which *promises by employers were perceived to be delivered*. Such positive contracts resulted in *attitudinal outcomes* such as high levels of commitment and job satisfaction, and *behavioural outcomes* such as organizational citizenship and effort.

Evidence on the Psychological Contract and Training and Development: Declining Levels of Trust and Cynicism

At least three positions are discernible on the impact of environmental change on psychological contracts.

What Has Changed?

The first position draws on "objective" evidence of changes in psychological contracts and careers. For example, in the UK, Guest, Conway, Dickman & Briner (1996) concluded that "the traditional psychological contract built around job security and a career is still alive and surprisingly well" (Guest et al., 1996, p. 1). They have received some support from economic data that have shown the position on job tenure to be no worse in the early 1990's than in 1975 (Burgess, 1997). Interestingly, these data do not square with the early findings of the recent UK Workplace Employee Relations Survey (WERS, 1998). This research, although silent on employee perceptions of job security, points to significant increases in different forms of flexible working over the last five years – particularly contracting out (Cully, et al., 1998).

The Need for a New Organizational Career Philosophy

The second position or thesis is that although significant market and organizational change may have occurred, organizational career philosophy has yet to catch up in all but the most enlightened organizations. This is the essentially normative argument concerning the new deal being offered by some employers. For example, Adamson, Doherty & Viney (1998) in the UK and Cappelli (1998) in the US have argued that organizations are now talking not of opportunities for advancement and/or progression but of opportunities to improve *marketability* and *employability*. These researchers outline key changes in career philosophy that are predicated on the break-down in long-term employer-employee relationships and future time orientation of careers. They foresee that career progression is no longer likely to involve upward hierarchical movement in the one organization but is more likely to involve lateral development.

What About the Employees?

Essentially, researchers associated with this perspective have acknowledged that important changes have occurred but point to the negative consequences of these changes for careers and psychological contracts (Herriot & Pemberton, 1995; Herriot, Hirsh & Reilly, 1998; Kanter & Mirvis, 1989; Hutchison, Kinnie & Purcell, 1996). The argument here is that psychological contracts have come under pressure as a consequence of the competitive conditions of the 1980's and 1990's and the associated policies of employers in trying to do "more with less" and in "leaning out" organizations. The received wisdom has been that employers have been drawn towards more flexible organizational structures with the "knock-on" consequences for decreasing levels of job security.

Some of these claims are supported by the recent WERS data (Cully, et. al., 1998). One of the report's major conclusions is:

> ...a significant minority of employees feel that the overall deal they have – their implicit, or psychological contract – is a poor one. Lower levels of job satisfaction are particularly evident among some groups and among those who feel inadequately consulted and, to a lesser extent, those who do not have access to *training* (our emphasis)...(p.28).

Firmly rooted in this "what's in it for employees" perspective on HRD and psychological contracts are two lines of relevant discourse and evidence. The first of these is a thesis based on the concept of trust and transitions by Herriot, Hirsh & Reilly (1998). They contend that the recent response of organizations to economic pressures through new dealing has further decreased trust in management to do as they say. Furthermore, recent *perceptions* of job insecurity have exacerbated this low trust dynamic. However, they argue that organizations are responding

to environmental pressures by ever more frequent transitions in products/services, structure and culture. Such transitions have implications for individual career management that require people to participate willingly in achieving a balance between short and long term considerations such as growth and contraction or centralisation and devolution of decisions. This balancing act is contingent on the trust relationships in organizations; if high levels of trust exist, managing transitions becomes easier because employees have faith in the company to do "the right thing" in the long term. Without such trust, employees will become increasingly sceptical and cynical of managerial rhetoric and disengage from or oppose those very transitions on which organizational success is based (Reichers, Wanous & Austin, 1997). This position has received support from a major US study by Tsui, Pearce, Porter & Tripoli (1997) which found that investment in employees appears to "pay off". Their research showed that employees performed better, demonstrated greater organizational citizenship behaviour and higher levels of affective commitment in situations when employers engaged in "mutual investment" relationships with employees. Whereas circumstances in which employees perceived they were working in "under-investment" relationships with their employers produced the worst results on attitude and performance variables such as absence, performance on core tasks and citizenship behaviour. They concluded that the overall pattern of their results provided support more support for the mutual investment relationship, in which "open-ended inducements provided by employers are balanced by open ended contributions from employees" (p. 1113).

Conclusions From the Literature

This discussion on the psychological contract and the so-called new deal leads us to four relevant conclusions. First, the conceptual and empirical literature on both sides of the Atlantic point strongly to the conclusion that promises on, and the level of investment in, HRD and career development are important *antecedents* of psychological contract breach and violation (Andersson, 1996; Robinson & Rousseau, 1994). Second, perceptions of contract breach and violation over HRD and career development are likely to lead to deteriorating trust relations and increased employee cynicism concerning programmes of organizational change. Third, these negative attitudes and emotions are likely to result in significant under-performance in areas such as productivity, quality and innovation because of their affects on the *ability and motivation* of individuals to change (Guest, 1997). Fourth, the jury is still out on the empirical evidence on the "new deal" and the calls for changes in organizational career philosophy. Although there is some positive evidence on careers and new dealing, some researchers have argued that new dealing is mere rhetoric and is likely to be met by lowering degrees of trust, commitment and performance amongst many employees. This is particularly so amongst those employees that lack sufficient external labour market power to benefit from new deals.

Method

The case study is of NCR (Dundee), a Scottish subsidiary of a major US multinational enterprise (MNE). The Dundee plant is a world leader in the design and manufacture of financial services equipment, predominantly automatic teller machines (ATM's) and has won a number of awards for its exporting and manufacturing performance (Wheatley & New, 1997). The programme called Education-for-all (EFA), which has been in operation for eight years, has had a broad focus on education. It has also attempted to be inclusive by engaging the whole workforce.

Education for All

NCR (Dundee) have been one of a small number of high profile companies that have attempted to maintain long-term employment relationships by *investing in employees* and committing themselves to *job security* (Denton, 1998; Martin & Riddell, 1996; Tayeb, 1998). In the early 1990's senior management took a decision to invest in a high risk and somewhat unfashionable programme of long term education as a means of producing significant organizational change. At different points in the plants' history, these measures represented significant high trust initiatives that were intended to signify to the Dundee workforce that they had a long term future with the Company and that investing in people was central to its plans. EFA1 began in 1990 and was intended as a key

2 The key features of EFA are to encourage self-development amongst employees by paying for, and supporting with time-off work, any form of educational course broadly related to the business of the company. Such courses must lead to a recognised national qualification and be supported by the employee's manager.

underpinning for the Dundee company's strategic objectives of growth through continuous innovation, customer-focus and cost-competitiveness. To fully understand the progress of EFA, it is necessary to show (a) how it is embedded in a particular historical and organizational context, and (b) how the programme may have changed over time (Pettigrew, 1995). Our case study plant in Britain began life as a subsidiary of NCR, a Midwestern-based US MNE. The plant had a very patchy early history. Employment rose dramatically between 1945-70, reaching a peak of some 6,300 employees in 1970. However by 1972, NCR's traditional world markets began to diminish rapidly in the face of intense and successful Japanese competition. By 1980, employment in the British plant was down to 820 people, with strong rumours that the plant was scheduled for closure.

By the time of the launch of EFA in 1990, however, the fortunes of the British subsidiary had turned around dramatically with NCR (Dundee) having become the *world leader* in its market. This position has been maintained in a fast growing market in which product innovation has been a key factor. During this period the Scottish company won national and international recognition for its achievements in exporting and plant management (Kotter, 1995;Wheatley & New, 1997). Currently, the Dundee plant employees some 1500 managers, design and development engineers and assembly workers.

In 1997, however, a change in (US-driven) corporate direction towards a "solutions" strategy resulted in significant outsourcing and in the recent sale of manufacturing facilities. These moves have had a clear impact on the Dundee plant, who remain one of the few integrated design *and* manufacturing operations in the NCR corporation. Following these changes in strategy, a general air of uncertainty has pervaded the Dundee plant. Moreover, for the first time since 1980 and despite record order books and production, 200 hundred redundancies out of a total headcount of 1500 employees were announced in March, 1998, following decisions to outsource aspects of production in Dundee. This discussion of the nature of the EFA programme and its contextual embeddedness has important implications for the state of psychological contracts in the Dundee plant at the present time. So, following our conclusions from the literature review, we have sought answers to the following questions of our case study data:

Question 1 During the context of growth and job security (1990-early 1997), did the EFA programme lead employees to perceive that they were being treated fairly in relation on career development and were these perceptions an important influence on employees' psychological contracts?

Question 2 During a context of growth and high job security (1990-early 1997), did the EFA programme have a positive impact on employee trust in management and key outcomes of the psychological contract such as job satisfaction, organizational citizenship and motivation?

Question 3. During the current periods of insecurity (1997-98), did EFA have a reduced impact on employee perceptions of fairness, trust in management and key outcomes of the psychological contract such as job satisfaction, organizational citizenship and motivation, and

Question 4 Have employees in NCR adjusted to perceptions of job insecurity and feelings of powerlessness through increased cynicism and by engaging in a more transactional form of relationship?

The Data

The research is essentially a retrospective account of work that has been conducted intermittently over a four-year period between 1994-98. We have drawn on three sets of data collected between 1993 and 1997. First, we undertook an interim survey of participants on EFA in July, 1995 to assess the programme and its effects on key HRD objectives, including commitment to the company and its impact on careers. Second, primary interview data were collected during the Spring of 1998. These data were collected from twenty semi-structured interviews with employees and their managers drawn from different departments, occupational groupings, levels and stages in their respective careers to capture *maximum variety* of experiences (Miles and Huberman, 1994). Third, we have also used secondary data from in-company surveys that are conducted every six months. These data provide a quantitative account of changes in key elements of employee psychological contracts during the period 1993-97. Thus, we were able to track changes in *inputs into psychological contracts* such as employee perceptions of the involvement climate, job security and the company as an employer. We were also able to assess the changing state or *content of psychological contracts* by using proxy variables for fairness and trust such as recognition from management for doing a good job and the extent to which employees feel valued by the company. Finally, we could assess changes in key measures of *outcomes of psychological contracts* such as individual job satisfaction and overall satisfaction with the company.

The Results

Our first question was aimed at assessing employee expectations on career development and the extent to which these had been satisfied during the context of job security and growth. As our literature review has shown, these expectations are an important influence on perceptions of psychological contract breach.

The Impact of EFA on Expectations of Career Development.

The 1995 survey data showed that participants on EFA programmes were positive about career development in the company with nearly 40% of respondents changing jobs or been promoted since completing their EFA courses. Moreover, of that 40% nearly three-quarters claimed that EFA had been a contributory factor in securing promotion. Respondents were also asked how successful their EFA courses had been in achieving their career development aspirations. Nearly one third of respondents attributed part of the career development to EFA with a further 10% prepared to believe that it might be a future contributory factor.

The interview data conducted in 1998 were broadly consistent with these earlier perceptions. Although there were variety of reasons given for undertaking an EFA programme, the most common response was for some form of self- development. However, most interviewees also saw education as providing the means to either upward promotion or to a sideways change in their job.

The longer-term attitude survey data on training and development (covering the period 1993-97) provided some inconsistent data. On balance, however, it showed that respondents felt that the company had encouraged skill development and that staff in the plant had been given enhanced opportunities to develop their skills between 1993 and 1997.

In summary, the impact of EFA on expectations of career development was positive and these expectations were broadly being met by the EFA programme.

The Impact of EFA on the Outcomes of Psychological Contracts in the Plant during 1993-97

Our second, third and fourth questions concern the impact of EFA on the outcomes of psychological contracts and the influence of context. During the earlier period of job security between 1993-97, the data from the 1995 survey showed that EFA had a positive impact on key elements of employees' psychological contracts. For example, employees reported EFA as having a significant impact on their view of the company as an employer and was also more inclined to make them stay with the Company.

Three years later, however, our interviews raised some questions about psychological contracts in the plant. A number of interviewees expressed views that were indicative of an emerging transactional contract, with stress being place on how the programme made them more employable externally. Thus although most interviewees saw NCR as a fair or good employer that treated people consistently, only a few saw EFA has having made them any more favourably disposed to NCR than previously (admittedly from a high base). Furthermore, in response to questions concerning what they actually gained from participating in EFA, employees cited three main benefits all of which related to their own feelings of self worth, development and features not directly connected with knowledge and skills acquisition.

1. EFA as compensation for dull jobs,
2. EFA as personal development, and
3. EFA as group development

These qualitative data were broadly in line with the survey results of the whole workforce comparing 1993-97. Thus, by 1997, certain key aspects of employee perceptions of the psychological contract were significantly less positive than in 1993. The main areas of concern expressed by employees were:

i. There seemed to be less faith in colleagues' ability to cooperate to get the job done.
ii. Unconvinced that clear and well documented policies and procedures were in place to deal with inappropriate behaviour
iii. Less satisfied with the company and their job.
iv. More negative about the company as compared to other companies as an employer.

Even where the results of the comparison between the two period were positive, such as involvement in decision making, the data gave no impression that the Company had done well in this regard. This finding was supported by the interview material, which implied that opportunities for involvement were not meeting employees' expectations.

These results described in the previous paragraphs raise the question of whether the context of uncertainty and insecurity had begun to affect the psychological contracts in the plant. Certainly, the results of the question on job security showed a dramatic and understandable decline between the two time periods. Consequently, we would have expected this feature of the psychological contract to have a marked negative influence on virtually every other aspect of company policy and practice. The survey data on the whole workforce shows the predicted negative influence of job insecurity appears to have been borne out, with the exception of a significant improvement in two key areas, i.e. in the area of *career development* and in the *involvement climate*. Such a finding, we believe, allows us to speculate on the positive long-term influence of EFA on *trust relations* in the Dundee plant. In short, our belief is that EFA has had a strong compensating effect. Thus, we argue, had it not been for EFA (in combination with other HR policies), it is likely that employees (particularly those that participated in the programme) would have held even more negative perceptions of the company and of their future with it. At least in the areas of career development and involvement, employees saw the company as continuing to deliver the old deal. This speculation is supported by the interviews with EFA participants. Although most interviewees felt less secure at the present time because of the uncertain future of the Dundee plant, in general these feelings did not appear to influence their attitudes to the company, with only a minority feeling more negative than before.

Discussion

To-date most of the interest and research on life long learning has focused on government policies and educational provision and little, if any, systematic research has been undertaken on organizations that have well-developed programmes in place. The data from the case generally show that the programme has had a positive influence on career development and psychological contracts during the period of study. This was even so during the current context of uncertainty and job insecurity.

Concerning our first question on the relationship between EFA and perception of fairness on career development, the quantitative and qualitative data strongly supported the conclusion that EFA had a positive influence on employee perceptions of career development. To a lesser extent, because we only have interim data, they also support the association between participating in EFA and internal movements and transfers within the company. The second question focused on the relationship between job security, EFA and the psychological contract. In this connection, EFA was found to have had a marked positive influence on employee psychological contracts, in that it had helped create commitment to the company, caused employees to see the company as a fair employer and also give them a sense of self-worth.

The third question explored the relationship between the context of job insecurity and perceptions of trust and key outcomes of the psychological contract. Here, we can conclude that EFA had remained an important symbol of the old deal and a signifier to employees that they had a long-term relationship with a "good employer." In contrast to nearly every other aspect of employee perceptions about the company and their relationships with it, career development was seen in a positive light. Indeed, we believe that the data show – and our subsequent discussions with mangers support this assertion - that promises kept on EFA have helped mitigate the potentially damaging effects of redundancies and uncertainty about the future of the Company. Our fourth question concerned the move to more transactional forms of relationships and the consequences of these for future organizational change. Our data in these areas are not robust but are indicative that job insecurity has led to employees beginning to perceive a breach of the old deal by the company and to the emergence of transactional contracting by employees in their attitudes to EFA. As might be expected, employees were beginning to stress benefits that were more connected with external employability and as compensation for what they were unable to get from working in the company.

Our overall conclusions and speculation are in line with the recent arguments of Herriot, Hirsh and Reilly (1998) and the findings of Tsui, Pearce, Porter & Tripoli (1997) discussed previously. We believe that one of the strongest benefits that the programme has brought to this organization is the high trust response from employees in the company, even under conditions of adversity. Although morale and overall satisfaction with the company is currently low, employees still see themselves as being treated fairly, especially those who have taken advantage of EFA courses. Moreover, employees have not resisted the current changes through taking industrial action, even

though they would have been strategically placed to do so due to booming order books. Indeed there is every sign, according to HR staff and union officials, that they have co-operated with the changes being put in place. However, we believe there are strong warning signs that the trust dividend reaped through a programme like EFA may be diminishing. The data suggest that employees are focusing more on the employability aspects of EFA, which in tight labour market conditions may lead them to use education as a passport out of the organization (Cappelli, 1998). Perhaps more importantly, we speculate that any significant move towards more transactional contracting by pruning EFA may create a downward trust dynamic that will make organizational change more difficult to achieve. This is particularly likely to be so, as a number of studies have indicated (Haskell, 1998; Huemer, von Krogh & Roos, 1998; Nonaka & Tageuchi, 1995), when a company relies on knowledge creation and on the build-up of intellectual capital for its global market leadership.

Comparing International HRD Practices and Experiences With Cross-cultural Theories and Research: A Case Study of the Office for National Statistics

Dana Bourland
University of Minnesota

Darren Short
Office for National Statistics, London,

In this paper, the authors report on the experiences and practices of a small-scale international HRD provider and compare them to cross-cultural HRD theory. This case study highlights the importance of cultural issues to international HRD, identifies steps to bring international HRD organizations into line with theory, and raises issues for advancing those theories based on practitioner experiences.

Keywords: International HRD, Cross-Culturual Theory, Case Study

The setting for this study is the Office for National Statistics (ONS), a public sector department of the British government responsible for the collection and analysis of most official statistics as well as for the registration of births, deaths, and marriages, and the ten year population census. The Human Resource Development (ONS HRD) team consists of 27 internal HRD trainers and consultants who provide a wide range of leadership, management, computing, statistical, and general skills training and consultancy in addition to supporting other employee development initiatives.

Research Problem

Since 1995, ONS HRD has been involved in projects with statistical organizations in other countries with funding from the UK and European Union development aid budgets. This involvement began with a Bulgarian management development program, and was expanded in 1996 with a major program, on-going, to provide leadership and management training in the Hungarian equivalent of the ONS. A similar program in Slovakia followed, as well as work with the Ukraine and Russia. At the time of writing, further work was being arranged in Europe, as well as Asia and Africa.

As ONS HRD's international workload expanded into new countries, its senior management became increasingly interested in the need to offer a professional service to match other potential providers. Professional service in this instance was defined, in part, relative to perceived best practice as informed by HRD theory. Although this practice-based research was stimulated by the need to improve HRD effectiveness, ONS HRD managers were keen to also contribute to the theory-research-development-practice cycle (Swanson, 1988) by informing the development of HRD theory. The research problem was therefore defined to identify how existing international HRD experiences and practices at the ONS compared with best practice in cross-cultural consultancy, and to draw conclusions about the changes needed to those practices and the implications for advancing theories.

Theoretical Framework

The most frequently cited theories on culture are those of Hofstede (1980), the Halls (1990), and Trompenaars (1994). In addition, a large number of other published works have described research and reflective practitioner accounts either on the culture of a single country or on the general topic of cross-cultural consultancy and international HRD. A literature review of books and articles led to a clustering of content into the headings of: national cultures and their differences; the influence of national cultures on organizational culture; the suitability of Western HRD for application in other cultures; and the implications for HRD consultants. Each are addressed here in turn.

The published literature contains many definitions of culture, all rather close in meaning to Hofstede's, "culture is the collective programming of the mind that distinguishes the members of one category of people from

Copyright © 1999 Darren C. Short

those of another" (1980, p. 25). One natural grouping of people is at the national level where certain behaviors are favored and others repressed, and the norm for a society is the most common and generally most acceptable pattern of values, attitudes, and behavior (Adler, 1991). Those patterns of values, attitudes, and behaviors are then disseminated to new members by symbols and artifacts (Kroeber & Kluckhohn, 1952, cited in Adler, 1991), and are manifested through characteristics such as communication and language, dress and appearance, food and feeding habits, time and time consciousness, rewards and recognition, relationships, values and norms, sense of self and space, mental process and learning, beliefs and attitudes (Harris & Moran, 1979). When combined, these factors create distinctive national cultures which most likely contain sub-cultures, including regional, occupational, educational, ethnic, religious, gender, and age-group cultures.

Several authors have sought to define the dimensions along which national cultures differ. For example, Hofstede (1980) identified four major dimensions of culture: power distance, uncertainty avoidance, individualism, and masculinity; and to those Hofstede (1991) later added long-term orientation. Hall and Hall (1990) also illustrated how cultures differ according to the four basic principles of cultural interfacing: space, time, information flow, and context. Trompenaars (1994) examined how cultures differ in relationship to time, other humans, and towards nature.

In Eastern Europe, national cultures have been influenced by the common heritage of adhering to a totalitarian form of government (Harris & Moran, 1979), although several authors warn of assuming that national cultures are therefore the same. Hungary, for example, was considered ahead of other Eastern European countries in terms of market orientation (Czaban & Whitley, 1998), and since 1989 differences in policies as well as changes in structural and economic positioning have amplified differences between countries (Estrin & Peiperl, 1998). Consequently, such countries cannot be viewed has having similar, nor static, cultures.

At a level below national culture, organizations have their own culture and sub-cultures (Schein, 1985). Some of the differences between organization cultures are due to the effects of national culture (Adler, 1991) as evidenced from the same problems being addressed using different means in each country (Trompenaars, 1994, DiStefano & Lane, 1992), the different operation of human resource management within national cultures (Sparrow, Shuler, & Jackson, 1994, cited in Tregaskis, 1998), and different experiences and understanding of common organizational terms such as authority, bureaucracy, and accountability (Harris & Moran, 1979). Wigglesworth (1995) also noted the influence of such factors as national values, perceptions, cultural heritage, unique ways of doing business, behavioral customs, and the processing of information.

In Eastern Europe, where ONS HRD does all of its existing international consultancy, organizational cultures have also been affected by problems in recruiting sufficient qualified employees (Estril & Peiperl, 1998), the challenges of transition from state-ownership (Cseh, 1997), the need for innovative management development approaches (Cseh, 1997), and the need for adapting theories and methodologies across cultures (Santalainen & Taino, 1984).

As a consequence of national culture and its impact on organizations, there are significant issues for HRD consultants working outside of their own culture. Some deal with the appropriateness of applying US American organization and management theory in other countries, and specifically the need for adaptability of content, systems, and practices (Adler, Campbell, & Laurent, 1989, Tregaskis, 1998). Others deal with the need for HRD consultants working outside of their own culture to be aware of: the cultural values and assumptions inherent in HRD (Sorensen, Head, Johnson, & Mathys, 1991), knowledge of the visited culture (Harris & Moran, 1979), and knowledge of their own culture (Wigglesworth, 1995). That is in addition to consultants requiring other competencies viewed as fundamental for working in other countries, such as the understanding of others, tolerance of ambiguity, interaction skills, and persistence (Wigglesworth, 1995).

Research Questions

The research problem was to identify how existing international HRD experiences and practices at the ONS compared against best practice in cross-cultural consultancy as suggested by theory and research, and to draw conclusions about the changes needed to those practices and the implications for advancing those theories. The theoretical framework identified several key aspects of best practice on the need to adapt HRD content and processes, develop international competencies, and identify local business etiquette. The research was therefore designed to answer the following questions:

- What was the existing level of awareness of cross-cultural HRD issues among ONS consultants, how were cultural competencies developed, and how was the utility of international HRD and cross-cultural theories perceived by those consultants?
- What processes were in place to adapt ONS HRD course content, HRD processes, and trainer behaviors to suit host countries, and what were the roles of the various parties (ONS HRD, funding agencies, host countries) in assessing the suitability of, and adapting, the content, processes, and behaviors?
- What had been the experiences of ONS HRD consultants during international work (including identifying critical incidents) and could those be understood through the theoretical framework?
- What changes to the existing ONS HRD practices were suggested by the theoretical framework?
- What lessons from ONS experiences offer opportunities for advancing HRD understanding?

Research Design

As Torraco (1997) stated, "case studies, more than other methods of study, allow researchers to focus specifically on a phenomenon of interest, and they offer the greatest potential for revealing the richness, holism, and complexity of naturally occurring events" (p. 130). Even though this research was seeking to provide information to improve the effectiveness of one specific HRD team, the researchers wanted to use case study methodology to design an instrumental study (Stake, 1994) so as to understand the issue of international HRD and help advance theory.

Qualitative research methods were used given their suitability for exploration and discovery in times of emerging realities, and rapid and fundamental change (Swanson, Watkins, & Marsick, 1997). Interviews were preferred to questionnaires given the small number of consultants involved, the ease of access to them, the potential to explore answers in depth, and the past success of interviews in the organization. Observations were not possible given the cost of attending international courses and the timing, which did not coincide with course delivery. Organization records studied were: course programs and materials, evaluation reports, and reports of visits made by senior ONS consultants to Hungary and Slovakia. As it happened, those documents were useful preparation for the design of interviews but provided relatively little information when compared with interview evidence.

Interviews were arranged with representatives of three groups: funding agencies (three interviews with the UK's Department for International Development, the Training for European Statisticians project in Luxembourg, and the European Commission); ONS HRD consultants (six interviews, three with the most experienced consultants and three with a sample of the six other consultants selected to cover different levels of experience); and other ONS staff with recent international consultancy experience (three interviews with consultants, all of whom had provided statistical training advice to countries in which ONS HRD was yet to work but where contracts were possible in the future).

Semi-structured interviews were used whereby all interviewees were asked the same set of core open-ended questions, although in a conversational format so that not all interviewees were asked questions in the same order. Those core questions were designed around the research questions, in addition to those on their backgrounds and relevant experience. Three separate lists of additional questions were used for interviews with those from funding agencies (dealing with their role), ONS HRD consultants (dealing with HRD-specific issues and experiences), and other ONS consultants (dealing with issues specific to the countries they had worked in). In addition to core questions, the interview structure allowed sufficient scope for additional probing, which mainly occurred to explore examples of critical incidents (stories from practical experience).

All interviews were completed by the same interviewer in September 1998, and were recorded on audio-cassettes. Interviews were listened to again by the interviewer, key points transferred onto a word processor file, clustered for analysis under research question headings, and a chronological chain of evidence created to order data (Swanson, et al, 1998). The authenticity of the data analysis was verified through feedback to informants (by interview and draft written reports), which also provided additional information on the meaning of outliers and guided the correct weighting of evidence. The literature review on international HRD was also re-visited and expanded slightly at the analysis stage to provide a deeper understanding of emerging themes (Marsick and Watkins, 1997).

Results and Findings

Awareness of Cultural Issues, Development of Cultural Competencies, and Perceived Utility of Theories

The interviews identified considerable enthusiasm for international HRD within the ONS team and a desire for continuing learning from experiences. However, very few interviewees knew of cross-cultural theories, and some expressed doubts about how theories could benefit their work. For example, the view was expressed that the need to address cultural differences was reduced considerably by offering mainly process models.

There was a strong focus on developing competence through experience, and in that way the most experienced consultants had developed a good awareness of practical cross-cultural issues which they then sought to share with the less-experienced through oral briefings and a practice of pairing experienced and inexperienced consultants for international projects. Nevertheless, awareness of cultural issues varied considerably between consultants depending on the nature of their experiences and the thoroughness of their subsequent reflection, and was affected by the unsystematic way in which cross-cultural knowledge was disseminated within the team. Apart from the most-experienced consultants, interviewees reported little preparatory work on the culture of an assisted country prior to visits, and one less experienced consultant commented that s/he, "went abroad appreciating it would be different but was completely unprepared for how different it turned out to be." Preparation for the more experienced consultants was more thorough, although it concentrated on the visible components of culture, and they relied more on experience in the country to develop any deeper understanding.

Processes to Adapt Course Content, HRD Processes, and Trainer Behaviors

As a consequence of experience-based learning, cultural consideration within the consultancy team focused on the practical and the visible. In adapting processes and content, the emphasis was therefore placed on translation, logistics of working in other countries, obvious differences in business approach, and coping with less participative training than would be the case in the UK.

Work to adapt material to address less visible components of culture was reported to be achieved through a lengthy period of discussions between senior HRD consultants and representatives of international organizations. Those discussions considered the suitability of particular material and its match to the values of assisted organizations. Although there was no evidence that the process was theory-based, the outcome was reported as being well-received by the assisted organizations suggesting a good degree of effectiveness achieved by the practice-based approach to international competence development within the team. Documents also provided evidence of very positive reactions to the training in every country, and further evidence of obvious learning transfer.

Funding agencies and aid co-ordinators were interviewed to explore their role in the adaptation process. Their responses suggested a solid practitioner-based grounding on the importance of cultural issues, the need to adapt material, and the different cultures within Europe. However, they reported themselves as being poorly placed to discuss specific HRD cultural implications, leading to their view that consultants should have that responsibility.

Experiences during International Consultancy and their Relationship to the Theoretical Framework

The interviews identified many examples of where culture had affected the HRD content or process. Here are ten, offered to illustrate the variety of experiences and to provide the article with practical 'color'. Their relationship to the theoretical framework is explored in the conclusion section.

(a) Language - one consultant commented that, "the scary thing about working abroad was the language... I was not prepared for its impact... I could not read body language nor pick up on tone of voice." Those interviewed reported how using interpreters reduced the amount of deliverable content and introduced doubts about the accuracy of information received by trainees. Several estimated that they covered around two-thirds of what could be achieved with a British audience. Consultants also spoke about problems in translating such words as cascade, stakeholder, and leadership.

(b) Availability of local trainers - the original intention had been to transfer, through a staged process, the training program to internal trainers of the host country. However, neither the Hungarian nor Slovakian organizations employed trainers and instead added training work to job descriptions of already busy employees who lacked a knowledge of management theory and felt somewhat uncomfortable with participative training techniques.

(c) Training style - Eastern European managers were accustomed to a lecture-style of training either in a large group seated 'theater-style' or smaller groups seated around meeting tables. The British trainers were accustomed to 'U-style' seating without tables, and some found the setting in Eastern Europe daunting and less suited to encouraging participation and openness.

(d) Perceived need for management training - it was reported that attitudes varied among senior managers, mainly according to their past experiences. Some lacked any experience of management training and had problems with the concept and the need - a situation found rarely in the British public sector.

(e) Ways of doing business - ONS consultants reported several shadowside issues (Egan, 1993) including: the role of tribes as a hidden hierarchy in Kenya; the lack of openness or desire to be critical of senior management in some Eastern European situations; the need to relate personally with officials rather than relying on formal authority or systems in Botswana; and the difference between the British working day and practices in some other parts of Europe.

(f) Greater satisfaction for trainers - according to several consultants, "participants in the Eastern European programs were generally extremely positive about being involved, and displayed far more enthusiasm than British managers attending similar courses."

(g) Humor - several interviewees spoke about the significant role played by humor in the British training room and problems in using it in other countries. One interviewee highlighted potential problems: "The different sense of humor was hard - some jokes were not laughed at. I told one story, tried to be funny, but it may have offended some. I learned to be very careful with humor."

(h) Similarities between professional statistician participants in each country, many of whom were reflective learners (Honey & Mumford, 1986) interested in detail more than the big picture, and with issues around combining manager and statistician roles. Interviewees reported that the professional statistician culture appeared to have a strong influence across national boundaries.

(i) Generation differences - interviewees reported the younger managers as having better spoken English, being more enthusiastic of Western management theories, and being less skeptical of the help offered through the consultancy compared with some of their older more senior colleagues.

(j) Value differences - several interviewees spoke of observable differences in behavior due to apparent value differences, most notably on political correctness as defined in Britain. On one occasion, "such differences caused embarrassment for us and we were uncertain how to react."

Changes to Existing Practices Suggested by the Theoretical Framework

The interviews suggested that the ONS consultants had developed an effective operational level of cultural skills and awareness through practical experience, and interviews combined with documentary evidence suggested successful outcomes from the design and running of international programs. The evidence also suggested that some of the ONS experiences could have been anticipated from the theoretical framework (thus saving time), and also that the informal and incidental learning processes could be usefully supplemented by formal systems informed by the theoretical framework. The particular areas for development were:

(a) Increasing the value placed on cross-cultural HRD theory within the team - the current level of theoretical knowledge, and the perceived utility of such theories, were mixed. Supplementing reflective practice with theory offers a means to avoid potentially costly mistakes, particularly when preparing to work in a country for the first time.

(b) Introducing a systemic, systematic, theory-based process for the cultural reviewing of HRD processes and course material - current adaptation steps are based on past experience in other countries (assuming few effects from different national cultures), from experiences in the assisted country (possibly resulting in issues emerging during program delivery), and from discussions with the assisted country during program development (assuming clients are well placed to judge the suitability for their culture of material and processes).

(c) Introducing a formal, systematic approach to training and developing international consultants and sharing cross-cultural knowledge within the consultancy team, and increasing consultants' knowledge of cross-cultural HRD theory. Current approaches offer international experience over several years, supplemented by informal sharing of knowledge and experiences within the team. Development can therefore be slow and unreliable.

(d) Identifying sources of cultural information on the countries consultants plan to work with - one problem with being an occasional international provider is that experiences are limited and fewer in number and variety than in a large organization specializing in international consultancy.

(e) Developing a clearer understanding with funding agencies and aid coordinators of where responsibilities lie for assessing the cultural implications of requests for HRD support, offers of HRD help, and the delivery of HRD services. Currently, too many assumptions are made that others are assessing projects for cultural issues.

Opportunities for Advancing International HRD Understanding

The research provided some specific practitioner examples to supplement existing theories, and in doing so identified two areas where further research could advance theories to the benefit of practitioners. Those areas were:

- the need for information on the relative influences on organizational cultures of: national cultures; sectoral cultures (e.g. public or private); professional cultures (e.g. statisticians, accountants, lawyers); multi-national organizational cultures (i.e. the influences of a foreign head office with a strong corporate culture); tribal and other sub-cultures; and generational cultures (which were more noticeable in Eastern Europe more than in Britain);
- the various costs, in time and precision, of training through interpreters.

Conclusions

In the case study, the authors looked to identify how ONS HRD international experiences and practices compared with best practice in cross-cultural consultancy, and to draw conclusions about the changes needed to those practices and the implications for advancing the theories.

Through interviews with consultants and a study of records, the authors determined that ONS HRD had run successful training programs in Eastern Europe, as perceived by clients, where there was documented evidence of training transfer. The success of those programs had been achieved based on little knowledge of cultural theories, and instead by applying learning from experiences and using informal systems for sharing experiences between consultants. That success highlighted the effectiveness of a 'learning by doing' approach, although discussions on consultants' experiences also highlighted negative consequences. Firstly, consultants can take a long time to develop a satisfactory level of knowledge and skills on international HRD, which may affect their performance and confidence. Secondly, the approach relies on consultants reflecting on their experiences systematically and critically, and the degree of such reflection varies between consultants. Thirdly, it requires a systematic process for sharing learning among consultants, and an informal or unsystematic process will be less effective. Finally, it will likely produce knowledge of international HRD focused on more visible components of culture (e.g. language and ways of doing business) rather than on such components as individualism or a particular temporal focus, and that limited focus could influence the effectiveness of steps to adapt content and processes.

Based on these findings, the authors concluded that ONS HRD would benefit from making a number of changes to their practices, including by: seeking ways to increase the value placed on, and use of, HRD theories; introducing a systematic, theory-based process for the cultural adapting of content and processes; and introducing a formal systematic approach to training international consultants and for sharing learning within the team. The authors argue that these findings would be applicable to other international HRD providers whose current approach matches that of the ONS.

In addition to examining ONS practices in the light of HRD theories, the authors also examined theories in the light of ONS experiences, and found a clear link in the areas of: the need to adapt HRD content, systems, and practices; addressing different understandings of organizational terms; dealing with unique ways of doing business; and the need for consultants to develop a knowledge of cultural values and assumptions in HRD, a knowledge of values and assumptions in their own culture and that of visited countries, and developing their understanding of others, tolerance of ambiguity, interaction skills, and persistence. The ONS experience also supported existing research on the nature of the challenges facing Eastern Europe.

The ONS experiences also identified several issues not covered by the literature review, or which emerged with greater significance than expected: the influence of the statisticians' professional culture on the cultures of statistical organizations; the costs of interpretation in terms of the reduced amount of content covered and doubts on accuracy and precision; the enthusiasm of the audience; the lack of a basic understanding in some senior managers of the need for management training; and the problems transferring training knowledge and skills over to assisted organizations that lack experienced trainers. The authors felt that practitioners would benefit from the results of further research into the many influences on organizational cultures and the impact of training through interpreters.

To conclude, the case study produced evidence from the experiences of a small international HRD provider to support the practical utility of international HRD theories, and illustrated how those theories can be used to suggest improvements to international HRD practice. The evidence also identified areas where further research would be useful to practitioners.

Management and Career Development in the UK in Practice

Paul Iles
Liverpool John Moores University

Longitudinal data on changes in UK management and career development (MCD) since 1987 are presented, and an open systems model of MCD in the UK discussed. The determinants of the amount of in-company management training, its impact on the organization, and the degree to which it has achieved its objectives are identified as well as the determinants of the priority given to MCD. Evidence is also presented of the changing roles and responsibilities in managerial career development.

Keywords: Managerial, Career, UK

In 1986 and 1987, three influential reports into the education, training and development of British managers were published, each identifying major weaknesses in the system of management development in the UK, especially in comparison with its major competitors (Mangham and Silver 1986, Constable and McCormick 1987, Handy 1987). Implications for Britain's economic efficiency and relative economic decline in the 20th Century were noted, and an ambitious agenda for improving the management development system in the UK developed. However, despite a plethora of Government reports and initiatives (eg National Training Targets, National and Scottish Vocational Qualifications, Investors in People) and several small - scale studies, we lack a picture of the current state of play in management and career development (MCD) in the UK a decade on from these reports, and whether the quantity and quality of MCD has improved. We also lack a theoretical framework, based on empirical research, as to the organizational processes by which MCD takes place in organizations. This paper seeks to remedy this deficiency by providing useful longitudinal data on changes in British MCD in the last 10 years, and by developing a model of organizational MCD which seeks to identify causal relationships among the elements of the MCD system.

Theoretical Framework

There are a number of explanations for Britain's poor progress in MCD up to the 1980's (eg. Thomson 1999). Factors often cited include the late split between ownership and control, the status of managers, the links between the technical and managerial functions, the slow development of a managerial professional identity, the assumptions that managers were born, not made, and the consequent lack of linkage between education and training for managers. A number of events in the 1980's led to a greater interest in MCD (eg the recession, company turn-arounds, increasing government interest, increasing University activity in MCD).

Some models of MCD have tried to relate it to corporate strategy, using concepts such as 'fit', integration or maturity (eg Guest 1997, Garavan 1991, Burgoyne 1988). However, there is a need to move beyond existing descriptive or prescriptive models by building on the analysis of Pettigrew et al (1988) which identified several factors as likely to stimulate HRD activity: the ability to manage increased complexity, internal labour markets with open career structures, HRD aiding recruitment, and a context where internal actors and systems favour an integrated approach to recruitment, learning and career development. Conversely, factors inhibiting HRD included preoccupation with immediate tasks, a lack of background qualifications, and training perceived as a low status activity. This paper presents an 'open systems' model of MCD identifying inputs (eg structure), processes (eg policy), outputs (eg quantity of training) and outcomes (eg impact on organization).

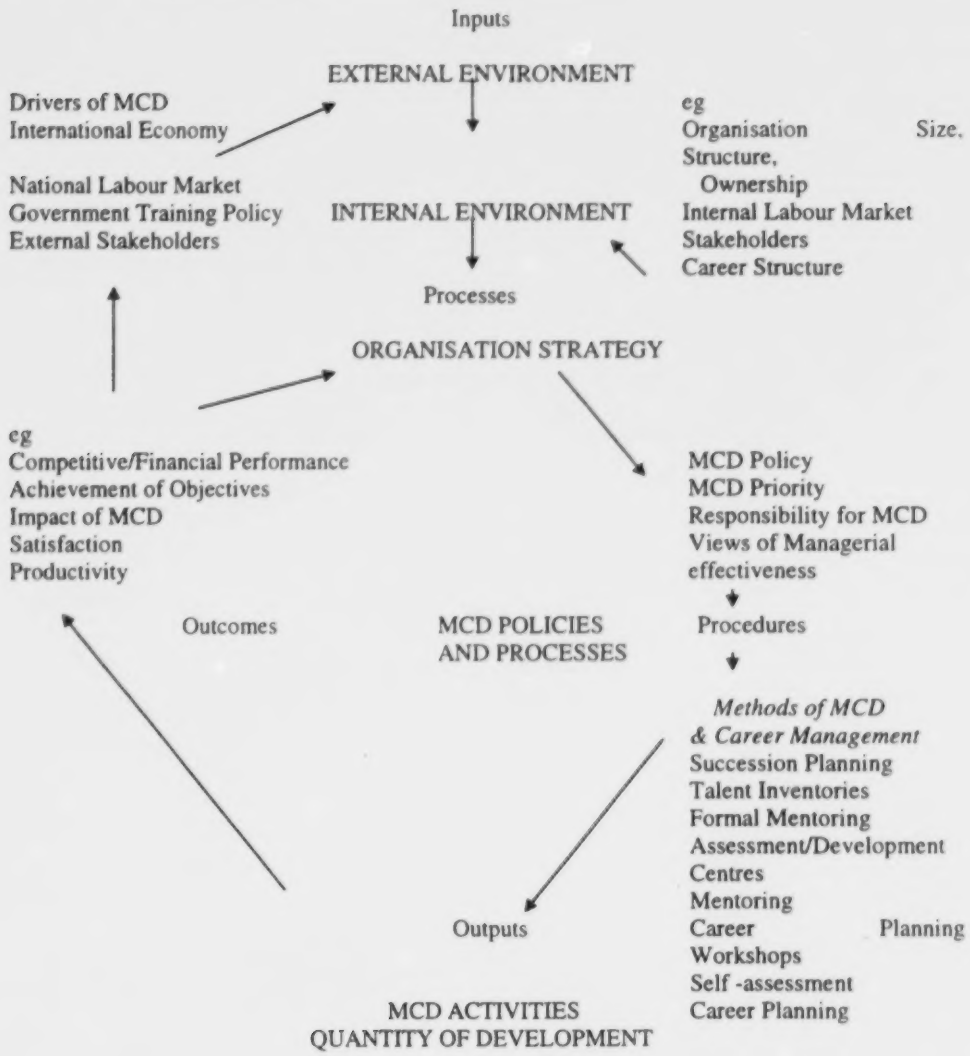
Figure 1. A Model of Management and Career Development



Research Questions

There are a number of questions which need to be asked about MCD in the UK, including:

1. How has MCD in the UK changed since 1986 / 1987?
2. What is the relative importance of environmental, structural and policy factors in explaining the quantity and impact of MCD activity in the UK?
3. What is the relative significance of the various 'drivers' of MCD in the UK?
4. Is there evidence that organizations in the UK have abandoned responsibility for managerial career development, making it an entirely individual responsibility? In other words, is there evidence of 'cellular' or 'protean' careers, as discussed by Allred et al (1996)?

Methodology

A series of large scale surveys of MCD in the UK have been conducted in 1996 and 1997, summarised in Thomson et al (1999). Here we will only report on :

(a) A 1996 telephone survey of 501 people responsible for MCD in their organization, structured for sector and size, lasting around 45 minutes and covering around 50 questions, employing many of the same questions used in Constable and McCormick (1987) and so providing valuable longitudinal data over a 10 year period.
(b) A 1997 postal questionnaire survey of c. 8000 MBA graduates drawn from membership of the Association of MBAs, using a structured sample of 500 drawn from a 17.4% response rate (n = 1398).

The primary data have already been published as research reports by the sponsoring bodies (theAssociation of MBAs 1998 and the Institute of Management 1997). This paper will present further analyses of these data, and also focus on their implications for career development in particular (Iles 1999).

Results

- *The AMBA Survey, (b)*

Respondents to the AMBA study (Association of MBAs 1997) in general reported: low levels of satisfaction with organizational MCD, but much on-going personal MCD at all levels. Much was outside employer provision, using a wide range of learning methods, with external courses and experiential learning both rated more highly than internal courses. A great determination to pursue MCD, at all levels was reported, with respondents anticipating a variety of modes and sources, both structured and unstructured and primarily driven by the individual; MCD was seen as necessary to keep up to date in a changing environment and to broaden skills and respondents were willing to make considerable personal investments in time and money. There was a substantial demand for further MCD to be recognised, and widespread access was reported to personal development facilities but with only limited reading of managerial journals. Only a limited personal role in MCD vis - a - vis other managers was envisaged, but a considerable degree of personal mobility was reported. In terms of organizational MCD, respondents reported that considerable MCD was being undertaken even without a policy framework, as many organizations only offered weak policy frameworks (no written statement and a low priority given to MCD, with a low assumption of responsibility for it by the organization). Differences in MCD seemed more related to policy than structural circumstances, but MCD did not seem to fully reflect business strategy, though company strategy was however perceived to be the primary driver of MCD, and was associated with the presence of 'strong' MCD policies. MCD generally was seen to have failed to meet its objectives or to have a positive impact on the organization.

- *The Company Survey, (a)*

Company survey respondents took a more positive view of MCD in organizations than individual managers, reporting that priority given to MCD had increased significantly compared to 10 years ago, and was expected to increase still more. Most companies were now involved in MCD, with only 4% doing no training, compared to 50% in 1987, whilst the amount of formal training carried out averaged c. 5.5 days per manager per year, compared to the 3.1 days estimated for 1987, and the 7.3 days anticipated in the forseeable future. The balance of responsibility for MCD was now seen as involving a partnership between the individual and the company, not as the responsibility of either party alone. The main drivers of MCD were perceived to be strategic, not operational or external, but appraisal was seen to be the main trigger for individual development, and much MCD seemed tactical and short - term. MCD activity appeared to range across all levels of management, was not just reserved for high - fliers, but was most emphasised at junior managerial levels. A reasonably equal balance was reported between formal and informal training activity, as was a considerable move forward in the language of managerial competence as compared to 1987, with better defined objectives for MCD. However, few major changes in training methods were anticipated, and post – experience education and training was now ranked higher than pre - experience education in terms of what makes a good manager compared to 1987, though inherent ability and job experience were still ranked higher, as they were in 1987. In general, MCD was judged to be achieving its objectives and having a positive impact on the organization.

The picture of MCD in the UK that emerges from these two studies seems more positive than it was in 1987, and MCD appears to be growing in significance, addressing research question 1. In order to address research

questions 2, 3 and 4 and to test the model of MCD presented in Figure 1, further analyses have been carried out on the primary data collected from the company telephone survey, (Thomson et al 1998). The main dependent variable analysed here is the output variable of amount of training, as measured in days per manager per year. Each variable was tested separately, and the clusters of variables were also tested for their collective impact. Table 1 presents results from the clusters of variables only.

Regression analysis shows that the policy variables (existence of a policy statement, priority given to MCD, organizational responsibility for MCD, and views on what contributes to the development of a good manager) contribute much more strongly than external or internal structural variables or career variables to explaining variance, in that order. Of the policy variables, priority given to MCD emerged most strongly, and policy variables also most strongly predicted amount of training anticipated in the future. Priority given to MCD again emerged as the most important single variable here, along with internal variables. Satisfaction with the amount of training provided was even more strongly predicted by the policy variables, along with the internal variables. Only three perceived drivers of MCD, out of fifteen variables selected from suggestions of a panel of experts and rated by respondents in terms of importance on a 1 - 10 scale (National Vocational Qualifications, competitive activity and demand from managers), predicted the amount of training undertaken (Table 2).

* $p < 0.05$ ** $p < 0.01$ *** $p < 0.001$
(Adapted from Thomson et al 1998, p. 99).

Priority given to MCD also emerged as the dominant variable in terms of predicting the extent to which MCD objectives were achieved and the perceived impact of MCD, the outcome variables in figure 1 (both rated on a 1 - 10 scale, Table 3).

Table 3

Influencing Variables on Achievement of Objectives and Impact on Organization (Outcome Variables)

	Achievement of Objectives	Impact on Organization

* $p < 0.05$ ** $p < 0.01$ *** $p < 0.001$
(Adapted from Thomson et al 1998, p101)

Company responsibility for career development was however interestingly also strongly predictive of positive impact and achievement. The amount of training carried out predicted both whether MCD achieved its objectives and whether it had a strong impact on the organisation. A further set of analyses was undertaken to explore what

predicted the policy variables, including priority given to MCD. Priority given to MCD as a dependent variable was predicted by the career variables in particular (career structure, upward progress, and existence of fast - track, Table 4).

Table 4

Priority given to MCD in relation to external, internal and career clusters of variables.

(Adapted from Thomson et al 1998, p102)

However, the strongest predictors in terms of individual variables were the existence of a separate budget for MCD and non - British ownership of the company. The existence of a policy statement for MCD was strongly associated with the drivers of Investors in People, staff retention, support of the Board, and the importance of strategic considerations (Table 5).

Implications for Managerial Career Development

In terms of research question 4, analysis of the two surveys does not suggest that the extreme views of the 'career is dead' school can be entirely supported. If the 'career is dead' school were accurate in their view of what is happening to managerial careers, we might expect the following to be reported from individuals and organizations in the two surveys:

1. A decline in the use of career management techniques, alongside a rise in the use of career planning techniques, as depicted in figure 1.
2. A decline in those features characteristic of 'relational'/employment security contracts, such as long-term planning and diffuse obligations alongside a rise in those features associated with 'transactional' contracts, such as short time horizons and specific obligations (Iles 1999).
3. A rise in behaviour characteristic of 'career resilient' managers, such as moving quickly, showing commitment to life-long learning, taking responsibility for career development, continuing commitment to the organization, being resistant to career disruptions, showing flexibility, and displaying evidence of being networked and connected (Iles 1997).
4. A rise in 'cellular' or 'protean' career behaviours, with the individual, not the organization, taking responsibility for career development (Allred et al 1996).

1. The AMBA Study, Study b.

With the usual caveats over representativeness, this study does seem to show some evidence of 'resilient' behaviours and the use of career planning techniques by AMBA members - perhaps not surprising, given the nature of a sample highly committed to education, qualifications and personal and career development, and one in which we might expect to detect the first glimmerings of 'cellular' behaviour (Allred et al 1996). Respondents seem clearly focussed in their commitment to continuous professional development; they seem clearly networked and connected in their membership of professional associations; and above all perhaps career resilient in their commitment to life - long learning, as indicated by their responses to what makes a good manager and their aspirations to continuous development. However, there is some indication that they have not turned their backs entirely on organizational support in a purely 'cellular' or 'transactional' way. They still see the value of in-company training, albeit with a low opinion of what they have experienced. There is some indication that they see career development as moving towards a middle position, where responsibility for career development is shared between employee and employer. We might characterise this position as a 'partnership' model, and infer that the psychological contract of the AMBA respondents includes the provision of in-company training. However, this is in many cases either an unfulfilled promise, or respondents are often disappointed in the quality or relevance of what they are receiving.

Other indications of 'boundaryless,' if not 'cellular,' careers are the findings that only a minority of respondents report being appointed for a 'career' (perhaps evidence of short-term transactional contracts?), and that respondents had on average worked in 4.2 previous organizations, crossing various categories of size, sector, and employment status. In addition, they anticipated moving frequently in the future. Their overwhelming intention to pursue more MCD, driven primarily by the individual as a means of keeping up-to-date and to develop broader skills and supported by a willingness to make substantial personal commitments of time and money, is almost a text-book definition of the flexible, life-long learning, commited, career-resilient manager.

On the other hand, many managers, (especially those in large companies with a clear policy statement on MCD, where the company takes responsibility for it and where MCD is perceived to have a positive impact and to be experienced as satisfying by recipients) reported the existence of planned career structures and succession planning practices. This indicates some continuing company responsibility for career development, perhaps characteristic of a 'partnership' model as a matter of strategic choice by the company.

2. The Company Study, Study a.

The company study gives further support to the widespread emergence of a 'partnership' model of MCD in the face of the emergence of strong 'transactional' or 'resilient' behaviours and attitudes. Some company respondents indicated a strongly transactional, specific, short-term view of MCD. For example, many companies did not expect managers to stay with them, and appointed them for a job rather than a career. However, other reponses reveal a longer-term, even 'relational' focus, such as the operation of internal, rather than external labour markets, the widespread use of succession planning, the commitment to development of all managers whatever their age or

grade, the linking of development with appraisal, the expectation that many managers will spend their entire careers in the organization, and the acceptance that responsibility for MCD is to be shared equally between the individual and the organization.

In terms of the model depicted in Figure 1, it appears as if company responsibility for career development is highly predictive of MCD having a positive impact on the organization. Career variables also predicted whether the organization gave priority to MCD, especially the presence of career structures, upward progress, and the existence of fast-track career management systems. Thus it appears that if UK companies do take responsibility for managerial careers, then this taking responsibility is associated both with relatively high priority given to MCD and with MCD having a positive impact on the organization. Priority given to MCD is in turn associated with the amount of training actually carried out by companies and with the amount of training anticipated to be carried out in the future, as well as with satisfaction with the training carried out and with judgements of whether training had achieved its objectives.

It appears that though many UK managers are taking responsibility for their own career development in ways resonant of 'transactional', 'cellular' and 'resilient' managers, especially in their commitment to career planning and to continuous professional development and networking, this has not meant that organizations have simply abandoned responsibility for career development. Iles (1997) argues in favour of 'sustainable' career development, where fostering resilience is seen as in the interests of both organization and employee, and where partnership between the parties involves commitments and entitlements on both sides. These might include the individual offering high performance, life-long learning, flexibility and commitment in return for development, challenge, and enhanced marketability and employability. The organization may therefore need to provide continuing support in the form of opportunities for self-assessment, benchmarking of skills, and continuous development as well as lateral and other moves, communication on strategic direction and changes, the training of managers as career coaches and counsellors, and the provision of career and learning resource centres. Rather than seeing a move from purely 'relational' to purely 'transactional' contracts, we may see the emergence of a diversity of contracts, mixing elements of 'transactional' contracts such as high pay for high performance and the assessment of goals and the achievement targets alongside aspects of 'relational' contracts, such as a commitment to internal labour markets and to the long-term development of managers.

Limitations

The research conducted clearly has a number of limitations. It was not possible to ascertain how far the sampling procedure for the AMBA study reflected the total membership, due to recording limitations. Respondents are likely to show greater interest in MCD than non - respondents, and AMBA members neither reflect the views of all managers or even of all MBAs (a highly aspirational group). In many cases, company and AMBA respondents are probably giving impressionistic answers, lacking access to relevant records. Many organisations kept few records, and a 'corporate' view may have been ascertained. Amount of training is used as the output variable, rather than perhaps more meaningful but harder to measure variables like numbers trained with appropriate skills and competencies. Outcomes are measured in terms of perceived impact and achievement of objectives, not value - added or contribution to organisational performance. There are many other outputs, outcomes and drivers of relevance to assessing the impact of MCD than are measured in this study. In addition, informal process of MCD have been neglected in favour of a concentration on formal processes only. Thus the study must be regarded as a first step in developing a model of MCD, but goes some way to address the research questions.

Information and Feedback Seeking in U.S. and British Human Resources Development and Training Settings

K. Peter Kuchinke
University of Illinois at Urbana-Champaign

Darren C. Short
Office for National Statistics, London

This survey-based study investigated information and feedback seeking behavior in U.S. and British Human Resource Development and training settings. It involved some 400 participants at two U.S. and 3 British universities and government agencies. Using self- and other-rating forms, the results indicated differences in perception of teaching styles and source, frequency, and usefulness of information regarding performance feedback and learning objectives. The study suggests that adult learners self-regulate in learning situations to a greater degree than instructors anticipate. The study has implications for the education and training of HRD instructors and trainers and adds to the knowledge base of instructional theory.

Keywords: Feedback, Training, Instructional Theory

This study investigated a series of research questions related to information and feedback seeking (FBS) behaviors of participants in Human Resources (HR) education and training. Feedback research has been prevalent in many social science fields and is considered a core construct in areas as diverse as instructional design, training, performance technology, systems engineering, and job design. An informal survey of current HRD journals, however, has found very few empirical studies related to the topic. While the general effectiveness of feedback appears unquestioned, there is a need to explore the topic anew and, especially, from an international perspective. Further, most of the existing research has focused on the trainer or instructor, treating the trainee as a relatively passive recipient of such feedback. This study takes a very focused look at the role of the training participant in actively seeking information about his/her learning requirements and actual performance during training.

Overview of the Literature

Feedback has been the focus of research by a large number of researchers in the fields of education, psychology, and organization behavior over the past 100 years (Brinko, 1993; Kluger & DeNisi, 1996). Feedback has been conceptualized as a "special case of the general communication process in which some sender ...conveys a message...to a recipient" (Ilgen, Fisher, & Taylor, 1979, p. 350) related to some aspect of the recipient's behavior. In the organizational context, feedback is most frequently related to performance and consists of evaluative statements about to the "effectiveness of one's work behavior" (Taylor, Fisher, & Ilgen, 1984, p. 82) and in particular about the results of past behavior (Van Dyne, 1992).

Feedback research originated in classic behaviorism and stimulus-response theory (Annett, 1969) and, more recently, cybernetics or control theory where knowledge of the results (KR) of one's behavior is seen as useful in regulating subsequent action. Feedback is seen as crucial for the functioning, maintenance, and adaptation of social systems, whether at the individual, group, organization, or societal levels because it provides information about the system's current state compared to some standard (Taylor, Fisher, & Ilgen, 1984). Without feedback, goal attainment would be improbable and action haphazard and random. Feedback is generally considered to improve performance and thus constitutes an important organizational and individual resource (Ashford & Cummings, 1985; Campbell & Campbell, 1988). A recent meta-analysis of feedback research by Kluger and DeNisi (1996), however, revealed important exceptions to the widely shared assumption that feedback consistently improves performance. Feedback interventions (FI), according to these authors, "have highly variable effects on performance, such that in some conditions FIs improve performance, in other conditions FIs have no apparent effects on performance, and in yet others FIs debilitate performance" (p. 254). Most of these moderating conditions are poorly understood and point to the need for continued research efforts on feedback despite the long history of feedback research. Moreover, recent reviews (for example Kluger & DeNisi, 1996; and Van Dyne, 1992) emphasized the

Copyright © 1999 K. P. Kuchinke

multidimensional and multipurposive character of the construct and have called for renewed research efforts to deepen our understanding of this important topic.

The concept of feedback is closely linked to the notion of learning and therefore critical to the field of Human Resource Development. In a behavioristic frame, feedback provides information about the appropriateness of various courses of action in a trial-and-error mode. Leaders in organizations provide employees cues that reinforce or extinguish certain behaviors through a variety of rewards and sanctions, such as raises, promotions, desirable job assignments, and positive or negative performance evaluations. Successful training programs incorporate feedback as an instructional design element (Goldstein, 1993; Kowitz & Smith, 1985; Viau & Clark, 1987) to increase learning during training and increase the transfer of training (Schoenfeldt, 1996). A large number of research studies have addressed feedback in training settings. Most of these studies are experimental in nature and have addressed issues as diverse as the effects of feedback on self-efficacy related to the training task (Karl, O'Leary-Kelly, & Martocchio, 1993), transfer to training (Phye, 1991; Schroth, 1997a; Schroth, 1997b), achievement of training outcomes and motivation (Quinones, 1995), attitudes toward the training content and group members in cooperative teams (Archer-Kath, Johnson, & Johnson, 1994), and the effects of feedback during training for dangerous task performance (Kleinan, 1988).

Consequently, a voluminous literature exists related to the practice of using feedback during the instructional process to improve training and education. Among the more recent journal publications are guidelines for industry trainers (Viau & Clark, 1987), for supervisors providing in-service staff training (Parsons & Reid, 1995), and for college and university instructors (Dunkins & Precians, 1992; Brinko, 1993).

Most of the research, however, focuses on the antecedents, processes, and outcomes of providing feedback, while comparatively little attention has focused on the issue of information and feedback seeking. The shift from feedback giving to feedback seeking behavior (FSB) constitutes a conceptual and paradigmatic shift in focus that has renewed vigor and interest in an old concept. Rather than viewing the employee as a passive recipient of feedback provided by others, the FSB perspective posits that individuals are active participants who seek out information in the organizational context from a variety of sources on a frequent basis. In this context, feedback is viewed as a valuable information resource for individuals who actively monitor their environment for cues related to various goals. Given the open systems nature of organizations (Katz & Kahn, 1967) characterized by equifinality (more than one possible way to attain a goal) and equivocality (competing goals with equal valence), individuals in work environments are flooded with information and often experience uncertainty about what behaviors are appropriate and what goals to pursue. Role and goal uncertainty, ambiguity, and conflict are especially characteristic when individuals enter organizations as new employees; are transferred, promoted, or begin new assignments; or during times of organizational change (Ashford, 1989). Individuals at all levels of an organization, therefore, engage in frequent self-monitoring and seek information from the environment in order to reduce uncertainty, decide toward which goals to allocate their efforts and time, and make judgments about their own competence (Ashford, 1989; Ashford & Cummings, 1983). Several monitoring strategies are available, ranging from implicit (such as vicariously learning from the consequences of a colleague's action) to explicit (such as asking one's superior for direct feedback on a project.) Each strategy carries specific costs in terms of the effort required, the risk involved, and the amount and type of inference necessary to obtain the desired information; thus individuals will seek information if "the message reward value exceeds the expenditures incurred in obtaining it" (Ashford & Cummings, 1983, p. 387.)

The FBS perspective is built upon the assumptions that individuals self-regulate their behaviors and are actively involved in meaning-making. The FSB literature, therefore, takes its theoretical roots from control theory (as does the traditional feedback literature), but also symbolic interactionism (Berger & Luckman, 1966) with its emphasis on the individual interpretations and construction of reality. "Thus, individuals do not respond directly and instinctively to events, but rather respond in terms of their interpretations of those events" (Ashford, 1989, p. 143.) The perspective responds to the call for a more active and comprehensive view of employee behavior, rather than the relatively passive view granted to individuals in the behavioral sciences (Brief & Aldag, 1981). It also begins to address some the call for increased research from the employees' perspectives raised by Bjorquist and Lewis (1994).

FBS has personality- and situation-related antecedents. At the individual level it is related to a person's tolerance for ambiguity, and it plays an important role in managing the impression an individual wishes to convey in work-related situations. Performers, in particular, are often less likely to seek feedback because of fear to appear less than competent (Ashford & Northcraft, 1992). Vandewalle (1995) further suggested that the frequency, type, timing, and target of feedback seeking behavior were influenced by an individual's goal orientation (Dweck, 1986; Dweck & Leggett, 1988). Individuals with a learning goal orientation (focused on improving their abilities, acquiring new skills, and mastering new situations) will seek feedback more frequently, more immediately, and from an expert source, than individuals with a performance goal orientation. Those intent on demonstrating and

validating the adequacy of their ability by seeking favorable judgments and avoiding negative judgments related to their abilities will seek feedback less frequently, with longer delay, and from a source who possesses organizational power.

Situation- and context-based influences on feedback seeking behaviors include cultural norms and characteristics of the feedback source, the nature of the feedback that was obtained, and the nature of the relationship between the feedback seeker and the source. Technology can play an important role in this: as Ang, Cummings, Straub, and Early (1993) found, individuals in computer-mediated feedback environments sought feedback more frequently than individuals in face-to-face feedback environments, especially when the feedback giver was perceived to be in a bad mood.

Personal outcomes of FBS include an increase in the amount and rate of concept learning (Schroth, 1997a, 1997b). Morrison (1993a, 1993b) demonstrated the linkage between frequency of information seeking and overall satisfaction, intention to stay with an organization, and job performance among newcomers to an organization. Feedback seeking, as Madzar (1995) pointed, is of value to employees and organizations because it "reduces uncertainty about behaviors as well as about how these behaviors are evaluated by others" (p. 338). FBS constitutes a crucial aspect of employees' self-regulation framework, it reduces time-on-task, and is positively related to goal attainment.

The implications of FBS research for HRD practice have been summarized by Madzar (1995): since feedback is an important resource for individuals and organizations, opportunities to seek feedback should be enhanced. This can be accomplished through training (stressing the importance of FBS, encouraging process as well as outcome feedback seeking, and reducing the personal risk involved in seeking feedback through role-modeling) and through organization development (developing technologies that facilitate the feedback process, creating a culture where feedback seeking is encouraged, and changing communication norms and expectations.)

Purpose of the Study

The focus of this study, then, is to examine the process of feedback seeking in management training and HRD university instruction settings in the United States, Britain, and selected Asian countries. By using management training and HRD university instruction settings for this field-based research, this study expands the body of existing FBS research into an area of central concern to HRD, provides an international perspective, and provides an extension of traditional research focused on feedback giving in training and education.

Management and leadership training constitute the second largest category of training provided in the United States (Training, 1997). Over 85% of all U.S. organization with more than 100 employees report to conduct some form of management, leadership, or supervisory training. The extent of management training has been attributed to the flattening of organizations and the increase in job roles at all levels of an organization. Management skills are seen as critical for an organization's success, and research findings have confirmed their important role for a firm's performance (Gordon & DiTomasio, 1992; Howell & Avolio, 1993; Yammarino, Spangler, & Bass, 1993).

Management training is appropriate for the study of FSB, in particular to the extent that it presents a novel situation for trainees who are advancing in an organization. In this situation, new behaviors, skills, knowledge, and attitudes are introduced which are of importance to employees who will be assuming new levels of responsibility in their organization. Management training often serves as a rite of initiation to employees and signals their impending enhanced status and responsibility in an organization. In particular for newly appointed managers and supervisors, the behaviors learned in management training are important because they represent those skills they will need in order to succeed in their new roles.

Similarly, HRD is among the fasted growing areas within schools of education in the United States. HRD graduate courses are attended by full-time and part-time students who often work in professional positions in business and industry. Often, courses are taught at night to accommodate the schedules of working adults and by instructors with extensive business and industry experience. These instructors are either practicing professionals themselves and teach on a part time basis, or have had extensive business and industry experience themselves prior to joining a university faculty. Moreover, many HRD faculty continue to be actively involved in service and consulting work and maintain active professional practices.

Whether in management training situations or in HRD university instruction, students prepare for future professional roles, and learning, in this situation, represents an important performance criterion (Martocchio & Dulebohn, 1994). Students and trainees (hereafter: students) can be expected to engage in feedback seeking behavior to obtain information about the training and learning objectives and to seek feedback to assess their performance relative to the objectives.

Research Questions and Hypotheses

The research questions for this study were as follows:

1) What sources of information regarding learning requirements and feedback about their performance do students use? How useful are the information and feedback they receive? How frequently do training participants use each source during a training event?
2) What individual level variables influence the amount, frequency, and source of information and feedback seeking? Does the amount of variance explained vary by culture?
3) What contextual and instructor-related variables influence the amount, frequency, and source of information and feedback seeking? Does the amount of variance explained vary by culture?
4) How is the information and feedback-seeking behavior related to perceived relevance of the course and intention to transfer the learning?

Methodology

This was a non-experimental, survey-based study using a post-hoc research design using multiple samples from the U.K. and the U.S. The study used volunteer samples from four institutions offering graduate and professional education and training in HRD and from one organizations conducting management development training.

At each institutions, volunteers from among the teaching faculty were recruited and asked to participate in this study by administering a 2o-minute written questionnaire to volunteers from among the students currently enrolled in their HRD courses, to complete a 10-minute questionnaire on their own teaching style.

The data collection for this study consisted of two written surveys, one each to be completed by the students and the instructors. The student survey was a 50-item instrument developed from existing and psychometrically proven scales. It consisted of Likert-type items, short scenarios, and ranking questions. Pilot tests had established that the instrument takes an average of less than 20 minutes to complete. The instructor questionnaire was a shortened and parallel version of the student questionnaire with 40 questions that took less than 15 minutes to complete. All scales used in the two instruments had been tested in previous research and yielded acceptable measures of validity and reliability. The questionnaires were completed anonymously and confidentially.

Results

The surveys were administered in the summer and fall of 1998. 299 of the initial sample of 383 students in 20 courses participated in the survey, for an overall response rate of 78%. In addition, 24 trainers and instructors returned completed surveys. Table 1 shows the demographic information for the sample. Chi-square tests established no differences in gender or age among participants from the five institutions. There were differences, however, by education and professional experience.

Table 2 shows the descriptive statistics, reliability indices and zero-order correlations among the variables in this study. All scales showed sufficient internal reliability and were minimally intercorrelated, suggesting independence of the constructs measured.

The results show that, as a group, students rated their instructors highest on their ability to provide inspirational motivation and to act as role models by acting in a charismatic manner. Lower scores were given to the instructors' ability to react to individual needs and, surprisingly, to provide intellectually challenging content. Students ranked about in the middle on the individualism/collectivism scale and on the learning versus performance orientations. They reported comparatively lower levels of motivation to learn, intention to transfer the course material, and the perceived usefulness of the course material. They also reported average levels of ambiguity for tolerance. With respect to feedback and information seeking behavior, the results show higher average scores for seeking information about course and learning requirements than for obtaining feedback about their performance. They sought information about learning requirements primarily from the course assignments and their peers, followed by the instructors, and least from their own thoughts and feelings. In contrast, students used their own thoughts and feelings most often to obtain feedback about how well they were performing in the course, followed by the assignments and peers, and least from the instructors.

When comparing student scores to instructor perceptions, significant differences emerged. Overall, instructors overrated the degree to which they provided individual consideration to each student (instructor score:

4.26, rank 1 of 4; student score: 3.63, rank 4 of 4). They also overestimated their impact related to providing intellectually stimulating education and training. Instructors, further, underestimated the degree to which their students perceived them as acting in a charismatic manner.

Table 1

Response Rates and Demographic Characteristics

Instructors further overestimated the amount and source of students' information and feedback seeking behaviors. They thought of themselves as the most important source for information on learning requirements and feedback about learning performance. Table 3 shows student and instructor scores.

Table 3

Student and Instructor Scores on Instructor and Feedback/Information Seeking Scales

Scale	Instructors (N=24)	Students (N=299)
Charisma	3.78 (.51)	4.01 (.58)
Individual Consideration	4.26 (.48)	3.63 (.87)
Inspirational Motivation	4.15 (.49)	4.13 (.66)
Intellectual Stimulation	4.03 (.48)	3.80 (.72)
Feedback Constituencies	3.60 (.46)	2.78 (.50)
Feedback System	3.22 (.53)	2.88 (.97)
Feedback Self	3.68 (.70)	3.05 (.90)

Referent Systems	3.87 (.62)	3.63 (.72)
Referent Self	3.74 (.68)	3.19 (.80)

Instructor-related variables played a major role in determining the amount of information students sought. Individual Consideration, for example, accounted for 15 percent of the variance in seeking information about learning requirements from course assignments and peers. Intellectual Stimulation accounted for 26 percent of the variance in the amount of information sought. In contrast, students' perceptions of the value of the course determined how much feedback about their performance they sought. When students found the course material relevant, they sought more information about their performance and did so more frequently. Where they were motivated to learn the course material, they sought more performance feedback from their own thoughts and feelings.

Finally, regression analyses were conducted to determine which factors contributed to the three outcome variables: motivation to learn, perceived utility, and intention to transfer. Almost one-half (47%) of the variance in Motivation to Learn was accounted for by four variables: Intention to Transfer (33%), Perceived Utility (6%), Usefulness of Information about Learning Requirements (6%), and Amount of Feedback from Assignments and Peers (3%). 44% of Perceived Utility was accounted for by Intention to Transfer (33%), Frequency of Information about Learning Requirements (6%), and Motivation to Learn (5%).

Conclusions

This study sought to investigate the relationship between instructor and student-related variables to information and feedback seeking behavior in HRD education and training situations. Obtaining survey data from 20 different HRD courses, in five different university and government agency settings and in the US and the UK, the survey resulted in a number of insights related to the research questions.

The results of this study indicate empirical evidence that adult learners use their own thoughts and feelings as a primary source for obtaining feedback about their performance in a learning situation. The second most frequently used source is assignments, with the instructor being used least often. With respect to learning requirements, students used assignments and peer most often, followed by the instructor and their own thoughts and feelings.

Instructors tended to overestimate the amount, frequency, and usefulness of performance feedback and information about learning requirements that students were seeking. Students sought considerably less feedback and performance information than their instructors assumed they did. Also, instructors tended to overestimate their own role in providing feedback.

Instructors also overestimated the amount of individual consideration and intellectual stimulation they were providing: students reported receiving considerably less individual attention and intellectually stimulating training and education than their instructors perceived. On the other hand, instructors tended to underestimate the degree to which their students perceived them as charismatic.

Instructional styles influence the feedback and information seeking behavior of students. Individual

consideration and intellectual stimulation, in particular, explained a sizeable amount of the variance of both behaviors. In turn, student perception of the relevance of the course determined their level of performance feedback seeking.

Finally, the three outcome variables measured in this study were highly intercorrelated: students are motivated to learn the course material to the extent that they perceive it as relevant and intend to transfer it.

Interestingly, neither orientation toward individualism or collectivism, nor tolerance for ambiguity or learning orientation appeared to influence feedback and information seeking behavior. This finding is in contrast to previous studies.

The implications of this study extend to the practice of HRD training and education and the preparation of trainers and educators in the field. True to adult learning principles, adults appear to self-regulate their behavior to a larger degree than instructors are aware of. Instructors tend to overestimate their own roles and importance in providing feedback, paying personal attention to students, and conducting courses that challenge the students' minds. Given the premise that it is helpful for instructors to have an accurate picture of students' perception, instructors might be advised to revise their own expectations regarding students' behavior and obtain more frequent feedback about their students' opinion about their own teaching and training styles. Where trainers and educators pay attention to individuals' learning needs and challenge their assumptions and beliefs, students are more likely to seek information and feedback about the course and their performance. Lastly, students' motivation to learn appears to be influenced primarily by their perception of the relevance of the material and their intention to transfer the learning. Facilitating the transfer or, at least, increasing the likelihood that there is opportunity to apply the newly learned material at the work site, can, in turn, increase the students' motivation to learn. Transfer, it appears, should be considered prior to the course and not only upon completion of it.

This study was conducted in clearly defined settings: university HRD instruction and a series of management training courses. The fact that the study contained 20 sites and courses lends confidence to its findings. Clearly, however, there is a need to replicate the study in different settings and with different performance requirements to examine whether the findings are an artifact of the specific settings of this study or, in fact, can be found elsewhere. Further, a more detailed analysis by course is required to investigate what specific aspects of the 20 courses in this study contributed to the findings. Equally important will be to conduct longitudinal research to find whether and what kind of movement or chance in FBS behavior occurs.

Feedback and information seeking behaviors are complex, yet critical issues for HRD. As the learning requirements of adults in the workplace increase, so will our profession need to advance the research on learning for work. This study contributes to this agenda in a small way.

Mentoring as a Tool for Faculty Development: Predicting Positive Outcomes for Mentors

Ellen J. Mullen
John Van Ast
Iowa State University

Harry Grant
University of California at Irvine

Mentoring programs have emerged in various organizations, from industrial to educational, for employee socialization and development purposes. Not all programs have experienced return on the investment. This study looked at the relationship between mentoring outcomes and mentoring activities as well as mentor and mentee characteristics. Female mentors reported greater benefits, as did those who served more psychosocial and vocational functions. Among mentees, only hours spent with one's mentor was a significant predictor of mentoring benefits.

Keywords: Mentoring, Faculty Improvement, Mentoring Programs

Mentoring promotes the professional and personal growth of the mentee through coaching, support, feedback and the sharing of information and is considered an invaluable development tool for those new to an organization or in early career stages (e.g., Bova, 1995; Chao, Walz, & Gardner, 1991; Dreher & Ash, 1990). Studies have shown generally positive consequences of mentoring programs for mentees, with relatively little focus on outcomes for mentors. This study looks at the mentor perspective on formal mentoring among faculty in higher education. A greater understanding of mentoring and mentoring outcomes would help to maximize the effectiveness of mentoring models, benefiting the faculty involved and the institutions employing the programs.

Mentoring in Business and Industry: Outcomes

In business, benefits of mentoring are most often monetary and positional. Mentees most often report greater salary as an outcome, as well as promotions, career advancements, and more internal mobility (e.g., Aryee, Wyatt, & Stone, 1996; Baugh, Lankau, & Scandura, 1996; Chao, 1997; Corzine, Buntzman, & Busch, 1994; Scandura & Schriesheim, 1994; Turban & Dougherty, 1994; Vincent & Seymour, 1995). Others cite the development of relationships, new information, receiving job-related help, and imparting knowledge to others (Allen, Poteet, & Burroughs, 1997).

Intrinsic benefits most often associated with being a mentor are job satisfaction and perceived career success for individuals, as well as more satisfaction in helping others, and new perspectives of a mentor's own situation (Allen, Poteet, & Burroughs, 1997; Ayree et al., 1996; Chao, 1997; Corzine et al., 1994; Mobley, Jaret, & Marsh, 1994; Ragins & Scandura, 1994; Scandura, 1997; Thibodeaux & Lowe, 1996; Turban & Dougherty, 1994). Companies using mentoring programs can also reap rewards, such as increased employee satisfaction and development (Berube, 1996; Hale, 1996; Scandura, 1997).

Some research suggests that mentoring can help women succeed in male-dominated organizations (Matsumoto, 1997), but overall gender effects in mentoring are unclear (Johnson & Scandura, 1994; Mobley, et al., 1994; Ragins & Scandura, 1994; Turban & Dougherty, 1994). The closeness of the relationship appears to be an important factor related to outcomes (Allen, Poteet, & Burroughs, 1997; Burke & McKeen, 1997; Heimann & Pittenger, 1996).

Effective communication skills, sincerity, motivation and past experience of a mentor have been shown to influence the effectiveness of mentoring (Aryee, Chay, & Chew, 1996; Mullen, 1994). Mentees show significantly higher needs for power and achievement than nonmentees, an internal locus of control, high self-monitoring, and high emotional stability (Fagenson, 1994; Turban & Dougherty, 1994).

Mentoring in Education: Outcomes

Copyright © 1999 Ellen J. Mullen, John Van Ast, and Harry Grant

Mentoring programs in academia have been widely viewed as beneficial (e.g., Bush & Coleman, 1995; Ganser, 1994; Rehrig, 1996; Southworth, 1995). Mentored instructors tend to have a better understanding of student needs, and their students show greater learning (Dembele, 1996; Freiberg, 1994; Van Ast, 1995). Mentoring enables professors to improve instructional materials, keep up-to-date on new technology and teaching, and to network with other faculty (Foote, 1996).

Mentored instructors report intrinsic benefits, such as mutual respect, trust, and emotional support from their mentors, and personal development (Abell, 1995; Ballantyne, 1995; Jordan, 1995; St. Clair, 1994). Campbell (1995) reported that mentees felt less of a need to seek help than nonmentees. According to Graham (1994), mentors were reminded of the value of their past experience and had an opportunity to examine themselves; mentees obtained insight into learning and working styles and were more confident. Although faculty mentoring programs in educational settings produce many benefits, they appear to more psychosocial than vocational (Majette-Daniels, 1993; Shumate, 1995).

Research on gender and mentoring in educational institutions has produced mixed results. Freitag (1995) concluded that males and females were equally likely to pursue mentoring relationships. Another study of female professors/mentees revealed less psychosocial support received as rank of the mentor increased, regardless of the mentor's gender, but more vocational activities (Struthers, 1995). Issues were indicated when both gender and race were analyzed together. Females from minority groups experienced compounded stereotypes and conflicts between culture and academic values (Bova, 1995; Shumate, 1995). Mentees with white, male mentors received higher annual compensation; white, male mentees were more likely to establish a relationship with white, male mentors (Dreher & Cox, 1996). Characteristics of the relationship may also influence outcomes. Some studies have suggested that informal relationships may be more beneficial than formal situations (Bainer & Didham, 1995; Tepper, 1995), and that more than one mentor per mentee may be important (Henderson & Welch, 1993; Orpen, 1995). According to Westhoff (1995), teachers who have been mentored feel more support and general awareness and information regarding procedures, whether the relationship is formal or informal.

Whereas, in business, individuals reported the extrinsic benefits of money or advancement, as well as intrinsic outcomes, the benefits described by those in education were almost entirely intrinsic. Some studies in education showed that mentees were gaining good psychosocial support, but less career-enhancement activities (e.g., Majette-Daniels, 1993; Shumate, 1995). The following objective was addressed in this study to increase understanding of faculty mentoring programs and how to maximize outcomes for mentors and their institutions:

Research Objective

To examine mentoring outcomes for mentors and their relationship with selected individual differences among mentors and mentoring relationship characteristics.

Method

Data Collection

The data used were obtained from participants in the faculty mentoring program at a large Midwestern university from 1993 to the present. Surveys were sent to 331 faculty members/mentoring participants at the university (165 mentors and 166 mentees). The overall response rate was 33% (n = 189). Mentors responded at a rate of 40% (n = 55); mentees responded at a rate of 37% (n = 52). Participants were told that a survey was being sent to their respective mentee or mentor and that all responses would be completely confidential. They were asked to complete the survey independently. The mentor and mentee surveys were parallel in form and content. A self-addressed, stamped envelope was provided for the return of the completed survey.

Measures

Predictors:Mentors were asked whether they had previous experience in a mentoring relationship. All respondents were asked about the length of the relationship and the number of hours per month spent with their partners. Participants were also asked to indicate their age, gender, partner's gender, and the number of years at the institution. Noe's (1988) 29-item scale was used to examine the extent to which the mentor was providing

psychosocial and vocational mentoring functions. Nine items were developed for this study to measure the use of mentoring activities to promote intended outcomes (e.g., "To what extent did you have regular meetings with your mentee?"). Both scales used a five-point, Likert response scale, ranging from "To a very small extent" to "To a very large extent." For the two multiple-item scales, single indices were obtained by averaging across the 29 items and 9 items respectively.

Dependent variable: Mullen's (1994) 21-item scale was used to measure benefits of being a mentor (e.g., "Indicate the extent to which you developed new ideas and innovative thinking as a result of this mentoring relationship"), with a five-point Likert response scale ranging from "To a very small extent" to "To a very large extent." A single index of mentor benefits was obtained by averaging across the items.

Data Analysis Strategy

Analyses included the computation of Cronbach's alphas as indices of scale internal consistency reliability; correlation coefficients indicating the degree of overlap between variables included in the study; and hierarchical regression equations to examine the relationships between mentor benefits and individual and relationship characteristics, including mentoring activities.

Results

Means, standard deviations, and correlation coefficients are shown in Table 1. Table 2 depict hierarchical regression analyses. Demographic characteristics of participants were as follows: 34% of mentors were female (n = 30); 49% of mentees were female (n = 49); mean age of mentors was 49.68 (n = 89); and mean age of mentees was 40.08 (n = 100). Mentors reported spending an average 8.38 hours per month with their mentees, while mentees reported 4.48 hours/month. 31% of mentors had been mentors in the past (n = 28).

The average mentor held a Ph.D. (or equivalent) and had been at their institution for 16.82 years. The average mentee held a Ph.D. (or equivalent) and had been at their institution for 5 years. The average mentor was a tenured full professor. The average mentee was an assistant professor. 29.57% of mentoring dyads (i.e., mentor and mentee) were cross-sex (n = 16). The male mentor/male mentee relationship was the most frequent type, and the female mentor/male mentee was the most infrequent type. The average mentoring relationship lasted 15.32 months.

Mentors

Mentors reported a mean level of 2.27 on the mentor benefits scale, indicating benefits in the range of "small extent" to "some extent." As shown by the correlation coefficients (see Table 1), mentor benefits were significantly related to: (1) the extent to which mentors engaged in mentoring activities to promote mentee outcomes ($r = .58$, $p < .01$); (2) the extent to which mentors seek feedback on their research from their mentees ($r = .45$, $p < .01$); (3) the extent to which mentors seek feedback on their teaching from their mentees ($r = .33$, $p < .05$); (4) mentor information seeking from their mentees ($r = .33$, $p < .05$); (5) mentor gender ($r = .48$, $p < .01$); and (6) serving psychosocial and vocational functions ($r = .68$, $p < .01$). Mentor benefits were not significantly correlated with mentor age; the gender mix of the relationship; the number of hours spent together; job satisfaction; or experience as a mentor in the past.

The results of the hierarchical regression analysis (see Table 2) indicate that only gender (beta = .30, $p < .05$, in step two) and mentoring functions (beta = .40, $p < .05$) significantly predicted mentor benefits. Age, gender composition, time spent together, having been a mentor before, and mentoring activities did not bear significant beta weights. Female mentors who served greater mentoring functions tended to report greater benefits of being a mentor.

Mentees

Overall, mentees indicated a mean response of 3.02, or a moderate level, on the mentoring functions scale, representing the extent to which mentees receive psychosocial and vocational functions from their mentors. Illustrated by the correlation coefficients (see Table 1), psychosocial and vocational functions were significantly related to mentoring ($r = .87$, $p < .01$); mentor benefits ($r = .64$, $p < .01$); gender composition of the relationship ($r = .28$, $p < .05$); and hours spent together ($r = .48$, $p < .01$). These correlations indicate that mentees experience more psychosocial and vocational outcomes when more structured mentoring activities are utilized. This suggests that

more structure to the relationship and preparation of mentors would positively impact outcomes for mentees. Further, mentees who reported receiving greater mentoring functions also reported spending more time with their mentors, perhaps indicating that mentors should be encouraged to spend ample time with their mentees.

The hierarchical multiple regression analysis resulted in a significant beta weight only for time spent together (beta = .32, $p < .05$, in step one). Mentee's age and gender, relationship gender composition, mentoring functions, and mentoring activities did not bear significant beta weights with the mentee data.

Discussion

It appears from these results that mentors who put more into the relationship tend to get more out of it. Mentoring functions significantly predicted mentoring benefits with the mentor data in both hierarchical equations. Disappointingly, mentoring activities did not bear a significant beta weight in either regression equation or for either mentors or mentees. This may be due to overlap with mentoring functions (i.e., multicollinearity), the items themselves, or some other methodological issue, because the correlation coefficient reflecting the relationship between mentoring activities and mentoring benefits was relatively large and significant with both mentor and mentee data. The fact that we have begun to quantitatively examine mentoring activities and their influence is a step that deserves to be taken further.

These findings also suggest that, for mentors, mentor benefits are not significantly associated with the mentor's age or having been a mentor before. For mentors, there was not a link between mentoring benefits and the amount of time spent with one's mentee, although among mentees hours spent together did predict mentoring benefits. And while mentor gender *was* related to mentoring benefits (mentor data), gender composition of the relationship did not have an influence. In this case, female mentors reported greater mentoring benefits, but the gender mix of the relationship did not seem to matter. The only other predictor that was significantly related to mentor benefits was mentoring functions, indicating that mentors who served more psychosocial and vocational mentoring functions reported greater benefits. Practical mentoring activities did not relate significantly to mentoring benefits among mentors or mentees in the regression equations, although they produced significant correlations. This suggests continuing to look at the influence of mentoring activities or strategies for promoting positive outcomes more systematically.

With the mentee data, only hours spent together was significantly predictive of mentor benefits. The mentees who spent more time with their mentors perceived greater benefits for their mentors.

As Kram (1985) has suggested, the mentoring relationships characterized by greater mentoring functions are the most beneficial for mentees and, may be beneficial for mentors as well. Perhaps for the mentors, "the more you put into something, the more you get out of it." Among these mentors, those who served vocational and psychosocial functions report greater benefits of being mentors. Future research should examine the influence of vocational and psychosocial (mentoring) functions separately as well as look at specific benefits of mentoring. Our study aggregated vocational and psychosocial functions into mentoring functions along with combining the various benefits of mentoring.

Encouragingly, mentors benefited whether they had experience as mentors or not and irrespective of the gender mix of the relationship. Age of the participants also appeared not to be a factor of concern in maximizing mentoring benefits. Activities used to serve mentoring functions, e.g., regularly scheduled meetings, were not related to mentoring benefits in this study as expected, at least not according to the regression analyses. The correlation coefficients suggest otherwise. This was a disappointing finding (i.e., the regression results) since, again, it was expected that what one "put into" the relationship was expected to be related to what one "got out of" the relationship. Methodological issues are likely a factor.

There were differences in the reportings of mentors and mentees on the same issues. The most interesting discrepancy found between mentor and mentee responses was the reported hours spent together. Mentors and mentees disagreed in terms of how much time they spent together (mentor mean = 6.13 hours per month; mentee mean = 4.00 hours per month). The need for greater explanation to participants regarding what constituted time spent together as mentor and mentee may be indicated. Time spent together significantly predicted mentoring benefits only among mentees, not among mentors. Benefiting from mentoring among mentors was not a function of how much time they spent with their mentees. For mentees, the two were linked. Further work should focus on this discrepancy and what it reflects.

This study is not without limitations, like most empirical studies. First, survey data were used, which may be subject to method bias. The limitations of such data should be noted. However, this was the only feasible means of data collection and two sources (mentors and mentees) were used in effort to avoid using a unilateral perspective.

Certainly, these are perceptions, but perceptual data was sought. Self-report with some mentee report was the most feasible approach for gathering perceptions from this sample.

Second, because of the largely preliminary nature of this study, several variables used were summary variables. The mentoring activities variable summarized nine items ranging from "To what extent did you have regular meetings with your mentee?" to "To what extent did you do research jointly with your mentee?" These items may be more meaningful in isolation. They should be examined separately in future work. Also, psychosocial and vocational mentoring functions were merged into mentoring functions. Although mentoring functions were a significant predictor of mentoring benefits in this study, it might be more useful in the future to separate the two. Third, only one educational institution was represented in this study, making the representativeness of the data of other institutions and the generalizability of the results to other settings questionable. Still, it offers some preliminary results and opens the door on these issues, hopefully leading to further work.

In conclusion, these data show that the mentors and mentees in this sample did perceive that they experience benefits of mentoring. Institutions with faculty mentoring programs may take heart at this. Readers are advised to be cautious in generalizing these findings beyond the institution examined. Future research needs to attempt to replicate and expand upon these findings in other academic and nonacademic settings. These results also hint that we may not need to be concerned with the gender mix of mentoring relationships when matching mentors to mentees. The fact that hours spent together related to benefits for mentees, but not mentors, also merits further attention to look at the reason(s) behind this finding.

Because some mentoring programs in organizations target assisting female employees, it is encouraging to see that the female mentors in this study benefited more, rather than less, than the male mentors. It would be interesting as well as useful to investigate why women did tend to benefit more in this sample. Finally, finding a significant relationship between serving mentoring functions and benefiting from mentoring is consistent with what many of us would suspect: That mentors who put more into the relationship also get more out of it. Certainly, this finding is worthy of continued examination.

The better we understand these relationships, the more likely we are to be able to maximize the positive outcomes. A greater understanding of mentoring should lead to greater value added from mentoring programs and, thus, greater justification for the investment organizations make in these programs. Overall, the results suggest there are positive outcomes for both the mentor and the mentee involved in this university mentoring program, particularly if the mentor serves the necessary functions.

A Corporate-University Partnership For The Development Of HRD Professionals: A Case Study

Marijke Kehrhahn
University of Connecticut

Rudolfo Verrilli
The Hartford Life Company

This case study reports the implementation and outcomes-to-date of a corporate-university strategic partnership for the development of HRD professionals and HRD scholars. The partnership was designed using Jacobs' guidelines for HRD collaborations and analyzed using current partnership-building theory.

Keywords: Corporate-University Partnership, Partnership Building

For years, scholars and business professionals alike have written about the need for universities to reach out to business and industry (e.g., Lynton & Elman, 1987; Sheckley, Lamdin, and Keeton, 1993). Traditionally, work on this topic has emphasized the benefits to organizations if they partner with higher education: access to professional knowledge and access to expanded learning resources. Jacobs (1996, 1997) extended the discussion of university-business partnerships in HRD by highlighting the importance of negotiating and producing mutual benefits. Brown's (1983) organizational interface theory and Suchman, Botelho, and Hinton-Walker's (1998) propositions for partnership building provide rich frameworks for examining the features of effective corporate-university partnerships.

Problem Statement and Theoretical Framework

Jacobs (1997) posed several challenges to the current practice of forming HRD collaborations between universities and organizations. While service agreements between universities and organizations for such items as the delivery of training or program evaluation are common, Jacobs ultimately asks the question: How much have these collaborations affected organizational practice and advanced the field of HRD? Jacobs proposed that corporate-university collaborations should be expanded to professional partnerships focused on producing mutual benefits rather than service agreements for specific activities. In our case, the University of Connecticut Adult and Vocational Education program was in need of connections with organizations in which graduate students could experience, observe, and research HRD practices. The Hartford Life Company was in need of specialists who could help with a transformation of the Education and Development division from a training-based enterprise to a performance-based one by providing consultation and up-to-date information.

Brown (1983) described inter-organizational partnership as organization interface, the "linkages between two organizations that evolve over time" to provide mutual benefits in addressing common or compatible interests. Brown depicted organization interface as the processes and interchanges between individuals and selected groups who serve as representatives of their organizations and build the relationship between the two organizations. Organizations as parties to the partnership have interests that may be diverse, complementary, or similar. Organizational representatives provide exchanges and linkages, process information, monitor events, and work to influence representatives of the other partnering organization to best achieve organizational outcomes.

Suchman, Botelho, and Hinton-Walker (1998) extensively defined what Brown (1983) termed the "events at interface" that are required for building effective partnerships among healthcare organizations and stakeholder groups (See Figure 1). The authors proposed that building and maintaining relationships, working toward mutual benefits, conflict management, and successful representation and negotiation of systems-level needs and requirements, are the hallmarks of effective partnership building.

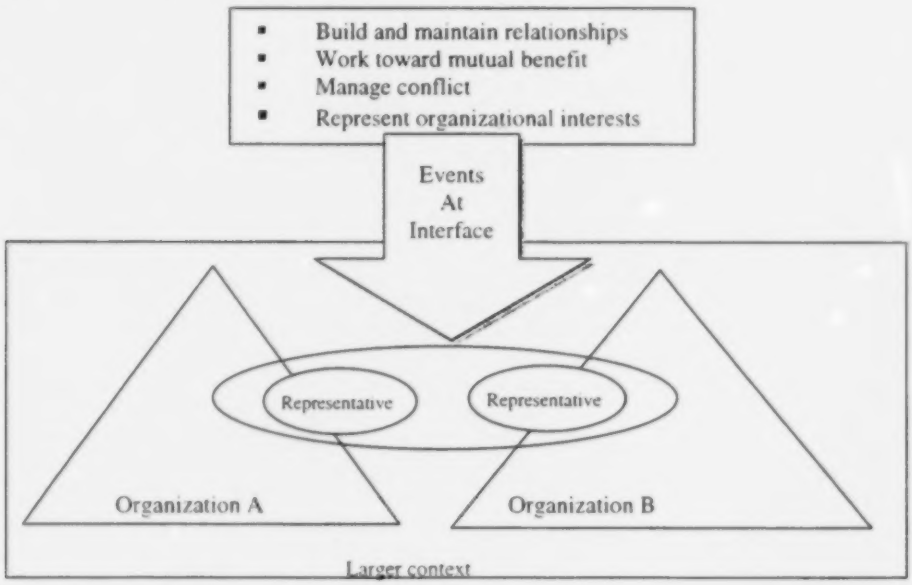
According to Suchman (1998), building and maintaining partnership relationships requires understanding the perspectives of others as well as exploring, respecting, and valuing differences. The process demands sensitivity to communication processes used by the partnering organizations and the representatives as well as the ability to engage in ongoing reflection about the current state and the desired state of the partnership. In addition,

Copyright © 1999 Kehrhahn and Verrilli

Brown (1983) highlighted the value of establishing roles, monitoring progress, assessing strengths and weaknesses, and solving problems as they arise.

Botelho (1998) proposed that working for benefit to both partnering organizations requires identifying common goals and interests through dialogue and looking beyond individual needs to the needs of systems as wholes. Organizational representatives of the partnership must work to assess obstacles to producing benefits and opportunities for capitalizing on the partnership. Partner differences in emphasis, expertise, perspectives, and cultures can become obstacles to effective partnership and result in conflict if they are not explored and addressed.

Figure 1. Partnering events at organization interface



Note: Adapted from Brown, L. D. (1983). Managing conflict at organizational interfaces. Reading, MA: Addison-Wesley Publishing Company.

Productive conflict management is characterized by Brown (1983) as problem solving where common interests are paramount, common concerns are mutually perceived, information is exchanged relatively openly, and alternatives that are beneficial to both parties are explored and selected. Finally, successful representation and negotiation of organizational needs by the representatives requires effective strategies for representing and understanding needs and using win-win approaches that foster collaboration (Suchman, Botelho, & Hinton-Walker, 1998). Partnerships between organizations experiencing constant and rapid change require constant re-evaluation of needs and re-negotiation of partnership activities.

Brown (1983) proposed that partnerships can benefit and grow from careful analysis of the events at organization interface. While corporate-university partnerships abound, systematic examination of the partnerships are few. Therefore, the main study question is: What characterizes the activities and events associated with the development of a successful corporate-university partnership? Specifically, how are mutual benefits established and achieved? What obstacles to partnering emerge and how are conflicts managed? How are partner needs re-evaluated and activities re-negotiated?

Research methodology

Marsick and Watkins (1997) instructed case study researchers to identify a focus and assumptions for their research by using the literature, to decide on the unit of analysis, to select data collection methods that fit the case, to analyze the data for emerging themes and patterns, and to interpret the findings in light of what is known about

the established focus. In this case study, the unit of analysis is the activities of the organizational representatives responsible for forming and sustaining the corporate-university partnership.

Data were collected to describe and interpret the events that occurred in the partnership building process among the organizational representatives. Data were gathered through observation, dialogue, reflective observation, and group meetings, and were culled from field notes, focus group notes, meeting notes, and documents such as

memoranda and reports. Data were collected and analyzed for a 12-month period. The authors of this report were the primary researchers and the primary organizational representatives in the partnership. The primary researchers discussed, framed, and interpreted events, activities, and results. Interpretations were checked by members of the partnering parties – university interns and corporate education specialists – to confirm and expand the meaning of events. Experts in the HRD field served as peer debriefers and offered alternative interpretations and raised important questions for reflection.

The trustworthiness of the case study was enhanced by triangulation, member checking, peer debriefing, and prolonged engagement. Nevertheless, the case study results are limited to the specific corporate-university partnership that is reported on and limited to the specific point in time in which the data was collected. The results and conclusions will help other corporate-university partnerships to engage in reflective observation and reflective dialogue about their own efforts.

Description of Partnering Organizations

This case study focused on the partnership between the Hartford Life Company Organization and Employee Development (OED) unit of the Individual Annuity Services Division and the University of Connecticut Adult and Vocational Education (A/VE) program of the School of Education. Hartford Life Company is a diversified organization offering life and annuity, group pension and deferred compensation, group life and disability, and structured settlement products. The company is described by Standard & Poor as having strong products, efficient structure, and a well-diversified distribution system. Sales for 1996 totaled $9.8 billion. The partnership with Hartford Life was formed specifically with the OED unit, made up of 25 education specialists and led by Rudy Verrilli, who served as the Hartford Life's lead representative to the partnership.

The University of Connecticut is the state's only public research university and one of only two Carnegie Foundation Research I universities in New England. With a current enrollment of 22,300 students UConn stands with the leading institutions of the nation in the size, scope, and contributions of its research involvement. In the last ten years, University researchers at Storrs and at the Health Center in Farmington have attracted nearly one billion dollars in support of their work. The UConn side of the partnership involved the A/VE program, a graduate program with an enrollment of 50 and focused on workplace learning and professional development research. Marijke Kehrhahn, one of two faculty in A/VE, served as UConn's representative to the partnership.

Description of Partnership Building Activities

Jacobs (1997) provided specific guidelines for forming partnerships that are more likely to result in mutually-beneficial outcomes. Jacobs' guidelines were selected to frame and organize the strategic partnership and provided an excellent structure within which we could explore the research questions. Specifically, the focus for our work was to design and implement a strategic partnership to provide a number of opportunities for the development of HRD professionals working in the corporation as well as graduate students pursuing advanced degrees. A major component of the development plan was to support HRD practitioners to gain knowledge and skills in theory and research and HRD scholars to gain knowledge and skills in corporate HRD practices. Table 1 lists examples of how Jacobs' guidelines were implemented in this partnership.

The corporate-university partnership is built on the assumption that research is an important and integral part of effective HRD in corporate settings. With that assumption in mind we clarified that practitioners and scholars would be research partners rather than handing research responsibilities over to scholars. We established a joint purpose to conduct ongoing, longitudinal transfer of training research in the organization.

In our efforts to implement Jacobs' guidelines, we found that the day-to-day work of OED offered a multitude of opportunities for research with clear potential to advance both theory and practice. Faculty and interns worked with performance support teams to design and implement organizational research projects focused on training effectiveness and performance improvement. The partnership determined the use of research up front to benefit both partners. The organization was looking to improve practice, report to senior management, and

justify resource allocations to HRD efforts. The university was looking to conduct studies for theory-building and publication. We had common interests in advancing the practice of HRD and building support for HRD within the organization.

The organizational representatives envisioned a long-term ongoing partnership that is supported and encouraged by the partnering organizations. We worked to keep the partnership responsive to the changing needs of the organization's represented by continuously generating goals, outcomes, timelines, and products that were used by both the organization and the university. We established a formal process of holding regular meetings, writing progress reports, solving problems, articulating benefits, and making adjustments

Table 1. Jacobs' guidelines for building successful HRD partnerships and implementation strategies

Jacobs' (1997) Guidelines	**Examples of partnership building activities conducted by organization representatives**
1. Expect research to be a part of all HRD collaborations.	• Agreed that specific research and data collection were a critical part of the partnership. • Provided scholars to assist with HRD research that the corporation wished to conduct • Agreed that research projects would be a source of dissertation research, joint publications and presentations.
2. Derive research questions from practice.	• Joined forces with OED to derive research questions from the field. • Designed and implemented organizational research projects focused on training effectiveness and performance improvement.
3. Determine the use of research up front.	• Recognized that the organization's need for data and research was different than the university's. • Established mutual appreciation for different needs and joint goals for research.
4. Make HRD collaborations a formal process.	• Continuously generated goals, outcomes, timelines, and products that can be used by both the organization and the university. • Held regular meetings, wrote progress reports, solved problems, articulated benefits, and made adjustments.
5. Seek long term collaborations.	• Committed ourselves to and regularly discussed the benefits of a long-term partnership. • Included a number of formal projects and informal sharing of ideas and resources related to the partnership to benefit both partners in the long term.

Results

The data analysis was guided by the question, what characterizes the activities and events associated with the development of a successful corporate-university partnership? A broad analysis emphasized that the activities were characterized by a) cooperation and collaboration for producing mutual benefit, b) the identification and surmounting of obstacles and conflict resolution, and c) continuous partnership development. The three components of partnership building that emerged in this case study clarify the value of the various recommendations made by theorists in the field and highlight focused efforts that support corporate-university partnership development.

Cooperation and collaboration for producing mutual benefit.

The corporate-university partnership consistently focused on producing benefits that were mutual and complementary. Much as Brown (1983) proposed, ongoing dialogue between the organization representatives focused on the mechanics and effectiveness of the partnership in producing the desired outcomes for both parties. In the partnership studied, practitioners and scholars worked arm-in-arm to address real organizational problems in a scholarly way, and at the same time provided complementary benefits. The collaborative activities were consciously and carefully designed to produce and confirm mutual benefits. For example, in one such collaboration, HRD practitioners set out to evaluate the performance outcomes of a specific training module. With

the help of doctoral students, practitioners designed the evaluation as ongoing research and included measured of employee and work site variables that are likely to influence task performance. Through this collaboration, scholars developed a better understanding of practicality issues associated with field research while practitioners built skills for improving the rigor of their evaluations. The collaborative activity was characterized by open communication, continuous give and take, and regular evaluation of progress. Additional results of the partnership that amounted to complementary benefits to the partnering organizations are listed in Table 2.

While Table 2 delineates complementary benefits, the partnership provided mutually beneficial outcomes as well. Partners developed a number of products: conference presentations, publications, handbooks for evaluating training effectiveness and designing workplace learning, and a course that provides a template for a new course at the university. In addition, partners formulated a common vision for HRD practice and designed learning projects that addressed the needs of both partner groups.

Table 2. Summary of partnership benefits

Benefits to Hartford Life Company	Benefits to University of Connecticut
• HRD focus on employee performance was enhanced by HRD scholars' knowledge of research, theory, and techniques of how employee improvement can be designed, delivered and evaluated. • Practitioners are able to respond more readily to organizational research needs and to conduct more varied and pertinent research. They are better able to provide solid data to management to show that HRD practices are resulting in improved performance and productivity • Practitioners participated in skills and knowledge assessments that enhanced professional development plans. • HRD managers influenced content and methods in the university classroom and became active partners in the university's education programs by providing internships and research opportunities that impact business goals. • Access to latest research and trends that may impact the future of the HRD • On-site, customized workshops and work sessions designed to provide content and dialogue to generate working solutions to real business problems. • Avenue for demonstrating the company's commitment to ongoing professional development for its HRD specialists. 6. The university offers graduate and undergraduate credit to further promote professional development. 7. Residual modeling benefits with the design, development, delivery and evaluation of programs that the university instructor uses to interrelate adult learning concepts to the business environment.	• Scholarly focus on theory-building and theory-to-practice translation was enhanced by HRD practitioners' knowledge of workplace realities and practical applications. • Scholars are more able to design and conduct field research in HRD and more knowledgeable about activities necessary to bolster the validity of field research. Specifically, the partnership provided opportunities for more in-depth research on transfer of training in corporate settings • Scholars participated in skills and knowledge assessments that enhanced academic development plans. • Faculty and interns became active partners in the corporation's employee development programs and learned skills and attitudes necessary to design and conduct corporate projects. • Access to latest HRD practices and tools in use in state-of-the-art corporate settings. • Opportunities to meet and recruit new students for the Adult and Vocational Education program. • Opportunities for graduate students to design and deliver customized workshops and work sessions as well as refine and practice consulting skills.

Obstacles to Partnering and Conflict Management

Brown (1983) predicted that obstacles to effective partnerships would emerge and that the productive resolution of conflict that arises strengthens the partnership. Botelho's (1998) frames for differences as obstacles were relevant in this case study. The partnership experienced differences in emphasis (i.e., production, profit, and results v. learning, dialogue, and practice), expertise (i.e. experts collaborating with novices and the challenges of translating and communicating across those boundaries), perspectives (i.e. value of experiential learning v. traditional education formats), and cultures (i.e., culture of business v. culture of academia) had the potential to become obstacles to effective partnering. For example, restrictions, approval processes, and administrative requirements from both the university and corporate structures slowed up many partnership activities. Organization representatives of the partnership struggled to explain the procedures and requirements of their organizational systems to each other, to develop mutual strategies for working through red tape and approval channels, and to continue the work of the partnership in the temporary absence of formally approved activities. As one organization representative explained:

> The corporate structure requires a number of sign offs to engage in such an lliance.TheHRD professionals need to champion this cause and seek out a senior manager sponsor to assist with the approval process. Once the approval is given, the HRD professional must continue by meeting the needs of the business goals by providing the instructional support to improve employee performance. The impact of supporting the business goals and employees becomes the rationale for this relationship."

Resolution of conflicts around emerging obstacles was characterized as problem solving. Organization representatives worked to understand concerns, shared information and requirements openly, and crafted solutions that would benefit both parties. Management of conflict required openness, honesty, and reflective observation. For example, a conflict arose involving the university publications office and the approval of an article to be published about the partnership. The writer inaccurately portrayed partnership activities in the article and the organization representatives from both Hartford Life and UConn would not approve the article for publication. The writer, under deadline pressure, involved university executives to apply pressure to UConn's organization representative to influence her Hartford Life counterpart to approve the article. The series of events created conflict for the faculty member who was required to represent the university's needs and at the same time, to maintain the partnership. Throughout the resolution of this conflict, the university partner had to represent the interests of the corporate partner in the face of criticism from the university publications representative and remain committed to working with him in order to get the PR that her adminstrators required. The conflict was resolved through open communication and honest feedback about conflicting requirements with all parties – organization representatives and their public relations offices, as well as administrators – and a solution was negotiated that benefited all parties - the article was published at a later date. The driving force that propelled positive conflict management was the commitment to maintaining a healthy partnership.

Continuous Partnership Development

Both Brown (1983) and Suchman, Botelho, and Hinton-Walker (1998) proposed that effective partnership development requires ongoing attention to maintaining relationships, communication, and evaluation of outcomes. The case partnership was characterized by re-evaluation of the needs of the partnering organizations and re-negotiation of activities, roles, and responsibilities based on those needs. Re-evaluation actvities were particularly necessary in response to persistent change in personnel and structure of the corporate partner. For example, senior executives at the Hartford Life Company, in order to provide continued support for the partnership, required clear evidence that the expenditures of time and money were meeting business needs. Specifically, in a production environment, senior management needed to see that partnership activities were not impinging on production and were having positive results that improved production. As the Hartford Life representative stated:

> "A commitment to the alliance is essential. A senior sponsor is one of the keys to establishing this program. However, the real key is demonstrating that there is a business need and how this program meets that need. In essence, the business leaders must "see" the results...

improved employee performance."

In response, the organization representatives devoted a significant amount of time, along with the partnering groups, to collecting and organizing data that showed positive results on production to share with senior executives. Similar evaluation of corporate and university needs led to re-negotiation of activities. For example, intern assignments changed: Confidentiality statements were drawn up and signed to ensure that interns would not divulge any information about the company's activities; one intern ultimately left the project because he was consulting with a competitor. Learning projects and teaching formats were reorganized: The team learning project format for developing skills in instructional design was too time consuming as an enormous re-training project and an unexpected reorganization emerged. The entire instructional design project was re-evaluated and reconfigured to meet the immediate needs of the OED group. These examples demonstrated the commitment to keeping up with partner needs within an environment of constant change and making sure that the partnership was meeting current pressing needs.

Discussion

While partnership building theory offers many interesting propositions for the effective development of partnerships, the results of the case study highlighted the importance of three key activities and implications for the development of corporate-university partnerships. First, the results of the case study confirm the necessity of focusing collaborative efforts on producing mutual benefits (Brown, 1983; Jacobs, 1997; Suchman, Botelho, & Hinton-Walker, 1998). Specifically, keeping a focus on producing mutual benefits gives clear purpose to the partnership and prevents partnering parties from focusing entirely on their own needs. The mutual focus helps partners develop a clearer understanding of each other's perspectives, needs, and assets, enhancing the potential for further collaboration. Those interested in building effective corporate-university partnerships should develop frameworks and activities that include dialogue and planning that will result in positive outcomes for both partnering organizations.

Second, the results of the case study emphasized the importance of identifying obstacles and resolving conflicts as an integral part of partnership building. It is easy to try to avoid conflict in efforts to maintain harmony in newly formed relationships, but, as Brown (1983) pointed out, conflict that is productively addressed can strengthen the partners' capacity for problem solving and planning. Partners should seek out and value differences, discuss and understand them, assess the differences as potential obstacles, and work openly to understand and resolve conflict.

Thirdly, the building of the corporate-university partnership in this case hinged on continual development. Given the extent and speed of change in today's corporate environments, considering a partnership built or stable doesn't make sense. Agreement that the partnership is in a constant state of development and needs continued attention supports responsiveness to real rather than conceptualized needs. In addition, the case results suggested that universities must develop flexibility and the capacity to change, while corporations might benefit from developing more comprehensive foundations for their HRD work.

Conclusion

Building effective corporate-university partnership demands as much attention to process as to logistics. Often partnerships are formed and maintained by individuals who serve as organization representatives, requiring them to attend to the intricacies and health of the partnership while they represent the interests of their organizations. Obstacles and conflicts will emerge as a function of the activities that attempt to span diverse organizational structures and cultures to create mutual benefits to both partners. The partners' capacity for continuous partnership development, identification and overcoming of obstacles, conflict resolution, and working toward mutually beneficial outcomes is critical to the ultimate success of the corporate-university partnership. The actual task of building and maintaining the partnership is not simple or easy. However, the justification for the partnership is in the growth of HRD professionals and university programs, and improved business processing and employee performance.

Employed Adults in a B.S. Ed HRD Program Option: Who Are These Students and Why Are They Here?

Hui-Chin Chu,
Ana Martinez
Barbara E. Hinton
University of Arkansas

This descriptive study was conducted to determine if demographics of students in a distance learning HRD bachelor degree-completion program are consistent with the demographics of the "new adult learner" as identified in the literature, and if factors influencing student participation in this program are consistent with findings in a previously conducted needs assessment of potential students. Data was collected through open- and close-ended questions in a survey of 71 students in the program.

Keywords: Bachelor Degree Completion Programs, Distance Learning, Working Adults

Many working adult looking for career advancement or new jobs do not have a baccalaureate degree. Not having a degree limits opportunities for working adults to continuing education and access to responsible positions or career advancement. This situation is particularly problematic in rural areas. In the state of Arkansas, this situation is very significant.

Poverty and low levels of education characterize remote parts of Arkansas. In addition, educational opportunities beyond a two-year degree are scarce. Arkansas workers are facing difficulties in accessing higher education. School opportunities are restrained to two-year community and technical colleges. Lack of flexibility in scheduling makes higher education impractical for many working adults.

The Department of Vocational and Adult Education of the College of Education and Health Professions at the University of Arkansas is responding to the need of working adults through the delivery of a baccalaureate degree with a concentration in Human Resource Development. The degree completion program, launched in the fall of 1996, requires 125 semester hours. It requires 24 hours of HRD courses, 12 hours of internship, and allows up to 33 credit hours for experiential learning through portfolio development. The option provides the upper division courses required for degree completion on a two-year rotation. Students must take 56 hours general studies, which can be completed at a community or four-year college. Instruction is delivered via compressed interactive television to nine sites on Friday evenings and Saturday mornings.

The degree completion program described above was developed and implemented based upon a statewide needs assessment conducted in 1993. Motivators identified in the needs assessment as contributing to students entering such a program included organizational tuition reimbursement, degree completion opportunities, and desire for professional growth. Barriers identified in the needs assessment included: time away from job, location of program, lack of program information and lack of manager support. However, no analysis has been made of the student population currently in the program. The research problem was to determine if the demographics of the students in the program and factors that may have influenced their choosing to enter the program are consistent with the literature and the previously conducted needs assessment.

Theoretical Framework

Adults are the fastest-growing segment of all the population groups in higher education. According to the projections predicted by U.S. Bureau of the Census in 1995, the number of nontraditional (age 25 or older) college students will arise to almost 46 percent by the year 1998. The Education Resources Institute reported that the percentage of college students age 40 or over grew from 5.5 percent of the total enrollment in 1970 to 11.2 percent in 1993. The figure makes this group to be an increasingly significant part of the college classroom (1996). Nontraditional students are causing institutions of higher education to rethink the focus of academic and student affairs programs. Institutions of higher education have developed alternative structures, policies and programs that serve to provide adult access to higher education.

Copyright © 1999 Chu, Martinez, and Hinton

The globalization of commerce and trade has had a structural impact on the U.S. economy. The challenges of a global economy require our workforce to be more educated to be able to function in a global community. Today, production, manufacturing, commercial trade, and information have become global in a telecommunications-rich environment that transcends national and geographical boundaries. As American businesses restructure to meet the demands of a global economy, American workers face a future in which they must continually upgrade their knowledge and skill, or learn new skill in order to remain competitive and to increase their earning power. As increasing number of working adult students seek access to higher education, they will demand more time- and place-independent learning options and technology-based institutional learner support services (Dubois, 1996).

Husson (1996) defined the "new adult learners" as being approximately 35 years old, working full or part time with their employers providing tuition assistance and as students who are focused, goal-oriented, and motivated. They have severe time constraints, and will not tolerate hassles. They will immediately apply learning to their work. They are serious and hard working, and they have to balance multiple roles at the same time. Foster reported that degree completion, job advancement, improved long-term income, development of vocational skills, and interaction with others (1993) motivate adult learners. Aslanian (1989) found that adult learners tend to choose to study subjects directly related to their jobs or careers. Population, mobility, technology, occupations, housing, income, life expectancy and government affect societal changes. These accelerated changes are forcing adults to learn new skills, knowledge, attitudes and values.

Distance learners bring those characteristics to the educational process at the time of entry, such as: educational preparation, and motivational and persistence attributes, but also variables that more situational in nature (Billings, 1988; Kennedy & Powell, 1976; Sweet 1986). Situational barriers stem from a person's life situation and involve time constraints and family and employer support (Powell, Conway, & Ross, 1990; Pythian & Clements 1982; Rubenson, 1986; Woodley & McIntosh, 1980). Swift (1987) suggested that financial problems play a role in the attrition of nontraditional students. Financial aid from the institution or employers of the adult learners is positively associated with retention. Higher socioeconomic status is often a positive predictor of academic success.

According to Aslanian (1993), 82 percent of undergraduate adult students are degree seekers; most of them want to obtain degrees so as to advance in their career. Eighty-five percent of adult students are women, which reflects a different in life schedules: some women are doing later while some men did earlier (Aslanian, 1993). According to Foster (1993), 75 percent of the adult learners are age 25 to 44, 55 percent have some college credits, and 32 percent are in professional/managerial positions. According to Loser, Trabandit, Hatheway, and Donell (1996), 70.3 percent of telecourse students are female, 29.7 percent are male, 59 percent work full time and 19 percent work part-time. While asked reasons they take telecourses, they reported that conflict with on-campus class is the highest scored factor (43%) while minimized travel to campus is the second highest scored factor (35%).

According to the College Board (Aslanian, 1996), there is a national demand for accelerated degree programs and weekend colleges through the use of distance education. It was found that 45% of all undergraduate adult learners have taken most or all of their courses on weekday evenings, while 10% have enrolled in day and evening classes and 5% in weekend courses. The report also states that 20% of undergraduates have had some courses on the weekend.

Distance education responds to two national trend: adult learners are as the"new majority" in higher education which demands institutions become more responsive to learners' needs as degree seekers; and the greater availability of telecommunications technologies now makes it possible to serve students almost universally with expended educational services and distance learning opportunities. Distance education is a catalyst for change and is helping to shape the transformation of higher education from a facilities/faculties-centered to learner centered. Distance education also create an opportunity for adults to develop new skills, pursue a clear path way to a degree, and obtain educational credentials without having to forsake family and work responsibilities (Dubois, 1996).

Research Design

The primary purpose of study was to determine the demographics, educational background, and work experience of a group of nontraditional HRD students participating in a distance-learning bachelors degree-completion program. A secondary purpose was to examine the students' perspectives on factors which may influence their entering the program including the type and amount of family and employer support they are receiving in pursuing the degree, their motivation for pursuing the degree, and their perceived challenges/strategies to their completing the degree.

Participants in the study were students in the HRD distance-education degree-completion program option. The total number of the population was 71 students. Data was collected through a survey consisting of both closed-ended and open-ended questions. (Case studies are currently underway for phase two of the study.) Students were mailed the survey; within six weeks, a second survey was mailed to those not returning the original survey. A total of 63 useable

surveys were returned (89%). Student participation was voluntary, and each participant was required to sign a letter of informed consent. Data was analyzed through descriptive methods, reporting frequencies, range, and percentages of responses to each closed-ended question. Responses to open-ended questions were grouped according to topical responses. Data is reported in aggregate form, and individual students are not identified. The study was supported by a grant from the U.S. Department of Education, Fund for the Improvement of Postsecondary Education (FIPSE).

Research Questions

The research questions were: Do the demographics of these students differ from those identified as the "new adult learner in the literature"? Are the factors that are perceived to be important for attendance in this program consistent with those identified in the prior needs assessment?

The following questions were included in the survey:

1. What are the ages, gender, and ethnicity of the students?
2. What is the education background of the students? How many hours of college credit did they have prior to entering the program? How many of them had an associate degree?
3. What is the work experience of the students? How many years of work experience do they have? What is the type of position do they hold in their current job? What kind of organization do they work for? How many years have they worked in their present position? What is the longest time they have been employed in any position? What is the size of the organization where they are employed?
4. What do they perceive to be the amount of family support they are receiving? What are the examples of this support?
5. What do they perceive to be the amount of employer support they are receiving? What are examples of this support?
6. What are the primary reasons why they are pursuing this degree?
7. What do they perceive to be their most difficult challenges to completing this degree? How do they plan to overcome these challenges?

Results

The following is a summary of the results of the survey:

Enrollment by Ethnicity

The majority of the students are Caucasian (89%). The seven black students (11%) are located in a region of the state referred to as the Delta region, an area of high black population. The proportion of black students in this group is higher than that of the black population of the general undergraduate enrollment at the University of Arkansas, which reported an undergraduate black enrollment of 6.09% and undergraduate Caucasian enrollment of 83.37% in Spring 1998.

Enrollment by Gender

The female (59%) and male (41%) student populations in this program are somewhat similar to the general undergraduate population for the University of Arkansas, which was 48.85% female and 51.15% male in Spring 1998. However, the College of Education and Health Professions traditionally has a larger female undergraduate enrollment than male undergraduate enrollment, as evidenced by the Fall 1996 enrollment of 25% male and 75% female.

Persons with Associate Degree

A majority (52%) of persons entered this degree completion program with an associate degree. The number of on-campus undergraduate students at the University of Arkansas with an associate degree is not available; however, it is expected that the majority of traditional students would not have the associate degree since the University of Arkansas does not grant an associate degree.

Age of the Participants

Eighty-six percent of participants ranged in age from 22 to 50, which is consistent with the survey results reported by Foster in 1993 that 75% of the adult learners are age 25 to 44. The majority (70%) of the participants in this program is between the ages of 31 to 50. There is no student younger than 22 and older than 59.

Years at Present Job

Seventy-nine percent of those participating in this program had worked at their present job between 1 to 10 years. Percentage of persons at the same job for 16-19 years totaled only 3%, while those working between 11-15 years totaled 13%.

Longest Years of Employment

The majority of students (63%) fell into the 6 to 15 years of employment range while only 18% had been employed five years of less and only 5% had been employed over 21 years.

Family Support

All students reported some degree of family support with the majority of them reporting total support from their families. Specific support mentioned included verbal encouragement (89%), financial support (27%), child-care assistance (25%), help with responsibilities at home (59%), transportation (22%), and other (16%).

Employer Support

Only 6% of the students reported little or no support from their employers for their attendance in the program. The largest percentage (41%) described their employers as being totally supportive. Specific support mentioned included verbal encouragement (67%), tuition reimbursement (67%), time off from work (68%), other (16%).

Type of Work

Of the students participating in the program, 44% described their work as being in management and 16% described their work as supervisory. Thirty-eight percent described their positions as being non-supervisory in nature.

Kind of Organization

The largest percentage of students (30%) works in an educational setting. The second largest type of organization was manufacturing (20%) followed by service (12%), transportation (11%), and health (8%). The remaining students were fairly evenly spread among health, government, utility, agricultural, aircraft, accounting, retail, and technology.

Distance of Travel to Classes

Sixty-three percent of the students travel less than 30 miles to attend classes. The host sites are located at two-year institutions, which are within 30 miles of most citizens in the state

Years of Anticipated Graduation

The two cohorts started in 1996 and 1997 respectively. Seventy-four percent of the students enrolled in these two cohorts anticipate graduating on time; i.e., within the two-period in which the classes are being offered.

Discussion and Conclusions

The demographics of this group of students do not differ greatly with the work of Husson (1996), Foster (1993), Aslanian (1989) and others who describe the "new adult learner" as one who is typically around 35 years of age, working full time, receiving tuition assistance from employers, goal oriented, and motivated. However, the demographics of the group do differ from the traditional, on-campus student at the University of Arkansas. For example, black enrollment (11%) is higher for this group than the undergraduate black student enrollment of 6.09% on campus in Spring 1998. When examining black enrollment by site, it is noteworthy that 58% of the students at a host site in southeastern Arkansas located in a predominately black community located in an area known as the Delta were black women. This suggests that program accessibility in other black communities could increase minority enrollment. This notion is supported by the responses to open-ended questions, which noted that when asked what was the primary reason for enrolling in this program, 40 persons said to earn a degree. Other responses included schedule fits requirements (5 responses), personal satisfaction (5 responses), and desire to be more competent in my job (4 responses). The features of the program that appeal most to the students were Friday and Saturday classes (19 responses); 9 weeks per semester/2-year course rotation (15 responses); and recognition of experiential learning (10 responses). Content, getting a degree, instructors, availability and access each received 7 responses and content geared to adult learners was mentioned 4 times. The convenience of living within 30 miles of program delivery sites seems to be a positive factor with many students.

This program appeals to a gender-balanced population, which is similar to the general undergraduate population at the University of Arkansas; however, it differs greatly to the College of Education and Health Professions undergraduate population, which has a 75% female-25% male ratio. It is not clear if the more gender-balanced enrollment is because of the nature of the subject matter, the delivery method, or a combination of both.

The majority (75%) of students has from one to 10 years of employment at their present job. This seems to suggest that those working in their present job for ten years or less might be more inclined to seek further education than persons employed in their present job for more than 15 years. It may be more important to persons in mid-career to earn a degree than those nearing the end of their career. The fact that a majority of the students (44% management, 16% supervisory) are in a management/supervisory role in their present position may also account for their motivation to improve their skills by returning to school. The students indicated that they would like to get information and knowledge in the Human Resources Development field and gain skills that they can use in their jobs. The nature of the content (HRD) seems to appeal to a broad constituency, with students employed at a variety of work settings. The fact that the host sites are at educational institutions and that some of those institutions allow their employees to take courses at a greatly reduced tuition rate could explain the relatively large percentage (30%) of students being employed in an educational setting.

The participants were informed about the HRD program from someone in their companies or from the University of Arkansas and other educational institutions. Newspapers and friends were other source of information about this program. The things that appeals most to the participants about the HRD program are the weekend classes, the nine-weeks per semester/two-year course rotation and the recognition of experience for credit. They also mentioned content, getting a degree, instructors, and availability as features that appeal to their entering the program.

The most difficult challenges the participants have faced in completing the degree have been the portfolio development, time management, and the internship activity. Participants believe they can overcome these challenges through hard work and better focus, managing time, patience, and persistence. Participants also mentioned instructors support, as an important source of encouragement. Seventy-four percent of the students expect on-time graduation. A few students were admitted prior to completion of the general studies requirement, which could account for the 26% who anticipate taking longer than two years to complete degree requirements. Thirty-eight percent of the participants plan to enter a graduate degree program after completing their baccalaureate degree.

For the final question about what program changes they would suggest, four participants suggested a three-hour course on portfolio development, three participants suggested less time per class, three participants suggested more weeks, and three participants suggested adding one evening class during the week. In comparing the results of this study with the prior needs assessment, it is clear that there is agreement on the factors identified as important to prospective students and those identified as important to this group of students.

New HRD Knowledge

While the authors do not intend to generalize the findings of this study to the general population because of the small number of participants, it is clear that offering a baccalaureate degree program at two-year colleges by distance learning

indeed benefits working adult students who are not geographically accessible to 4-year institutions. The results of the study, while informing the authors on issues involved in program evaluation, should also assist other educators with identifying the demographics and needs of working adults, in designing curriculum systems and practices for nontraditional students in HRD programs, and in delivering these programs through distance learning. Identification of the demographics and motivation factors of these students will help educators identify prospective under-served student populations. In addition, an understanding of the educational and work backgrounds of this group of students should help educators design curriculum appropriate for this audience. Understanding of the reasons for students pursuing the degree as well as challenges and support available from family and employers should help educators in designing delivery systems to meet the special needs of working adults.

Women Entrepreneurs: Maintaining Business Success Through Human Resource Development

Dominic G. Kamau
Gary N. McLean
Alexander Ardishvili
University of Minnesota

Women entrepreneurs own more than 7.7 million enterprises employing approximately 35% of the labor force in the US. They are important clients for HRD activities. This study investigated the contributions of HRD to business success. Women entrepreneurs recognize the need for HRD, for both themselves and their employees. Some women entrepreneurs have their employees participate in formal HRD programs, but many do not have formalized programs. Practitioner and research opportunities exist for HRD professionals.

Keywords: Organizational Development, Change, Systems

Entrepreneurs are not a homogeneous group; they can be grouped by ethnicity, immigrant group, gender, age, or other criteria. Each group of entrepreneurs has its own distinct characteristics, challenges, and opportunities. Hisrich and Brush (1985), Kaplan (1988), and Moore and Buttner (1997) have presented women as one of the fastest growing groups of entrepreneurs. Currently, according to Moore and Buttner (1997), women own more than 7.7 million firms that employ approximately 35% of the labor force in the United States.

According to Miner (1996), "real similarities and real differences exist between men and women entrepreneurs" (p. 141). He based this assertion on years of research on entrepreneurship and entrepreneurship development. Women entrepreneurs may experience a different set of challenges in their entrepreneurial lives from other groups of entrepreneurs. Thompson (1995) stated that women entrepreneurs experience difficulties in getting capital and training and are restrained by household and child-rearing responsibilities. Hisrich and Brush (1985) also stated that women entrepreneurs lack support systems that would facilitate their efforts.

Women entrepreneurs are not a homogeneous group, either. Moore and Buttner (1997) pointed to the danger of treating women entrepreneurs as a single group: "Previous findings that had yielded a single profile of female entrepreneurs as being primarily sole proprietors with similar educational backgrounds and a basic interest in extending home skills into the marketplace no longer fit" (p. 2).

Despite the differences among women entrepreneurs, it is possible to study women entrepreneurs as a distinct entity. Prospective women entrepreneurs are likely to benefit from learning about the success stories of other women entrepreneurs. Experienced women entrepreneurs who participate in a study on women entrepreneurs may reap intrinsic benefits by sharing their experiences. Women entrepreneurs may experience such problems as conflicting role expectations and responsibilities. Experienced women entrepreneurs will probably have overcome unique problems in their entrepreneurial journeys. Sharing their experiences in a research project would be helpful to prospective women entrepreneurs and others who may not be as successful.

In spite of increased research on entrepreneurship, very little is known about women entrepreneurs (Moore & Buttner, 1997). Thompson (1995) acknowledged "the missing gender dimension in studies of entrepreneurs" (p. 107). Earlier, Hisrich and Brush (1985) had decried the lack of studies on women entrepreneurs. There is need to increase our knowledge of women entrepreneurs.

People learn from role models. Prospective women entrepreneurs are likely to learn from successful women entrepreneurs—*role models* (Williamson, 1988). Profiles of successful women entrepreneurs are likely to provide prospective women entrepreneurs with reference points for their own entrepreneurial journeys. Stories of success may in fact be an inspiration and a target at which to aim in order to succeed. Recognition of research participants as successful entrepreneurs may be a morale booster in their already successful entrepreneurial journeys.

Statement of the Problem and Purposes

Entrepreneurship is emerging as the defining trend of the business world of the 21st century, driven by student demand. No field of business education is growing faster today than that of entrepreneurship. More than 120 accredited business schools are offering entrepreneurship as a major (Bronner, 1998). Many U. S. high schools, community colleges, technical colleges, and universities have entrepreneurship development programs (Pitman, 1988; Van Hook, 1987; Williamson, 1988). Vesper (1996) stated that there are over 400 universities and colleges that offer entrepreneurship courses and/or entrepreneurship concentrations. Stewards and Boyd (1989) suggested that entrepreneurial education was a realistic alternative for women and minorities. The researchers in this study believe that entrepreneurial programs for women are worthwhile investments. Such programs should of necessity draw from the experiences of women entrepreneurs--their stories need to be told or they need to appear as resource persons in entrepreneurship development programs. Hence, there is a need to develop descriptive profiles of successful women entrepreneurs.

In this study, stories of successful women entrepreneurs will be documented for the purposes of providing role models for women entrepreneurship development. The researchers will also describe how these women entrepreneurs generated business ideas and identified business opportunities that they considered would lead to success. The researchers will describe the critical points in the lives of these women entrepreneurs; the strategies employed by these women entrepreneurs to ensure success; the strategies used by these women entrepreneurs for recruiting, developing, and maintaining human resources; and the meaning of business growth to these women entrepreneurs.

Need for the Study

The researchers are aware of the criticisms leveled by Low and MacMillan (1988) at studies on personality or cultural background of entrepreneurs. The gender of the entrepreneur would probably fall under the same criticism. In spite of the criticism, little is known about this important segment of entrepreneurial population (Moore & Buttner, 1997; Thompson, 1995). Therefore, the researchers consider a study on women entrepreneurs to be a valuable addition to our knowledge of entrepreneurship.

Further, Moore and Buttner (1997) have stated, "Among the things revealed by broader and more intense scrutiny was that practically nothing was known about female entrepreneurs" (p. 12). The scrutiny Moore and Buttner were referring to was on the advances made in research on entrepreneurship. There is simply not enough information on women entrepreneurs. Therefore, there is a need to add to our knowledge through research about this fast growing group of entrepreneurs.

In addition, reporting about the successes made by women in the business world has been largely negative because emphasis has been placed on what they have not achieved rather than on what they have achieved (O'Brien, 1998). Though O'Brien was commenting on popular reporting in the media, it is the desire of the researchers to present a broader view of women entrepreneurs. Women entrepreneurs have demonstrated that they have the capacity to participate fully in national economic development. Researchers in entrepreneurship should have more studies on successful women entrepreneurs in order to match the growth needs of women entrepreneurs.

Relevance of the Study

Women entrepreneurs as a group constitute one of the largest sources of employment for the labor force. This is likely to continue to increase as women-owned ventures continue to grow. As employers of labor, women entrepreneurs have concerns related to human resource development. HRD concerns for women entrepreneurs are threefold--entrepreneurial development for the women entrepreneurs themselves, personal development for the women entrepreneurs, and human resource development for their employees.

HRD practitioners and researchers in HRD cannot afford to ignore such a large employer of human resources. The researchers studied women entrepreneurs in order to identify issues related to human resource development for women entrepreneurs and their employees. HRD practitioners need to know the needs of women

entrepreneurs in order to do business with them, and they need models to share in their HRD practices. This study on women entrepreneurs and how they recognized business opportunities, how they achieved success in their businesses, and how they dealt with human resource issues will be a valuable addition to studies on women entrepreneurs.

Objectives of the Study

The objectives for this study are:

1. To develop detailed descriptions of some successful women entrepreneurs operating businesses in the cities of Minneapolis and St. Paul.
2. To determine how these women entrepreneurs generate business ideas.
3. To determine how these women entrepreneurs identify and evaluate business opportunities.
4. To record the ideas of these women entrepreneurs on human resources and HRD.
5. To record what these successful women entrepreneurs consider to be the critical points in their entrepreneurial lives.
6. To determine what business growth means to these women entrepreneurs in relation to their businesses.
7. To identify strategies these women use to ensure business growth.
8. To discern the lessons these women entrepreneurs can offer to prospective women entrepreneurs and less successful women entrepreneurs.

Research Question

Moore and Buttner (1997) found that some women entrepreneurs have been able to move beyond the glass ceiling. The central question for this study is: *What lessons can we learn from a group of successful women entrepreneurs*? Of main interest to the researchers are the lessons related to human resource development for women entrepreneurs and their employees.

Constraints of the Study

This is a case study of some women entrepreneurs operating in the cities of Minneapolis and St. Paul. The methodology does not require nor permit generalization. Interviewing is the method of data collection and may affect the quality of data collected. The selection of the research participants was done by referrals which involved a subjective judgment (in terms of who is successful) on the part of the referrers. However, more detailed information is collected using interviews than when using other methods of data collection.

Review of Literature

The literature reviewed explored the meaning of entrepreneurship, general issues of entrepreneurship, groups of entrepreneurs that have been studied before, and available literature on women entrepreneurs.

Meaning of Entrepreneurship

There is no agreement about the meaning of entrepreneurship. Cochran (1968) explained that the word "entrepreneur" has developed to mean an adventurer and a person who bears uncertainty. He added that, besides having to supply capital, entrepreneurs must have judgment, perseverance, knowledge of business, innovative approaches, and an ability to lead/manage. He further noted that entrepreneurship can be exercised by business people as well as non-business people.

Brandstatter (1997) also had difficulty with the word "entrepreneur." To him entrepreneur entailed business ownership, decision-making power, leadership, or size of company. He saw entrepreneurs as business owners or top managers of a company, referring to the latter group as dependent or employed entrepreneurs.

Lumpkin and Dess (1996) also recognized the lack of consensus in characterizing entrepreneurship, leading to difficulties in investigating relationships of entrepreneurship and other business variables such as performance. They concluded that it is unlikely that there will be consensus regarding the meaning of entrepreneurs and entrepreneurship in the near future.

Researchers normally find it necessary to define what entrepreneurship means for them and their research. For the purposes of this study, women entrepreneurs will be those women who own businesses and/or take active roles in management of business ventures, be they sole proprietorships, partnerships, or corporations. The venture should be making annual revenues from sales or fees of $500,000 or more. An earlier study by Moore and Buttner (1997) had a lower range of annual revenues of $250,000 to $499,999. The reason for using a higher revenue criterion was the fact that the study is targeting successful women entrepreneurs. Another criterion for inclusion in this study was the venture's potential for growth. The researchers are aware that success can be defined in terms other than revenues (Moore & Buttner, 1997; O'Brien, 1998). However, a quantitative value would give a more consistent measure of success than a subjective one would. The researchers began the research study by using qualitative measures of success, that is, asking leaders of associations to identify successful women entrepreneurs within their membership. The leaders of the participating associations did not have access to the financial details of their members. Thus, initial identification of successful woman entrepreneurs was based on subjective criteria or a combination of criteria.

Research in Entrepreneurship

There are many studies on entrepreneurship, several of which have been presented at conferences on entrepreneurship research. Babson College has been holding annual conferences on entrepreneurship research since 1981. These conferences have included both general entrepreneurship and specific classes of entrepreneurs.

Classes of Entrepreneurs

Moore and Buttner (1997) have described two types of entrepreneurs--traditional and modern. They stated that traditional women entrepreneurs tended to be in sole proprietor service businesses and remained small and slow growing. They contrasted traditional with modern women entrepreneurs who engage in a variety of occupations and have experience in the business world through better preparation in technical and planning skills and social networks. Miner (1996) developed a classification of four types of entrepreneurs--personal achievers, super-salespersons, real managers, and expert idea generators. Entrepreneurs could also be classified on the basis of their social background, gender, national origin, type of business (service, manufacturing, construction), and ethnicity. Brandstatter (1997) studied Austrian entrepreneurs and found that there is a difference between those entrepreneurs who founded their businesses and those who inherited businesses or entered into business ownership through marriage. Each group of entrepreneurs is likely to experience different opportunities and challenges from other classes of entrepreneurs.

Women Entrepreneurs

In a study of women and minority entrepreneurs, Hisrich and Brush (1985) reported that 90% of women entrepreneurs operated service businesses, while other groups of entrepreneurs had other types of businesses, such as construction and manufacturing. They also found that women and minority entrepreneurs experienced similar problems of finance, lack of training, and focusing primarily on service-oriented businesses. Moore and Buttner (1997) reported, however, that women entrepreneurs are now entering into non-female businesses of finance, insurance, manufacturing, and construction.

Brush and Hisrich (1988) investigated the strategic origins of women entrepreneurs and their relationships to the growth of their business ventures. Earlier, Hisrich and Brush (1987) had studied women entrepreneurs for personal characteristics, family background, and management skills and their impact on business success and growth. Kaplan (1988) also investigated the reasons women change from employment to business ownership.

Research Methodology

This research was designed as case studies of successful women entrepreneurs operating in the cities of Minneapolis and St. Paul, Minnesota. Information was collected from the research participants through face-to-face interviews. All interviews were held on the premises of the research participants, except for one. The researchers utilized interpretive research designed to collect information, stories, and experiences from women entrepreneurs who were considered successful by their colleagues or leaders in business organizations.

Research Design

Initial plans were to interview thirty successful women entrepreneurs. Twenty women entrepreneurs agreed to participate in the study. Four of the research participants did not meet the criteria ($500,000 annual sales or fees) for inclusion in the study. An interview guide was developed, but the interviews were largely unstructured. The research participants were allowed to make uninterrupted responses.

Research Participants

The selection of research participants was largely through referrals by leaders of associations of business owners and other business support groups, such as funding agencies. Leaders in the St. Paul Area Chamber of Commerce, the Midway Chamber of Commerce, The Collaborative, and the Milestone Growth Fund made referrals of women entrepreneurs whom they thought had been successful. Personal referrals were also made by women entrepreneurs in the course of interviews. Directories were also a source of valuable information for contacts. In this regard, the national directory of the National Association of Women Business Owners (NAWBO) was used as a source of contact information for women business owners. Numerous efforts to contact (by telephone and letters) the leaders of the Minnesota Chapter of NAWBO were unsuccessful.

Instrumentation and Validation

The study was designed from an interpretive perspective. Its validity is built on agreement between the researchers and the participants on the themes emerging from the interviews or conversations. The following questions were used in the interviews:

1. Explain how you began your operations.
2. Describe the nature of your business.
3. How do you determine that a business opportunity will be successful?
4. Describe the critical points in your entrepreneurial life.
5. What does human resources mean for your business?
6. What does human resource development mean for you and your business?
7. Explain what business growth means for you and your business.
8. Describe your strategies for ensuring business growth.
9. What advice would you give to other women entrepreneurs, especially prospective ones?
10. What additional comments on any topic/issue related to women entrepreneurship would you like to make?

Individual interviews were held with 16 women entrepreneurs. The interviews were conversational as much as possible with the research participant being allowed as much time as desired to answer questions. Interviews continue to be held as research participants are identified. The interviews were tape recorded for those who had no objections. One interview was recorded manually at the request of the interviewee. Tape recordings were transcribed and hard copies made to enable analysis. Background information of the entrepreneurs was also collected from the entrepreneurs in the course of the interviews. The research participants have committed themselves to provide additional information whenever needed. To ensure validity of the data collected, the research participants will be provided with a summary of their transcripts and be invited to make written corrections of any misrepresentations of their views or facts.

Analysis

Analysis entailed development of descriptions and identification of themes from the transcripts of the tape-recorded interviews. Dominant themes were identified regarding the critical points in their entrepreneurial careers, the meaning of business growth and strategies for growth, and human resource development practices. Themes were identified by the frequency of their occurrence. In the final report, the findings will be supported by extensive quotes from the research participants.

Findings

Findings are based on the interviews and any materials made available by the research participants to the researchers. The findings (and themes) identified fall under operations, idea generation, evaluation of opportunities, critical points, human resource development, business growth and success, sources of support, and advice to other women entrepreneurs.

Nature of Operations

These women entrepreneurs are engaged in a variety of business ventures. Some of these women are engaged in businesses that require a high level of professional education and training, such as engineering or law. One woman called these ventures "high barrier" ventures. Most were involved in the sale of services, such as translation, marketing research, and human resource services. Others were engaged in what would be termed "low barrier" ventures, such as dealing with processing and trading (e. g., bakery). There is no one category of business venture that can be said to belong to these women entrepreneurs. They are in all aspects of the business world.

Business Idea Generation

These women largely entered into business areas in which they had prior experience as employees, or they had adequate academic and professional training, or in areas where they served a very special need. Employment served as a good training ground for entrepreneurship. One woman entrepreneur with a large staffing business began as a clerical employee in the company she now owns. Academic and professional training also played a key role in determining which business to operate. Academic and professional education in engineering and law played a part in the decision of women entrepreneurs in those fields. Of those who did not have experience in their business areas, one had a franchise (bakery) and the other was in the translation business—a special need among her Asian community. Now she has personnel to translate into Eastern European, Japanese, and African languages.

Evaluation of Business Opportunities

Some of the women drew elaborate business plans, but others used intuition to determine which business ventures would be successful. At the initial stages of a business venture, evaluation of business opportunities is largely by intuition. It is only when the businesses have achieved considerable growth do these women entrepreneurs draw business plans. Where business plans have been used, they have been contracted out.

Critical Points

Initial analysis indicates that the first two years in business are critical and have fond memories of family support. Strong support came from the spouse, but in most cases it has included other members of the family, including fathers, mothers, and grandmothers. Partnerships have not worked well for those women entrepreneurs who have tried them. Partners have not been faithful as far as financial resources are concerned, or the women entrepreneurs did not consider seeking a partnership relationship. One partner explained how she came back from leave only to find her partner had left the business, yet she was the one in charge of financial resources. Because of that partner, she had to reduce her staff to continue in business. A partnership with her spouse has worked well. Another partnership in a legal profession has also worked well. These two partnerships have worked well because the partners have worked responsibilities based on individual expertise.

Human Resource Development

For the large business ventures owned or operated by women, HRD programs are based on the needs of the ventures. For example, two women entrepreneurs' businesses provide care for vulnerable adults—the elderly and adults with developmental/mental disabilities, where training and retraining of employees is required for state registration. Training programs are needed to remain in business. The other women brought with them skills (mainly technical and professional), hired those with skills that they need, and, to a lesser extent, sought programs for human resource development. However, all women entrepreneurs valued human resources and human resource development. One woman engineer running her own business said that all that they sell is "between the ears."

Business Growth and Success

These women are capable of achieving high levels of business growth. One has grown a corporation into annual revenues of over two hundred million dollars. She has been the president of the company since its inception. Two others have gone beyond the one million dollar mark. The majority of the women interviewed have achieved gross revenues between $500,000 and one million dollars. Two have not reached the $500,000 mark, in spite of this being one of the criteria for being interviewed. One of these has the potential to become a multi-million dollar business. The other is unlikely to reach this mark in the next two years. Most of the women entrepreneurs interviewed are not enthusiastic about unchecked growth. One expressed concern about how to disengage herself. In her view, the bigger her venture grows, the more difficult it will be for her to sell it when she decides to retire.

Sources of Support

The greatest source of support for these women is the immediate family (spouse, mother, father, and children). The spouse was cited as the most important source of emotional and financial support. All stressed the need to have an understanding spouse to encourage and give financial support at the initial stages of the business venture. Two women have their spouse as their partner. In both cases, the women were the initiators of the businesses. One woman found her greatest support from her grandmother who co-signed for the first loan for the business. Women's associations were also a source of support. One woman gave an example where she and other women act as board members for each other's businesses.

Advice to Prospective Women Entrepreneurs

The most frequent advice is that of being persistent in their pursuit of business goals (don't give up) and building good personal working relationships with bankers, professionals (accountants, lawyers) that one may hire, clients, employees, and family.

Conclusions, Implications, and Recommendations

The following conclusions, implications for HRD, and recommendations for further research apply:

1. Women entrepreneurs can be successful in a wide spectrum of business ventures---in "high barrier-high return" as well as "low barrier-low return" ventures. Some of these women have found success in areas that have been male dominated.
2. Prior employment, academic education, and professional training play an important role in determining the kind of business enterprise in which to engage. These women sought business opportunities in areas in which they had experience as employees or have professional preparation. None of the participants had considered entering a business that was completely new to what she already knew or did. Only the Asian woman in the translation business was an exception. However, she is in an area with high demand and little competition.
3. Intuition as well as business planning played a role in evaluation of business opportunities.
4. Strong family and professional relationships are important for success in entrepreneurship. They also need good customer relations.
5. Women entrepreneurs value human resource development for both themselves and their employees. Some employees attend regular training in keeping with government regulations. One woman includes training in the

budget for new hires. Many women expressed a desire for professional development to help them run their businesses in a better way--accounting and management were mentioned frequently.

6. Women entrepreneurs can act as role models for other entrepreneurs, women or men. Through associations, women entrepreneurs can help one another, including prospective women entrepreneurs.

Implications for HRD

HRD professionals should accord women entrepreneurs the importance they deserve as clients for HRD activities. Women entrepreneurs have training and organization development needs, for themselves, their employees, and their organizations.

Recommendations for Further Research

Much more information is needed in the area of women in entrepreneurial environments. This study needs to be replicated many times to continue adding interpretive knowledge and information to the insights gained in this study. Research into the specific HRD needs of women entrepreneurs—training and development, organization development, and career development—will all add useful information. Teaching case studies developed from research cases will provide useful material for entrepreneurial development activities. Additional descriptive research will also be useful in provide more information about "modern" women entrepreneurs. It would also be helpful to detemrine the characteristics that allow some women to succeed in entrepreneurship, while others fail.

Evaluating the Impact of a Union-Management Career Development Program

Gregory M. Chajnacki
Harleysville Group, Inc.

Andrea D. Ellinger
The Pennsylvania State University at Harrisburg

The purpose of the study was to evaluate the impact of a career development program in a steel plant which recently underwent severe restructuring and downsizing. Impact was measured in four specific areas: employee's perceptions about the effect of the program on their past job, during transition, on a new job, and socially. Using a descriptive survey design based upon a non-random sample of 129 active participants in the program, this study also examined the reasons for participation and the utilization levels of various career development activities.

Keywords: Career Development, Program Evaluation, Union-Management Partnership

Learning and learning-how-to-learn have become critical competencies in the modern workforce (Dixon, 1990; Senge, 1990; Zuboff, 1988). Yet, despite the investments that are being made in formal, informal, and on-the-job training to foster learning in the workplace, few organizations in the United States are evaluating the effectiveness, merit, or worth of these training programs (Hilbert, Preskill & Russ-Eft, 1997; Preskill, 1994). Although numerous models of training program evaluation exist, Kirkpatrick's four-step appoach or four-level model (Hilbert, Preskill & Russ-Eft, 1997; Kirkpatrick, 1994) is one that is most often used by practicioners despite some of its limitations (Holton, 1996). In Kirkpatrick's model, there are four levels of possible training outcomes: reactions, learning, behavior, and results (Kirkpatrick, 1994). Reactions, Level 1, are intended to examine what the trainees think and feel about the training received. Learning, Level 2, is the extent to which trainees have increased their knowledge and skills as a result of the training. Behaviors, Level 3, relate to the extent to which trainees are using the new knowledge and skills they have acquired. Results, Level 4, seek to examine how the training has had an impact on the organization. This model serves as the framework for this evaluation study.

Definitions associated with career development focus on either the wholeness of an individual or the balance between the needs and development of an employee and an organization. When career development is primarily individual-centered it deals with the needs, wants, capacities, and potential of the whole person including environmental pressures, significant others, and social responsibilities to children and aging parents (Wolfe & Kolb, 1980). When career development is primarily organization-centered it can be defined as an organized, formalized, planned effort to achieve a balance between individual needs and organization workforce requirements. Organization career development integrates and links its activities with the human resource function of an organization and refines basic human resources activities (Leibowitz, Farren & Kaye, 1986). The program in this study views career development as individual-centered without a formal link to the human resource functions within the plant.

The current study was designed to evaluate the impact of a unique union-sponsored Career Development Program within the steel industry and reports the findings from a recently conducted impact evaluation. This Career Development Program is an example of a union-management partnership that is centered around work-life issues. Its beginnings can be traced back to the 1970s with the United Autoworkers and General Motors. This particular program is one of 52 national programs sponsored by the United Steelworkers and 13 participating steel companies with a yearly enrollment level of 34,000 employees and total funding approaching $120 million (Institute for Career Development, 1997).

The subject of this research is a Career Development Program that was created in 1992 at a steel company with 3,500 eligible employees. Participation in this comprehensive program is voluntary. Primary program services include tuition assistance, basic skills courses, pre-technical and trade training, computer training, personal development workshops, and career counseling. This program, in particular, has encountered tremendous challenges to its mission as a result of drastic organizational changes including a potential merger with a foreign steelmaker, department and position restructuring, the introduction of new manufacturing technology, and large-scale downsizing which eventually led to a complete plant shut-down in the first quarter of 1998. Apart from annual interest surveys and course evaluations, there was little information on what kind of impact this program had on the lives of its participants.

Copyright © 1999 Gregory M. Chajnacki & Andrea D. Ellinger

Despite the local plant shut-down, a major obstacle to continued national growth and effectiveness in administering the more than 50 nationwide programs is the lack of a systematic evaluation model or framework. Only a small number of somewhat related programs have been studied to determine their impact, and most of this research has been associated with the United Autoworkers, General Motors Corporation, and the University of Michigan (Lawler, 1992). Furthermore, regardless of the methods of evaluation that practitioners may subscribe to, the majority of research relates to measuring training at levels that do not exceed participant reaction (Brinkerhoff, 1989; Holton, 1996; Kirkpatrick, 1994).

The lack of systematic evaluation within this national program, and specifically at this steel plant became the impetus for this initial study. This study focuses on post-participant reactions, participant perceptions of learning, the extent to which skills and knowledge improved, and the application of these skills in new settings. It is the first attempt within the steel industry to evaluate a Career Development Program based on a review of research literature surrounding union-sponsored career development activities.

Purpose of the Study

The purpose of this study sought to evaluate the impact of a multi-service career development program on its participating employees as they experienced the results of organizational restructuring, downsizing, and finally, plant shut-down. Specifically in this study, impact referred to the employees' perceptions about the effect their participation in the program had in four areas: their past job at the steel plant, their transition period following lay-off, their new job, and social roles and interactions.

Research Questions

This study is guided by the following questions:

1. What was the initial reason for employee involvement in the program?
2. Did anyone encourage employees to get involved in the program?
3. Did any barriers restrict greater employee involvement?
4. What career development activities had the highest levels of participation?
5. Did participating employees believe their participation had a positive impact on a) their past job, b) their transition period immediately after lay-off, c) their new job (if applicable), and d) their social roles and interactions?
6. Did a participant's educational level or job classification make a difference in their perception of a positive impact?

Additionally, it was anticipated that this research could offer a profile of the typical active Career Development Program participant within this national union-sponsored program.

Methodology

This study used a descriptive survey research design. A questionnaire was developed to address each of the research questions. The questionnaire was divided into four major sections: Participant Information, Program Services, Program Impact, and Personal Experiences. The Participant Information section included demographic information, and questions relating to reasons for initial program involvement, encouragement by others, and reasons for not getting further involved in the program. The Program Services section attempted to ascertain the services most used by this target population. The Program Impact section included 24 personal development statements associated with job responsibilities at the steel plant, during the transition period, on a new job, and social roles and interactions. The Personal Experiences section offer participants the opportunity to describe how the program impacted their life, how the program could be improved, and what was most valuable about the program. These items were measured using Likert scales, multiple choice, and open-ended responses.

The survey instrument was piloted with a random sample of 5 participants from the target population of 129 active participants. This target population was selected by including employees who had participated in two primary services of the program: tuition assisted courses and on-site, customized courses over a two year period. Because of their demonstrated participation, it was anticipated that this target group would have the best overall understanding of the program mission and services. After a debriefing with each member of the pilot study one-on-one and in a group, a final survey instrument was compiled that incorporated their recommendations regarding question order and terminology.

The survey was administered to a non-random sample of 129 members of the target population of a most active participants. Surveys were coded for tracking purposes. A self-addressed, postage paid envelope accompanied the confidential survey to enhance the response rate. A follow-up mailing was done 3 weeks after the initial mailing. A total of 83 surveys were received during a 6 week period yielding a 64% response rate. It should be noted that the plant shut-down occurred during the implementation of this questionnaire.

Data from the survey were analyzed both quantitatively and qualitatively. Survey responses were entered into a microcomputer spreadsheet in the order they were received. Descriptive statistics including mean, standard deviation, frequencies, and percentages of the data were calculated . The frequencies were rank ordered to identify their relative importance. Correlational analyses were also conducted to determine the relationship between perceived impact and both educational level and job classification. Responses to open-ended questions on the survey were thematically analyzed, however, this paper reports the findings from the quantitative analyses.

Findings

The major findings of this study are organized and presented in the order of the research questions:

Question 1: What is the initial reason for employee involvement in the program?

This question seeks to understand initial employee involvement before the fate of the plant became obvious. Table 1 depicts the reasons for the initial involvement with frequencies and percentages for each response. As shown, the overwhelming reason for participation was to prepare for a job in another industry. Other primary reasons for participation included preparing for company-sponsored training and preparing for retirement.

Table 1. Reasons for Initial Program Involvement (n=82)

	Frequency	Percentage
Prepare for a job in another industry	68	82.9
Prepare for company-sponsored training	28	34.1
Prepare for retirement	27	32.9
Prepare for transfer or promotion within the company	18	22.0
Discover a new hobby interest	11	13.4
Meet new people or socialize	10	12.2
Brush-up for a college course(s)	5	6.0
For general knowledge or just enjoy learning	4	4.9
To complete a college degree	4	4.9
Wanted to get my GED	3	3.7

Question 2: Did anyone encourage employees' involvement in the program?

This question examined the extent to which employees were encouraged by others to become involved in this program. Table 2 reveals that nearly one-third of participants did not respond to this question. It is possible that for some individuals, self-realization and motivation were sufficient to get involved in the Career Development Program, however, given the responses, this is purely speculation. For others, the encouragement from friends, family and role models may be needed to move from contemplation of potential program benefits to active involvement. Co-workers encouraging employees to become involved in this program was the primary response cited in the survey.

Table 2. Individuals Who Encouraged Program Involvement (n=52)

	Frequency	Percentage
No response	32	61.5
Co-worker	28	53.8
Union representative	18	34.6
Spouse or family member	18	34.6
Company representative (other than foreman)	11	21.2
Program staff or instructors	3	5.7
Foreman or supervisor	2	3.8

Question 3: Did any barriers exist that prevented greater program involvement?

This question examined the potential barriers that employees perceived to be impediments to becoming more involved in the program. Table 3 indicates that while several barriers were perceived to prevent greater participation, almost one-half of respondents indicated they were as involved as they wanted to be. Work shifts were deemed the primary impediment to greater involvement. This is not unusual in a three-shift production environment.

Table 3. Types of Barriers Preventing Greater Program Involvement (n=74)

	Frequency	Percentage
I am/was as involved as I wanted to be in the program	33	44.6
Work shifts	20	27.0
Overtime	12	16.2
Too busy looking for a job	11	14.8
Worried about possible transfer to another plant	10	13.5
Confused about which courses/programs to take	9	12.2
Program no longer offered anything of interest to me	4	5.4
Health condition of myself, spouse, or family member	4	5.4
Spouse or family did not support my involvement	0	0.0

Question 4: What career development activities had the highest levels of participation?

This question was intended to measure the level of activity in other areas of the program. The program offers a wide variety of training and development services which include on-site courses, tuition assistance, career counseling, career and educational resource material, computer facilities, and staff support. Information regarding enrollment in on-site courses and tuition assistance is tracked separately in a program database. Table 4 depicts the 11 activities there were included in the survey. Respondents rated each activity on a Likert scale from 0 to 3 (0 indicated no participation and 3 indicated a high level of participation). The highest responses provided by participants are associated with information provided by the program staff, career days which highlight high-demand occupational areas and related educational opportunities, and annual interest surveys mailed to each eligible employee.

Since career development treats the progression of jobs in one's lifetime and issues dealing with work/life balance, the following four areas were included in the survey to get a broader view of the program's impact on each participant: past job, transition period, new job (if applicable), and social roles/interactions. Each area or dimension of career development has six concrete examples which attempt to define the meaning of the dimension. Respondents are asked to rate each example on a Likert scale of 0 to 3 (0 indicated no impact and 3 indicated a high level of impact). The rank provided with each example is the overall rank based on 24 total examples regardless of dimension.

The first dimension examined the impact of the program on the participant's job within the steel plant. This dimension measured the most immediate impact the program was likely to have on a participant's daily work responsibilities. Table 5 shows that the program had the lowest overall impact on this dimension. The highest response within this area was attributed to the program helping a participant seek more challenging work assignments.

Table 4. Rank of Program Activities Other Than On-Site Courses and Tuition Assistance (n=81)

	Mean	SD
Information from program staff	2.17	0.84
Career Days	2.16	0.95
Annual interest surveys	1.59	1.15
Education Fairs	1.47	1.16
Job Search Information	1.41	1.09
Computer lab activities	1.24	1.02
Resource library	1.09	0.98
Career counseling	0.88	0.93
Education referral network	0.62	0.80
Summer workshops on personal development topics	0.59	0.89
Study groups and/or Tutoring services	0.51	0.87

Question 5: Did participating employees believe their participation had a positive impact on a) their past job, b) their transition period immediately after lay-off, c) their new job (if applicable), and d) their social roles and interactions?

Table 5. Rank of Examples Associated with Impact on Past Job (n=82)

	Mean	SD	Rank
Seek more challenging work assignments	1.46	1.14	18
Think of better ways to do a task or project	1.40	1.10	19
Increase the effectiveness of my communication skills	1.37	1.08	20
Work better with my co-workers	1.35	1.03	21
Listen to and follow directions on the job	1.27	1.12	22
Manage my time better on the job	1.24	1.09	24

The second dimension looked at the impact of the program in the transition phase immediately following job separation. This dimension included retraining and job search activities to help participants recognize their transferable skills and unique experiences. Out of the four dimension, this dimension ranked second in overall impact. Table 6 shows that the program most helped participants understand local job conditions and trends.

Table 6. Rank of Examples Associated with Impact on Transition Period (n=77)

	Mean	SD	Rank
Understand local job conditions and trends	2.31	0.67	3
Improve writing skills for resumes and applications	2.23	0.93	8
Develop an educational plan to learn new job skills	2.18	0.72	10
Develop a plan to identify/select the best job prospects	2.17	0.85	12
Contact potential employers & interviewing skills	2.17	0.67	11
Improve reading skills for use in retraining activities	1.94	0.94	14

The third dimension focused on the participant in their new job, if applicable. At least 53 respondents answered these questions. This dimension ranked first in overall impact. Table 7 shows that the program helped participants in a new job seek more challenging work assignments.

Table 7. Rank of Examples Associated with Impact on New Job (n=53)

	Mean	SD	Rank
Seek more challenging work assignments	2.39	0.75	1
Increase the effectiveness of my communication skills	2.33	0.67	2
Listen to and follow directions on the job	2.26	0.78	5
Think of better ways to do a task or project	2.26	0.67	4
Manage my time better on the job	2.23	0.79	6
Work better with my new co-workers	2.19	0.95	9

The fourth dimension looked at a participant's social roles and interactions. This dimension was included to satisfy the work/life balance associated with career development programs. Another reason to into account those participants who sought retirement or not an immediate transition into a new job. Out of the four dimensions, this one ranked third. Table 8 shows that the program most helped participants use a computer to learn new things.

Table 8. Rank of Examples Associated with Impact on Social Aspects (n=70)

	Mean	SD	Rank
Use a computer to learn new things	2.23	0.91	7
Improve readings skills at home	2.04	0.86	13
Try new hobbies or leisure activities	1.91	0.96	16
Enhance my role as a spouse or parent	1.91	0.82	15
Become a smarter, more informed shopper or customer	1.61	0.89	17
Increase my involvement in church/community group	1.24	0.94	23

Question 6: Did a participant's educational level or job classification make a difference in their perception of a positive impact?

Survey data were analyzed for correlations that may exist based on a participant educational level (low grade indicates less than or equal to 12 years of formal education and high grade indicates more than 12 years of formal education) and job classification (craft job position versus non-craft job position). Perceived impact differences according to educational level were noticed in the following items: challenging work assignments on the past job, listening and following directions on the past job, managing time on the past job, improving social reading skills, and attempting new hobbies/leisure interest. Perceived impact differences according to job classification were noticed for challenging work assignments on the past job and listening and following directions on the new job. Table 9 lists mean scores indicating any amount of perceived impact for total respondents group, educational level subgroups, and job classification subgroups.

Table 9. Perceived Impact by Percentage Comparing All Respondents with Educational Level and Job Classification Subgroups

On the Past Job	All Responses	Low Grade	High Grade	Non-Craft Job	Craft Job
Challenging work assignments	67.0	71.1	56.5 *	77.4 *	60.7
Think of better ways to do a task or project	68.2	71.1	60.8	74.1	64.7
Communication skills	62.1	64.4	56.5	67.7	58.8
Work better with co-workers	65.4	67.7	59.0	70.9	62.0
Listen and follow directions	70.7	66.1	82.6 *	67.7	72.5
Time management	69.5	76.2	52.1 *	77.4	64.7
Transition Period					
Understand local job conditions and trends	98.7	98.1	100	96.6	100
Improve writing skills	94.8	92.7	100	90.0	97.8
Develop an educational plan	90.9	87.2	100	83.3	95.7
Develop a job search plan	92.2	92.5	91.3	93.3	91.4
Interviewing skills	96.2	94.5	100	96.5	96.0
Improve reading skills	92.3	92.7	91.3	96.5	89.7
On the New Job					
Challenging work assignments	100	100	100	100	100
Think of better ways to do a task or project	100	100	100	100	100
Communication skills	96.2	94.2	100	93.3	97.3
Work better with new co-workers	96.2	94.2	100	93.3	97.3
Listen and follow directions	90.5	85.7	100	80.0 *	94.7
Time management	96.2	94.4	100	93.3	97.3

Social Roles and Interactions					
Use a computer to learn new things	92.8	90.0	100	95.0	91.6
Improve reading skills at home	75.7	72.2	87.5 *	76.6	75.0
Try new hobbies or leisure activities	87.8	83.3	100 *	90.0	86.3
Enhance role as spouse or parent	94.8	92.4	100	93.1	95.8
Smarter shopper/customer	88.4	85.4	95.6	90.0	87.5
Increase church/community participation	91.3	93.1	86.9	96.7	88.0

* differences between subgroup and total responses more than 10%

Discussion

Some of the findings of this exploratory study support current research in the adult education literature. Specifically, the primary reasons articulated by participants for their initial participation in the program mirror the participation literature which suggests that employment-related motives, social interaction, and learning for its own sake are reasons often given for participation (Merriam & Caffarella, 1999). Additionally, the barriers cited most often for nonparticipation include lack of time and lack of resources (Merriam & Caffarella, 1999). In terms of this study, lack of time featured among the participants' responses for not becoming more involved in the program.

With regard to the specific activities comprising each of the four dimensions, more than 95% of respondents indicated that the program made an impact in the following ways: thinking of better ways to perform their new jobs, being able to communicate their experiences and knowledge on their new jobs, being able to understand local labor market conditions, developing an education plan to learn new skills, and accepting more challenging work assignments on their new jobs.

In terms of the four dimensions examined in the study, the findings suggest that the highest level of impact was associated with the period in which respondents were employed in new positions following the plant shut-down. The lowest level of impact was associated with previous positions held at the steel plant. The transition period and social roles/interactions each had moderate levels of impact.

When overall program activity was analyzed according to participant demographic information, only education level made a difference. Respondents with lower educational levels believed the program made more of an impact on their jobs at the steel plant, and those with higher educational levels believed the program made more of an impact in their social lives and interactions. When differences in job classification were analyzed, non-craft respondents reported the program made more of an impact when thinking of better ways to do their past jobs, and craft respondents reported more of an impact on developing better co-worker relationships in their new jobs.

Limitations

Despite the exploratory nature of this initial study, there are several limitations. The use of a non-random sample of 129 active participants certainly warrants caution and precludes generalizability. The use of active participants may also introduce response bias. Additionally, this instrument assesses participant reactions to training interventions, and reports employees' perceptions of long-term learning and potential transfer. Ideally, a comprehensive survey of all past and current program participants or all eligible employees would have been preferred. Both were deemed too unwieldy because of cost, time, and the relocation of former employees following the plant shut-down.

Conclusions

This study represents the first research attempt to evaluate a national, union-sponsored Career Development Program within the steel industry. Although caution needs to be exercised in interpreting these findings beyond this one steel plant which has since been closed, this research provides a foundation upon which future studies can be

built. Specifically, future research initiatives could extend this initial study by broadening the population to include participants in other programs throughout the steel industry.

The Superiority of Employee-Owned Companies: Reality or Myth?

Robert B. Gudgel
Work in Northeast Ohio Council

Fred C. Feitler
Karen Thomas
Kent State University

This study examined cultural strength of eight manufacturing firms in Ohio by use of questionnaires and discussion with company representatives. Half were employee-owned (ESOP), the other half proprietary or publicly-held. ESOP firms were expected to demonstrate stronger cultures due to employee involvement in managing the business; results indicated non-ESOP firms had stronger cultures instead. Differences among ESOP firms are examined and common assumptions about ESOP firms are analyzed. Suggestions for HRD approaches in newly formed ESOP firms are offered to promote successful transition to employee ownership.

Keywords: Organizational Culture, Employee Ownership, Employee Involvement

The past 25 years have seen dramatic growth in the number of employees and private sector organizations embracing employee ownership. This concept is intuitively attractive and appears consistent with current emphases on employee involvement in decision making, teamwork, democratization of the workplace, and strategies to promote employee motivation and high performance. What are the cultures of these firms? Are they demonstrating the characteristics of high performance and democracy touted in current literature?

This study examines the organizational cultures of four firms with employee ownership; similar data are collected and compared for four similar manufacturers who are privately held/proprietary. We expected to see clear advantages of employee ownership with improved performance results, as well as stronger culture factors. The results were surprising and have important implications for human resource development professionals.

Theoretical Framework

Employee Ownership (ESOP)

A number of studies have compared employee-owned firms to comparable nonemployee-owned companies. Employee ownership contributes to greater efficiency (Berman, 1967), productivity (Swad, 1982), employment growth (NCEO, 1995; Rosen & Klein, 1983), sales growth (Quarrey, 1985), and higher pay (Kardas, Keogh, & Schiff, 1998).

The Employee Ownership Index is an index of 357 public companies with 10% or more employee owners which benchmarks the impact of employee ownership among publicly-traded firms. The Index has outperformed other indices of stock market averages since 1991 (Gates, 1998). A closer look at firms included in the Employee Ownership Index shows publicly-traded firms with 20% or more employee ownership are more stable organizations (Blair, Blasi, & Kruse, 1998) and suffer less disruption due to bankruptcy, liquidation, and private buyouts. Among employee-owned firms, the percentage of stock ownership by nonmanagerial employees is a factor linked to higher performance. Sales margin in an earlier study correlates positively and significantly to the percentage of nonmanagerial stock ownership (Conte & Tennenbaum, 1978). Employee ownership does appear to make a favorable difference in company performance.

Employee participation combined with employee ownership is a significant factor in productivity increases. The General Accounting Office conducted several studies to measure the productivity of ESOPs. ESOP adoption did not improve productivity and performance except in firms which established structures for participation. Employee involvement in decision making contributed positively and significantly to productivity (GAO, 1987).

Research of ESOPs in Ohio (OEOC, 1993) show similar trends in terms of job growth and company performance as reflected in national studies: 41% of respondents increased employment, 22% reduced employment,

Copyright © 1999 Robert B. Gudgel, Fred C. Feitler, and Karen Thomas

and 37% showed little change. In comparing these results within their industries: 49% of ESOP firms performed better than their peers, 50% performed as well, and only 1% decreased productivity.

Today, employees own stock in an estimated 11,100 U.S. businesses. There has been steady growth in the number of employee-owned firms since Congress created Employee Stock Ownership Plans (ESOPs) through ERISA legislation in 1974. The National Center for Employee Ownership (NCEO) has estimated the number of ESOP and stock bonus plans at 1,600 in 1975, 6,000 by 1985, 10,000 by 1995, and over 11,000 in 1998. The number of employee participants in these plans has grown from an estimated 248,000 employee participants in 1975 to approximately 7.7 million in 1998. The assets of these plans are estimated to be worth about $400 billion. A 1992 survey conducted by the Ohio Employee Ownership Center (OEOC) indicated that roughly 350 Ohio firms have established ESOPs representing an aggregate employment of about 300,000 persons and plan assets worth $4 billion.

The US Congress established ESOPs as a way to boost U.S. productivity, increase the retirement income of American workers, and encourage reinvestment in business and industry. Today companies with employee ownership can be found in every location, type, and size of business. While ESOP plans are found in public and private firms of all sizes, a majority of plans are established by small to mid-sized firms. The 1992 Ohio Study found 60% of ESOP companies had 150 or fewer employees, 20% had between 150-200 employees, and another 20% of these firms had over 500 employees. Nationally, most of the growth of ESOPs has occurred in smaller firms as well, according to the NCEO.

The creation of an ESOP often launches a process of cultural change, yet research suggests the transformation, especially among traditional, closely-held firms, is gradual and uneven. For example of Ohio firms surveyed, only 46% regularly provide employees with the company's financial statements, though another 28% of the firms provide financial reports upon request.

Organizational Culture

Assumptions about ESOP firms can also be viewed as demonstrating a stronger organizational culture within ESOPs compared to non-ESOP companies. Stronger cultures are defined as a set of homogenous values and beliefs shared by members of an organization (Deal & Kennedy, 1982; Sathe, 1983; Schein, 1985) or shared practices (Hofstede, Neuijen, Ohayu, & Sanders, 1990). Strong cultures serve to increase commitment to the organization (Ouchi, 1980), increase productivity (Deal & Kennedy, 1982), and create effective communication practices (Schein, 1985).

Sathe (1983) suggested that culture affects the behavior of organizations relative to cooperation, commitment, communication, decision making, and decision implementation. Schein (1983) argued that organizations develop a culture to create a common vision and goals individuals identify with. Weick (1987) suggested culture helps people develop a sense of trust and confidence in each other's actions. Hofstede et al. (1990) suggested culture is manifested in the daily practices of organizations. Thus research into the culture of any organization can be approached by learning about practices relative to communication, decision processes, cooperation, vision and goals, trust, commitment, and shared ideas.

Research Questions/Hypotheses

The primary research question which emerged from the theoretical framework of this study was "Do ESOP companies possess stronger cultures than non-ESOP companies due to greater involvement of employee owners in managing the business?" From this question several hypotheses emerged: (a) ESOP companies will possess stronger cultures than non-ESOP companies, (b) ESOP companies which are majority-owned by employees will have stronger cultures than those which are minority employee-owned, and (c) majority employee-owned firms will demonstrate greater employee involvement in decision making than minority-owned companies.

Instrumentation

The Organizational Culture Questionnaire (OQC) was used to collect data for this study. The OCQ contains 62 short statements that describe nine culture factors. These nine factors and the reliabilities are as follows (a) Teamwork (.82), (b) Trust (.70), (c) Risk (.64), (d) Communications (.81), (e) Decision Making (.69), (f) Change (.82), (g) Responsibility (.76), (h) Vision (.52), and (i) General Organizational Issues (.12). The overall reliability for the

instrument as a whole was .95. The OCQ has been used in the private sector, in healthcare, and in schools. A pilot study was conducted at two plants of a large manufacturing firm to obtain reliability data (N=319). Respondents were asked to use a Likert Scale indicating the extent of agreement with each of the 62 statements, e.g., 1 = Very Little Agreement, 3 = Moderate Agreement, 5 = Great Agreement. Strength of culture is measured by scores reflecting greater agreement with statements, e.g., 1 or 2 = weaker culture, 4 or 5 = stronger culture. The instrument has construct validity. In a study of six middle schools comparing established and emerging "middle school" characteristics, the Questionnaire distinguished significant differences between group statistics.

Sample

Data were gathered from eight companies who were contacted and agreed to participate. Four of these were employee-owned and were participants in a network of such companies. Four were proprietary or publicly-owned but were not employee-owned. To legally be classified an ESOP, a company must have at least 20% employee ownership. All eight companies were manufacturing firms located in Ohio, U.S.A. In the study sample, ESOP ownership varied from less than 30% to 100%. A total of 682 Culture questionnaires were completed from a possible 1,681 employees from the eight companies for a response rate of 40%. For six of the eight companies, Culture questionnaires were collected on site by the researchers. In the remaining two companies, questionnaires were distributed by company officials and returned by mail.

Results

The Neuman-Keuls Analysis

The Neuman-Keuls analysis provides a method of comparing differences among pairs of organizations. While the original study design anticipated such differences would be between employee-owned (ESOP) and nonemployee-owned (non-ESOP) companies, the analysis also provides data regarding significant differences between all possible pairs, i.e., differences between (a) ESOP and non-ESOP, (b) ESOP and ESOP, and (c) non-ESOP and non-ESOP pairs. This distribution of significant results, although not anticipated in the study design, provides understanding of ESOP and non-ESOP culture comparisons.

Results from Table 1 indicate three ESOP companies had scores in the lower half of the sample of eight. Non-ESOP companies, in contrast, had three of the highest scores. Neither company B or C, which are 100% employee-owned, had scores in the upper half of the score set. Company B had the lowest total score (2.86) among the eight companies. Based upon the theoretical discussion and the ensuing hypotheses, one would expect the ESOP companies to have higher mean scores than their non-ESOP counterparts. Further, one would anticipate the majority-owned ESOPs would have higher mean scores than the minority-owned companies. These results failed to support higher ESOP mean scores overall and higher scores for majority-owned firms.

Table 1

Total Mean Culture Scores, Percentage of Employee Ownership of ESOP Companies

Company	M	% Employee-Owned
A (ESOP)	2.92	33%
B (ESOP)	2.86	100%
C (ESOP)	3.07	100%
D (ESOP)	3.23	<30%
E	3.48	
F	3.15	
G	3.08	
H	2.89	

For the ESOP and non-ESOP comparison, in three cases, there were significant differences between group pairs. However, for two of the three, the non-ESOP companies had higher culture scores than the ESOP companies. In four other comparison pairs the differences were between ESOP and ESOP companies (A vs. D, B vs. D) or between non-ESOP and non-ESOP (F vs. G, E vs. H). Company D, as a minority ESOP, scored higher than expected compared to the majority ESOPs (B and C) (see Figure 1).

ANOVA	F = 4.16 F prob. = .0002	Significant at .05 Level

Newman-Keuls

M		ESOP				non-ESOP			
		A	B	C	D	E	F	G	H
2.92	A								
2.86	B								
3.07	C								
3.23	D	x	x						
3.48	E	xx	xx						
3.15	F								
3.08	G					xxx			
2.89	H				xx	xxx			

x = pairs of significantly different scores within ESOPs. xx = pairs of significantly different scores, ESOP and non-ESOP comparisons. xxx = pairs of significant difference scores within non-ESOPs.

Figure 1. ANOVA and Neuman-Keuls Scores: Total Culture Scores.

While no scores were significantly different within the Teamwork category, the expected difference favoring ESOP teamwork was surprisingly absent given theoretical basis for supposed ESOP superiority. While not significantly different from non-ESOP scores, three of four of the lowest teamwork scores were ESOP companies. In the category of Trust, six of eight significant differences between ESOP and non-ESOP companies demonstrated lower scores for ESOP companies. Only Company A's and D's scores were higher than Company H's score. All other ESOP scores were lower than non-ESOP companies. The results indicate six of seven significant differences

between ESOP and non-ESOP scores for the category of Risk. All but one of these differences showed lower scores for the ESOP companies. Results for the category of Communications were the only score set that had all companies at 3.00 or above. This suggests relatively stronger communications within all eight companies. ESOP companies A and B had the lowest scores and significant differences with Company E, which is non-ESOP. The results for the category of Decision Making indicate that among five significant differences between ESOP and non-ESOP companies, scores were lower than non-ESOP scores in all five instances. These results would seem to be contrary to theoretical framework that suggests superior ESOP performance is due to greater employee involvement in decision processes.

The results for the category of Change and Innovation show two instances of significant differences within the ESOP group (A and B vs. D) as well as three instances of significant differences between ESOP and non-ESOP groups (A and B vs. E, D vs. F). Company D had the second highest score among all eight companies while companies A and B had the lowest scores among the eight participants. Results from this comparison indicate one non-ESOP company as significantly different from all other ESOP and non-ESOP companies in this sample. Although not significantly different, ESOP scores for the category of Responsibility and Commitment represented three of the four lowest scores. As with several other culture categories, companies A, B, and C had the lowest scores while Company D scores were among the highest.

Of note in the results for the category of Vision and Goals are significant differences within ESOP companies (A and B vs. C, B vs. D) as well as between ESOP and non-ESOP companies. Again, three of four lowest scores in this category are from ESOP companies (A, B, D). Within the category of General Organizational Characteristics, ESOP companies A and B had the lowest scores. Significant differences were seen between companies E and H (non-ESOP) and companies A and B (ESOP).

Discussion

Results from this study indicate non-ESOP companies often possess stronger cultures than ESOP firms. This finding was contrary to expectations that ESOPs would possess stronger cultures (Berman, 1967; Estrin, Jones, & Svejnar, 1987; Swad, 1982). These results were especially surprising since the culture categories of decision making and communications demonstrated higher culture scores for non-ESOP companies. Given assumptions that employee ownership increases decision participation of worker owners and increases business-related communication, these results appear to contradict expectations.

The answers to these contradictory results may be explained by research about differences between ESOPs with formal employee involvement and those with no formal involvement. Research by the General Accounting Office (1987) demonstrated that ESOPs with formal employee participation in decision making had better productivity measures than ESOPs with no formal participation. A study by Moloney (1991) supported the results of the 1987 GAO study. The Moloney study also suggested a "frustration" effect occurs when employee financial participation is not accompanied by participation in decision making. This effect is shown by employee frustration and diminished performance. An earlier study by Cable and Fitzroy (1980) supports improved productivity of high participation employee-owned firms and reduced productivity for low participation employee-owned companies. These results are consistent with Moloney's findings regarding positive productivity for high involvement firms and a "frustration" effect for low participation firm.

A review of 20 years of research about employee ownership and performance by Conte (1992) supported employee ownership as contributing to productivity when accompanied by formal employee participation in decision processes. Conte's review also found the productivity of employee-owned firms without formal participation is no better or worse than non-ESOP companies.

Apparently employee ownership per se is not a single, causal factor in improved firm performance. The current study suggests the culture of ESOP companies is weaker than non-ESOP companies. Weak cultures could contribute to reduced company productivity (Deal & Kennedy, 1982). While the current study does not address firm productivity, it does support the notion that being employee-owned is not in itself an indication of strong culture.

Logue and Patton (1994) studied the reasons for failure and closure of democratically-run ESOPs. Several findings are of interest: (a) Democratic ESOPs were often created to "rescue" a threatened plant closure. Employees sacrificed financially to complete the buyout which provided ownership. Dual and conflicting goals of maintaining profitability and job retention often resulted. This is similar to the "frustration" effect described by Cable and Fitzroy (1980) and Moloney (1991). Conflicting goals may weaken the culture of these companies. Also, troubled companies that become ESOP remain troubled and exhibit weaker cultures, and (b) failed democratic ESOPs often had poor financial and marketing management. This may yield poor company performance, disruption, tension, and

turmoil which can further weaken culture. The expectations of employees who become owners is that democracy and democratic processes will result in their involvement in decision making (Logue, Glass, Patton, Teodosio, & Thomas, 1998). Legally and in practice this "democratizing" may not occur when a firm becomes ESOP. Unmet expectations may contribute to frustration and a weaker culture.

Several factors appear to impact ESOP organizations to, in fact, create a weaker culture. Lack of employee participation in decision making, conflicting goals, weak competitive position at the time of becoming ESOP, and poor management may all individually or in combination contribute to a weaker culture and/or failure. The point of interest for HRD researchers and practitioners is a firm becoming or being employee-owned does not guarantee, in and of itself, participative practices or a strong culture. The current study suggests ESOP companies may have weaker cultures.

In addition to questionnaires completed by employees of the eight participating firms, discussions were held with managers of ESOP companies to the extent of relative employee participation in decision processes. An analysis of the four ESOP companies which participated in this study relative to percentage of employee ownership and employee participation in decision processes indicated the following: (a) Company D, which had the lowest percentage of employee ownership (< 30%) and the highest culture scores, did not have employee participation in decision processes; (b) Company B, 100% employee-owned, had limited employee involvement in decision making and the lowest culture scores of the four participating companies in this study; (c) Company C, 100% employee-owned, had moderate employee involvement in decision processes and the second highest overall culture scores among the four ESOPs in this study; and (d) Company A, which is 33% employee-owned, had moderate employee involvement in decision making and lower culture scores than Company C or D. In summary, no clear pattern emerges among these companies based upon percentage of employee ownership, participative practices, and culture scores.

Conclusions

Organization theory, particularly postulation regarding the nature of culture, participation, worker motivation, and productivity points to employee ownership as a potentially powerful tool to influence positive culture and operating characteristics. Specifically this research was based upon a belief that employee ownership would create firms with stronger culture than for those without employee ownership. Similarly, the greater the percentage of employee owners the more positive would be the effects on culture. Despite a relatively small sample of organizations, the samples were robust and the results were clearly different than anticipated.

We conclude the idealistic projections based upon literature and even existing ESOP research were not supported by our real world data. The variations in "why companies become employee-owned" appear to far outweigh or influence the culture of the ESOP organizations we studied than the social psychological constructs found in texts and journals. Stated differently, organizations become employee-owned for a number of reasons, several of which are not based upon increasing employee motivation or upon sound management principles. Walking into many ESOP organizations would not be different from observing other struggling small businesses, with autocratic leaders and practices, highly hierarchical structures, and little horizontal or upward communication. In practice, being employee-owned does not ensure greater involvement of employees, better informed employees, or employees who are happy with their work and managers.

These results have important implications for HRD professionals. These are (a) Employees embarking on employee ownership require an accurate sense of what such provisions mean to them. Assumptions should be clearly articulated and discussed. (b) The participative structures available to employees should be spelled out in advance and be clearly understood. (c) Open communication should be encouraged and available about operating conditions and variation, and (d) Economic education should be provided to enhance realistic expectations about the job and about prospects for economic growth and profitability. Finally, this research can be viewed as just scraping the tip of the iceberg. Additional study and research is needed to confirm the variation in these findings and to study the effects of controlling critical variables.

Recruiting and Retaining Women in Business: Women Executives Maneuver To Change the Status Quo

Laura L. Bierema
Michigan State University

Preliminary focus group research findings are shared for a group of executive women in a Fortune 500 consumer products company who are working to advance women in their organization. The findings include challenges related to the recruitment and retention of women, and the awareness and actions underling executive women's work for organizational change

Key Words: Women's Development, Diversity, Career Development

Today, women comprise 46 percent of the U.S. workforce and 48 percent of the managerial and professional specialty positions (1996, Bureau of Labor Statistics). Working women occupy positions from line workers to CEO's. Yet, women's presence at the top ranks of business has remained stagnant over the last ten years, fluctuating between three to five percent (Eller, 1991; Feminist Majority Foundation, 1991; Powell, 1993). Although women's workforce participation has steadily increased and shows no sign of diminishing on the eve of a new millennium, they lag behind men in pay, promotion, benefits and other economic rewards (Knoke & Ishio, 1998). Despite the progress over the last fifty years, about half of the world's workers are in sex-stereotyped occupations and women work in a narrower range of occupations than do men. A few women have broken through the proverbial glass ceiling, yet, many bump into it. Corporate culture has proven resilient to women's advancement throughout history, because it is typically designed and controlled by a homogenous group of white males (Ruderman, Ohlott, & Kram, 1995; Sharpe, 1994). Women have identified being female and experiencing sexism as the greatest obstacles to advancement (Korn/Ferry and UCLA, 1993), and Tharenou, Latimer, and Conroy observe that, "A male managerial hierarchy is thought to be a critical feature influencing the processes affecting men's and women's managerial advancement" (1994, p. 901). Further, the structure of primarily male managerial hierarchies tends to decrease women's career encouragement and training (Tharenou, Latimer, and Conroy, 1994), and women are expected to demonstrate personal strength and prove themselves more extensively than men before being awarded promotions (Ruderman, Ohlott, & Kram, 1995).

While the prospects for women's advancement do not seem favorable based on the past, some daring executive women are maneuvering to assure change in the future. This study examines their process and results. The theoretical frames underlying this study draw on women's career development and adult learning. Career development literature sheds some light on how adults progress through their careers, but has been criticized for basing models on men's careers, and being insensitive to the multiple roles and responsibilities of women across their life span.

Research Questions

The purpose of this study was twofold. The primary purpose was to identify issues related to the recruitment and retention of women in a *Fortune* 500 consumer products company. The question was based on the company's assumption that it was doing poorly in creating an atmosphere that attracted women. The secondary purpose was to understand how executive women navigate through an endeavor that addresses organizational inequalities in the company. Questions driving this study included:

1. What are the variables contributing to the recruitment and retention of women in the company?
2. How does a group of executive women maneuver through an initiative to improve the status quo for women?

Methodology

Study questions were investigated via a qualitative approach, the primary data collection method being a focus group. The purpose of the focus group was to engage the executive women of the organization in a conversation about the issues of recruitment and retention of women in the company. The focus group participants were primarily executives, and all of them attended the 1998 Catalyst Awards meeting in New York City. Catalyst is a

Copyright ©1999 Laura L. Bierema

non-profit organization founded in the sixties by Felice Schwartz. Its mission is to work with for-profit business to advance women in the workplace. The focus group following the Catalyst event, and launched a more long-term diversity initiative and research project than is presented here. This study is unique as the top woman executive of this organization commissioned it. This project is not without risk, and the company and participants shall remain anonymous. I have privileged access to this group and serve as its facilitator.

Data Collection and Analysis

A semi-structured interview or question guide was developed and reviewed with the Vice President of Human Resources in advance of the focus group meeting. The focus group questions were:

1. What are some of the assumptions made about women in the company (by both men and women)?
2. What attracts women to the company?
3. What causes women to leave the company?
4. What causes women to stay with the company?
5. What are some strategies for addressing the organizational issues raised?
6. What actions need to be taken immediately? Long term? By whom?
7. Where do we go from here?

During the focus group, the executives raised and prioritized issues. The three-hour focus group was tape recorded and transcribed verbatim by a transcriptionist yielding 50 pages of single-spaced text. Anonymity of responses was assured with all findings of the study reported as aggregate data. Names of individuals and business units were removed from the analysis. Tapes and transcripts were supplemented with notes and correspondence generated between the Vice President of Human Resources and me. An inductive approach was used for this analysis, also know as constant-comparative analysis. The data were evaluated for common themes, stories and clusters of information. Through constant comparison of themes, categories were derived inductively. The findings were shared with all participants and have been used as a map for further efforts which will be described at the end of this manuscript in the "next steps" section. The limitations of this study include that it represents a single corporation and the results may not be generalizable to corporate America. The focus group methodology may have influenced the data shared. The focus group required these women to risk sharing on a topic that had never been discussed formally in the organization. Individual interviews may yield different information and are planned for 1999.

Findings

Data analysis is still underway, but themes have been identified for the two streams of inquiry in this study. The executive women identified several challenges related the recruitment and retention of women in the organization. Two themes emerged regarding how a group of executive women learns and navigates through an initiative to improve women's status: (a) Awareness of self and the organization; and (b) action to change the status quo. Each of these categories will be discussed.

Challenges Related to the Recruitment and Retention of Women in the Company

Issues related to recruitment and retention were organized according to the following sub-categories: lack of leadership, lack of strategy to improve representation, different rules for women and men, low flexibility, minimal diversity, few developmental opportunities or plans, and mis-aligned value systems.

Lack of Leadership

There was a sense that management had not shown enough leadership in making diversity a strategic imperative for the business. One participant noted, "Women who are relatively new, leaving after a year or two years or less time than that, because of poor management and leadership." Although the participants generally agreed that leadership was lacking as far as minorities and women were concerned, there was agreement that leadership in recruitment and retention needed to focus on all employees, not just men or not just women.

The Rules are Different for Women

A recruiting challenge raised was that the rules of the game differ across gender lines. One executive complained, "It is my perception that we do try hard, we do put more into it, and need to, to get [ahead]." The concluding sentiment was that women must work harder and longer than men to achieve executive positions.

Low Flexibility

Levels of work flexibility vary across the corporation. The prevailing sense, however, is that there is not enough flexibility as evident by these comments, "We do not offer any type of flexibility, " or "We have complete inflexibility about hours." One of the executives who is a new parent recalled, "Day one, when I talked to my boss and he said 'it's eight to six,' and I said 'well how about seven to five,' and he said, 'no, it's eight to six and I really mean it'." This group had little hope about alternative work arrangements, such as working from home.

Minimal Diversity

Lack of diversity was cited frequently. There was frustration about the small representation of women and minorities in upper management, and lack of management action to change this trend, "The fact that [there is] only one woman of color on our management team at all is scary."

Lack of Strategy to Improve Representation

The absence of a plan to improve company representation of women and minorities was raised several times. Here is a sampling of what the participants had to say about this challenge: "I don't think that we're any better recruiting women than men." "I can't think of any specific policies or procedures that we have in place in our organization that are directed towards women." "There really weren't any goals in terms of how many women do we want in these positions, how many minorities, how many real targets." "[There is a] lack of company data, to make any really informed decision". Further, succession planning in the organization was perceived as a group of white men non-systematically discussing people known to them.. As a participant noted, "I don't believe that there really is an all out effort to have representation goals."

Few Developmental Opportunities

The overwhelming sense was that no systematic career development process exists. Some participants have experienced being pushed into new positions with little guidance and low confidence that they are ready and they have been expected to survive as best they could. "I've been pushed into the next position, even though I know I'm not ready, yet, I've been expected to survive, make it, and succeed." "It's still a personal struggle for me, where I'm pushed before I'm ready to fly, and it remains to be seen, whether I'll survive it." This lack of developmental focus prevents women from learning about and training for opportunities across the company. When asked, "What attracts women to your company?" the reply was, "I would hope it is the same thing that attracts men to the company." The participants felt that opportunities were not well communicated in the company. Even though there was dissatisfaction at the level of communication about opportunities, everyone agreed that if opportunities to grow disappeared, they would leave the organization. "Whenever I've left somewhere, it's because the opportunities to continue to grow and learn, and feel empowered, have stopped." The unanswered question, however, is why did the opportunities stop for some of the women? No one attributed it to systemic discrimination of women, however, this question will be followed up in a future study.

Mis-Aligned Value Systems

In some cases, mismatched values presented another retention problem. The focus group expressed values of being continually challenged, and doing work that aligned closely with personal philosophy. No one expressed a current desire to leave, but it was clear that values were important in the following comments: "I don't feel compelled to leave the company, however, at some point, if I were to feel personally compromised . . . then I would leave immediately." Another shared, "I guess I'm getting older, and for me, the values of a company are so much

more important." Another observed, "What has been able to keep me retained, so to speak, is enjoying my work. And then, hopefully, it's in an organization that has a value system that supports my philosophy."

How Women Executives Navigate through Change Initiatives

The assessment of how a group of executive women navigate through a change initiative yielded two themes: (a) awareness self and organization, and (b) action to change the status quo.

Awareness of Self and Organization

The women had a keen sense of their surroundings and spoke about the realities their experience. They shared insight into the organization and themselves.

Inhospitable Environment

The women spoke about the work environment as sometimes being inhospitable to executive women. They identified certain attributes that influence both women's career experiences and decisions to leave. These include better opportunities elsewhere, inflexible working hours, non-recognition of accomplishment, poor leadership and supervision, isolation, and differences between the way executive men and women are treated at the company. One example of different treatment was relayed in a perception that not all-male colleagues are accustomed to dealing with women in executive business roles. As one participant observed,

> [Men] are not accustomed to, women [executives], and therefore, they tend to relate to a female peer in the same way that they would relate to their wives, and so, besides trying to do your work, you're also educating them on how to relate to you as a business peer.

The environment also made it harder for women to learn the rules of the culture, and sometimes the women felt isolated. The observation of women who were not successful was, "technically, they were good in their area, but at least one of the things they lacked was knowing how to get around in the company, in the network." The unsuccessful were described as not understanding how to work the system. The women thought a lack of a peer, mentor or confidant at the executive level contributed to failure. The group identified the need for a safe forum to share, learn and vent. A recurring metaphor of the isolation that some of the women felt was iterated through the image of a woman sitting on the edge of her bed wondering if she could carry on. "This is the first company I've worked for where I've had the days that I sit at the edge of the bed and say 'why am I going in in the morning?' I've never had that experience anywhere else." This moment of contemplation resonated with the group as another participant explained:

> So when you're sitting on that bed, not wanting to get out, what you're doing is reflecting on that situation so that you can name it. And then put together your strategies to get past it, and I think in the positions that those of us in the room have now, we are faced more so, with those situations that keep us on the beds some mornings, and sitting on that bed, is again, trying to name the situation, identify your strategies, and look at your exit card, to make certain that whatever is on that exit card, hasn't been played, and then think of your strategies when you go in.

Sense of Entitlement

There was also a belief that men felt "owed" advancement by virtue of their positionality in the culture. One participant observed, "I think men . . . have more of a feeling of entitlement in terms of advancement and promotability. . . . I just don't think women can take that for granted." Another executive noted that:

> Men seem to be upset if they don't get that promotion . . . it's not that they earned it and they deserve it, [but they feel] darnit, they really should have that. Whereas, I think women . . . feel more, 'Jeez it must be some shortcoming of mine. I'm not trying hard enough. I'm not doing enough.' It's more of an indoor pressure, and then the drive translates from that, as opposed to … 'they're wrong because they haven't given it to me.'

Pressure to Perform.

Not only do women put "indoor pressure" on themselves, they also get it from the organization. The participants described tremendous pressure to perform. The collective observation was that it takes women longer to achieve vice president status than men, and that women have to work harder to do it. Further, if women fail in their quest to succeed, it is viewed much more seriously than if men fail. It is generally felt that when men fail in the organization, it is not a notable event. On the other hand, when women fail it is a big deal. One executive observes:

> If that woman could [not] succeed she was weak. Now if a man doesn't make it, it doesn't matter, because if you have a hundred men, and one doesn't make it, that's okay. But if you have one woman who's a director and she doesn't make it, she was weak.

Fear of Misperception

Although these women were keenly aware of their environment, they had an interesting fear about their participation in the project to advance women in the company. They were anxious about being perceived as "recipe swapping male-bashers." This thought captures the sentiment, "I had a . . . concern that, . . . we've all participated in these kinds of things before, and [someone's] specific experience had been that they're either recipe swaps or male bashing," This woman went on to note how pleased she was with the process and that, "what we had here is clearly showing our level in business thinking, our sophistication as business people, and our understanding what the real issue is." Another woman shared,

> [My boss is] gonna ask me, . . .gonna put me in a room and say, 'what did they say, what did they do? You know tell me everything.' Not because he's suspicious, but he just has to have his hands in everything. I really was sort of expecting this to be, not necessarily a male bashing thing, but when I left the other day and [my boss] said, 'have fun, what do you think they're gonna do?' I said, 'I don't know, we'll sit around and say chicks rule,' but I really thought it was gonna be . . . less of a constructive thing, and I'm so impressed... you know some of you I work with, but others I have never met before, and you all are just so articulate, and so you know, just so incredibly impressive, so I'm so glad to be included in your little group.

Pioneering Spirit

These women regarded themselves as pioneers and role models for the future. They regularly referred to themselves as "pioneers" when they were speaking about their roles as executive women in the company. One woman reflected, "If women were to come [here], I think that they would have to like to be the pioneer, and if they didn't like that, then it's really not the place for them." Being a pioneer is not easy." One executive shared, "There certainly have been frustrations along the way, and . . . I've sat on the edge of the bed and said, "I just can't do this again." She felt her investment in her work kept her going, " When I'm siting here thinking, okay what made you get up and wash your hair and go into the office? . . . at some point you have an investment be it a personal investment, an emotional investment."

Solidarity

There was a strong disposition to take collective action devoted to women's advancement, for instance, "I'm a firm believer of the power behind the voice, that we've gotta sing off the same page." Beyond working together to support women's advancement, it was strongly held that there are sound business reasons for pursuing this initiative and that the company would suffer if no action is taken. The women also felt that they could convince the male executives that this was worthwhile by tapping into their competitive spirit, "So we've got that political mindset, and this is about power, [and] when it comes down to it, men see things competitively." Another observed, "It's all around power, and power's a relational concept, and I love it, I want it, and it makes good things." There was general agreement that this process could only be powerful, however, if the women worked in concert.

Action for Meaningful Change

The women were adamant about taking action and were not only thinking strategically about women's advancement, but also, about how to use the power of influential women in the organization to advance this initiative. A participant reflected about the outcome of the focus group's prioritized issues, "I think it's another example that shows how when women are given an opportunity, they are going to think holistically and be business minded, and the myth is that we're just going to take care of our nest." Toward the end of the focus group, the women complimented themselves on being strategic, as this woman noted, "Not one time during our interaction did we not focus on the success of the company as a whole, and how each one of our individual companies could contribute, and I would like that message to be clearly heard by senior management." Another comment was, "We are here because of a commitment to company performance." "By bringing forward what we have here, that's something that's not been done before that will increase market share. . . . We are an untapped resource." The focus group was highly proactive and creative in identifying actions that the company can take in this initiative to advance women. The issues were categorized initially in the focus group. The group prioritized issues and actions and created an action plan. The highlights follow.

Learn Where the Company Stands

The focus group participants wanted information. The group suspected that company performance in advancing women was below par, but facts and figures were not available. There was interest in benchmarking other companies to see how they approached women's advancement.

Secure Management Commitment

Like any organizational initiative, management support is imperative in effecting change. The focus group wanted to see evidence of commitment to this process. The fact that the meeting happened at all was a very encouraging step to the group. Next steps include acting on the actions specified and having a more visible management commitment in this effort. The sentiment was that this commitment is important to retaining key employees.

Create a Plan to Address Recruitment and Retention Issues

When a plan for advancing women was discussed, it was usually centered on "what is it?" The group consensus was that there is currently no plan and that a key outcome of this group's effort would be to develop and implement a plan for the advancement of women in the company. Measurables were called for as well. The women spoke appreciatively of getting the space to make mistakes, free from retribution.

Network

Building strong networks of support, both inside and outside the company was viewed as pivotal to success and necessary for balance. "I think one of the challenges that we as women have [is] as . . . you rise up in the organization, you see less of yourself."

Mentor

Mentoring is the classic developmental strategy, and this group viewed it as a critical developmental process. There was a sense that mentoring was a special responsibility of this group, particularly with women who are at earlier points in their careers. The notion of peer mentoring and learning from everyone in the organization was also discussed.

Cross-Fertilize

A recurring complaint was over little exchange in the company across divisions, whether in job opportunities or information sharing. The women felt that no cross-company commitment for people development existed and they called for more cross-company opportunity. This lack of exchange is viewed as a waste of available resources that may be putting the company at financial risk.

Capitalize on Diversity

There was unilateral support for using peer pressure and the drive to win, to get visibility and action for women's advancement. The women were not aware of any diversity initiatives as one noted, "I can't say that I'm aware of any sweeping initiative to help women." An even more cynical viewpoint about getting male buy-in to diversity was captured in this remark, "Sort of capitalize on that male, I'm the male, I wanna win thing . .. [because] this is a marketing issue."

Focus Group Follow-up and Next Steps

At the conclusion of the focus group, the women described some dynamics related to advancement in their company and established an aggressive response to the challenges. Since the initial focus group, this group has corresponded about the issue, held a strategic planning session, reviewed EEO (Equal Employment Opportunity) data, named itself "The Advisory Committee," established a mission, created an action plan for presentation to top management, and secured top management support to implement a policy for improving diversity. The next meeting in January 1999 will set the stage to solidify the group's efforts for the future.

Conclusions

Women's career development is a complex, diverse process. Women have made advances in United States organizations, but the consensus is that they have not scaled career ladders fast or high enough. The workforce is becoming more diverse, and it is in the best interest of the US economy to develop women in their careers. Yet, as Fernandez observes, "corporate America as a whole, has failed to effectively address the challenges posed by diversity, particularly with regard to racism and sexism" (1999, p. 3). While the landscape of career development is changing, problems like discrimination and equal access endure. While there are more women in positions of power in organizations, progress has been slow. In 1997, there were 61 female top earners in *Fortune* 500 companies out of a total 2,458 top earners. Women comprised 2.5 percent of the total (Catalyst 1997). This research has provided a glimpse into how executive women align themselves to address women's interests in the corporate setting. It has identified issues important to the career development of women from executive women's perspectives. It has offered several strategies for addressing the challenges of recruitment and retention of women in a tight job market. Finally, it offers an example of how corporate executive women are working to advance women in their own organizations. Yet, this is just one example of how women are working for change in organizations. More initiatives and research are needed to create equitable, accessible workplaces for an increasingly diverse workforce.

Income Effects of Human Resource Development for Higher Educated Professionals

Martin Mulder
University of Twente

Bob Witziers
University of Twente

This paper addresses the question of whether individuals benefit from participating in HRD-activities. In particular the questoin is addressed whether participating in these activities lead to a higher job level and/or higher income. The results, obtained through means of a path analysis and based on a sample of 1876 respondents, show that participating in HRD-activities has no impact on individuals job level and income. The reverse is the case for other variables included in the analysis, such as gender, level of initial qualification and work experience.

Keywords: Human Resource Development, Adult Education, Outcomes

Introduction and Research Question

Research into the relationship between educational level and income has a long tradition. The initial steps were taken in the human capital theory developed by Becker (1975). In this theory students are thought to be investors, making a choice between spending time on income-generating activities and spending time on educational activities. In line with micro-economic thought, it is assumed that the income received as a result of time spent in education is the benefit the student strives to maximize in order to maximize his utility. The main focus of studies using this framework has been to determine the actual returns of education to the individual. In the Netherlands an important contribution is delivered by Glebbeek (1993), who has developed and studied a model for estimating effects of education on career development. He has found that education has a direct influence on income (.35), and an indirect influence via jobs persons held in the past (.71), jobs they hold later in their career (.45), and management functions they hold (.32). The magnitude of this indirect influence on income is .15. Peschar & Wesselingh (1995) conclude that this means that persons with the same jobs have different incomes according to the differences in their education. They state that this is according to the human capital theory that states that more education always pays.

The most recent development in this field are summarized by McMahon (1996). In this review he states that researchers over the last years have attempted to arrive at a comprehensive estimate of the current total returns to education as objective as possible, that is, to estimate these returns without overestimation or underestimation. As a result, economist have more than ever been able to detect the true effect of education on earnings. Moreover, these results show that some of the returns to education may have been seriously underestimated in the past.

Mincer (1979, 1989) has build on ideas formulated in the human capital theory by stating that individuals, after they have entered the labor market, keep investing in educational activities. Moreover, his theory predicts that these activities increase their human capital, which in turn leads to a higher income on the labor market. This notion is supported by several studies investigating the effects of participating in corporate training. For instance, a study conducted by Groot (1994) in the Netherlands showed that participants of corporate training earn 11% more than non-participating members of the work force. Similar results were found in studies conducted by Barron, Black & Loewenstein (1989), Holzer (1988) and Mincer (1989). However, other results can be found in studies conducted by Bonn (1993) and Tuynman (1989). These studies found that participation in HRD had no impact at all.

This paper builds on the notion developed by Mincer by exploring the effect of participating in HRD activities on the income of higher educated professionals. The relationship between HRD and income is difficult to study, as there are many variables related to the distribution of income. Work experience is one important example (Cohn & Geske, 1990), in particular since it can act as a substitute for training and education. Moreover, research has shown that there are gender differences and differences between workers in different economic sectors: ceteris paribus women end up in less managerial positions and earn less too, while workers in the profit sector earn more than workers in the non-profit sector (Meesters, 1993). Given these other factors affecting income, the research question we try to answer is:

Copyright © 1999 Martin Mulder and Bob Witziers

What is controlled for other relevant variables. the relationship between participation in human resource development and income of higher educated professionals?

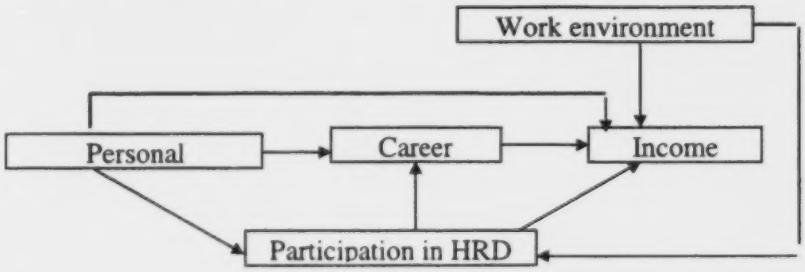
Methodology

Conceptual Framework and Operationalization

The data on which the study is based come from a study that is conducted for a national weekly magazine (with a readership of over 225,000) with a large number of advertisements for jobs for higher educated employees. This study started in 1995 with a base-line measurement. It was repeated with a slightly changed questionnaire in 1996 (Mulder & Witziers, 1998). And it will be repeated again in the years 1998 and 2000. The results presented in this paper are from the data that were collected in 1996.

The 16-page questionnaire comprises 63 questions with sub-questions in the following categories: 1. General questions; 2. Start on the labor market; 3. Career history; 4. Present situation; 5. Additional training; 6. Most important additional training program; 7. Quality of this additional training program; 8. Plans for further participation in training.

Based on the available data the following exploratory model was employed to study the research question at hand:



Firstly, this model proposes that individual characteristics (such as work experience, gender and initial educational level) affect individuals' career position, income and participation in HRD-activities. Secondly, it proposes that participation in HRD-activities affects directly individuals' career position and their income. Thirdly, it assumes that participation in HRD activities affects income indirectly by promoting their career position. Finally, the model takes into account that income and participation in HRD activities are a function of environmental factors such as the size of the organization and the economic sector of the organization. More specifically, the following variables were selected:

Personal characteristics

- gender (0 = female, 1 = male)
- number of years of work experience
- level of initial education (0 = vocational college; 1 = university);
- perceived quality of education (11 items);
- size of the job (number of hours an individual works per week);
- received a higher qualification of a regular educational institution (0 = no, 1 = yes)

Participation in HRD

- number of training programs taken per year
- amount of days participated in training programs per year

Career position

- job level (5 categories)

Work Environment

- size of the organization (number of employees);
- economic sector of the organization (0= profit; 1=non-profit).

Income

- gross earnings per annum

The meaning of most variables is clear, except (may be) the variable perceived quality of initial education. This variable measures the contribution of the initial education to finding a job. Therefore, participants in the survey were asked to denote whether or not their initial education contributed to aspects such as finding a job easily, finding a job with high salary, finding a job with good career prospects etc. The variable income (gross earnings per annum) is measured in seven blocks of 25.000 Dutch guilders (this equals with blocks of 11,261 Euro) each.

A path analysis was conducted to test the proposed model.

Sample

The questionnaire is published in the magazine on November 22, 1996. Apart from that 4,500 printed copies were sent by direct mail to a random selection from the readership. The number of respondents was 1,765. From the 4,500 questionnaires that were sent by direct mail, 859 came back; from the magazine, the remaining 906 were returned. Although the response rate is relatively small, the total number of respondents is large enough to make a valid statement about HRD for higher educated employees, and the relationship between HRD and income. Moreover, a non response analysis was carried out aimed at comparing the participation in HRD-activities of respondents with non respondents. No significant differences were found between the response group and the non-response group.

Results

Our analysis started with the model described in a previous section. However, our results show that, in order to get a better fit, some changes in the model had to be made. These changes concern opening the paths between the work environment factors and the career position variable.

Our final results (see table 1) show that the most important factors contributing to job level are gender, level of initial education, work experience and perceived quality of initial qualification. More specifically, this implies that higher positions are hold by men, university graduates, workers with more work experience and workers who's initial education gave them the opportunity to obtain a good job. Both indicators measuring the level of participation in HRD-activities have a negative relationship with job level. However, their contribution to this variable is not significant at the 0.05-level.

Table 1

Job level

Variable	Path coefficient	Standard error	T-Value
Gender	0.11	0.056	1.96
Level of initial qualification	0.31	0.043	7.20
Received higher diploma?	0.13	0.053	2.41
Work experience	0.05	0.004	12.57
Quality of initial education	0.13	0.032	4.22
Size of organization	- 0.13	0.015	- 8.67
Economic sector organization	- 0.18	0.050	- 3.56
Number of HRD-training programmes	- 0.03	0.019	- 1.56
Number of HRD-days	- 0.00	0.000	- 0.60

$R^2 = 0.18$

The results concerning the income variable show that all most all the variables included in the analysis have a significant relationship with income (see table 2). More specifically, this implies that the variables having a positive relationship with the variable job level, also affect directly the variable income. In other words, controled for job level, men have a higher income than female workers, university graduates earn more than vocational education graduates, workers in the profit sector earn more than workers in the non-profit sector. Moreover, workers in larger organizations and having more work experience earn more than workers in smaller organizations and workers having less work experience. Finally, respondents stating that their initial education gave them an easy and comfortable access to the labor market earn more than respondents stating this was less the case. Again, our results show that participation in HRD-activities does not have a significant contribution to income. As such, the main conclusion is that participation in HRD-activities has no (in)direct impact on respondents' income.

Table 2

Income

Variable	Path coefficient	Standard error	T-Value
Job level	0.45	0.023	19.85
Gender	0.32	0.054	6.00
Level of initial qualification	0.41	0.042	9.68
Received higher diploma?	- 0.11	- 0.051	- 2.19
Work experience	0.12	0.004	31.47
Quality of initial education	0.26	0.018	8.50
Size of job	0.22	0.024	9.03
Size of organization	0.12	0.014	8.35
Economic sector organization	- 0.32	0.048	- 6.68
Number of HRD-training programmes	- 0.03	0.018	- 1.43
Number of HRD-days	- 0.00	0.000	- 1.15

$R^2 = 0.62$

The results concerning participation in HRD-activities show that only a few variables have an impact the level of participation. The most important variable is work experience, indicating that in particular young people engage in HRD-activities.

Table 3

Number of HRD-Programmes

Variable	Path coefficient	Standard error	T-Value
Experience	- 0.06	0.004	- 15.48
Size of organization	0.08	0.018	4.69

$R^2 = 0.13$

Table 4

Number of HRD-Days

Variable	Path coefficient	Standard error	T-Value
Number of HRD-programmes	0.08	0.810	8.02
Received higher diploma	0.06	0.225	3.97
Work experiece	- 0.77	0.160	3.97
Economic sector	0.50	0.211	2.38

$R^2 = 0.07$

The results concerning model assessment show that our data fit the model reasonably well. Although the Chi-square test of exact fit suggests to reject the model given the small p-value, all other measures indicate that the data fit our model reasonably well.

Conclusion

The main conclusion of this paper is that most of the variables included in our model have a significant and positive relationship with job level and income. More specifically, gender, work experience, level of initial education, economic sector, size of job, perceived quality of initial education all have a significant relationship with either job level and/or income. Moreover, the direction of the relationships are in most cases in the expected direction. That is, our results are in line with either theoretical notions and/or results from previous research. However, it must be noted that variables relating to participating in HRD-activities do not have a relationship with the endogeneous variables job level and income. In other words, participants of HRD-activities do not benefit from their participation in terms of obtaining a higher position and/or getting a higher income. As such, these results are in line with other European studies (Boon, 1993; Tuynman, 1989). The results of these studies show that participating in HRD-activities does not contribute to a higher job level and /or a higher income.

Concerning the question of why participating in HRD does not pay off, in our view the most important reason has to do with the nature and context in which participation in HRD takes place. Most respondents state that they take part in HRD to develop themselves and, moreover, without informing their employee. In other words, the linkage between their HRD-activities and their job is weak. As such, the absence of a relationship between participation in HRD and benefits such as a higher job level and income is not a surprise. Moreover, respondents state that they participate in HRD to keep up with changes in their work situation. As such, this implies that their behavior is primarily oriented at continuing their present level than aimed at getting a better job. Therefore, it is no surprise that there is no relationship between participation in HRD and income.

Of course, our results can also be the result of the limitations of our study. For instance our study is limited with respect to the measurement of several variables, including the income variable and the measurement of participation in HRD. These deficiencies can mask the true effect of participating in HRD.

Do Higher Performing Managers *Actually* Receive Better Ratings? A Validation of Multirater Assessment Methodology

Allan H. Church
W. Warner Burke Associates Inc.

Despite significant cost and effort associated with feedback based OD/HRD interventions, relatively little attention has been paid to validation vis-à-vis hard performance measures. This study presents an applied example of a validation process based on a sample of 76 senior level managers from a global health services organization. Results confirmed the relationship between managerial performance and higher ratings on multirater feedback instrumentation, as well as its link with managerial self-awareness. Implications for practice are discussed.

Keywords: Multirater Feedback, Managerial Self-Awareness, Performance Ratings, Validation

In a society that is increasingly being driven by measurement and metrics (Church & Waclawski, 1998a; Hronec, 1993; Swanson, 1994), it should be no surprise that the process of assessing and developing managerial behavior has become one of the core practice areas of applied organizational scientists. While more traditional single-source methods of performance assessment are still common enough in organizations (Bretz, Milkovich, & Read, 1992; Murphy & Cleveland, 1995; Schuler & Huber, 1990), more and more HRD, OD and I/O practitioners are turning to development and appraisal applications based on data collected from multiple sources (e.g., Antonioni, 1996; Bracken, 1994; Church, 1995a; O'Reilly, 1994; Shipper & Neck, 1990). Though the terms vary considerably (e.g., multirater, multisource, full circle, 360-degree, and upward feedback), the interest in this process as a performance and change management tool is evident.

Based on a combination of action research and survey feedback (e.g., Lewin, 1951; Nadler, 1977), one of the fundamental assumptions of the multirater approach is that data about one's specific workplace behaviors, when compared with internal (self) perceptions, can be used as a catalyst for enhancing self-awareness and subsequent behavioral change (Church & Waclawski, 1998b; London, 1997; McLean, 1997; Tornow, 1993; Yammarino & Atwater, 1997). Fortunately for all those involved in implementing such systems, research results supporting the link between individual performance and managerial self-awareness have begun to reach critical mass (e.g., Atwater & Yammarino, 1992; Church, 1997; 1994; Church & Waclawski, 1999; Furnham & Stringfield, 1994; Van Velsor, Taylor, & Leslie, 1993). Moreover, while there are still significant questions regarding the efficacy of feedback itself as a tool (Kulger & DeNisi, 1996), some research does support its impact on behavior change when used in conjunction with OD/HRD interventions (Cheston, 1996; Hazucha, Hezlett, & Schneider, 1993; London & Wohlers, 1991).

Thus, in spite of the myriad of issues and concerns associated with implementing multirater feedback systems—e.g., regarding confidentiality, validity, rater training, cultural support, etc—current estimates of usage run anywhere from 12% to 29% (Mercer's Fax Facts..., 1996; Waldman, Atwater, & Antonioni, 1998) and appear to be growing still. Moreover, when one considers the extent to which multirater methods have already been employed in executive and management development efforts in the past (e.g., Bernardin, 1986; Burke, Richley, & DeAngelis, 1985; Church, Javitch & Burke, 1995; Hazucha et al., 1993; London & Beatty, 1993; Nowack, 1992), the total use percentage is likely to be even higher. In short, the notion of using data from a variety of perspectives for developing and improving individual effectiveness has moved beyond being just another consulting fad—it is now a legitimate OD, HRD and I/O intervention methodology.

Given the establishment and indeed institutionalization of multirater feedback methods in some organizations, however, practitioners have begun to question whether these technologies may be being adopted too quickly and recommend a host a cautions and warnings regarding implementation (e.g., Antonioni, 1997; Church & Bracken, 1997; Church & Waclawski, 1998b; McLean, 1997; Waldman et al., 1998). At this point, what is needed is a more concerted effort at developing a meaningful body of theory and research to effectively guide practice.

One critical issue in the area of multirater research and practice, that has received relatively little attention, is the nature of the multirater instrumentation used itself (Church & Waclawski 1998b, McLean, 1997). It is a common (though probably not often articulated) assumption among many feedback practitioners, for example, that

Copyright © 1999 Allan H. Church

higher ratings on a given multirater assessment instrument--almost regardless of its purported content--will directly translate to or correlate with some degree of improved individual performance. This is one of the central reasons why a large number of practitioners and consulting firms feel comfortable specializing in developing customized instrumentation for multirater interventions based on key issues in the client organization (Church & Waclawski, 1998b). The idea is, with enough focused attention and one-on-one coaching and interpretation, almost any set of practices will provide some level of meaningful information for the focal manager. Oddly enough, this is also the same rationale for justifying the use of standardized behavioral measures across different (and arguably unique) organizational settings. Unfortunately, however, these assumptions, particularly in the former situation, are rarely tested. Instead, it is common practice, especially among non-research based practitioners and firms, for feedback systems to be designed, implemented and then ultimately abandoned before the notion of data-based validation has ever been truly considered. Although there are a myriad of reasons for this situation--e.g., cost, effort and issues of confidentiality associated with linking individual feedback to existing internal performance measures, not to mention the fear of finding out that perhaps the multirater instrument constructed does not in fact correctly differentiate among levels of performance—there is arguably an ethical responsibility on the part of feedback practitioners to validate these types of applied instruments. Clearly, regardless of the amount of time, money, or effort being directed at a given OD or HRD feedback effort, if the instrument being used for assessment purposes lacks validity and reliability from a measurement perspective (Nunnally, 1978), or applicability for the organization from a practice perspective (Church & Waclawski, 1998b; Waldman et al., 1998), it will not matter what the data collection process reveals about an individual's developmental needs.

For the most part, however, the issue of instrument validation has belonged to the realm of I/O Psychology related selection and appraisal applications (e.g., Murphy & Cleveland, 1995), rather than OD and HRD based developmental programs. In fact, this may be one of the contributing factors to the "softer" connotations often associated with these latter types of interventions (Church & Burke, 1995). In any case, despite the importance of this seemingly obvious measurement issue, few organizations take the necessary steps to validate the use of an instrument for their own employees, regardless whether it is a standard or customized measure. In other words, although many internal and external OD, HRD and I/O practitioners work with feedback processes on the belief that a measurement instrument derived from set of core values, practices, or competencies (i.e., whatever the source) will indeed differentiate among more and less effective performers, relatively few validations of this assumption are ever tested empirically.

The purpose of the following study, then, is to contribute to the feedback literature by describing the results of an applied case example of how this multirater assessment tool validation process can be done using existing data from various feedback and personnel related resources. A secondary interest is to attempt to replicate prior findings (e.g., Church, 1997) regarding the link between managerial self-awareness and performance. More specifically, the following research questions were explored:

- Do higher performing managers receive better (i.e., more positive) ratings from their co-workers compared to lower performers?
- Are higher performing managers more self-aware (i.e., exhibit greater self-other ratings congruence) of their own behaviors?

In short, this paper will detail both a process and a set of results for exploring the validation of a multirater instrument. The findings will be relevant to both practitioners *and* researchers working with feedback related systems.

Method

Sample

Data for the present study were collected from 76 senior level managers (and 308 direct reports, 291 peers and 71 supervisors of the same individuals) from a global health services organization. These individuals represented a subset (for which additional differentiating performance evaluations were made available) of a larger group (n=389) of attendees of one of 12 senior management training and development programs conducted by an external consulting firm during a two year period. Participation in the program was based primarily on position in the organization and scheduling availability. In terms of overall attendee demographics, 78% of the participants were male and 22% female. Regarding tenure, 8% indicated having recently joined the organization, 20% had been there

2-5 years, 22% had 6-10 years tenure, and the remaining 50% had been with the organization for more than 11 years. In terms of age, approximately 20% were under 39 years old, while the majority (45%) were in their forties. Although geographic location was distributed among areas including Africa, Asia, Australia and New Zealand, Canada, Central/South America, Europe, Japan, and the UK, the majority of respondents (59%) were based in the U.S. with the next largest group (18%) being stationed in Western Europe.

Procedure

As pre-work for the program, all participants were required to complete a self-report behavior instrument and return it directly to an independent external firm for report purposes. In addition, parallel forms of the behavioral questionnaires were distributed to the direct reports, peers and supervisors of these same individuals for completion and subsequent return. Before completing the questionnaires, all raters, including the participants themselves, were familiarized with the developmental intent of the rating process and the manner in which the feedback would be used. Raters were instructed to be as candid and honest in their assessments as possible. All the data obtained remained anonymous throughout the feedback process.

Additional data were provided by the HRD/OD function of the organization for a subset of these attendees in order conduct a validation analysis—i.e., to link responses obtained from the multirater assessment process to actual performance evaluations. Selection into the subgroup for this study was based on the extent to which individuals were considered to be either *consistently above* or *consistently below* average in their overall performance over a two year period using archival formal appraisal ratings from personnel records as the criterion. All performance evaluations had been collected from supervisors substantially prior to selection to or attendance in the development program. Thus, this performance measure was entirely independent of the multirater feedback process at the direct report and peer level.

Although a larger number of individuals (n=100) were initially identified based on prior performance, some managers had not yet attended one of the senior management development seminars at the time of the study and others had been to a program offered earlier with different data collection procedures and thus were excluded. The final group for analysis consisted of 76 executives in total—i.e., 41 higher performers (rated by 170 direct reports, 162 peers and 39 supervisors), and 35 lower performers (rated by 138 direct reports, 129 peers and 32 supervisors).

Measures

The behavioral assessment tool used was a custom designed instrument that had been developed for this organization based a new set of core competencies and strategic leadership objectives. The instrument contained 61 items pertaining to various aspects of managerial behavior. For each item respondents were asked to rate the focal individual using a scale from 1 to 7 (where 1 = seldom, 3 = sometimes, 5 = often, and 7 = almost always) on the degree to which that senior manager engaged in a given behavior (e.g., " gives others clear feedback regarding their performance, " cooperates with others"). Content areas included developing and rewarding employees, promoting individual and organizational learning, resolving conflict, clearly communicating to others, building relationships within and across functions, focusing on strategic and business issues, and making decisions. Overall, the internal reliability of the instrument was quite high across each rating perspective ranging from .95 for self to.98 for supervisors.

A second "outcome" measure of work group climate (Burke, 1986) was also distributed to focal managers and their direct reports. Used in prior feedback programs and research (e.g., Church, 1995b; Church & Waclawski, 1997; Litwin & Stringer, 1968; Litwin, Humphrey & Wilson, 1978), this 28 item measure assessed perceptions of the climate experienced in the work group on a day-to-day basis along six dimensions: clarity, recognition, participation, standards, intraunit relations and interunit relations. In order to be consistent with the metrics of the behavioral measure, a 7 point scale was also employed. In general, the internal reliabilities for the summary scores for the instrument were also quite high among the present sample (.94 and .97).

Analyses

The data were analyzed at both the summary score and item levels using a variety of techniques including MANOVA, and simple oneway ANOVAs and t-tests. Averaged other ratings by source were used where multiple ratings existed (e.g., direct report and peer). Managerial self-awareness vis-à-vis self-direct report congruence was computed using two different methods: (a) the collective level of agreement between self and direct report ratings using a standard index of profile similarity *d*, i.e., the square root of the sum of squared item differences between

self and averaged direct reports ratings (e.g., Church, 1997, 1994; Nunnally, 1978); and (b) the four category agreement method (e.g., Yammarino & Atwater, 1997) whereby participants are classified as being either under-raters, *lower behaving* accurate-raters, *higher behaving* accurate raters, or over-raters based on a comparison of self and direct report total scores. Standard correlations were also performed for comparison purposes with prior research.

Results & Discussion

In general, the data were examined for a variety of performance and source (i.e., self, direct report, peer, supervisor) related effects across several different levels of analysis. Results are described below according to two major categories.

Multirater Feedback and Performance

First, a simple analysis of the overall summary scores by ratings source revealed the typical results—i.e., weak or nonexistent correlations—among self and others' ratings (see Table 1 for details). Consistent with prior ratings studies (e.g., Church, 1997; Harris & Schaubroeck, 1988; Nowack, 1992; Van Velsor et al., 1993), these senior managers tended to over-rate themselves compared with their direct reports ($t = 2.12$, $p < .05$). It was interesting to note, however, that peer ratings did not significantly differ in level from self-assessments, and supervisors provided the highest set of ratings overall across all 61 behaviors compared with direct reports ($t = 4.67$, $p < .001$) and peers ($t = 2.74$, $p < .01$).

Table 1.Descriptive Statistics for Summary Ratings

			Behaviors				*Climate*	
	M	*SD*	*Self*	*Drs.*	*Prs.*	*Supv.*	*Self*	*Drs.*
Behavior								
Self	5.51	.62	.95					
Direct Reports	5.27	.62	.05	.98				
Peers	5.48	.47	.21	.37*	.97			
Supervisors	5.70	.75	.04	.40*	.41*	.98		
Climate								
Self	5.40	.73	.75*	.24	.24	.25*	.94	
Direct Reports	5.03	.66	.09	.79	.36*	.43*	.37*	.97

Note: * $p < .05$, reliabilities are printed on the diagonal

These latter findings are more consistent with prior research on influence or laterally-based positions (e.g., Church & Waclawski, 1999) suggesting that the management of peer and supervisor relationships were particularly important for these executives. Although self perceptions of climate were also significantly higher than direct report ratings on this measure ($t = 3.80$, $p < .001$), the level of these ratings for both groups overall were significantly lower than they were for the behavioral assessments (self, $t = 2.37$, $p < .05$, and direct report $t = 4.60$, $p < .001$).

Next, the primary objective of this research was addressed—i.e., the relationship between managerial performance and multisource ratings—using an MANOVA model to look for overall effects across summary scores by performance group. Since the overall omnibus F was significant $F(4,56) = 5.96$, $p < .001$, additional univariate models were examined. As anticipated, the outcome of the univariate models (see Table 2) confirmed that higher performing managers were indeed rated significantly more positively by their co-workers (direct reports and peers) across the behavioral measure compared with their lower performing counterparts. In addition, direct reports of higher performing managers indicated experiencing significantly more positive climates in their work groups compared with those of lower performers.

Table 2. Univariate ANOVA Results for Ratings Source by Performance

		Lower Performers		*Higher Performers*	
	F	*M*	*SD*	*M*	*SD*
Behavior					
Self	0.01	5.51	.67	5.50	.57
Direct Reports	3.81*	5.11	.60	5.39	.61
Peers	3.90*	5.36	.53	5.58	.38
Supervisors	30.01**	5.25	.79	6.07	.47
Climate					
Self	2.41	5.26	.76	5.53	.68
Direct Reports	6.92**	4.81	.67	5.22	.61

Note: * $p < .05$, ** $p < .01$.

When examined at the item level for direct report ratings, 11 behaviors were found to significantly differentiate between higher and lower performers. In general, these centered on four major content areas: building relationships, decision making, problem solving/conflict resolution, and providing feedback & motivating employees. A similar set of content areas emerged when the peer data was examined at the item level as well. More specifically, 18 different peer assessments (in the areas of learning & skill development: problem solving/conflict resolution, integration with the larger organization, customer focus, and communication) served to discriminate among executives in the two performance groups. With respect to climate, 13 of the 28 descriptors yielded significant differences among work groups as well suggesting greater levels of clarity in roles and goals, standards of performance for the group, positive and friendly relations among members, and relationships and coordination with other workgroups in the organization. Although only a subset of behaviors and climate areas were identified, primarily having to do with relationships within and between functions, it is important to note that the trend in means was extremely consistent across almost all items and probably would have reached significance had the sample size been larger. In any case, these findings appear to confirm the notion that higher performing executives do indeed exhibit effective managerial behaviors more frequently and foster stronger or more positive work group climates.

Supervisor ratings also conformed to this relationship, yielding a particularly strong degree of differentiation among performance. In fact, when examined at the item level it was apparent that almost all (i.e., 58 out of 61) of the behaviors assessed served to significantly differentiate between higher and lower performers. While this should not be surprising given the non-independence of the initial performance appraisal measure (i.e., supervisors were the only group that would have been previously aware of the performance of the focal executives), nonetheless, this high degree of consistency does further support the validity of the multirater assessment process. Further, given the already present degree of inflation among supervisors ratings, the confirmation of the central relationship here should be encouraging for practitioners. In other words, even with major rating biases and level effects a multirater feedback tool can be strong enough to correctly differentiate among higher and lower behaving managers and, thus by implication, their performance as well.

Aside from the confirmation of this central relationship, one interesting and somewhat surprising finding here was the total absence of significant differences among self-ratings by performance for either behavior or climate. Although one might expect better performers to rate themselves higher on each measure as well (e.g., whether due to knowledge of past performance, greater levels of self-awareness, or simply inflated egos), this was not the case. Instead, both groups of executives were equally likely to over-rate themselves compared with observations from direct reports and peers. Perhaps this reflects a modesty bias on the part of higher performers, a trend which has been suggested in the past (Church, 1997; Yammarino & Awtaer, 1997). Alternatively, given their senior positions in the organization, this trend may reflect a relatively consistent positive ego perception on the part of this sample. One way to explore this trend further, of course, is through an analysis of ratings congruence.

Managerial Self-Awareness and Performance

Next, the data were examined for differences with respect to managerial self-awareness. Although prior research (e.g., Church, 1997; Church & Waclawski, 1999) has shown an empirical relationship between self-awareness and performance, the differences observed here between self and direct report behavior ratings, though sizeable, did not reach statistical significance. The same test performed on climate ratings, however, did support the

notion that higher performing managers were more aware of the strengths and weaknesses in their work unit's climate than lower performers (see Table 3).

Table 3. ANOVA Results for Profile Similarity by Performance

		Lower Performers		*Higher Performers*	
	F	*M*	*SD*	*M*	*SD*
Behavior: Self-Direct Reports	1.82	1.36	.42	1.23	.36
Climate: Self-Direct Reports	5.80*	1.38	.52	1.13	.28

Note: * $p < .05$. Lower profile similarity values indicate greater item-by-item congruence.

When these same data were examined using the four group categorical approach (e.g., Yammarino & Atwater, 1997), which is intended to avoid the problems associated with difference scores, however, the outcome did support the link between performance and managerial self-awareness at the behavioral level (Chi-square of 7.60, $p < .05$). Although the number of individuals in each cell were low, nonetheless, a significantly greater proportion of the higher performers comprised the accurate higher behaving group (64%) than the accurate lower behaving one (25%). In addition and as suggested earlier, while there were no differences by performance in the over-rating group, modesty may also been a factor in that a much larger proportion of higher performers compared to lower performers (71% vs. 28%) comprised the under-rating group. Interestingly enough, although the trend in percentages was very similar, the differences in group composition for the climate ratings did reach significance using this method of self-other comparison.

Although one could argue based on these different outcomes that methodology plays a role here, given prior research, it is more likely that the power to detect significant effects in the present sample of executives was simply too limited. Future studies over time and with larger samples should be able to help us determine the definitive answer to this question. For now, however, these results do continue, at least in part, to support the relationship between self-other ratings congruence (i.e., managerial self-awareness) and hard measures of managerial performance.

Limitations & Suggestions for Future Research

In general, there are several limitations that limit the generalizability of these results. Most significant is the nature of the sample itself. Inclusion in the present study was limited to a small set of very senior level executives from a single health services organization, all of whom had also attended a feedback-based developmental program. Although this is clearly not an ideal sample in terms of size or diversity, it is a common enough example of the realities of working with and linking existing datasets and measures midstream in an organizational setting. Unfortunately, using what is available in an organizational system often results in unavoidable issues with respect to sample size (and therefore reduced power to detect effects) as well as a variety of potential selection issues. The fact that any effects were present at all given the size of the present sample should provide some indication of the importance of this relationship. In any case, future research should focus on replicating the effects demonstrated here across a variety of samples from different levels, functions within and across various organizations and industries. Another limitation in this research is the lack of other types of hard performance measures. While supervisor appraisal records over a two year period due represent an independent and arguably "hard" measure of managerial performance (after all, this is the information by which organizations make personnel decisions), the addition of other types of indicators such as sales figures, departmental turnover ratios, size of budgets, span of control, etc. could have helped to substantiate the effects reported even further. Whenever possible, researchers need to work hard to gather and incorporate this information into their analyses.

Examination of The Tendency of Coefficient Alpha to Support The Choice of Instruments With Response Category Restriction.

Shani D. Carter
University of Scranton

This paper examines the effect of item construction on coefficient alpha and the effect of coefficient alpha on the comparison of instruments measuring similar constructs. It is predicted that decreasing the number of response categories of instrument items increases alpha for an instrument, but the response category restriction also decreases construct validity. Interpretation of alpha and the decision to use an instrument can be improved by considering item construction before deciding to use an instrument.

Keywords: Coefficient Alpha, Evaluation, Construct Validity

Previous research has found that job-related outcomes such as training effectiveness, post–training behavior, job satisfaction, and turnover, are significantly influenced by personal characteristics, such as motivation, affect (i.e., mood), and self-efficacy (Endler, 1976; Goldstein, 1993; Judge, 1992; Kane, 1986; Kanfer & Ackerman, 1989; Noe, 1986; Pervin, 1978; Terborg, 1981; Wexley, 1984). These personal characteristics influence performance even when ability and environmental factors remain constant, and therefore should be measured as part of any study of training outcomes (i.e., reaction, knowledge, behavior, and results; Kirkpatrick, 1959).

Measurement of Personal Characteristics

Instrument design

Personal characteristics such as affect and motivation are generally measured through self-report questionnaires using Likert scales (DeVellis, 1991). These questionnaires are based on theory, and are used when it is difficult to measure the construct in another way (DeVellis, 1991; Nunnally, 1978). These questionnaires generally contain 5 to 30 questions, where respondents are required to indicate their degree of agreement or disagreement with a statement. The degree of agreement or disagreement is generally restricted to a three-point scale (e.g., no agreement, neutral, agreement), a five-point scale, or a seven-point scale. Question responses are usually summed, so that the possible range of scores of an instrument is directly related to the range of possible responses to individual questions.

Numbers of Response Categories

Instruments with a higher number of response categories per question are able to measure a greater level of detail of the range of differences between respondents. For example, for a questionnaire with 10 questions, if there are three response categories per question, the range of scores for the questionnaire is 0 to 30, but if there are five response categories per question, the range of scores for the questionnaire is 0 to 50. The questionnaire using five response categories therefore reports the range of responses between participants in much greater detail than the questionnaire with only three response categories. This greater detail of measurement of personal characteristics can lead to higher construct validity (i.e., more accurate portrayal and measurement of the construct) which can lead to greater criterion-related validity (i.e., prediction of job-related outcomes).

Examining Reliability and Validity

Effect of Reliability and Validity on Generalizability

Using reliable and valid instruments to measure personal characteristics leads to greater generalizability of conclusions about job-related outcomes (Carmine & Zeller, 1979; Cook & Campbell, 1979; DeVellis, 1991; Nunnally, 1978). If a researcher uses a poorly constructed instrument, the researcher may be led to the erroneous conclusion that a particular personal characteristic had no effect on job-related outcomes, although the lack of

Copyright © 1999 Shani D. Carter

correlation was actually due to the instrument's poor construction. It is therefore crucial to ensure that instruments used to measure personal characteristics are of the highest reliability and validity possible.

Measuring Reliability

Researchers commonly use coefficient alpha to examine the reliability of instruments before deciding whether to include instrument scores as variables in studies of job-related outcomes, such as training evaluation analyses (Cronbach, 1970; Peterson, 1994). Some researchers rely exclusively on coefficient alpha as the indicator of the reliability and usefulness of an instrument. This heavy reliance on alpha can lead a researcher to design an instrument that can measure only small amounts of variability, because coefficient alpha is based upon the inter-item correlations of an instrument. For example, a researcher may choose to use an instrument with items that are answered on a three point scale rather than a five point scale because the three point scale allows for less possible variability of scores and thus produces higher inter-item correlations and higher alpha.

Drawbacks of Exclusive Reliance on Alpha

Previous researchers have discussed the drawbacks of relying on coefficient alpha as an indicator of the reliability and usefulness of an instrument without also examining other characteristics of the instrument such as actual correlations and instrument length (e.g., Cortina, 1993; Barchard & Hakistian, 1997; Schmitt, 1996; Thompson, 1990; Zimmerman, et al., 1993). For example, Cortina (1993) and Schmitt (1996) recommended examining the effect of the number of questions of an instrument, and also examining the dimensionality of the instrument before deciding whether to trust coefficient alpha as an accurate gauge of an instrument's reliability. Barchard and Hakistian (1997) recommended examining confidence intervals when using coefficient alpha. Thompson (1990) recommended examining the statistical relationship of individual items to the instrument as a whole when interpreting alpha. Finally, Zimmerman, et al. (1993) recommended examining the correlations of subtest scores when interpreting alpha.

Hypotheses

The current paper extends this research by suggesting that item construction also should be examined before determining whether to trust coefficient alpha and whether to include an instrument in research on job-related outcomes such as training evaluation. *It is predicted that decreasing the number of response categories of instrument items will increase the instrument's mean inter-item correlation, thereby increasing alpha for the instrument.*

The response category restriction decreases construct validity which decreases criterion-related validity. Exclusive use of alpha for analysis of reliability of an instrument can then lead a researcher to the erroneous decision to use an instrument with weak construct validity and criterion-related validity, which can then lead to the erroneous conclusion that a construct has no significant effect on job-related outcomes.

Method

Subjects

A repeated measure design was used. Two sessions were conducted where subjects completed questionnaires during weeks 1 and 5. Of the 93 subjects enrolled in the study, ten subjects did not complete the two sessions, and so were dropped from further analysis.

Measures

The current research uses Affective Trait as the construct to be examined. Affective trait is the tendency to experience a general emotional state (i.e., mood), and can be either positive or negative (George, 1991). Although negative affect does not influence either recall or learning, positive affect does influence recall of material (Isen, Daubman, & Nowicki, 1987). When in a state of positive affect, individuals recall more material and more diverse material, which leads to more creative and efficient problem solving (Isen, et al., 1985). Because affect has been

shown to influence learning, it is a useful variable to be included in training evaluation, and the results of this study can be used to design instruments for future training evaluation research.

Affective trait was measured with the Positive and Negative Affect Schedule (PANAS), which measures positive affect and negative affect as two independent dimensions (Watson, Clark, & Tellegen, 1988). The measure contained 20 items, where positive affect (PA) and negative affect (NA) were measured with 10 items each. Responses were on a 5-point scale, where 1 was low and 5 was high. Responses were summed, so that the range of possible scores for the positive affect and negative affect sections was 10 to 50 each.

Affective trait also was measured with the Neutral Objects Satisfaction Questionnaire, (NOSQ; Judge, 1992). This instrument measures affective disposition as an affective bias toward items that are common in everyday life. The instrument contains 25 items, and has three response categories, where 1 is dissatisfied, 2 is neutral, and 3 is satisfied. This instrument will be used as a comparison for the examination of the effects of response category restriction of the PANAS.

Analyses

The following analyses were conducted to examine the effects of response category restriction on the PANAS.

1. Correlations and factor analyses of the PANAS and NOSQ were conducted to determine the extent to which they measure the same underlying construct.
2. Participant responses to PANAS items were recoded from a scale of 1 to 5 to a scale of 1 to 3. This recoding simulated PANAS scores if the items had been constructed with 3 response categories. The specific method of the recoding was done as follows: Actual responses of 1 or 2 were recoded 1; actual responses of 3 were recoded 2; and actual responses 4 or 5 were recoded 3. Thus, actual responses in the low range (1 or 2) were still coded low (1), actual responses that were neutral (3) were still coded neutral (2), and actual responses that were high (4 or 5) were still coded high (3).
3. Coefficient alpha was computed and compared for the PANAS actual and recoded scores.
4. Correlations and factor analyses were then repeated using the PANAS recoded scores and NOSQ actual scores.

Results

PANAS and NOSQ Variable Correlations

Correlation matrices were produced for the NOSQ and PANAS variables. These contained correlations for session 1 and session 2 for: the actual and recoded PA variables; the actual and recoded NA variables; and the actual NOSQ variables. The mean inter-item correlations and alpha statistics derived from these tables are summarized in Table 1. Alpha was computed as follows: (alpha = (k*r)/(1+(k-1)*r), where k = the number of items and r = the mean inter-item correlation). Table 1 show that there were small differences between the mean inter-item correlations for the actual and recoded PA and NA variables. For PA, the mean inter-item correlation increased from .26 to .27 with recoding in session 1, but decreased from .52 to .49 with recoding in session 2. For NA, the mean inter-item correlation decreased from .30 to .26 with recoding in session 1, and decreased from .36 to .30 with recoding in session 2.

Table 1

Mean Correlations and Alpha Statistics for PANAS and NOSQ

	Correlation Session 1	Correlation Session 2	Alpha Session 1	Alpha Session 2
PA	0.26	0.52	0.78	0.91
PA recode	0.27	0.49	0.79	0.91
NA	0.30	0.36	0.81	0.85
NA recode	0.26	0.30	0.78	0.81
NOSQ	0.11	0.15	0.76	0.81

PANAS and NOSQ Coefficient Alpha

Alpha statistics for the above discussed correlations also are presented in Table 1. For PA, alpha increased from .78 to .79 with recoding in session 1, but remained at .91 with recoding in session 2. For NA, the alpha decreased from .81 to .78 with recoding in session 1, and decreased from .85 to .81 with recoding in session 2. Alpha for the NOSQ was .76 at session 1 and .81 at session 2.

Factor Analysis of NOSQ and PANAS Variables.

Results of factor analysis using varimax rotation for the actual and recoded PA and NA variables are presented in Table 2. This table shows that the PANAS measured two constructs (PA and NA), and that there were few significant differences in the magnitude of the factor loadings between the actual and recoded PA and NA variables. In addition, the variance explained by each factor remained largely consistent between the actual and recoded variables.

Factor analysis of the NOSQ was unsuccessful due to nonconvergence. Therefore, the high alphas for the NOSQ for sessions 1 and 2 (.76 and .81) are used as indicators of the instruments unidimensionality. Factor analysis of the NOSQ and PANAS variables together also was unsuccessful due to nonconvergence.

Analysis of NOSQ and PANAS Constructs

The NOSQ, PA, and NA variables were summed to produced the respective constructs. Table 3 contains correlations for the NOSQ and PANAS constructs. This table shows that the correlations for the actual and recoded PA and NA variables were nearly 1.0. The correlation between the actual and recoded PA was .97 for session 1 and .98 for session 2. The correlation between the actual and recoded NA was .96 for session 1 and .93 for session 2. There were differences in the correlations between the NOSQ and the PA and NA constructs for the actual and recoded PA and NA variables. For session 1, the correlation between NOSQ and PA increased from .31 to .35 with recoding and from .19 to .24 with recoding for session 2. For session 1, the correlation between NOSQ and NA decreased from -.23 to -.19 with recoding and from -.22 to -.19 with recoding for session 2.

Factor analysis of the NOSQ and PANAS constructs was again unsuccessful due to nonconvergence.

Discussion

The hypothesis that decreasing the number of response categories of instrument items would increase alpha for the instrument was not supported with this sample. Although there were small differences between correlations for the actual and recoded variables and constructs, these differences were inconsistent for PA and NA. This result could be due to the fact that few respondents used the extreme ends of the PANAS scale (i.e., 1 or 5), such that the recoding had only a small effect on the PA and NA variables.

Nevertheless, the assumption that decreasing the number of response categories of instrument items would alter the correlation between the instrument and another instrument was supported. Specifically, the correlation between PA and NOSQ increased with recoding of PA for session 1 and session 2. Further, the correlation between NA and NOSQ decreased with recoding of NA for session 1 and session 2. These results indicate that research could inadvertently overestimate or underestimate the construct validity or criterion-related validity of an instrument if the instrument has response category restriction.

Conclusions

Although the hypothesis regarding alpha was not supported, the results indicated that response category restriction does affect construct validity and criterion-related validity when an instrument is validated against another instrument. It is therefore recommended that instruments used to measure personal characteristics should contain 10 to 20 items, and that items should be constructed with scales containing five to seven response categories. Instruments with low numbers of items should contain more response categories, and vice versa. An instrument constructed in this way can measure a sufficient level of differences between respondents, but is not so long or tedious as to fatigue the respondents. In order to determine whether to use an instrument after data is collected, researchers should examine: (1) the coefficient alpha; (2) the dimensionality of the instrument through factor analysis; (3) inter-item correlations; and (4) the relationship of the instrument to a similar construct. The results of these four statistical analyses should be interpreted in light of the number of items and number of response categories of the instrument.

A Factor Analytic Investigation of the Content of Participant Reactions: Affective and Utility Judgments

Ronald B. Morgan
Wendy Casper
George Mason University

The premise of this research is that increased understanding of the content of participant reactions is a necessary step toward improving the construct validity of those judgments. This study examines the factor structure of a large data base of participant reactions, and explores the construct validity of "utility" judgments as defined by Alliger et.al. Results suggest that reactions are multidimensional, and that "utility" judgments represent an underlying factor.

Keywords: Training Evaluation, Participant Reactions

Participant reactions are by most accounts the principal means by which organizations evaluate training programs (Bassi, Benson & Cheney, 1996; Saari, Johnson, Mclaughlin & Zimmerle, 1988). According to Training Magazine (1996) approximately 86 percent of organizations use participant reactions to evaluate their training efforts. Furthermore, for most of those organizations, participant reactions are the sole means of evaluation. Consequently, improving the technology of participant reaction will yield great benefits. The purpose of this research is to identify strategies for improving participant reactions as a training evaluation methodology.

Kirkpatrick (1959; 1996) describes four levels of training evaluation. This framework has served as the organizing scheme for both practitioners and researchers. Level I represents the reactions of participants to training, typically collected through questionnaires administered at the conclusion of the training program. The second level of evaluation consists of measures of actual learning in the training program. This typically involves post training measures of knowledge, skill or attitude change. In essence, it represents an examination of the "internal validity" of the training effort. Level III evaluation is focused on gauging the extent to which learning is "transferred" to the job, and typically consists of traditional measures of job performance including ratings provided by superiors, peers or subordinates. Finally, Level IV evaluation assesses changes in organization outcomes (revenue, profit, turnover, etc) attributable to the training program.

Because Level II, III and IV outcome data are far more costly to plan and collect, organizations tend to hold their training program to the minimal level of outcome, that is, to determine simply whether or not participants react favorably to the program (Bassi et al., 1996).

The Uses of Participant Reactions

To understand the potential for an improved technology of participant reaction, it is helpful to discuss the various uses reactions serve. First, participant reactions can provide substantive input for the design and improvement of training efforts. Brinkerhoff (1986) describes a continuous improvement process, with participant reactions providing one source of data for continuous improvement of each component of the training effort. Presumably, credible reaction data can be a tremendous diagnostic tool for improving the design and delivery of training. Second, the process of collecting participant reactions can serve a "public relations" function, building up the customer's sense that the training function is sincerely interested in the service they deliver. A number of authors have argued for the importance of "customer orientation" and the measurement of customer satisfaction in human resources (Heneman, Huett, Lavingna and Ogsten, 1995).

A third use for participant reactions is as a surrogate for other, more costly criteria of training effectiveness-- measures of learning, measures of on the job behavior or performance, and measures of organization results. Because of the efficiency of the methodology (e.g., surveys collected at the conclusion of training) the development of reactions as predictors of actual learning, transfer to the job, and organizational results, would dramatically increase the utility of training evaluation.

The Relationship of Trainee Reactions and Other Evaluation Criteria

A number of studies have examined the correlation among the four levels of training criteria, with generally discouraging results (Alliger, et. al, 1997; Alliger and Janek, 1989). The meta-analytic results presented in those studies show little systematic relationship between traditional participant reactions and other levels of training criteria. In fact, the low magnitude of correlation of trainee reactions and other criteria have led some (Holman, 1996) to question the appropriateness of participant reactions as a criterion of training effectiveness.

While trainee reactions in general show little systematic relation to learning, job performance and organization results, particular facets or dimensions of trainee reactions appear to hold great promise. Alliger et. al (1997) and Alliger and Janek (1989) distinguish between "affective" and "utility" judgments. Affective judgments measure the extent to which the participant "liked" or was satisfied with different components of the training. Utility judgments, on the other hand, reflect the extent to which the participant can apply the content to their job. These researchers present evidence to suggest that "utility" judgments show modest but significant relationship to immediate learning (level II) ($r = .26$) and to transfer (level III) ($r = .18$). Furthermore, studies reporting combined scale of affective and utility judgments show significant relationship to immediate learning (level II) ($r = .14$), to behavior (skill) learning, a level II distinction made by those researchers ($r = .12$), and to on the job use (level III) ($r = .21$).

Understanding the Underlying Constructs of Participant Reactions

While the Alliger et al. (1997) research is promising in that it illustrates the potential utility of specific judgments, a number of observations must be made. First, the distinctions drawn by the research to date (Alliger and Janek, 1989; Warr and Bunce, 1995; Alliger et al., 1997) have characterized clusters of items which appear on evaluation forms, but have not presented any factor analyses of any multi-item reaction forms. While these constructs may well be relevant and important characterizations of trainee reactions, there has been no empirical basis to suggest that trainee reactions are adequately summarized by either Alliger et al. framework of "affective" and "utility", or Warr and Bunce's (1995) "affective," "utility" and "difficulty" dimensions. Alliger and Janek (1997) present reliability estimates for the affective and utility judgments, and evidence that the item clusters relate to other criteria, they do not present evidence to suggest that those two dimensions adequately account for the variability of participant reactions. While this research offers great promise for increasing the effectiveness of training evaluation, it must be noted that the dimensions they identify are conceptually based. No factor analysis of comprehensive participant reactions have been reported. Clearly, continued development of the technology of training evaluation will benefit from identification of the underlying dimensionality of participant reactions.

It is the premise of this research that an understanding of the underlying constructs of participant reactions will improve their predictive utility. In effect, the current researchers assert that the low magnitude of relationships between participant reactions and other criteria (Alliger & Janak, 1989; Alliger, et al., 1997) are due to an inadequate understanding of the diverse content of participant reaction instruments. An increased understanding of the "facets" of participant reactions will allow researchers and practitioners to achieve stronger predictor - criterion relationships. This premise is based in part on the evolution of the job satisfaction literature. An extensive body of literature investigated the relationship between job satisfaction and performance, and repeatedly found low relationships ranging from .14 - .17 (Brayfield & Crockett, 1955; Iaffaldano & Muchinsky, 1985) leading many researchers to conclude little relationship existed between employee satisfaction and employee job performance. However, other researchers (Fisher, 1980) proposed that the low relationship between satisfaction and performance may be due to measuring satisfaction and performance at different levels of specificity, such as measuring general job satisfaction but then measuring performance on a very specific task.

More recently, this same argument has been made to explain the low relationships typically found between personality and job performance. Since the early 1990s (Barrick & Mount, 1991), there has been a plethora of research on the value of personality in predicting performance (Barrick, Mount, & Strauss, 1993; Hogan, Hogan, & Murtha, 992; Hough, 1992; Ones, Mount, Barrick, & Hunter, 1994; Tett, Jackson, Rothstein, & Reddon, 1994). Research has typically found the percent of variance personality predicts in job performance to be small. However, recently Borman, Hansen and Hedge (1997) suggested that these low relationships might be due to using supervisory ratings as the performance criterion. They argued that supervisory ratings typically reflect both task and contextual aspects of performance, but that if a more specific measure of contextual performance was used, the personality-performance relationship may be larger than previous research has suggested (Borman, Hanson, & Hedge, 1997). One study provides support for this notion in finding that supervisor ratings typically do represent both task and contextual aspects of performance (MacKenzie, Shankster, & Kohler, 1991).

Thus, this same argument could be made to explain the low relationships between trainee reactions and other measures of training evaluation when over-general composite constructs have been used (Alliger & Janak, 1989) and the increased magnitude of relationships when more focused constructs such as "utility" have been used (Alliger et al., 1997). However, the current researchers assert that participant judgments will exhibit greater complexity than the constructs (utility, reaction and difficulty) discussed to date.

The Content of Participant Reactions

A fundamental principle of measurement is that the construction of a measure requires a clear understanding of the construct to be measured. Understanding the construct is a necessary step toward improving any measure. This is true of the measurement of participant reactions as well. It is our suggestion that research on participant reactions will benefit from an exploration of the entire content domain of participant reactions. To date, there has been little research that explored the full domain of participant reactions.

A number of opinions may be relevant as a means to capture participant reaction to training programs. Furthermore, the various facets of participant reactions may well predict different criteria. Phillips (1997) identifies 15 content areas (Progress with objectives, Program content, Instructional materials, Pre-work materials, Assignments, Method of delivery, Instructor/Facilitator, Motivation to learn, Program relevance, Registration/logistics, Facilities, Overall evaluation, Planned improvements, Recommendations for target audiences, and Instructor). Each of these content areas can be further broken down into a variety of relevant issues. For example, Phillips breaks the "Instructor" category into seven issues (preparation for sessions, knowledge of subject matter, presentation skills, communication skills, responding to learners, use of appropriate technology, and encouraging application) (Phillips, p. 115-116).

Clearly, the content domains of participant reactions are numerous and each domain likely consists of various issues and perceptions. Furthermore, each of these content domains may well serve different purposes in a systematic training evaluation effort. For example, certain dimensions may well be most useful in predicting customer satisfaction; others in predicting learning; others (utility judgments) in predicting use on the job, and still others in predicting organizational results attributable to training.

Judgments

In addition to measuring diverse content areas, a variety of judgments can be asked from participants. While no taxonomy of judgments is available in the literature, one can imagine measures of amount (too much - too little), measures of adequacy or effectiveness (judged against the individuals standards or against some defined or objective standards) and measures of satisfaction (judged against the participants needs or expectations). The diversity of judgments adds to the complexity of characterizing the dimensionality of participant reactions.

The Current Research

The current research examines the dimensionality of comprehensive participant reactions. This research is based on the premise that a refined understanding of the dimensions or facets of participant reactions will increase the predictive validity and utility of those judgments.

The Dimensionality of Participant Reactions

Three research questions emerge from the literature on participant reactions. First, what is the underlying factor structure of comprehensive participant reactions? It is reasonable to predict that the typical participant reaction form, organized into content areas (Phillips, 1998) will consist of content based dimensions. That is, items dealing with the instructor will co-vary; items dealing with the material will co-vary, and so forth. Furthermore, it is reasonable to suggest that these individual facets of participant reaction will have relevance to specific criteria. That is, judgments about course content will predict specific criteria, reaction data about instructor delivery will predict other criteria, etc. The central point is that only by mapping individual predictor--criterion relationships will the psychometric properties of participation reactions be improved. The second question to address is whether a more parsimonious set of factors can explain variability in participant reactions. Alliger et al. (1997) suggest that much of the diverse content of reaction forms collapses into a single "affective" dimension. Their model summarizes all of the variability in participant reactions into two dimension, "affective" and "utility" judgments. A

third question to address is whether or not empirical evidence emerges for the conceptual distinctions drawn by Alliger et al. In particular, this research will examine whether "utility" judgments emerge as an underlying factor in participant reactions. Finally, in addition to exploring the emergence of a "utility" factor, this research will investigate the amount of variance accounted for by these dimensions, and by doing so, explore their relative impact on overall trainee reactions.

Method

Procedures

Participant reaction forms were collected from 9,128 employees of a 750,000 employee organization. The form was used to collect level 1 evaluations for a variety of non-managerial training programs conducted over a three year period. Participants were asked to report some basic demographic data as well as their reactions to the training program. Participant responses were anonymous, as there was no identifying information (i.e. name, social security number) reported on the form. Data collected from participant reactions was included in a large data base which was later used to conduct the analysis reported in this paper.

Participants

About half (48.8%) were male, 36.1% were female and 15.3% did not report their sex. More than half of the respondents were White (54%), 19.7% were Black, 3.1% were Asian, 4.2% were Hispanic, 1.1% were Native American, 17.1% of the respondents did not report their race. Most of the employees were 40-49 years old (38.9%) or 30-39 years old (27.4%), while 12% were 50-59 years old, 1.2% were 60 or older, 2.5% were 17-29 and 18% did not report their age.

Items and scales

The reaction form consists of 32 items, organized into 8 categories. All 32 items ask the respondent to rate the satisfaction with aspects of training.

Results

Principle Axis Factoring with Oblimin rotation was performed on the 32 items which made up the participant reaction form (see Table 2), with the squared multiple correlation used to estimate communalities. The Kaiser criterion was applied to the initial solution, suggesting that six factors with Eigenvalues greater than one should be extracted. In addition, examination of the scree plot suggested the presence of six underlying factors among the items. Examination of the initial extraction shows that the first six factors accounted for a total of 62.8% of the variance. Eigenvalues and percent of variance accounted for by each of the factors are presented in Table 1.

After the initial extraction, the pattern matrix was rotated to examine for more interpretable loadings. We chose to rotate and examine the pattern matrix instead of the structure matrix because in using the oblique rotation method we were interested in the unique variance accounted for by each factor. Since the pattern matrix yields partial weights, the values in this matrix are more appropriate to interpret. In order to guide examination of weights in the pattern matrix, a .45 cutoff for the loading, which represented 20% of the variance, was required to retain the item with the factor. Finally, all the items which loaded on a given factor were examined in an attempt to discern what latent construct was underlying each factor. Table 2 presents the 32 items categorized into the 6 rotated factors, and the means and standard deviations for items. Table 3 presents the factor loadings

Table 1
Eigenvalues and percent variance accounted for by each factor

Factor	Eigenvalue	Percent of Variance
1	11.07	34.6
2	3.51	11.0
3	1.73	5.4
4	1.39	4.3
5	1.29	4.0
6	1.12	3.5

Factor 1 appears to represent a "satisfaction with instructor" dimension. Items 12, 13, 14, 15, 16, and 17 loaded on this factor. Factor 2 appears to represent "overall satisfaction with the training process". Items 26, 27, 28, 29, 30, 31, and 32 load on this factor. Factor 3 appears to represent a satisfaction with the testing process, with items 23, 24 and 25 load on this factor. Factor 4 represents a "utility of training" factor. Items 2, 3, 6, 8, 20, 21 and 22 load on this factor. In some ways, this factor may mirror what Alliger, et al (1997) referred to as utility reactions. Factor 5 represents a "materials" factor. Items 4, 5, 18, and 19 load on this factor. Factor 6 appears to represent a "course structure" factor, with items 9, 10, and 11 loading on this factor.

To examine the intercorrelation of the constructs, factor derived scale scores were created. The intercorrelation of the six constructs are presented in Table 4.

Table 2
Table of participant reaction item, associated factors, and item descriptive statistics

	Item	Factor	M	SD
1	How satisfied are you with communication of course objectives in clear, understandable terms?	-	4.5	.64
2	How satisfied are you with match of course objectives with your idea of what would be taught?	4	4.31	.75
3	How satisfied are you with the relevance of the course content to your job?	4	4.43	.71
4	How satisfied are you with the quality of course materials?	5	4.41	.74
5	How satisfied are you with the audio and visual aids used by the instructor?	5	4.33	.75
6	How satisfied are you with course's emphasis on most important info.?	4	4.39	.72
7	How satisfied are you with the order the course material was presented?	-	4.39	.68
8	How satisfied are you with realism of course presentation and class exercises?	4	4.30	.78
9	How satisfied are you with the length of training course?	6	2.42	.86
10	How satisfied are you with the pace of the course material presented?	6	2.75	.56
11	How satisfied are you with the amount of student participation in the course?	-	2.82	.55
12	How satisfied are you with the instructor's knowledge of course material and subject matter?	1	4.70	.54
13	How satisfied are you with the instructor's ability to keep interest of class?	1	4.53	.72
14	How satisfied are you with the instructor's presentation and explanation of course materials?	1	4.55	.67
15	How satisfied are you with the instructor's responsiveness to student questions and problems?	1	4.65	.60
16	How satisfied are you with instructor ability to relate to students individually?	1	4.62	.62
17	How satisfied are you with the instructor's overall effectiveness?	1	4.60	.66
18	How satisfied are you with the supplies and equipment for this course?	5	4.34	.77
19	How satisfied are you with classrooms, furniture, learning environment, etc.?	5	4.28	.86
20	How satisfied are you with the extent to which the course prepared you to perform current job tasks more effectively?	4	4.19	.78

[1]instructor satisfaction factor
[2]overall training satisfaction
[3]satisfaction with testing
[4]utility of training
[5]materials satisfaction
[6]course structure satisfaction

An interesting pattern of interrelationship exists among the factors, with the utility factor strongly related to "satisfaction with instructor" (r = .71), satisfaction with course testing (r = 52), and satisfaction with course materials (r = .65). The intercorrelation of the factor derived scales is presented in Table 4.

Conclusion and Discussion

The first, and most compelling finding from this research is the emergence of the "utility" factor described by Alliger et al. (1997). All four of the items presumed to measure the "usefulness" of training load on the same dimension, even though the items appear on different parts of the reaction questionnaire. Because Alliger et al. (1997) have demonstrated that utility judgments hold potential as predictors of learning and subsequent on the job use of the training content, this "empirical" support for the construct validity of the "utility" dimension is noteworthy.

A second finding of interest is that the instructor dimension (Factor 1) appears to carry great weight in trainees' overall perceptions of the training effort. The instructor factor accounts for approximately 34 per cent of the variability in those judgments. Furthermore, the fact that satisfaction with instructor is highly correlated with the utility scale (r = .71) offers added support for the importance of instructors in the training process. Clearly, instructors have great impact on the experience and perceptions of training participants.

A third finding of interest is that six factors emerge from the factor analysis. While the instructor factor accounts for a sizable proportion of variance, five additional factors contribute meaningful increments of variance. Also, the pattern of interrelationship among the factor derived scales supports the contention that participant reactions are multidimensional. While some correlations are high, others are low. This evidence of convergent - discriminant validity contradicts those who reduce participant reactions to unidimensional "smile sheets". It also suggests that two dimensional characterizations (e.g., affective, utility) fail to adequately capture the information available in well-developed participant reaction forms. Clearly, the constructs underlying participant reactions are more complex than those researchers contend.

Finally, examination of the scale intercorrelations yields another interesting note regarding perceptions of utility. In addition to the instructor scale, the materials and testing scales are all highly correlated with perceptions of the usefulness of training. Future research should examine the underlying components of training that contribute to participants' perceptions that it will be useful. This research suggests that the instructor, the materials and the testing practices may play an important role.

Summary

The stated objective of this research is to make progress toward an improved technology of participant reactions. Implicit in that objective is the authors' belief that there is merit in these judgments. At a minimum, the results presented here suggest that the constructs underlying participant reactions are more complex than previously suggested. It is reasonable to argue that the past failure to acknowledge the multiple dimensions of employee reactions may well account for the dismal pattern of correlation between participant reactions and other "levels" of training criteria. While the low correlation with other evaluation criteria have led some (Holman, 1996) to question the credibility of participant reactions as training criteria, the authors of this study are more optimistic about the role that participant reactions can play in systematic training evaluation. Clearly, additional work is needed to improve the understanding and measurement of participant reactions.

Future research will seek to replicate the factor structure and interrelationship of participant reactions in other data sets, and seek to further understand the constructs underlying participant reactions and their relationship to other indices of training effectiveness.

Effects of Two Different Learning Paths on School-To-Work Transition

Esther van der schoot
University of Twente

This study examines the relationship between curriculum characteristics and school-to-work transition of two learning paths in nursing and healthcare, namely: apprenticeship system and full-time senior and higher vocational education. A partly structured questionnaire has been used for interviews with employers, educational coordinators, experts, and graduates. Data have been analyzed by way of coding schemes, ATLASti and SPSS. Data analyses show that the path of learning makes a difference in school-to-work transition. Curriculum characteristics, as well as individual characteristics, organizational factors, and labor market factors have been important too in school-to-work transition.

Keywords: School-To-Work Transition, Curriculum, The Netherlands

The linkages between educational programs on the one hand and developments in the workplace on the other hand are less optimal than needed (Finch, et al., 1997). School-to-work transition is hard to accomplish, transfer tends to be highly specific and it needs to be guided, it rarely occurs spontaneously (Brown, 1995). In the Netherlands there are two different learning paths in vocational education and training, namely: apprenticeship system and full-time vocational education. Since the eighties there is a revaluation of the apprenticeship system. It is still not clear if the apprenticeship system will be the most suitable path of learning with regard to school-to-work transition (Streumer & Van der Klink, 1997). There is also talk of a shift towards the need of more transparent educational programs (Streumer, 1997) and educational programs which combine domain-specific qualifications with generic, broadly applicable qualifications (Nijhof & Streumer, 1994; Nieuwenhuis & Onstenk, 1994).

Public healthcare is growing very fast partly by demographic changes, causing a strong need for well-educated staff. A national qualification structure for nursing and healthcare educational programs has been introduced in august 1997, in which accent was on more broadness of educational programs to meet the above mentioned industry needs. Now students of the apprenticeship system and full-time vocational education have been educated along different learning paths towards the same attainment targets of the new introduced national qualification structure. In this study the expectation is that is does matter along which learning path a graduate makes his/her entrance at the labor market in nursing and healthcare.

There are many studies regarding the returns and effects of vocational education (Nijhof, 1998) and school-to-work research studies (Finch, 1996). The influence of different learning paths and the influence of curriculum variables on school-to-work transition has hardly been discussed yet. Research concerning the relation between curriculum characteristics and school-to-work transition has focused on the practical work components of educational programs (Nieuwenhuis & Onstenk, 1994; Bolhuis-Poortvliet & Snoek, 1996). In this studies the conditions for practical work situations seem to be important. There is also research into the effects of modular educational systems (Raffe, 1994; Meesterberends-Harms, 1994). It seems that the effects of modular educational systems can work the other-way-around with respect to school-to-work transition. Finally research after transfer of training and transitional skills have also been conducted (Moerkamp, 1996). In this study the question was posed if any transition at all occurred. Surveyed research Nijhof (1998) yielded a research model for connecting curriculum characteristics and labor market perspectives which is partly similar to the model of Baldwin & Ford (1988).

This input-process-output model contains important elements but it has no empirical validation yet with regard to school-to-work transition in the sector of nursing and healthcare. It also contains too many variables for the purpose of this study.

In this study the apprenticeship system will be compared with full-time senior and higher vocational education in nursing and healthcare. It would not be realistic not to take other variables in account as well. So it is stressed that individual characteristics of graduates, organizational factors (HRD) and factors stemming from the labor market can be significant too in answering the following research questions.

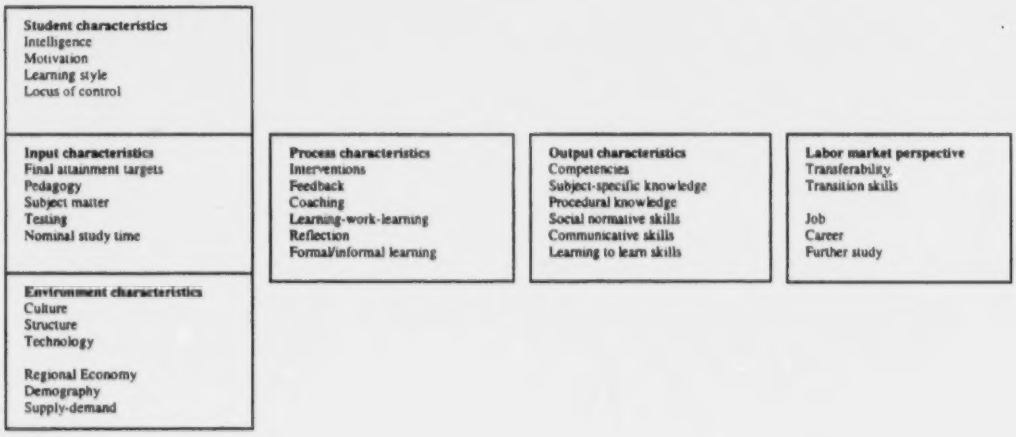

Figure 1. Research model for connecting curriculum characteristics and labor market perspectives, Nijhof (1998).

Research questions

1. Do graduates of the apprenticeship system have the same school-to-work transition* as graduates of full-time senior and higher vocational education in nursing and healthcare?
2. Which curriculum** variables do make a difference in the school-to-work transition of graduates from the apprenticeship system and full-time senior and higher vocational education in nursing and healthcare?
3. Which individual characteristics of graduates, organizational factors (HRD), and factors stemming from the labor market do make a difference in the school-to-work transition of graduates from the apprenticeship system and full-time senior and higher vocational education in nursing and healthcare?

* school-to-work transition: obtaining a job actually trained for, which belongs to a set of related jobs, which may be expected to require more or less different skills

** curriculum: implemented learning path

Methods

An embedded multiple-case design has been selected as the most suitable research method for this study. Such a design takes full account of the many variables/aspects that can be distinguished. As it is not possible to control events in the field of research and the application of methods can not be seen apart from the context. An embedded multiple-case design seemed most applicable (Yin, 1993; 1994). As mentioned before little qualitative research related to curriculum characteristics and school-to-work transition has been done yet (Streumer, 1997). That's why there has been chosen for a multiple-case study to get sight on relevant variables, which will result in a theoretical framework. In order to conduct a survey in a next phase of the study.

Participants

In an explorative phase of study it is important to get sight on different points of view. For this reason four groups of respondents have been selected, namely: employers, educational coordinators, experts, and graduates. Respondents have been selected by way of a combination of a selective selection and the snowball method (Baarda, De Goede, & Teunissen, 1995). The population from which they have been selected consists of participants related to two different learning paths of the educational nursing and healthcare system in the eastern part of the Netherlands. Respondents have been equally spread over the various educational programs. It was essential that graduates took their certificate at least one year ago.

In total 46 respondents (32 women and 14 men) have participated in this study. The *employers* consists of 8 respondents (=resp.). The *educational coordinators* consists of 11 resp. subdivided in: full-time senior vocational

nursing education (2 resp.); part-time and full-time senior vocational healthcare education (3 resp.); full-time higher vocational nursing education (2 resp.); nursing education of the apprenticeship system (2 resp.); and healthcare education of the apprenticeship system (2 resp.). The *experts* consists of 4 resp. Finally the *graduates* consists of 23 resp. subdivided in: full-time senior vocational nursing education (5 resp.); full-time vocational healthcare education (3 resp.); full-time higher vocational nursing education (5 resp.); nursing education of the apprenticeship system (6 resp.); and healthcare education of the apprenticeship system (4 resp.).

Instrument

A half-structured interview questionnaire has been developed on bases of theory, empirical research and a pilot study. The questionnaire (33 questions) contained five groups of variables, namely:

- Curriculum characteristics (16 questions), an example: "Does a modular educational system contribute to the connection to the demand of the labor market? Why yes/why not..."
- Individual characteristics of graduates (6 questions), an example: "Do graduates have sufficient capacities for functioning in their job? Why yes/why not...
- Organizational factors (2 questions), an example: "What are for employers important selection criteria in hiring their staff? Why...
- Labor market factors (7 questions), an example: "Are graduates flexible put to work in public healthcare organizations? Why yes/why not...
- School-to-work characteristics (2 questions), an example: "Do employees in public healthcare organizations move flexible at the labor market? Why yes/why not...

The four groups of participants have got the same half-structured interview questionnaire. For practical reasons graduates have got sometimes slightly different formulations.

Procedure

The interview round started. The length of an interview varied from 30 to 60 minutes, by the exception of the interviews of the graduates, which were interviewed telephonically during 15 to 30 minutes for practical reasons. All face-to-face interviews were taped and telephonic interviews have been worked out immediately. In case of unclearities the same explanations/examples for all respondents have been used.

Parallel to the interview round a coding scheme has been developed too. Beginning with a starting-list (Miles & Huberman, 1994) of core labels. Dimensions have been worked out from the core labels. At last loadings have been created on base of hypotheses (Baarda, De Goede, & Teunissen, 1995) and the interview protocols according to the phenomenographical point of view (Marton & Booth, 1997).

- The core label *curriculum variables* has been subdivided in the following dimensions: curriculum structure, practical work, attainment contents, attainment targets, educational method, educational approach, educational length, and examination;
- The core label *individual characteristics* has been subdivided in the following dimensions: ability, gender, motivation, and self-efficacy;
- The core label *organizational factors* has been subdivided in the following dimensions: working conditions, HRD policy, recruitment policy and selection criteria;
- The core label *labor market factors* has been subdivided in the following dimensions: labor market situation, substitution, and superseding.;
- The core label *school-to-work transition* has been subdivided in the following dimensions: future perspectives, and present school-to-work situation. For covering the whole concept of school-to-work transition a component of the dimension substitution, namely flexible available, has also been used for analyzing the data.

All protocols have been analyzed according to the developed coding scheme with the aid of ATLASti. The inter-subjectivity rate will be computed in the near future. In ATLASti theoretical frameworks have been built for variables (independent variables: curriculum, individual, organizational, and labor market variables) expected to have a positive as well as a negative relationship with school-to-work characteristics (dependent variable). In SPSS

these theoretical frameworks have been subject to statistical analyses (cross-tabs). Most questions in the questionnaire consist of a no, probably no, no opinion, probably yes, and a yes part (ordinal variables) and an explaining part (nominal dichotomy variables) that's why different statistics have been computed (Fisher Exact and ϕ for the nominal variables. Fisher Exact has been the most suitable statistic, therefore ϕ will only be used to show the direction of possible connections. Spearman Correlation has been used for the ordinal variables).

For statistical reasons the respondents have been split in two groups, namely: respondents related to the apprenticeship system (8 employers, 6 educational coordinators, 4 experts, and 13 graduates), and respondents related to full-time vocational education (8 employers, 7 educational coordinators, 4 experts, and 13 graduates). The group of respondents related to the apprenticeship system consists of 28 respondents (20 women and 8 men) and the group of respondents related to full-time vocational education consists of 32 respondents (22 women and 10 men). In total there are 46 respondents, however employers, educational coordinators (secondary vocation healthcare education) and experts can be spread over both groups for their assessment.

Results and Discussion

Referring to *research question 1:* "Do graduates of the apprenticeship system have the same school-to-work transition as graduates of full-time senior/higher vocational education?"

Results show that the learning path makes a difference in relation to school-to-work transition. Especially for graduates of full-time secondary nursing and healthcare education, 75% find themselves not capable enough for start working at the labor market. As a graduate pointed it: *"There was not enough time to learn skills in practice during the two practical works of each eight weeks. Lack of time causes a disconnection between the educational program and the work field."* In most of the times they simply are not succeeding in finding a job and have to start an apprenticeship program for being considered. Legislation of the government plays an important role in this with regard to reserved actions (Ministry of Healthcare, Welfare, And Sports, 1996). In the new qualification structure, implemented in 1997, educational programs are better prepared for contenting these requirements.

Results show too that especially graduates of full-time higher vocational education have a profound theoretical knowledge (stated by 72 % of all respondents). In contrast to graduates of the apprenticeship system who are immediately available but don't have a profound theoretical knowledge (stated by 80% of all respondents). This causes a different start at the labor market. As a graduate of full-time higher vocational nursing education mentioned: *"At the beginning more time is needed for reaching self-employment. You have to worm in an existing situation which costs time."* In contrast, a graduate of the nursing apprenticeship mentioned: *"I function perfect at my own department. Other departments function differently and there I have to start all over."* The apprenticeship system was rule in nursing and healthcare. The exception was full-time vocational education. As an expert posed: *"Now you can see different appreciation of employers for the two learning paths partly caused by legislation of the government. It is more wanted that people look more from a distance and with an analytical view to situations in public healthcare. As graduates of full-time higher vocational nursing education do."*

Employers' viewpoint about a well functioning staff seems to be important. Do they prefer working with own educated staff or do they prefer working with full-time more broad educated staff. Estimation of costs has to be taking in account as well.

Referring to *research question 2:* Which curriculum variables do make a difference in the school-to-work transition of graduates from the apprenticeship system and full-time senior and higher vocational education in nursing and healthcare?"

Results show that there are curriculum variables, which seem to make a difference in relation to school-to-work transition. However, for now it will be hard to set up precisely all curriculum variables which really make a difference. Firstly this has something to do with the many variables taken into consideration in this study. Besides curriculum variables, individual characteristics, organizational factors and labor market factors have been taken in account as well. Then the level of abstraction plays a role. Asking a respondent, *"Do graduates who have had sufficient time for practice during courses function differently from graduates who have had less time for practice?,"* will not cause any problems. However when trying to ask a question as, *"Do graduates who have had course centered education function differently from graduates who have had course exceeding education?"* one will face a lot of difficulties. Respondents simply did not really know the answer and are not capable in observing differences in daily practice. Finally this study brings out its own limitations, namely relatively small groups of

respondents. Generalization will only be possible for the vocational education and training system in nursing and healthcare in the eastern part of the Netherlands.

After taken these limitations into consideration there have been results too. Both significant positive and negative relations of curriculum variables in relation to school-to-work transition will be presented in table 1 and 2.

* Apprent: Respondents related to the apprenticeship system
** FT: Respondents related to the full-time vocational education
*** -.110: Fisher Exact significance 1-sided and α is .10
**** 31.3: Percentage of respondents who scored on both variables positively
*****.013: Spearman Correlation significance 1-sided and α is .10
****** 32.1: Percentage of respondents who scored on both variables positively

Nominal as well as ordinal variables are constant in the direction of the connection. The structure of the curriculum matters, as an employer declared: *"Graduates of the full-time education are theoretical more broadly what contributes in contacts with doctors and reporting skills. In the apprenticeship system is often talk of second chance education which we don't prefer."* Practical works do have an influence too, especially in getting a job. A

graduate of the apprenticeship nursing education pointed: *"This hospital really attention one's functioning at the work place."* In contrary an expert said: *"Employers judge themselves if an applicant is likely to the job."* Half of the employers prefer own-educated staff. At the start graduates of both learning paths function differently. However an expert marked: *"Graduates of both learning paths reach in a couple of years the same self-employment."* Right after graduating there can be a discrepancy between what graduates of full-time higher vocational education are capable of and what employers expected them to do. As an educational coordinator noted: *"Work field can have a different view on what they need then educational institutions. Probably this is caused by their apprenticeship background." "Looking at the educational approach it is really a question if organizations are that interested in educational programs. Educational results count in practice,"* as an expert observed.

There is no connection between the direction of the relationship of nominal variables and ordinal variables. Possibly declared by the fact that loadings have been created on phenomenographical point of view. Remarkable is that 20% of the employers do not prefer graduates of the apprenticeship system for reason of second chance education. Another important factor is the relation between educational institutions and work field. A graduate said it as follows:" *There is conflicts between the apprenticeship system and higher vocational education. The work field stands in the middle or is taken a side."*

With regard to practical work there is a difference between the coaching for full-time vocational education students and students of the apprenticeship system. An expert mentioned: *"Organizations paying the education for the apprenticeship system it is in their benefit to coach their students."*

Referring to *research question 3:*"Which individual characteristics, organizational factors (HRD), and factors stemming from the labor market do make a difference in school-to-work transition of graduates from the apprenticeship system and full-time senior and higher vocational education in nursing and healthcare?"

Results show that there are factors, which make a difference in school-to-work transition. Both significant positive and negative relations of individual characteristics, organizational factors, and labor market factors in relation to school-to-work transition will be presented in table 3 and 4.

Nominal and ordinal variables are not constant in the direction of the connection. The table shows that men are more career oriented then women and have a better position at the labor market. Very often students choose a learning path after their own attitude and all want to start working after graduating because of their motivation in helping other people. Graduates with full-time labor contracts have a more flexible attitude then their part-time colleagues. Probably due to family care. Graduates of the apprenticeship have a lead at graduates of full-time education when they start working for they have already a job at the start of their education. It depends on the recruitment policy of each organization if graduates of the apprenticeship system have the same opportunities in getting a job as graduates of full-time education.

As far as it fits the case nominal and ordinal variables are not constant in the direction of the connection. The table shows that women are less career oriented then men. Further organizations want staff continuity and graduates who match with their culture. As long as the supply is greater then the demand organizations can pick who they want. Government educational policy does not always connect with the situation in practice.

Another crucial question: *"Are graduates flexible available at the labor market?"* Looking at the future it would be preferable if graduates are flexible put to work with regard to mergers of organizations and increasing complexity of healthcare. However family care, less motivation for career opportunities, option for a specific direction, and a relatively bad situation at the labor market in the eastern part of the Netherlands keep people stuck at their place. As an educational coordinator noted: *"It would be preferable if graduates move more flexible at the labor market. However, graduates are not willing and organizations want to know who is on their pay-list."*

Recapitulating there is a difference in school-to-work transition between the two different learning paths. There are curriculum variables which make a difference in the transition. Until now we know that the curriculum structure, the educational approach, practical work, educational length, and attainment contents do make a difference. Individual characteristics (ability, gender, motivation, and self-efficacy), organizational factors (work conditions, HRD, selection criteria, and recruitment policy), and labor market factors (future, substitution, and superseding) do make a difference, too.

The following theoretical framework can be constructed after the results of this study and will be tested in the coming survey.

Table 3

Predictors of Success in Welfare-to-Work Training for the Information Technology Workforce

Albert K. Wiswell
Virginia Tech

Margaret G. McCrudden
Virginia Tech

A major challenge in welfare-to-work training programs is preparing welfare recipients for entry-level jobs with long term career paths at wage levels that allow real self-sufficiency. The current shortage of workers in information technology (IT) fields not only calls for innovative solutions but presents an opportunity for entry into the workforce. A demonstration program described here reports the extent to which various assessments prior to training could predict success in securing employment in IT positions.

Keyword: Information Technology, Welfare Reform, Workforce Training

On August 22, 1996 President Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (The Welfare Reform Act) which radically reformed the nation's welfare system. This law requires that the majority of individuals and their families receiving public assistance move from welfare into full time employment. It has been two years since this legislation was passed into law, and we are seeing positive results (ASTD, 1998). The Department of Labor reports that the number of people on welfare has dropped from 12.2 million to 8.9 million, a 3.3 million decrease. This dramatic change is the result of progressive initiatives that have begun across the country to maximize the opportunity to train this workforce to prepare them for employment opportunities in the public and private sector. With the reality of a tight labor market, and the need to create a diverse and skilled workforce, welfare reform creates an opportunity for businesses to assess their recruiting and training efforts, and to look at a viable, non-traditional labor pool to fill their labor needs.

As Human Resource professionals look to the future of their organizations, they see a demand for a workforce that is diverse, one that is reflective of the communities in which their businesses operate. As businesses experience a shortage of workers, the welfare reform act acts as a catalyst for organizations to consider the recruitment and training of the pool of diverse workers within the welfare system. While many existing training programs address the skills necessary to place these individuals into entry-level jobs, the most successful programs also address strategies for the individuals to grow their jobs into meaningful and lucrative careers (Friedlander & Burtless, 1995). According to the Welfare to Work Partnership (1997), businesses that hire former welfare recipients have experienced higher retention, lower turnover, and have reaped the benefits of hiring workers that are trainable and ready to work. Tax incentive programs are in place to assist businesses that are interested in filling their position vacancies with individuals from the current welfare pool.

The Workforce Investment Act of 1998 addresses the country's need for a more deliberate commitment on the part of the government to support the training demands of our society (Micco, 1998). This Act compliments the Welfare Reform Act because it shifts funds into the hands of local government to support the training efforts of local workforce investment. In the case of welfare reform, it provides an additional financial incentive to businesses to tap the pool of welfare recipients for training in preparation for their move from welfare to work.

The Workforce Development Challenge

Due to the dynamics of technological advances, businesses are challenged by the speed at which change takes place in the workplace. Organizations can benefit from developing and participating in training programs that prepare welfare recipients to operate more skillfully, and therefore more effectively, to enhance productivity in response to the reality of a highly competitive global economy (Riccio & Orenstein, 1996).

The IT Workforce Shortage The nations pervasive problem with unfilled jobs in information technology (IT) areas challenges educators and businesses alike to develop innovative solutions. According to a national survey

Copyright © 1999 Alkbert K. Wiswell and Margaret McCrudden

sponsored by the Information Technology Association of America (ITAA, 1998), almost 350,00 IT job openings were identified in companies with over 100 employees. These openings were present in every geographical region of the country and existed across many specific job areas.

A regional survey in the northern Virginia area making up part of the metropolitan Washington D.C. area placed the number of unfilled high technology jobs at 20,000 and growing. Of these 20,000 job openings, half were identified as "low-end" technology jobs, not requiring a college degree or extensive experience. Many different types of programs have been started in the last two years to prepare individuals with the potential to succeed in entry level positions which would provide an introduction to a viable career in the IT field.

A Brief Overview of TekAid TekAid is a unique partnership that was designed to bring education, industry and human services together to identify, train and place selected individuals on public assistance. The program delivery part of the partnership consisted of teams from Virginia Tech, Northern Virginia Community College, and from Mitretek Systems, Inc., a company largely devoted to solving technology transfer problems. Program funding was provided by the Fairfax County (Virginia) Department of Family Services and the Northern Virginia Regional Partnership, a state entity charged with addressing the IT employment demand in northern Virginia.

The program developed was an intense training program to prepare entry level technologists for employment in the IT field. Industry partners were involved in identifying the key components of the screening and the training that would identify and prepare specific candidates as most likely to succeed in this endeavor. A fourteen week training program was developed to train participants in computer programming (mostly COBOL) in order to qualify them for entry level programming positions in companies conducting Year 2000 date remediation work. The program consisted of a total of 16 credits of coursework, tutorial assistance, supplemental training, employability training, and job placement assistance. It is this program that is the focus of this study.

Problem Statement

Two important issues regarding today's workforce have been highlighted, the IT workforce job shortage and the initiatives for job training mandated by recent welfare-to work legislation. Industry is faced with having to tap heretofore unused resources, new pools of workers for IT jobs that may not have the necessary skill sets. Questions therefore arise about what form that training may take and who is most likely to succeed. Human service agencies are faced with a mandate to help clients secure permanent jobs before their benefit eligibility expires, jobs with paid benefits and salaries sufficient to sustain a family. Having the means to direct clients towards appropriate jobs and training opportunities that can result in success is a crucial part of this mandate.

Research Questions

This research addresses the following question:

What is the predictive value of the following variables on successful completion of an information technology training program directed to a group of selected welfare recipients:

1. Basic mathematics skills;
2. Computer programming aptitude;
3. Assessment of potential through personal interviews;
4. Prior experience with computer technology.

Method

All data measuring the independent variables mentioned above were collected in June of 1998. Math skills were assessed using the mathematics section of the Wonderlic Basic Skills test. Computer programming aptitude was measured using the Computer Operator Test Battery. Prior experience with computer technology was assessed using a demographic questionnaire.

These data were collected from 120 clients who were eligible for the program and who had expressed interest based on a brief presentation of the program. Based on the preliminary data, 70 clients were invited to a

personal interview. The 30-45 minute interviews consisted of the candidate and two interviewers. After the interview, the interviewers jointly completed a feedback form, reporting their impression of the potential of the candidate to participate in the program. They also completed a rating sheet consisting of items rated on a ten point scale. These items included assessment of the general aptitude for technology work and overall estimate of the likelihood of success in the program.

Based on these interviews, acceptance into the program was offered to 51 candidates. When the training started, a total of 49 candidates enrolled. After the first half of the fourteen week program, 40 students remained. The formal training ended October 30, 1998. Since the vast majority of participants were not employed at the end of the program, an intensive effort was made for the following two months to provide job placement assistance. Thus, the design allowed two different measures of success, (1) completion of coursework, measured by grades received (0-4, representing no credit, D, C, B, and A) and (2) securing of full time employment in a technology related job.

Analysis consisted of testing the predictive value of the independent variables though multiple regression. Since there is no current theoretical model of how the predictors may be related, and the primary aim of the research is to maximize predictability of success, a step-wise regression procedure was used. In addition, analysis of variance and T tests were used to examine differences between groups and Pearson correlations were calculated to examine relationships between individual variables of interest.

Results

As shown in Table 1, of the 49 participants who began the program, 35 successfully completed all training (defined as receiving the total 16 credits of coursework). Of these, nine were not employed in full time technology related jobs within two months following program graduation. In five of these cases, this was due to a combination of lack of English proficiency and lack of a permanent work visa. In four of the nine cases, a combination of limited technology skills, poor interviewing behavior, and low motivation contributed to inability to secure employment.

Table 1. Program Participant Outcomes

	Completed Program	Did Not Complete	*Total*
Full Time Technology employment	26	6	*32*
No Technology Employment	9	8	*17*
Total	*35*	*14*	*49*

Of the 14 participants who did not successfully complete the program, six received full time job offers in the last two weeks of the program and dropped out in order to accept these positions. The other eight terminated participation approximately midway in the program, for the following reasons:

- Problem pregnancy (2)
- Chronic illness (2)
- Lack of academic progress (2)
- Moved out of area (1)
- Substance abuse (1)

Those participants securing full time employment were receiving annual salary levels ranging from $19.5K to $60K, with a median of approximately $23K. However, due to prevailing hiring practices, most were in temporary probationary (for three months) positions that did not provide standard benefits.

Analysis of variance and T-tests comparing completion groups (completers vs. non-completers) failed to detect any differences due to any pre-assessment variables. Likewise, analysis of variance and T tests comparing employment groups (employed vs. not employed) failed to detect any differences. Pre-assessment variables included mathematics skills, computer aptitude, general technical aptitude, overall likelihood of success, and prior experience with computers. As depicted in Table 2, Pearson correlations of the pre-assessment variables with program outcomes (in terms of the grades received in the courses) showed moderate relationships in some cases.

Table 2. Pre-assessment and Outcome Correlations

		Pre-assessment Measures				
		Wonderlic	COAB	Technical Aptitude	Overall Assessment	Prior Experience
Program Outcomes (Grades)	Intro to Computers	.066	.135	.321*	.111	.444*
	COBOL I	.125	.277**	.332*	.239	.526*
	COBOL II	-.005	.012	.145	.037	.366*

* p<.02 ** p<.05

The Wonderlic mathematics skill assessment was not related to any of the success measures. The COAB computer aptitude measure was moderately related to success in the first COBOL course, but not strongly enough to support its use as a primary predictor. Interviewer assessment of technical aptitude was related to success in the first two courses and prior experience was related to success in all courses. No regression models could be developed that explained a significant amount of outcome variance, due to the multicollinarity of the predictors.

Discussion

These predictors do not take into account all of the personal, social, economic, and emotional factors that also may have contributed to or hindered a candidate's success. To a great extent, the inability to identify meaningful predictors of success was a function of the overall success of the program. The program delivery model combined intensive training with intensive support. For example, during the first week, mathematics remediation was provided to all participants with weak math skills. This remediation was targeted to specific individual weaknesses identified through testing and was very successful in increasing skills for the weaker students. In addition, ongoing social services support was provided through a caseworker specifically assigned by the county to work with these participants to help overcome financial, transportation, and other obstacles potentially interfering with successful completion.

Job Placement A crucial discovery some weeks before program completion was the great difficulty that would be encountered in securing employment for graduates. Industry partners that had expressed need for IT employees six months previously either did not have positions open at the time, or were seeking to fill positions for which program graduates did not qualify. Perhaps due to the employment environment of the region in which many employers are in fact contractors for federal agencies, certain placement obstacles were insurmountable. About one-forth of the participants were immigrants, on political asylee status or other visa that did not provide permanent work status, nor did it allow minimal security clearances required by many employers. Also, some contractors' clients required personnel with bachelors degrees, even though they were not necessary to perform the job functions. An anticipated attraction of a potential $8500 tax credit that employers could receive for hiring program graduates was meaningless, at best, for the medium to large companies with positions to fill. The hiring managers were aware that those funds would not come directly to a project, and at the vice president or higher level, it was deemed insignificant compared to ensuring project success or having to terminate and rehire.

Another feature of the employment environment that created placement challenges was the practice of hiring new employees on a temp-to-perm probationary status through placement agencies. This establishes a procedure whereby recruiters are tasked with matching job descriptions provided them with resumes, which was not always a perfect match with program participants. To a large extent, similar procedure existed when internal human resources department were doing the job screening. Also, the promise of the availability of a great many entry level positions proved to be severely limited, especially in the Y2K remediation arena. Many jobs for COBOL programmers existed, but they required several to many years of experience.

These employment environment characteristics required a much greater than anticipated involvement by all project staff in job placement after formal program completion. Supplementary training was provided in specific areas that seemed to be in demand, such a web page design and advanced office applications. Intensive assistance was provided to tailor resumes to specific job openings, Practice with interviewing was provided and group interviews with recruiters were arranged. Also, effort was made to dispel the notion of many program participants that job offers would be coming to them with little effort on their part.

Limitations The extra efforts made to ensure successful program completion may have blocked any potential predictive effect of the pre-assessment measures. Also, a moderate degree of the selection process was based on those measures, which may have resulted in a restriction of potential variance. Also, this population was drawn from an affluent metropolitan area with somewhat unique demographics as welfare recipients, facing a somewhat unique employment environment. Results with populations in other geographic regions may be very different. Moreover, it is not known at this point what the long term employability patterns will be for program participants. While the program was designed to provide entry into a field that has potential career paths and development opportunities, the extent this capability was achieved can only be determined by a longer-term follow-up examination.

Potential Implications

The results of this research have limited value for making selection recommendations for training for similar and related populations of candidates for job training. Based on the data from this study, it is clear that a simple formula for predicting employment or program success for this population is not possible. Objective measures have as great, and as limited a role as more subjective assessments.

However, there are particular implications for staffing and recruiting personnel in the information technology field, who are finding it increasingly challenging to fill IT jobs with the typical pool of applicants. The typical hiring procedure in which a project of program manager decides staffing requirements based solely on task requirements, and recruiters (internal or external) are tasked with matching candidates to job descriptions may need to be examined. A closer involvement by the placement personnel with the hiring managers may be more successful in matching unused resources with unmet needs.

For example, a manager may determine that a project or program requires, say, two system analysts and five experienced programmers. On examination of the tasks involved, it might be discovered that half of the tasks are of a low level routine nature, such as testing. A different staffing pattern of the two system analysts, two programmers, and three or four programming assistants may be sufficient. This would not only save money in personnel costs but would provide resources to develop into positions requiring more expertise.

To fill what has been identified as a critical need to hire employees for the current IT shortage, businesses need to look at nontraditional methods to meet those demands. Legislation has been designed to support, encourage, and challenge the business community to recruit and train welfare recipients. The challenge for human resource professionals is the need to engage in strategic recruitment and training efforts to gain access to a new source of labor. This effort requires creative and innovative measures to address this opportunity. Partnerships between the public and private sector are an essential and valuable vehicle for identifying the potential candidates to hire from the public assistance sector.

Workforce Preparation in a Rural Context: A Curriculum Integration Intervention

Gene L. Roth
Northern Illinois University

Considerable time and money have been expended at the Federal, state and local levels regarding workforce preparation in the United States. An approach that has received considerable attention in the last decade has been curriculum integration in the public schools. This paper describes a 3 year project that was funded by a state board of education. Four rural school systems participated in a project that featured the integration of science and applied agriculture.

Keywords: Rural Education, Workforce Preparation, Curriculum Integration

The transition from school to work for young adults is an important focus of federal and state funding in the United States (Stasz and Kaganoff, 1998; Orr, 1998). Part of this focus has included demonstration projects that feature curriculum integration interventions in public schools. This paper describes one such intervention that took place in a rural context. A vocational center was awarded a 3 year demonstration project funded by a state board of education in fiscal year 1995. The vocational center was owned and operated by eleven school districts. The curriculum integration project involved four member districts, and the four high schools represented approximately 800 students.

The following objectives guided the project planning, implementation and evaluation:

1. The project planned to improve math, science and agri-technical skills of 40-120 students (10th-12th grades) enrolled in agricultural career programs.
2. High schools students were expected to increase their abilities, knowledge, and interests in agricultural-business fields. This was to be accomplished by participating in an integrated program which incorporated on-site farm and agricultural projects, integrated applied academics, and university field experiences.
3. A usable structure for integrating math, science and agri-technical curricula was designed and implemented in the classroom by teachers based on knowledge, skills and strategies learned from staff development workshops.
4. Collaborative efforts between agriculture business/industry leaders, farmers, university faculty, students, parents and high school educators were used to build partnerships to promote scientific literacy in agricultural businesses.

Statement of the Problem

The current study was undertaken to empirically examine the perceptions of multiple stakeholders involved in a curricular intervention within rural schools. Understanding the ways in which students, administrators, teachers and counselors view an intervention in the rural context can address taken for granted assumptions that "one size fits all" with school to work policy issues. This study sought to bring attention to those factors unique to the rural context so that future researchers and practitioners might be better able to plan and implement school to work interventions.

Theoretical Framework: Workforce Preparation in a Rural Context

Generally speaking, little is known about workforce preparation issues in rural contexts. Workforce preparation, similar to other federally and state sponsored initiatives, have suffered from a lack of sustained inquiry about the unique problems of rural schools. Interventions envisioned at the federal level are often difficult to plan and implement in a full range of schools: rural, suburban, and urban (Roth, 1996). For several decades the research agenda for rural schools has been marginalized. National research agendas and their utility for serving rural issues and problems have been openly questioned by several educational researchers (DeYoung, 1987). These scholars

Copyright © 1999 Gene L. Roth

infer that the community based needs that are intertwined in the culture of rural schools often remain unserved by the massive quantitative studies of educational researchers in the United States.

Although schools in small towns and rural environments account for over one-third of the students in the United States, the nation's educational research agenda still allots rural schools a somewhat marginal status. A relatively minor amount of research has been conducted regarding rural schools, their students and teachers, and their learning environments (Federal Interagency Committee on Education, 1991). This dearth of research is noticeable in the urban bias of federal and state educational policies and actions (Roth, 1996).

DeYoung (1987) asserted that a shared understanding was held by scholars who have toiled in the area of rural education. This common core of beliefs depicts a lack of attention at state and national policy levels regarding the unique context of rural education:

- Rural education in the United States is viewed as an anomaly unbefitting of respect from educational theoreticians and researchers.
- Administrative, curricular, and staffing solutions that are frequently posed for urban and suburban situations may not offer utility for rural settings.
- Demographic, economic, and administrative variables of the rural context deserve ample attention from educational researchers and policy makers.

In light of the preceding observations, the framework for this study pertained to factors that influenced the planning and implementing of an intervention in rural schools. Perceptions were sought from various stakeholders regarding the unique elements of the rural context that influenced the intervention.

Research Questions: The Perceptions of Stakeholders

What were the perceptions of students, teachers, principals, and counselors in rural schools regarding a workforce preparation, curriculum integration intervention? Their perceptions were sought to identify factors that were pronounced in rural schools and that effected the intervention. The following questions guided the study:

- How does the rural context effect the dynamics of teacher interactions across disparate disciplines (including team teaching)?
- How do daily schedules of rural teachers effect planning and implementing an intervention?
- How does course scheduling within rural schools effect planning and implementing an intervention?
- How do rural school and community relationships effect authentic instruction?

An Overview of Project Methods

Merriam (1991) outlined the characteristics of different types of systemic inquiry, and her discussion will be used here to explain why both qualitative and quantitative methods were used in this project. "Non-experimental (or, as it is often called, descriptive) research is undertaken when description and explanation (rather than prediction based on cause and effect) are sought, when it is not possible or feasible to manipulate the potential causes of behavior, and when variables are not easily identified or are too embedded in the phenomenon to be extracted for study." (7) In this type of research, the researcher does not attempt to manipulate variables because the context might not permit it. The researcher accepts the situation as it is -- and does not try to prove cause and effect relationships among variables. Descriptive case studies are inductive in nature, because it is impossible for the researcher to identify all of the variables prior to beginning the study (Merriam, 1991). That is to say, understanding of the context emerges as the study is underway, and important research questions begin to form as one learns more about the case.

In this study, the researcher believed it would be difficult to isolate variables from the unique attributes of the rural contexts of schools. Each setting had variables that were too embedded within the context for them to be cleanly extracted. As examples, were science students' scores higher or lower on pre-tests and post-tests because of variables introduced by different teachers? Or were test scores different because of laboratory partners, attitudes toward homework, or extra-curricular activities? Perhaps scores were different because of the time of the day or because of preconceived notions about science classes or agricultural classes? Perhaps science students had different predispositions toward standardized tests as compared to agriculture students?

This project involved the doings of four rural schools. And it brought into account not a singular interpretation of what was occurring at these schools, but instead it involved the multiple realities of various constituents who were connected to the schools in one fashion or another. Given these multiple interpretations, one cannot make sweeping generalizations concerning cause and effect outcomes that might be directly attributed to the intervention associated with this project. There were too many variables that influenced the teaching and learning transactions in this rural education context. However, knowing as much as we can about the context helps us to make sense of the situations and occurrences.

Administration of Longitudinal Study of American Youth Instruments

Content and attitude tests were used with project students. These instruments were used to provide project personnel with a general idea of student skill in and attitudes toward science. The instruments were selected from materials developed by the Longitudinal Study of American Youth (LSAY). Data were primarily used for planning purposes among project personnel. Instruments were administered to 52 participants, with a gender break-down of 39 males and 13 females. There were 9 sophomores, 19 juniors, and 24 seniors who completed the instruments.

As explained in the LSAY Code-book, the intent of the science test is to measure the development in skill in cognitive processing related to science. The LSAY used items developed by the National Assessment of Educational Progress to measure four science related skills:

1. Knowledge of science
2. Application/utilization of science knowledge
3. Integration of science knowledge
4. Implications of science for society.

As explained in the LSAY Code-book, *Knowledge of science* deals primarily with factual material and is dependent on the ability to recall specific facts, concepts, and principles. *Application/utilization of science* involves the ability to combine factual knowledge with rules and formulas to solve a specified problem or answer a specific question. *Integration of science knowledge* refers to the ability to organize information more generally for problem solving, often involving use of scientific concepts and principles, drawing proper conclusions, and employing higher-order thinking skill in reaching a solution to a problem. *Implications of science for society* deals with the understanding of societal level applications of science and familiarity with scientific technology that one might encounter in discussions of societal issues.

Four questions on the test asked the students to provide their personal opinions regarding the test. These questions and student responses are listed below. They provide insight regarding the feelings of respondents regarding the difficulty of the test and the amount of work it required.

How much of this material on this test has been taught in your classes? Over 36 percent of the students thought most of the material on this test had been covered in their classes.

How difficult was this test? Over 55 percent of the students thought that the test was difficult, and over 28 percent of the students thought that the test was easy.

How well did you think that you did? Over 55 percent of the students thought that they had done well on the test, and over 28 percent of the students thought that they had done poorly on the test.

How hard did you work? Over 46 percent of the students stated that they had worked pretty hard on the test, and over 38 percent of the students stated that they had not worked very hard on the test.

Personal Interviews as Data Collection Methods

Interviews were conducted with teachers, counselors, and principals in their home schools. In each case, the participants responded to the protocol of questions that was developed by the researcher. These field research interviews were important data collection activities. The interviews provided insights about how the intervention was perceived by the practitioners in light of the unique characteristics of their home school. As a data collection method, the field research interview is a dynamic, non-linear process that requires active listening and empathetic interpersonal skills on the part of the researcher (Mason, 1993). The interviews allowed the participants to speak freely about their perceptions of the intervention, and they cited some of their trials and tribulations as they experimented with it.

Focus groups as Data Collection Methods

A focus group was conducted with all of the teachers at a central location (the vocational school). Focus groups were also used to collect student data at their home schools. As a data collection method, the focus group allowed the researcher to pose open-ended questions to the group and establish a dialogue among the participants. Greenbaum identified four ways that focus groups are different from traditional interviews: multiple respondents participate, participants interact, a moderator is present, and an outline or protocol of questions is used (cited in Herndon, 1993). An important aspect of the focus group method as a data collection device is the interaction that must be achieved with and within the group. The interaction allows insights and data to develop about the intervention that would otherwise not emerge. The intent of the focus group is to create a synergistic effect that can produce data that would not evolve from the highly structured nature of traditional interviews. Focus groups offer a unique vantage point from which to study the collective perspectives and experiences of participants who are engaged in an intervention.

Comments on the Emergent Themes

Content analysis, a method applied in this study, can be used to make valid inferences about the text of transcription. Content analysis allows the researcher to create classifications for data and help organize the data into useful arrangements. Given the nature of this study, broad categories were generated and coding schemes were developed and applied manually on the basis of conceptual issues. The researcher worked closely with two representatives of the area vocational school during the data analysis phase. An external reviewer examined the sorting process and conferred with the researcher on discrepancies. Transcripts of individual interviews and focus groups yielded data that were rich with patterns that could be traced to the dynamics of the intervention in a rural context. A discussion of study findings is presented in the following narrative.

Meshing Disparate Fields of Study

Bringing together disparate fields of study was both challenging and rewarding to teachers and students who were involved in this project. Preservice programs for these agriculture and science teachers were considerably different. When these two types of teachers were brought together as part of a team teaching assignment, their different methods of practice became evident to both teachers and students. These differences appeared to be pronounced as a function of the rural context. For the most part, the teachers accepted this as a positive challenge -- they learned from each other, they observed each other in action, and they borrowed teaching tactics from each other. Generally speaking, the agriculture teachers refined the laboratory reporting that was required from students and they integrated scientific methods with their instruction. The agriculture teachers gained a greater appreciation of structure from the science teachers. Generally speaking, the science teachers gained an increased appreciation for authentic learning that can be gained from work-based learning and community-based projects. They also learned how to be more flexible in their teaching as a result of working with the agriculture teachers.

Adapting to Team Teaching by Participating Students

Just as team teaching was new to most of the teachers who were involved in this project, it was also a new experience for most of the students in these rural schools. Students had to adapt to the notion of having two teachers in the classroom. Many of the students were accustomed to either an agriculture teacher or a science teacher. Students had to adapt to the styles of teachers who represented both the fields of agriculture and science. Students had preconceived notions of the instruction that they were about to receive, based on whether they had been an "agriculture student" or a "science student" within the context of the rural school. These preconceived notions effected student performance in the classroom. Students commented that they entered the class thinking it was going to be a traditional science or agriculture class, only to find out that the course was structured quite differently from their expectations. Generally speaking, the "science students" had to adapt to the outdoor and hands-on activities, and the "agriculture students" had to adapt to the theory-based "book work" associated with the science content.

The Need for Shared Planning Time

Communication among teachers was critical in this project that featured curriculum integration. It was clear to the students if the teachers were not "on the same page" in the classroom. Probably the most critical element of communication for participating teachers in the rural context was having the time to get together for planning instruction. Rural teachers wear many hats -- including a variety of extra-curricular assignments. If the time is available, they can begin to understand each others' teaching idiosyncracies. Shared planning time reduces the number of misunderstandings and mis-communications that can happen in a team teaching assignment. This issue was prevalent in the discussions with teachers throughout the duration of the project.

Increasing the Access to "Different" Fields of Study

An interesting benefit of this project was the "mixing" of students across ability levels and disciplines. In rural schools, teachers in certain disciplines can be assigned the same students over and over again. A teacher in a rural school -- even with a very small enrollment -- might never have a student in his/her class because the student does not take classes in that discipline. This project increased access to disciplines that students heretofore had not experienced. This project increased the access for students to receive both agriculture and science instruction. This allowed traditional science students to receive hands-on instruction related to science concepts, and it allowed traditional agriculture students to advance their academic skills in taking notes and writing laboratory reports.

Authentic Curriculum and Instruction

The project curriculum was considered to be a strength of this project. The teachers viewed the curriculum as being ill-structured, vague, and ambiguous. It was considerably different from the traditional, well-defined science text-books and their accompanying work-books. However, the types of problem solving that students are apt to perform in the work-place will most likely not be well-defined and clearly articulated. The work-place is full of messy, ill-structured problems that will be the real test of workforce preparation. The variety of activities of the project curriculum was appreciated by the students, and the activities were often meshed with problems, needs, and environments of the rural communities. Among the four participating schools, there were opportunities for students to learn about concepts with books, technology in the laboratory, greenhouses on-site, and off-campus learning situations.

The Problems of Course Scheduling in a Rural School

Scheduling in rural schools is a major problem. The availability of classes for students had varying effects on the enrollments in the project classes at the different sites. In some instances, students enrolled in the project class because there were no other options available to them. This problem seemed to be especially prevalent in schools that were on eight block schedules. In other cases, students could not get into the project class because it was scheduled at a time that conflicted with required courses. For example, if the school only had two sections of World History, then the school schedule needed to accommodate those courses. Enrollments in the classes should not be gauged as a simple indicator of whether the class was popular or not among students. In some cases, the constraints of rural school programming limited the enrollments in this elective course. A variety of factors influenced the enrollments, such as: (1) the size of the preceding year's class, (2) popularity of the teachers, (3) length of the class period, and (4) the general perception of the class by other school personnel and students. Some teachers suggested that upper limits should be considered for class size. Equipment, lab space, and the nature of experiments made it difficult for teachers to handle large enrollments in the class.

Which Students Can Most Benefit From This Type of Instruction?

A significant issue with this program pertained to the type of student who might benefit from this type of instruction. It was noted that the results of the science tests administered in this project showed a significant decline in 1997 as compared to 1996. Although many variables may have effected this decline, interview data strongly suggested that the academic skills of 1996 students were considerably stronger than 1997 students. Counselors, teachers, principals and even students alluded to this issue. It appeared that the rigor of this curriculum was not a good match for students with weak academic skills. On the other hand, average ability students who flourished in applied instruction seemed to perform very well in this program. Teachers expressed an interest in being able to

interview students prior to their admission to the program. In addition, teachers expressed the importance of certain prerequisite courses that should be met prior to a student's admission. These issues are intertwined with the scheduling issues that were outlined in the preceding section.

Putting Knowledge to Work

An important outcome of this project was the understanding that students gained regarding the relationship between the disciplines of agriculture and science. The project students were able to experiment with practical applications (through agricultural instruction) of science concepts that provided additional meaning to them. Teachers used authentic teaching and learning activities, such as shadowing experiences, field trips, work-based learning opportunities, community development activities, and other extensions of the classroom. This practice was highlighted in fiscal year 1996 and it continued through 1997. Students liked opportunities to put their knowledge to work for a greater cause than merely getting a grade. Students at all sites expressed their excitement about the outdoor education activity in which they were able to work as teams with students from the other sites. They had a great deal of fun learning together and they developed a great respect for the power of teamwork. Although rural schools might be short on human and fiscal resources, it seems that their closer relationship with community can make authentic instruction within reach of innovative teachers.

The Fit of Team Teaching in a Rural School

Issues regarding team teaching were just as prevalent in 1997 as they were in 1996. The issues varied according to the school sites and the teachers who were involved. In some instances the teachers seemed to have a synergistic effect on each other's teaching, and in other cases the complexities of the team teaching dynamics actually hindered instruction. The following factors influenced team teaching relationships: teaching styles, levels of content expertise, years of teaching experience, emphasis on one content area over the other, discipline issues, and personality types. As one principal stated, staff development and ample practice opportunities were needed to bring out the best of the team teaching model. Within this case study, is was doubtful whether human and fiscal resources were sufficient to serve these needs. Rural teachers are used to working independently in the privacy of their own classrooms. Teaching dynamics were quite different when these rural teachers were paired together to deliver a team-taught lesson. On a positive note, several teachers stated that the relationships formed between the agriculture and science teachers would continue to have a positive effect on this program.

Concluding Comments and Implications for the Field

The purpose of this paper was to examine a workforce preparation intervention that took place in a rural school context. Workforce preparation is an important part of the overall human resource development agenda of the United States. However, workforce preparation in rural schools has not received much attention from scholars and researchers. As previously noted, federal and state research agendas have tended to slight the unique characteristics of rural schools. In many instances, educational innovations that have emerged from legislative actions have been designed and targeted toward urban and suburban schools. Minimal consideration has been given to the close alignment of community and school in rural contexts.

This study noted that a specific workforce preparation intervention was entangled in the myriad contextual issues of the participating rural schools and communities. The dynamics of the rural context effected the planning and delivery of instruction, scheduling of classes, enrollment of students, and other factors. Planning, implementing and evaluating curriculum integration interventions in rural contexts cannot be activities that isolate the intervention from the larger realm of community.

In the future, researchers would be wise to consider rural, urban or suburban as research variables that merit attention in project design. One size glove does not fit all hands. Research designs and intervention strategies need to focus on the unique aspects of the context and how they might be woven into the planning fabric.

Human Resource Related Characteristics in Selected Small Manufacturing Companies in Mexico

William R. Venable
Oklahoma State University

The author interviewed executives from 31 selected small manufacturing companies in Mexico for the purpose of identifying, among other things, their perceptions of human resource related characteristics in their organizations. Analysis of the transcripts and observations of the workersled to conclusions. Human resource programs focus on employee relations more than on employee development. Training activities target personal more than skill development. Workers are treated as an expense more than a resource worthy of investment. High performance work practices are rare.

Keywords: Human Resource Problems, High Performance Work Practices, Mexico

This is a descriptive study about the human resource related characteristics of Mexican small manufacturing companies. It is an exploratory survey conducted through structured face-to-face interviews which were audiotaped, transcribed, translated, and analyzed. The survey is a preliminary step for a research project which hopes to contribute to the identification of appropriate interventions for enhancing high performance work practices in small companies which conduct business internationally.

The research problem is that, while small companies comprise almost all of the Mexican economy, and most of them manufacture products, many for exportation, there is little reliable information available about their human resource characteristics.

The data previously available are incomplete. They have been collected from some companies but not from others. They are inconsistent. That is, some data sets actually contradict what others say about the same companies. They are non comparable in that they have been collected in so many ways and by such varying categories that they cannot be directly compared. Many of these data have been collected by government or quasi-governmental agencies which are perceived to seek justification for increasing taxation, and may thereby be unreliable. And finally, relatively few data have been broadly accumulated about small manufacturing companies.

Overview of the Literature

There is substantial literature related to high performance work practices in the US. The future of competitiveness for the US company is related to how well its workers are trained, hoiw flexible and adaptable they are, and whether it is a high performance workplace. (Potter & Youngman, 1995). America's management paradigm has shifted to provide employees greater opportunity to influence the outcomes of work organizations. Through changes in the design of work and a renewed emphasis on the importance of training and development, selective staffing, compensation, and information sharing, management has begun to realize the effect workers can have on the attainment of organizational goals (Levine, 1995).

High performance work practices assist people to involve themselves in the decision making and problem solving processes of their work activities. Based on an analysis of previous research, some of the most frequently implemented high performance work practices are quality circles, work teams, job rotation, total quality management, crosstraining, employee committees, training and development, selective staffing, compensation, and information sharing (Youndt, Snell, Dean & Lepak, 1996; Marlow, 1998).

By allowing workers to influence their work activities, organizations can take competitive advantage of the human element. Creating high performance work environments which fulfill human, social, and psychological needs allows organizations to reap the benefits of increased productivity, product quality innovation, and flexibility (Schutz, 1994; Mirvis, 1993; Marlow, 1998.)

Small businesses have always comprised the vast preponderance of the economy in Mexico and, for that matter, throughout the rest of the hemisphere to the south and in most of the rest of the world. According to several

Copyright © 1999 William R. Venable

agencies which provide Mexican government mandated management development and employee training programs, small companies employed more than 95% of the workforce in 1997.

The government mandated training programs are by subscription. This means that the companies which earn the most money and employ the greatest number of employees are required to pay for and participate in the programs while the smaller ones are left out. This makes it difficult to estimate the potential for targeted training and development programs for management and for employees.

Purpose of the Study

The purpose of the study is to identify perceptions of selected small manufacturing executives about human resource related characteristics in their companies in the State of Puebla, Mexico.

Research Questions

What are the perceptions of selected Mexican small manufacturing executives about human resource related characteristics in their companies?
What are the perceptions of these executives about the future development of human resources in their companies?

Research Methodology

The methodology for the study was the conduct and qualitative analysis of interviews with top managers of small Mexican manufacturing companies which export. Transcripts of the interviews were reviewed and analyzed cognitively. Qualities of similarity, range of participant sources, and clarity of themes, thoughts and phrases were identified, sorted, and compared.

The CatPac textual analysis software package from TerraResearch was implemented for the purpose of evaluating several of the most disparate transcripts for frequency and proximity of words. Textual analysis involves three basic steps:

1) word count and creation of a table of correlations between words;
2) investigation of word clusters with high correlation to identify interest or significance; and
3) graphic presentation or mapping of word clusters of interest or significance.

While the word clusters sometimes reveal items for subgroup comparison or for traditional cognitive analysis, in this case no particular differences emerged beyond what could be extracted with cognitive analysis.

Interview Guide

A formal interview guide was developed from the feedback of ten subject matter experts in Mexico. These experts were Mexican economists, academics, consultants, writers, and business leaders who were experienced with small Mexican manufacturing companies which export products.The guide consisted of demographic, descriptive, and perceptual questions about respondent companies in the areas of demographics, human resources, organization, exportation, NAFTA, the future, and success.

Selection of Manufacturing Companies

Interviews were conducted with one executive from each of 31 approximately 50-500 employee-based manufacturing companies, or similar sized divisions of larger companies, which exported products. Purposive and snowball sampling were used to identify participating companies. A research decision was made to purposively collect data from companies identified as "apparently successful" by executives of other companies. Snowball sampling was chosen as the only way to get access to these executives, since a referral from a professional peer is often a prerequisite to entry for a data collector in Mexico.

"Apparent success" was deliberately left undefined in order to facilitate the identification of a sample selected by reputation among peers. Since there were no data available from which to identify a population of

successful companies by measurable criteria, it was determined that, while biased, selection by perceived reputation was likely to yield more subjects functioning at higher levels than selection with no criteria.

Initially, a few "apparently successful" companies were identified by officials at the Mexican university sponsoring this study whose owners or top managers were also board members, benefactors,or alumni of the university. These respondents were then asked to identify executives of other small exporting companies which they believed to be successful and who could be contacted with a referral from them. Those most frequently identified were invited to participate in the study.

Additional respondents would have been otherwise difficult to identify due to the frequent incompleteness, inconsistency, non comparability, and unreliability of statistics about companies in Mexico. They would have also been unlikely to participate due to their desire to hide or understate their "apparent success" for fear of being targeted by the government or by either industrial or common thieves.

A wide range of industries representative of the manufacturing sector in Puebla and central Mexico was incorporated into the interviews. These included rustic furniture (6); ceramics (2); clothing (7); marble and stone (2); plastic products (3); mechanical parts and appliances (2); snack foods (3); industrial chemical processes (2); and textiles (4).

Procedures

Interviews were carried out by one interviewer and one recorder who audiotaped each interview with two mini cassette recorders and took written notes of verbal and nonverbal responses by interviewees. The interviewer and recorder discussed and compared their impressions of each interview at its conclusion. Each interview was followed by a tour of the facility which included an observation of production processes and of worker performance and interactions.

Audiotapes were transcribed verbatim on disc and hard copy by a transcriptionist who was trained by the interviewer to attend to the idiosyncratic aspects of these particular interviews. Transcripts were reviewed and checked against notes, and corrected with the audiotape where indicated. The interviewer was American and the recorder and transcriptionist were both Mexican. All transactions were conducted in Spanish.

Transcripts were translated into English with the use of the software program Globalink Power Translator Pro v6.2. The translation was reviewed and corrected by the interviewer, and found to be sorely lacking. The transcripts were comprised of informal, colloquial, Mexican Spanish, much of which is expressed more as a series of idioms than of words. The translator used the Barcelona engine, which was developed for the European Economic Community, and translated decontextualized words rather than expressions. For example, it translated "materia prima", or raw materials, as "cousin means". While "prima" can mean female first cousin as well as prime or raw, the former obviously has no meaning in this context, and the more literal meanings of both words were discarded by the translator. In the end, the interviewer relied primarily upon the original Spanish transcripts and his own fluency in the language.

Results

Some of the companies had designated a specific area of human resources, but many did not. Where the specific area was designated, it was usually focused more upon the maintenance duties related to hiring, payroll, and absenteeism than it was directed to high performance work practices.

Where there was an administrator of human resources, such a person usually wore several organizational "hats", and human resources was often not considered to be the most important of these. The human resource administrator was sometimes the chief accountant, the director of operations, the bookkeeper, or even the owner of the company. In the larger of these firms it was sometimes a director of public relations or an ombudsperson responsible for negotiating with the unions and/or resolving employee disputes.

Most directors of human resources had no formal education in the field. Some had degrees in general management or engineering or accounting. Several had participated in short term training programs related to human resources. A few were former teachers or professors. One plastics manufacturing person had previously been an organization development consultant. The range of competence and insight from this person to others who were essentially administrative assistants with no higher education was dramatic.

The majority of companies carried out their responsibilities for human resources in a manner focused more upon short term survival than upon continuous improvement or development. Most companies were more concerned

about ensuring that enough enmployees appeared for work each day so that the plant could meet its production quotas than they were about increasing employee effectiveness.

There appeared to be a strong paternal relationship between managers and workers in most companies. Salaries and benefits were usually not far above the minimum legal standards in Mexico, approximately ten percent or less of that in the US. This "hand to mouth" condition left many workers dependent upon the good graces of their employer as the sole recourse for financial assistance through crises. So human resource directors were often charged with caring for valued employees who had special medical problems or legal predicaments. Employees were often encouraged to bring their personal problems which were affecting their work performance to the attention of the human resource person, who would sometimes attempt to intervene in their behalf.

Programs and activities related to human resources tended toward company sponsored parties on special occasions like national and/or religious holidays; periodic meetings with motivational speeches made by managers or invited presenters; field trips to recreational or cultural centers; and the posting or sponsorship of educational or personal development programs provided by other agencies in other locations after work hours. One exception to this pattern was the strong desire by several plants to meet the requirements of ISO-9000 in order to qualify for exportation into international markets, particularly in Europe.

Formal programs directed to the development of specific work related skills were less common. In a marble and stone company the top managers provided direct training to the workers. Many were taught to operate two machines simultaneously which had previously each been operated by one person. This job redesign training was provided for workers who volunteered and were selected. They were rewarded with an approximately 50% increase in salary. Most of these workers were also crosstrained on other machinery. The plant manager in this case was an industrial engineer who had received additional training in the US.

In response to questions about the effects of human resource programs upon the employees and the company's "bottom line", the executives talked about increased motivation to work and greater loyalty. A few said that the workers were more knowledgable about their work or about the organization. The director of a plastics factory, who said that he was studying philosophy and humanities in the evening to broaden his education beyond his management degree, provided reimbursement for the costs of formal education of any kind for his employees, without concern about whether it was work related.

Regarding future plans for human resources, most indicated that they would continue with what they were doing or that they would like to do more of the same. Very few spoke about striving for a new or different human resource function from what they currently had.

Some high performance work practices were observed, although few seemed to be implemented beyond a rudimentary level. Quality circles were not formally implemented. Work teams were present in some of the assembly plants, particularly in ceramics, clothing, and appliance manufacture. Some teams met weekly or daily to address issues of efficiency or specific assembly problems. Job rotation was present in several companies on a limited basis, as was crosstraining. There were few formal employee committees. Information sharing was conducted formally in a few organizations, but in most the financial data were held very closely within management.

Staffing was not done selectively in most cases. Many companies seemed desperate to find enough workers who could learn quickly and who would come regularly to work. A few plants had instituted a formal probationary period to precede year round employment, as they would often dismiss workers when the demand for their products was reduced by seasonal or other variations in the market.

Compensation ranged from minimum wage to from two to four times minimum wage, depending upon the perceived need for a stable workforce and the value to the company of skilled or trained employees. A form of profit sharing was present in a few plants where management indicated that it had affected production in a positive way. Medical benefits varied from none to very moderate. Most workers were relegated to services in the state run social security hospitals. Retirement benefits were required by the government but were quite modest. Other benefits not required by the government were rare.

Training and development for workers was mostly of the "on the job" variety. Workers were assigned as assistants of more knowledgable employees until they were recognized as able to function independently. Some plants encouraged workers to attend school on their own time, and a few had made specific arrangements for transportation to basic literacy programs. Managers were sometimes reimbursed for higher education expenses, and many of the top managers participated in management development seminars in Mexico and in the US.

Conclusions

There is an expression in Mexico that a successful company is one which is still in business after the peso devaluation and the continuing decline of its value as it floats against the dollar. (Its value depreciated from 3.5 to the dollar to six on December 14, 1994, and has continued to decline to its current value of approximately 10.5 to the dollar in January, 1999.) In this context, these organizations may be called successful because they are survivors rather than because of human resource programs or activities.

The role of human resources is most often seen as encompassing employee relations and personnel accounting functions rather than implementing high performance work practices. The failure to recognize the importance of employee development to global competitiveness will lead to serious problems as Mexican companies are challenged by plants in Asia and Africa where the labor force costs a smaller fraction of Mexican costs than Mexico's currently are of the US.

Many executives are familiar with current American and Western European management concepts and terminology. They profess an enlightened philosophy about planning and employee involvement, and human resource development. Many describe their ethical or religious obligations to help their workers and society as well as the company. But there is a gap between the positions taken and the extent to which they have committed resources.

Paternalism in the workplace competes with employee development and restricts its implementation. Treatment of workers as unfortunate, ignorant, or childlike does not usually lead to confidence in the value of investing in increasing their capacities to contribute to the organization.

Most of these companies are family owned and operated, in which most of the decision making is reserved for family members and their spouses. There is often an unspoken expectation of conformity with tradition and the status quo, and new ideas are sometimes looked upon with suspicion. Renewal and responsiveness to changing market conditions become more difficult to carry out, and competitive advantage is harder to acquire.

The emphasis of human resource programs upon recreational and caretaking activities more than developmental ones, and upon general more than skill based training, compromises the potential for improving worker productivity through human resource development. Examples include a company promoting the study of English as a second language by employees whose work skills have not been assessed, and another focused upon ISO-9000 certification without having done a cost benefit analysis of such an effort.Resulting disillusionment could lead to a further reduction in, or abandonment of, more focused and effective investment in their people.

Recommendations

Most of these companies, particularly the family owned ones, can benefit from opening themselves to fresh perspectives from new people. Many of them are physically hidden like military forts within their own communities. Executives guard their techniques and processes with great care from their competitiors. They could profit from recognizing the value of continuous renewal and innovation to competitiveness within Mexico and globally.

The tradition of paternalism should gradually give way to partnership with the employees. In the human resource programs, this would suggest movement from emphasis on caretaking activities like parties, motivational speeches, and arbitrary interventions for personal problems reserved for the most loyal workers, to employee involvement programs and a system of profit sharing reflected in compensation and benefits.

Training and development activities should be based upon formal planning and need assessment at the organizational, team, and individual levels.They should then be directed to the performance and productivity goals of the company, and emphasize pertinent knowledge and skill development.

High performance work activities should be considered for and adapted to the needs of each organization. Those with particular potential for improving human performance in these companies are selective staffing, information sharing, crosstraining, self managed work teams, employee committees, profit sharing compensation, and training and development.

Creek Women's Perceptions of Work: A Qualitative Study

Barbara Bussell Kawulich
Carol D. Hansen
Georgia State University

This ethnographic study of Muscogee (Creek) women's perceptions of work substantiated existing research indicating differences in the value systems held by this minority and those of the mainstream population. The result detail further how these and other differences may influence HRD professionals who work with and prepare these and other minority workers.

Keywords: Workforce Diversity, Culture, and Identity

As the workforce engages more minority women, in general, and more Native American women, in particular, practical and theoretical knowledge is required about how their motivational needs, patterns, and roles are framed by gender and cultural heritage. There is also a need to understand how to recruit, hire, place, and retain minority females. The participation of women of all races is expected to increase. By 2005, women are expected to make up 48% of the labor force (USDOL, No. 95-1, 1995). American Indians, along with Hispanics, Asians, Alaskan natives, and Pacific Islanders, are expected to see the most growth. These groups are projected to increase by 80% by 2005, while the participation of African American women in the workforce, for example, is expected to grow by only 34%.

This research studied the culture of Muscogee (Creek) women in central Oklahoma. The study's purpose was to give voice to a marginalized sector of America's workforce by exploring the work perceptions of Native American women, in general, and those of Creek women, in particular. Studies suggest that Native American value systems are different from that of the larger American culture (Brady, Crome & Reese, 1984; D'Andrea, 1994; Saks Berman, 1989). However, Native Americans have received little attention by organizational theorists. Research has tended to focus on social problems, such as alcohol abuse, dropout and suicide rates, instead of issues related to the workplace (Medicine, 1988). Another tendency has been to group all tribes into a single category without regard for socioeconomic status, tribal-specific structures, educational achievement, lifestyle patterns, or gender. As a result, no clear constructs have emerged. Medicine stressed that the differences in matrilineal and patrilineal family structures precluded a generalization of findings to all tribes. Such reporting accounted for much of the inconsistency and erroneous interpretations found in present research.

Study of Native Americans has been problematic for additional reasons. First, their numbers are small, and their influence historically has been less than that of other minority groups. According to the 1990 census, Native Americans, along with Alaskan natives and Pacific Islanders, make up about 3% of the population (US Census, 1990; USDOL, No 92-1, 1992). Second, there has been a tendency to group their cultural membership in the "white" category, which failed to appreciate their separate ethnicity (Kleinfeld & Kruse, 1982). This research included surveys conducted by the U. S. Department of Labor (USDOL) and much of the available research on gender work. Finally, many of these studies did not include labor that was not covered by employer taxes, such as volunteer work, unpaid work, home-based work, and self-employment. Thus, much current data does not acknowledge the large percentage of Native American women who are self-employed in home-based businesses that is higher than for the rest of the population. Almost 69% of Native American women-owned businesses are home-based (USDOL, No 89-9, 1989).

Theoretical Framework

Issues of workforce diversity, cultural identity, gender, and ethnicity framed the need for this study.

The term workforce diversity concerns issues of culture, gender, ethnicity, age, sexual and religious orientation, minority and social status, and physical and mental disabilities (Thomas, 1994). While any of these elements can lead to different work needs and approaches, perhaps the greatest cause of variance lies in one's cultural and ethnic origins. Work orientations develop at a young age and are greatly influenced by one's socio-cultural referents (Hofstede, 1994; Kelly, 1991; Patterson, Sochting & Marcia, 1992). In fact, one's cultural heritage

Copyright© 1999 Barbara Bussell Kawulich & Carol D. Hansen

may carry more weight in shaping occupational choices and definitions than organizational cultures (Hofstede, 1994; Laurent, 1986). Thus, a worker's cultural heritage is likely to play a larger role in shaping work approaches and expectations than the culture of the worker's employing organization.

Anthropologists traditionally have provided knowledge about culture. Since the early 1980's, organizational theorists also have found relevance in culture studies. Culture, as a construct of work, was defined in this study as:

> A learned, socially transmitted set of behavioral standards. It is self-expressed and shared by individuals through their personal values, norms, activities, attitudes, cognitive processes, interpretation of symbols, feelings, ideas, reactions, and morals (Morris, Davis & Allen, 1994, p. 70).

This definition suggests that, as a group's culture provides a framework for action and expectation of others, it gives members a sense of shared identity, a common past, and a sense of belonging. This framework provides the means for individuals to find meaning in life and for developing one's self-definition.

Identity is multifunctional and can be thought of in terms of group identity or in terms of individual identity, with the individual having several identities at various levels of relationships at once (Fitzgerald, 1974). One's cultural identity is her identity as part of a group based on cultural or ethnic association; her social identity is a less stable identity that is situation-specific (Fitzgerald, 1974). For example, a Creek woman's cultural identity, at all times, is Creek. However, with a co-worker she might have a social identity as a professional and a social identity as a friend to someone else. Cultural identity then implies stability, while social identities are adaptable, depending upon the situation. Because cultural identity provides a stable identity, while the social, situational identity is more flexible, one should consider the impact that cultural identity makes on the social identity as it relates to the workplace. Cultural identity upholds the values and belief systems one has; therefore, it is important for employers to know what the workers' individual cultures value in order for the employer to know how to motivate workers. In this way, employers can alleviate some of the problems associated with frequent employee turnover and dissatisfaction. For women who choose to become self-employed, the motivation again derives from the values and belief systems found in the context of culture.

Gender and Ethnicity as Products of Culture

Gender may be viewed as a learned function of socialization that is biologically assigned (Deegan, 1987; Goffman, 1987). Gender has been linked inextricably to class through its grounding in historical studies of the changes that have occurred in women's involvement in the workforce (Acker, 1989). Gender has been shown to mediate class through sex segregation of work and through the differences found in pay earned by males and females (Acker, 1989). How women, in general, are defined in the home and at work is changing (Deegan, 1987). The phenomena of change clearly characterize the roles of Native American women (LaFramboise, Heyle & Ozer, 1990).

Early feminist literature focused on the lack of attention paid to gender within existing theories (Franklin, Lury & Stacey, 1991). These feminists brought to light such concerns as male violence, sexuality and reproduction, and female oppression, in general, topics that had not been of interest in male-dominated research. While many of these studies emphasized the similarities among women's experience, Franklin et al. proposed that the differences in these experiences have been neglected as a result. The differences they pointed out that should be emphasized include ethnic identity, nationality, class, and sexuality. Some feminist views supported the understanding of the oppression of women. These perspectives pointed out the differences in the patterns of the lives led by women and by men (Maynard, 1994). Reid and Comas-Diaz (1990) also found gender research inadequate by neglecting issues of ethnicity. Likewise, ethnic research typically failed to include gender issues. In their review of the gender literature, Reid and Comas-Diaz found that, professionally, women were not valued equally with men, either monetarily or intellectually. Women were found to experience stress and low self-esteem in their various roles as a result of gender-typed expectations.

Diversity research has failed to address diversity among women and has focused instead on the dominant middle class population of women (Reid & Comas-Diaz, 1990). The double influence of gender and ethnic discrimination has influenced one's personal development, yet their combined effects have not been studied sufficiently (Essed, 1991; Reid & Comas-Diaz, 1990). The past 50 years have generated much information about workers, some of which related to women. For instance, Reskin and Padavic (1994) found that gendering occurs as a result of socialization, actions of social institutions, and interpersonal interaction. They identified a "system of social relations" in the way the workplace is organized, a system that contributed to the male advantage. The sexual

division of labor is a feature of work that assigns men and women to different work on the basis of the worker's gender. Yet, which gender is assigned what tasks varies from culture to culture (Reskin & Padavic, 1994). They maintained that women dominate almost the same occupations in 1990 as they did in 1940 and that the devaluation of their work is linked to a gender system that values male over female work. The more women found in a job field, the less they earn as compared to men in male-dominated job fields.

Focus Questions and Methodology

D'Andrea (1994) indicated that studies in this area have relied upon non-culturally normed instruments that are not appropriate for research with Native Americans. Therefore, qualitative methods were needed to overcome such norming barriers. By providing personal narratives in the emic or the informant's perspective (Pike, 1966), this study provided information through the Native American woman's voice. This kind of understanding uncovered the underlying perceptions and beliefs that influenced expectations for work approaches and interactions. Using narratives to give voice to Native American women enables them to tell their stories in their own words, thereby facilitating their "rediscovery of womanhood" (Greenman, 1996, p. 24).

These issues called for research on the Creek feminine perspective of work through qualitative means. In responding to the call, the following questions guided the research:

1. How do Muscogee (Creek) women define work?
2. What are the influences on their work choices?
3. What motivates them to do the work that they have chosen to do?
4. How do they perceive the dual effects of gender and ethnicity on their success as workers and on career choices?

It is important to note that these questions did not constitute testable hypotheses, but rather they provide a focal point that guided the collection and analysis of data.

The lead author went into this study knowing that there were many cultural differences in the Native American tribes of the U.S., yet the degree to which the available information about Indians described the circumstances of the Muscogee (Creek) people was unknown. For Native Americans as an ethnic group, the literature and census records indicated poverty level existence, high unemployment, high incidences of alcohol abuse (and related illnesses), diabetes, and tuberculosis, and low levels of educational attainment. Determining to what degree such conditions were present in the Muscogee (Creek) Nation was of primary interest to her.

As a "thin blood," she had wondered how these people would receive her. Knowing their hesitation to open up to researchers, she was unsure whether she would be accepted as Creek or would be viewed as non-Indian. Her previous experience with Indians had shown her that their communication styles differed from that of the mainstream society to some extent (that is, they do not rely on constant eye contact when talking), as did their social interaction styles (that is, there are many gendered role designations that, in some instances, preclude male-female interaction).

Multiple personal guided interviews (Spradley, 1979) were conducted with a purposeful sample of 16 Muscogee (Creek) women from rural east central Oklahoma. Three months of fieldwork that occurred in the form of four visits over a period of one year were required to collect the data. All of the informants were at least 33 years of age to correspond to an age range feasible for assuming their having experienced life sufficient for them to know the range of activities available to women of their culture. Ages ranged from 35 to 84. Educational levels ranged from eighth grade education at an Indian boarding school to a master's degree from a public university. Only two of the informants were not high school graduates. All of the informants were raised in the area where the data were collected.

To ensure the accuracy of the findings, several methods were used (Lincoln & Guba, 1985). Triangulation of methods (ethnographic interviewing, document analysis, and participant/unobtrusive observation) provided a means for verifying information received by one method through use of other methods. For example, what participants revealed in interviews was substantiated through observation. Further, member checks were used to ensure that understanding was correct. Each participant was sent a verbatim copy of her interviews for review and correction. Peer debriefing with Indians and non-Indians was also used to ensure correct understanding of the data. Using these techniques, the accuracy of the findings was assured.

Unobtrusive and participant observations (Merriam, 1988; Bernard, 1994; Spradley, 1979) took place in a variety of situations that included, for example, traditional ceremonies and dances, church services, community centers, council meetings, tribal offices, a job fair, Creek homes, and powwows. Document analysis included the

review of tribal documents, local and tribal newspapers, and material from the tribal cultural preservation office library and the Creek Council House Museum library.

While in the field, the lead author took the first three interview transcriptions and coded them, using the causal comparative method of analysis. Using 3x5 index cards, she developed an initial scheme of coding. As subsequent interviews were recorded and transcribed, she continued to code and recode them, reworking the coding scheme as needed. The resulting coding scheme included three categories with 32 subcategories. One category, Views on Work, included, for example, definitions of work, kinds of work done, views on education/skill acquisition, how work was chosen and how they felt about work. The category, Being a Creek Woman, included what it means, traditional and modern stances, how learned, feelings about Creek/non-Creeks, role designations, and Creek vs, female identity; and the category, Creek Culture, included family relationships, tribal beliefs and values, humor, cultural learning, and feelings about the past. The coded interviews and other coded data sources, including observations, field notes and logs, were input into QSR NUD-IST software, making the massive amount of coded data more manageable. To ensure that her own assumptions and perspectives were not clouding her insight into the data analysis, data were separately coded by another researcher, and the resulting coding scheme was compared to her own.

Results, Conclusions, and Limitations

In studying the unique heritage of Creek Indian women, this research shed light on how cultural referents can lead to differences in workplace behavior and expectations, while contributing to our understanding of little known American female minorities. The development of identity for Creek women was influenced by the extended family, by their shared heritage, traditions, culture, and language, by others' perceptions of them, by a sense of belonging, and by their pride in being Creek women. Their ethnic attachment was to Native Americans, rather than to other ethnic minorities or Whites. Like other Native American women, they felt a sense of duality from working in the mainstream and in returning to their homes where a different set of customs prevailed. They felt the most attachment to the extended family, the clan, their tribal town, to Creek people, then to Native Americans, and lastly to the mainstream American culture. Likewise, the data showed that Muscogee (Creek) women felt a stronger bond to the cultural heritage of their birth than to the occupational or organizational culture associated with the nature or habitat of their work. This finding did not vary as women became more educated or had more work exposure to the mainstream American culture.

The Muscogee (Creek) women followed career paths that began with work using the skills they learned growing up. These skills were either used to secure work in the public sector or in paying home jobs. At a later time, typically when survival needs were met, the women included community and/or volunteer work in their lives. This work helped them to meet responsibility they felt to help others and to preserve the Muscogee (Creek) culture. Through their lives the home work continued, strengthening the bond with familial others. At or near retirement, the work focused on home work and community/volunteer work. The model for ideal work for the women was one that incorporated their values, that enabled them to preserve the Muscogee (Creek) culture, that facilitated their involvement in family activities, and that enabled them to be of help to others of their cultural community. Whether Creek women chose to work for pay in the home, i.e. as a babysitter or housekeeper, or in public, that is, outside the home, i.e. as a teacher, nurse's aide, or waitress, they were concerned for others in their cultural community and wished to perform their work in a way that would support their heritage. This characteristic was an extension of their familial, communal nature.

Many theories of career development fail to consider that minorities, in general (Cohn, 1997), and Native Americans, in particular (Bataille & Sands, 1984), experience external constraints that hinder their career planning efforts. Scholars noted that minorities are typically more concerned with survival needs and concerns about cultural preservation. Therefore, the idea that work is a reflection of self-concept and personal fulfillment is not the perception that minorities in the U.S. have about work.

Data from this study substantiated research on the value systems of Native Americans as being different from those of mainstream America (Red Horse, 1980; Edwards & Edwards, 1980; Olson & Wilson, 1984) in terms of communication styles, spirituality, role designations, perceptions of time, and views toward collectivism and individualism. An overriding aspect of the Indian value system is its emphasis on harmony with nature, the tribe, and within the individual. A strong attachment to their sense of homeland was an essential ingredient that caused Muscogee (Creek) women to feel strong connections to their family homes, their hometown area, and to lands presently and previously held by their people. Thus, it is not surprising that the informants in this study saw their role in preserving the culture as more important than personal professional goals. This finding is consistent with the

literature on collectivism (Triandis, 1995). Finally, data from this study also found the Muscogee (Creek) culture more in line with the more nurturing attributes of feminist cultures as defined by Hofstede (1991). These values place importance on helping others, preserving the environment, higher government expenditure on welfare issues, complementary roles for each gender, and conflict resolution by negotiation and compromise. Both Hofstede and Triandis have characterized the mainstream American culture as possessing contrasting values of individualism and masculinity. Finally, data from this study illustrated change in role expectation and values identified in previous reviews of literature on Native Americans (Sattler, 1995). For example, little evidence of arranged marriages among Muscogee (Creek) women was found. Moreover, the informants indicated that women in their culture increasingly played leadership roles in their tribes and outside their tribal communities.

An ironic finding from this study that substantiated Medicine's (1988) work is that, as Muscogee (Creek) women attempted to provide service to their community by becoming better educated, they limited their opportunities to marry within the tribe. Upon returning home from, in particular, university instruction, they were viewed with wariness and perceived as less Indian after having spent time in the mainstream culture. This cultural conflict may discourage Muscogee (Creek) women from pursuing higher education. In addition, there was a general assumption that a woman's place was in the home, taking care of the family and teaching the customs of the Creek people. As a result, when women did work outside the home, there was guilt on their part and tension in family relationships, when the men in their families had different ideas about their roles. This finding was especially true in more traditional homes, where there had been little exposure to the mainstream culture. Likewise, the more traditional a woman, the less comfortable she felt working with non-Native Americans.

This study was limited to the perceptions of women. Future studies might include the perceptions of Muscogee (Creek) men about women's work or about their own ideas of work. Comparison studies with other tribes could shed light on the generalizability of a set of pan-Native American beliefs about work. Researchers might also assess the differences in the degree of identity salience for traditional and modern Creek women toward the tribe versus the degree of identity for the occupational subculture in which they work. Further, do women in certain subcultures feel more identity with their tribal traditions than do women in other occupational subcultures? For example, do Native American women, in general, and Muscogee (Creek) women, in particular, who are teachers identify themselves with the subculture of teachers more than similar women who are nurses?

How This Research Contributes to the Practice of HRD

We know little of the forces that influence workforce diversity (Choudhury, 1996; Creech, 1995). Far too often managers and human resource professionals rely on vague constructs, such as empowerment, or on programs, such as affirmative action (Dooley & Rice, 1995). Seldom do we delve into study of the different realities about the work held by women and men and by different minority and ethnic groups. This issue has become increasingly problematic as the composition of America's workforce has changed. The findings emphasized the importance of the Muscogee (Creek) culture to the development of the women's values, beliefs, and attitudes about work. The strength of the influence of tribal culture on their work attitudes and choices has implications for HRD in terms of addressing the leadership, communication and training needs of Muscogee (Creek) women. The following points offer a few examples of how the findings from this study might influence how HRD professionals work with and prepare others to work with Native Americans.

Data from this study corroborated reported views that Native American women have about leadership differing from that of the mainstream American culture (Fernandez, 1981; Meyer, 1971). These findings indicated a preference for a consultative and participatory approach to management, as well as a need to discuss issues as a forum. This tendency reflects those approaches that council members take in tribal meetings. Moreover, women in decision-making positions did not see themselves as leaders in an authoritative sense, but rather they saw themselves as service providers. Thus, the emphasis was how they, as managers, could facilitate the work of others. These findings are consistent with the literature on collectives as well as feminist societies, supporting the emphasis earlier reported in this study on providing service to others. HRD practitioners can use these findings in developing training designed to help managers customize their approaches to working with Native American employees and managers.

Career counseling and strategies need to recall the importance of cultural preservation as a motivator in career decisions. Career paths that permit Native Americans, in general, and Muscogee (Creek) people, in particular, to care for and protect their tribe may be more attractive. Likewise, career counselors should recall that bonds to one's cultural identity would take precedence over professional or organizational identities. In turn,

managers and HRD counselors should also be cognizant of the sense of duality and the resulting tension that Native Americans may feel when working in the mainstream American culture.

HRD professionals should also be aware of a difference in communication styles when working with Native Americans, in general, and Muscogee (Creek) women, in particular. As in all collectives, Native Americans place value on social relationships in establishing the trust needed for cooperation and open communication. A sense of group solidarity drives whom Indians are more likely to feel comfortable confiding in and whose counsel they are most willing to accept. The Muscogee (Creeks) were also found to be an oral culture who express themselves through stories. This form of communication is especially powerful because of the lessons that it conveys. The informants in this study frequently answered a question with a story. HRD professionals and other management personnel might employ storytelling techniques as described by Hansen and Kahnweiler (1993) to convey important organizational points and to learn more about the perspectives of this population.

Finally, Earley (1994) emphasized the need for trainers to consider the individualism/ collectivism dimension when preparing curricula and activities for classroom training. According to Earley's findings, collectivists had better performance from group-focused training, while individualists experienced greater impact from self-focused training. Because Muscogee (Creeks) are collectivists, it follows that they would respond to participatory small group training opportunities.

Summary

This study used ethnographic techniques to explore how Muscogee (Creek) women perceive the work they do. As members of a collective, matrilineal culture, there was a strong emphasis on the preservation of their cultural heritage and on a desire to serve their tribe. These differences affected the informants' work and career development motivations. Likewise, their expectations for management, communication, and training styles were influenced as a result of their cultural norms. As HRD specialists and researchers, we should be concerned about the developmental needs of ethnic minorities and adapt.

The Effect of Perceptual Learning Style and Self-efficacy on Preferred Instructional Method in an Advanced Technical Program: A Comparison of Computer Based Training and Lecture

Daniel L. Parry
University of Louisville

HRD departments are continually looking for more efficient ways to train employees. One training method that holds great promise is computer based training (CBT). Research has shown that CBT is effective, however the level of effectiveness varies with the trainees' level of self-efficacy. Another factor that needs to be studied is the effect of perceptual learning style and self-efficacy on preference for method of instruction. This study illuminates the effects of learning style and self-efficacy on trainees' preference for CBT or classroom instruction.

Keywords: Learning Style, Self-Efficacy, Instructional Methods

Harp, Taylor, and Satzinger (1998) stated:

> Corporate spending for training has risen to over $40 billion each year... and a large portion of that is spent on training for computer software. A recent survey of Fortune 500 companies found that in some industries, companies dedicate as much as 5 percent of their information system budgets to training. (p. 271)

Additionally, Christoph, Schoenfeld, and Tansky (1998) reported that corporations competing in the global market face the challenge of effective human resources training. They identified self-efficacy as one potential barrier to effective computer based training, and urged that barriers to the use of multimedia-based training be identified to enhance the success of computer-based training efforts.

Research by Cherry (1981), Butler-Tindell (1994), Harrison, (1997), and Parry, (1997) has shown that trainees exhibit different perceptual learning styles. The differences in perceptual learning style have been shown to be a factor in college course selection (Butler-Tindell, 1994). Perceptual learning style preference also varies by age and education level (James & Blank, 1991).

If corporate trainers are to achieve effective results from computer-based instruction and get the most benefit for training dollars spent, it is important for practitioners to be aware of which training method is best to use with their employees. Some employees may benefit from CBT while others may benefit from classroom instruction. James and Galbraith (1985) stated that "individuals who work in their dominant style(s) experience more success and feel a sense of calm and control".

This research explores the effect of self-efficacy and perceptual learning style on trainees' preference for computer-based training or classroom training. The results of this research will help HRD professionals determine which instructional methods to use with employees of differing computer self-efficacy and perceptual learning styles.

Theoretical Framework

For years, trainers attempted to teach all learners in the same way. Adults taking instruction were educated in structured classroom settings where the trainer dominated the instructional process. The educational processes used were as much a method of control and socialization as a means of education. This educational process was the result of the application of Taylor's management theory to education (Goodman, 1995).

A shift in focus began when theorists proposed that adult learners were individuals who had different needs in the learning process. Learning style theory stated each learner brought heritage, emotion, socialization, and experience into the learning process (Thelen, 1960). French (1975) proposed a learning-style theory based on the way one accepts input from the senses. He proposed four learning styles that included perceptual, cognitive, emotional, and social. Perceptual learning style involved the way one gathered information through the senses.

Copyright © 1999 Daniel L. Parry

Cognitive learning style referred to the processing of accumulated information. Emotional learning style concerned the feelings, attitudes, and personality traits that affected the information gathering, knowledge building, and application of knowledge. The social learning style reflected social sets that could enhance or inhibit the learning process (French).

The focus of the current study was the seven perceptual learning styles proposed by French (1975) and first tested by Gilley (1975) using the Multi-Modal Paired Associates Learning Test (MMPALT). French (1975) asserted that individuals receive information through all five senses, but had a preference for using one or two of the senses. If information was gathered through the dominant modality, learning took place more readily. This theory was supported by a study by James and Blank (1991).

As the concept of learning styles gained recognition among educators, curriculum developers began to look more closely at the learning process and designed programs that attempted to fit the learner. The introduction of computer-based training (CBT) was a result of the "learner-centered" training concept. The use of computers allowed educators to supplement standard instruction methods with additional drills and practice, tutorials, and simulations (Steinberg, 1991).

Research by Ayersman and Minden (1995) focused on making CBT more learner-centered. The researchers reported that the access to new technology would aid educators in the development of learner-oriented instruction. Research in this area focused on improving the delivery system and who controlled the learning process. However, Christoph, Schoenfeld, and Tansky (1998) reported self-efficacy was a factor in successful use of computer instruction. Bandura (1986) defined self-efficacy as "people's judgements of their capabilities to organize and execute courses of action required to attain designated types of performance".

Christoph et al. tested two directional hypotheses and found:

1. Students with prior exposure to multimedia-based courses had higher levels of existing self-efficacy than did students with no exposure to multimedia courses.
2. Students with prior exposure to multimedia-based courses had higher levels of developed self-efficacy than did students with no exposure to multimedia courses.

Hasselbring (1986) reviewed over 30 studies on CBT versus lecture on achievement in a number of academic subject areas including accounting, biology, chemistry, English, and mathematics. He developed the following conclusions:

1. When comparing CBT and traditional instruction, individuals receiving CBT demonstrate equal or better achievement.
2. Subjects obtained equal or better achievement in less time with CBT than with traditional instruction.
3. The positive effect on learning achievement occurred regardless of the type of CBT used, the type of computer used, or the age range of participants.
4. The use of CBT improved student attitudes toward the use of computers in a learning environment.

Kulik and Kulik (1991) evaluated 154 studies focusing on the effectiveness of CBT. They reported that students accomplished the same objectives in two-thirds the time of conventional instruction. Kulik and Kulik also concluded that in most cases subjects completing CBT attained achievement scores that were 12 percentile above conventional instruction.

The review of the literature to supported CBT as an instructional method. However, the review did not indicate that perceptual learning style or self-efficacy had any effect on the type of instruction preferred in a training situation. It is this combination of perceptual learning style and self-efficacy in the use of CBT that is the purpose of this study.

Research Questions

1. Did adult learners in an advanced professional training program exhibit the seven perceptual learning styles as described by French (1975)?
2. Did the adult learners' preference for instructional method vary with perceptual learning style strength?
3. Did the adult learners' familiarity with the computer effect their instructional preference for CBT or classroom instruction?

Methodology

Population and Sample

Dental hygiene students (N = 27) were tested for learning style preference using the MMPALT-III. Subjects were invited to participate and received an informed consent letter prior to testing. Participants were first given the MMPALT-III then the Instructional Preference Survey (IPS).

Instrumentation, Reliability, and Validity

The MMPALT-III was considered to be a valid and reliable test for perceptual learning style. Cherry (1981) added the olfactory element to Gilley's original MMPALT instrument and measured the learning styles of 96 adults ranging in age from 21 to 76. Statistical comparison with Gilley's study (1975) established concurrent validity. The highest correlation between the populations was r = .89 and was considered evidence of concurrent validity (Butler-Tindell, 1994). Research by James and Blank (1991) provided evidence of reliability of the seven MMPALT sub-tests. The researchers collected data on learning styles of 480 adults ranging in age from 19 to 86. Test-retest reliability was calculated: Print r = 0.85, Visual r = 0.87, Aural r = 0.80, Interactive r = 0.65, Haptic r = 0.74, Kinesthetic r = 0.67, Olfactory r = 0.73. Precise protocols and scripts were used in introducing each of the seven learning style sub-tests.

An instructional preference survey (IPS) was designed to measure the participants' familiarity with the use of computers and their preference for either computer-based training or classroom instruction. Research by Christoph et al. (1998), Wenzel and Gotfredsen (1996), Plasschaert, Wilson, Cailleteau, & Verdonschot, (1995), and Liu and Reed (1994) provided the basis for developing the IPS. The survey consisted of open-ended questions as well as Likert-type items. To assure construct validity a panel of experts in adult education, corporate research, and dental research reviewed the survey design.

The independent variables were perceptual learning style and self-efficacy relative to using computers in the learning process. The dependent variable was instructional preference of the participants.

The variables were operationalized through two instruments: the MMPALT-III for learning styles and the Instructional Preference Survey that was used to determine computer self-efficacy and preference for classroom or computer-based instruction.

Data Collection

The individuals who participated in the study were selected from the population of dental hygienists at a large metropolitan dental school. Each student was tested following the guidelines of the MMPALT-III designers. Demographic data MMPALT-III data were collected from October to December 1998. The tests were scored and the number of correct responses were transferred to a master sheet which contained only the subjects code number, test scores, and demographic data.

Data Analysis

The data were transferred from the master sheet to SPSS for Windows 7.5 for analysis. The data means were calculated to determine the dominant group learning style to answer question 1 and the means were used to rank order the sample group modality preference. The preference for CBT or classroom instruction and computer self-efficacy ratings (high or low) were used in calculating a series of one-way analyses of variance (ANOVAs) to determine if perceptual learning style had any effect on either preference for instruction or computer self-efficacy.

Results and Conclusions

The conclusions can not be generalized beyond this study, but do offer some insight into the usefulness of knowing trainees' preference for instruction in an HRD situation. The rank and mean scores of the perceptual learning styles indicate that, as a group, the participants prefer to learn through visual images, use of hands, and discussion (Table 1).

Table 1

Rank and Mean Scores of Perceptual Learning Styles.

Perceptual Style	Rank	N	Range	Min	Max	Mean	Std. Dev.
Visual	1	27	8	2	10	7.43	2.03
Haptic	2	27	9	1	10	6.80	2.70
Interactive	3	27	8	2	10	5.97	2.33
Aural	4	27	8	1	9	5.87	2.43
Print	5	27	8	1	9	5.13	2.13
Kinesthetic	6	27	7	1	8	3.60	1.61
Olfactory	7	27	5	0	5	1.97	1.50

Participants were almost equally divided between high and low self-efficacy as shown in Table 2. All participants except one were female so no gender statistics were calculated. Self-efficacy (SE) was coded 0 for low SE and 1 for high SE. There was no difference in self-efficacy by age.

Table 2

Computer Self-Efficacy Ratings

Self-efficacy	Frequency	Percent	Cumulative percent
High = 1	13	48.1	48.1
Low = 0	14	51.9	100.0

Although the participants' feelings of computer self-efficacy were almost equally divided between high and low, their preference for instructional method was skewed toward classroom instruction over independent computer-based training modules (Table 3).

Table 3

Instructional Preference Among High and Low Self-Efficacy Students

Self-efficacy	Instructional preference	n	Percent	Cumulative percent
High	Classroom	11	40.7	40.7
High	CBT module	3	11.1	51.8
Low	Classroom	13	48.2	100.0

Of the participants tested, 88.8% preferred classroom instruction even though 48.1% indicated they were confident they could succeed in a computer-based training module.

Question 1 is answered in the affirmative. The learning styles presented by French (1975) were present in this population The rank of the perceptual learning style preferences compare closely to other populations tested. Visual styles is dominant in all populations and haptic and interactive rank either second or third and vary with the population tested.

Question 2 is answered in the negative. Perceptual learning style had no significant effect on choice of instructional method.

Question 3 is answered in the negative. Familiarity with computers had no significant effect on preference for instructional method. Both high and low self-efficacy students preferred classroom instruction to CBT modules.

Contribution to New Knowledge in HRD

This research benefits both adult educators and adult learners. Educators have incorporated CBT in instructional methods since the late 1950's (Loughary, 1966). At the inception of this study, there had been no study reported on the individual's perceptual learning style or comfort level with using computers and the relationship to preferred instructional method. This study adds to the knowledge relative to identifying which individuals gain the most from CBT. Even though an individual may be computer literate and be high in computer self-efficacy, the results of this study indicate that classroom instruction is still the preferred mode in instruction for 88.8 percent of the participants.

The administrators involved in directing adult education programs need to be aware of trainee preferences. Research on instructional method indicates that adults learn best in their preferred perceptual learning style, it may also be that trainees in HRD programs learn best in their preferred method of instruction. Corporations are spending millions of dollars to train employees through computer-based training methods. This research indicates that classroom instruction should be included in the education process even where CBT modules are used for basic instruction.

Implications for Future Research

Further research is indicated in this area. Suggestions for research are:

1. Test groups for computer self-efficacy, establish a control and two treatment groups to see if learning differences occur when students are placed in CBT and classroom situations.
2. Expand the population being tested to develop a larger N.
3. Change the test population to one that is less academic and more the focus of HRD training to see if instructional preference is affected by perceptual learning style or computer self-efficacy in another population.

Subordinates' Information Seeking Behavior: Empirical Investigation of the Effect of Perceived Leadership Style and Individual Differences

Svjetlana Madzar
Gustavus Adolphus College

This paper is aimed at offering additional insights into subordinate-superior interaction in an organizational setting. Transformational and transactional theories were utilized to postulate that the content and frequency of information sought by a subordinate from his/her superior will vary depending on that superior's leadership style. This relationship was tested with individual difference predictors in mind. Empirical results, based on the field study using survey data and longitudinal checklist recording, show general support for the model. Implications are drawn for the role of information seeking for both managers' and subordinates' development and career advancement.

Keywords: Information Seeking; Leadership Style; Subordinate-Superior Interaction

In this paper I focus on subordinates' information seeking behavior and test suggested expansion of available models used to determine the sources of influence (Madzar, 1998). The hypotheses tested herein are based on the assumptions that: an important part of managers' task is to act as a source of information to their subordinates; and that managers are often characterized as employees' major link to the information environment. In this light, I explore the seeking process in terms of frequency and types of information sought by subordinates. The focus is on the influence of a superior's leadership style on subordinates' seeking behavior, in the midst of powerful evidence pointing to a strong relationship between leadership style and subordinates' satisfaction and performance. Lack of field research that deals with source attributes in general, and with superior attributes in particular, seems paradoxical. Exploratory in character, this study examined the intricate nature of the influence of such attributes, by using transformational and transactional leadership style frameworks (Bass, 1985). For full theoretical development of arguments that led to the set of hypotheses stated below, please refer to this author's paper presented at the 1998 AHRD conference in Chicago.

Transformational and Transactional Leadership: Effect on Subordinates Information Seeking Patterns

First, we can expect a more involved information seeking activity on the part of a subordinate from a transformational leader as this style will lower inference, face loss, and effort costs (Ashford & Cummings, 1983) by mentoring, one-on-one contact and intellectual stimulation.

H1: Perception of a superior's leadership style will add to the prediction of the frequency of information sought by a subordinate in that frequency will be higher if a superior is perceived as a transformational, rather than transactional leader.

Second, high probability of negative reinforcement or punishment in seeking performance feedback from a transactional leader will negatively influence the amount of feedback sought. Conversely, the style seems to encourage seeking technical and referent information, as they are distanced from self. Technical information is typically task-related and does not involve feelings or judgements. Seeking referent information can be regarded as a preparation for, or a confirmation of this exchange-based relationship.

H2: The frequency of seeking technical and referent information from a transactional leader will be higher than the frequency of seeking performance and social feedback from such a leader.

Next, intellectual stimulation and the insistence on the continuous development exercised by a transformational leader enhance a subordinate's interest in the process of work, not only its outputs. This interest, combined with enhancement of employee trust (Podsakoff, MacKenzie, Moorman, & Fetter, 1990) contributes to the amount of process performance feedback sought.

Copyright © 1999 Svjetlana Madzar

H3: Frequency of seeking process performance feedback, as compared to outcome performance feedback, will be higher if subordinates seek the feedback from transformational than from transactional leaders.

Exploring the Effect of Individual Difference Antecedents on the Focal Relationship

Also included in this study's model are those individual difference constructs for which there is considerable evidence of influence on feedback/information seeking. Following on the advice of Ajzen (1988) in regard to the conceptualization of individual difference constructs, I advocate the use of their more domain-specific levels that pertain uniquely to organizational settings.

Closely examined in the OB literature, job-related tolerance for ambiguity--JRTA (Benett, Herold, & Ashford, 1985: Norton, 1975) has been found to be negatively related with feedback seeking frequency (Ashford & Cummings, 1985; Fedor, Rensvold, & Adams, 1992). In the case of transactional leadership style, a subordinate-leader interaction is reduced to a minimum, and as such it provides for higher levels of the ambiguity of the situation and uncertainty about outcomes among subordinates who consequently lack referent and outcome performance feedback/information.

H4: The higher the subordinates' JRTA, the more referent information and outcome performance feedback they will seek from a transactional leader, as compared to other information types.

Recent feedback-related research on work domain--individual goal orientation has been grounded in social cognitive psychology (Dweck, 1986). VandeWalle and Cummings (1997)built on the distinction between two types of individuals and their behaviors--those with learning goals who focus on improving their ability, and those with performance goals who focus on proving their ability, all according to their implicit theories of intelligence. Because learning oriented individuals seek more feedback about their work, even under challenging conditions (VandeWalle & Cummings, 1997), it seems plausible that:

H5: Learning oriented subordinates will seek more process performance feedback in general than will their performance oriented peers, from both transformational and transactional leaders.

It has been suggested that subordinates high in self-esteem, are less influenced by the quality of their relationship with their feedback source in deciding whether or not to seek feedback (Vancouver & Morrison, 1995). On the other hand, subordinates with low self-esteem, needing approval and self-affirmation, as well as in search of self-diagnosticity, may take advantage of the developmental support they receive from transformational leaders, and become further intimidated and alienated by the possible negative reinforcement practices of transactional leaders. In general, it is expected that organization-based self-esteem--OBSE (Pierce, Gardner, Cummings, & Dunham, 1989), will influence the relationship between subordinates' information seeking and a perceived leadership style such that:

H6: The level of subordinates' OBSE will be inversely related to the amount of information they seek from transformational, and positively related to the amount of information they seek from transactional leaders.

More generally, and according to the behavioral plasticity theory (Brockner, 1988), subordinates with low OBSE are likely to seek information that appears less costly and does not have the potential to further deteriorate their sense of self-identity. They will thus be reluctant, in general, to seek information about self.

H7: The lower the subordinates' OBSE, the more technical and referent information they will seek, as compared to performance and social feedback, from both transactional and transformational leaders .

Methods

Sample

The participants in the study were employees of a large Midwest-based therapeutic medical technology company, a leader in a highly competitive global environment. The study data were collected from a homogenous sample of 75 predominantly white male electrical and software engineers (82.7% were male, and 96% were white),

who all work in the same division, performing essentially same tasks. All respondents have worked in the Division over six months. All participants had reported to the person they assessed as their immediate supervisor for at least three months prior to this study.

As described, the sample is a reflection of the following research question-driven requirements. First, to avoid data contamination, all participating employees belong to the same organization, and perform very similar tasks. This isolates the influence of a differing organizational/divisional culture that affects communication norms or customs, on the relationships of interest. Some organizational cultures tend to 'institutionalize' certain communication patterns which may affect the display of the information seeking behavior, and the variance among them would have to be accounted for in a cross-sectional design. Ashford & Northcraft's (1992) finding that publicness of the feedback seeking context is negatively associated with feedback seeking frequency is an example of this concern. Also important is the need to minimize the variance of the influence of the nature of the task itself on the information seeking behavior, both in regard to type and frequency. Finally, on a more general level, a single site design reduces a problem of morphogenesis, often encountered in longitudinal organizational research. Various components of most organizations are always changing at various rates and for a variety of external or internal reasons. With a single-site design, we assume that behaviors and attitudes of all participants are affected by the same set of changes. Specifically in regard to information seeking, such changes may be associated with contextual uncertainty and role ambiguity (Ashford & Cummings, 1985).

Second, newcomers to the organization were excluded from the study because the socialization literature has pointed to the differences in the information seeking patterns between newcomers and already socialized employees (Morrison, 1993; Ostroff & Kozlowski, 1992). The literature is not clear on determining the length of the socialization period which ranges from one month to one year (Fisher, 1986). Upon reviewing the task and training requirements of this sample, a six month guideline was implemented. Third, as the respondents assessed their superior's characteristics and behaviors on a leadership instrument, I assumed they needed to have spent at least three months as that superior's subordinate in order to be able to credibly assesses their perceptions. Fourth, the choice of the organization itself also concurs with the theoretical assumptions about the emergence of transformational leadership in crisis. Acknowledgment of a highly competitive global market, and the sensitive nature of medical products, create pressures on these employees, in their day-to-day operation (George, 1995).

Procedure

The research was designed to utilize field setting and survey methodology, to maximize the exploitation of a natural environment, as well as real-time, semi-longitudinal data collection. The data were collected in two phases.

Phase 1: Survey. The subordinate questionnaire includes the items related to the independent variables in the study: perceived leadership style, OBSE, JRTA, work-domain goal orientation, as well as demographic information. Leadership style was assessed with the Bass and Avolio (1991) 5X- rater version, of the Multifactor Leadership Questionnaire (MLQ) which contains 68 items on a 5-point scale. An approximate cut-off point of 2.5 was used to determine the style - transformational, transactional, both, or none- which is in accordance with other studies using this instrument. As can be seen from the hypotheses, this study is interested in the transformational/ transactional leadership dichotomy. OBSE was assessed with the 10-item Pierce *et al.* (1989) instrument on a 5-point scale. JRTA was assessed with a 3-item subscale from Norton's (1975) larger questionnaire, with responses on a 6-point scale. Goal orientation was assessed with the 13-item VandeWalle (1995) instrument, with responses on a 6-point scale. The means across items of the learning and performance scales were taken to represent learning and performance oriented individuals. In the final analyses individuals were considered to be learning oriented/ performance oriented through the dichotomy created by implementing the 3.5 scale score as the divider between the two goal orientations.

The transformational leadership scale had a mean of 2.91 (SD = .32), and the transactional leadership scale 2.70 (SD = .27). High alphas were reported for all leadership dimensions (from .81 for contingent reward to .93 for idealized influence and inspiration). The JRTA scale had a mean of 2.97 (SD = .89) and an alpha of .77, while OBSE scale had a mean of 3.43 (SD = .90) and an alpha of .95. Finally, the performance goal orientation scale had a mean of 2.69 (SD = .67) and the learning scale had a mean of 1.75 (SD = .60). The alpha levels were .87 and .93, respectively. Scores on the four scales were either uncorrelated or showed low correlation ($r = .23$; $p < .05$ between goal orientation and leadership style; and $r = .22$, $p < .05$ between OBSE and goal orientation).

Phase 2: Recording of information seeking patterns. Employees recorded daily in a behavior checklist the type and frequency of information they sought from their immediate superior. This phase was four weeks in duration, to allow for an information seeking pattern to emerge (20 days total). The respondents also recorded an unusual circumstance (when a subordinate or superior is sick, on holiday, etc.) which prevented them from seeking

information from their superior on a particular day. The one-way ANOVA, followed by the Tukey method of multiple comparison showed no significant differences in means between the number of 'unusual' days and any of the individual information types sought.

Scores on the dimensions of the main dependent variable, i.e., the types of information seeking, were correlated from $r = .43$; $p < .0001$ between social feedback and referent information seeking to $r = .67$; $p < .0001$ between process performance feedback and social feedback seeking. In regard to the distinctness of the five information types, the correlations compare to Morrison's (1993) which ranged between .24 and .75.

This design avoids the differential period problem (Kimberley, 1984) by having the respondents record their information seeking from their superior on a daily basis close to real time, and after they have responded to the items designed to measure their attitudes and perceptions. Also, the use of a true continuous scale for recording the frequency of information seeking episodes, partially accounted for an inherent potential problem with self-reports, which is that respondents may not be entirely accurate in reporting their past behavior.

Analyses

To test hypothesis 1, I used stepwise multiple regression analysis as the research goal is primarily predictive; the number of independent variables is relatively small; and independent variables are not substantially correlated with each other (Cohen & Cohen, 1983). Analyses for other hypotheses were more descriptive and correlational in nature, and thus required a range of simpler tests such as: a simple paired t-test; a one-way ANOVA, in some cases followed by the Tukey's method of multiple comparison; and correlation.

Results

Hypothesis Testing

As discussed, stepwise multiple regression was used to test Hypothesis 1 for the extent of information seeking dependent variable, as well as all individual information types sought among the subordinate sample. Along with testing for predictive strength of the perceived leadership style, the main effect of individual difference predictors--OBSE, JRTA, and goal orientation--were included in a series of seven regression equations. The equations include each of the five information types sought, a performance feedback composite, as well as the extent of information seeking composite as dependent variables. As seen in Table 1, the hypothesis was supported for all equations. Leadership style entered in Step 1 in all but one equation, with R^2s ranging between .10 for referent information to .21 for outcome performance feedback seeking, and beta weights from .33 to .47. Leadership style's total explained variance for the aggregated extent of subordinates' information seeking was $R^2 = .25$, with beta weight .50.

The contribution of individual difference independent variables was considerably lower. OBSE did not appear as a significant predictor in social feedback and technical information seeking equations, and its overall contribution was $R^2 = .04$, with beta weight -.19. JRTA's R^2s varied between .05 for technical information and outcome performance feedback seeking and .07 for process performance feedback, with beta weights from -.22 to -.23. JRTA did not appear as a significant predictor of social feedback and referent information seeking, and its overall contribution was $R^2 = .10$, with beta weight -.31. Finally, goal orientation only appeared as a significant predictor in process performance feedback seeking ($R^2 = .20$ and beta weight.39), and in social feedback seeking ($R^2 = .06$ and beta weight .25) equations. It did not enter in the overall equation.

A paired sample t-test was performed to test Hypotheses 2 and 3. Hypothesis 2 suggests that subordinates would seek more technical and referent information than performance and social feedback from a transactional leader. The difference in means was significant (with the 2-tail probability of .0001) for the technical-social and referent-social information/feedback seeking pairs. The findings thus provide only partial support for the hypothesis because the difference in means between technical and performance information/feedback sought appears nonsignificant, and also nonsignificant and negative between referent and performance information/feedback sought. Hypothesis 3, on the other hand, suggesting that subordinates would seek more process than outcome performance feedback from transformational than from transactional leaders, was supported. The difference in means for each leadership group was significant for the outcome-process feedback seeking pair, but the t-value is larger for the transformational leadership group (-3.58 versus -2.08).

Hypothesis 4 again tested for transactional leader group only, in regard to the suggestion that subordinates would seek more referent information and outcome performance feedback compared to other information types. One-way ANOVA was performed and followed by the Tukey's method of multiple comparison. The mean response

for JRTA was compared with mean responses on the extent of seeking each of the five information types. The hypothesis was not supported.

Table 1
Stepwise Multiple Regression Results

Info type sought	Step	Beta	R2	F
Extent Aggregate Info Seeking	1:Lstyle	.50	.25	24.49**
	2:JRTA	-.31	.35	19.55**
	3:OBSE	-.19	.39	15.07**

** p<.001; * p<.005; N = 75
FS = feedback seeking; S = seeking; Lstyle = leadership style; GO = goal orientation; JRTA = job-related tolerance for ambiguity; OBSE = organization-based self-esteem

Hypothesis 5, suggesting that learning oriented individuals will seek more process performance feedback than will their performance oriented peers from both transformational and transactional leaders, was supported. Results of one-way ANOVA indicate significant F values for both the transactional ($F = 7.01$; $p < .05$) and transformational leadership group ($F = 7.29$; $p<.01$).

Hypothesis 6 suggested an inverse relationship between OBSE and transformational and a positive relationship between OBSE and transactional leadership style. Correlation coefficients indicate only partial support for the hypothesis. OBSE was negatively correlated with the extent of information seeking among subordinates who perceived their leader as transformational ® = -.33; $p < .05$), but the positive correlation for transactional leadership style was nonsignificant.

One-way ANOVA, followed by the Tukey method of multiple comparison was performed to test Hypothesis 7. The prediction that the lower the subordinates' OBSE, the more technical and referent information as opposed to performance and social feedback they will seek from both leader groups, was unsupported. No significant difference was found on any of the above information types for either of the groups.

Discussion

In a series of stepwise regression analyses leadership style emerged as a significant predictor of all information seeking types, and was entered in step 1 in all but one equation. Dependent variables best explained by the model were process and outcome performance feedback seeking. This is not surprising knowing that the conceptual origins of all three individual difference variables in the model were tested mainly in the area of performance feedback seeking research. By comparing the process and outcome performance feedback seeking equations, the value of this Earley, Northcraft, Lee & Lituchy (1990) distinction becomes apparent. The equations differ greatly in regard to the leadership style (R^2 of 0.21 for the outcome versus R^2 of 0.10 for the process feedback seeking), and, to an extent, in regard to the OBSE and JRTA levels of explained variance. Goal orientation, which emerges as the most significant predictor of process feedback seeking, does not even enter in the outcome feedback seeking equation. The danger of collapsing these two performance feedback seeking types into one is shown in the equation with the performance feedback seeking composite. In it, the goal orientation effect is not even entered, thus creating a misleading picture of the overall performance feedback seeking predictors.

The model explained less variance of the other types of information seeking. This, again, is not surprising because the literature on the antecedents of seeking technical, referent information and social feedback from a superior is sparse at best.

The lack of stronger prediction by JRTA and OBSE can, to an extent, be attributed to a small statistical power of the sample size. JRTA did not contribute to the prediction of either social feedback or referent information seeking. This can be explained by the perception many employees hold that social feedback is not directly job-related, and its seeking can therefore be postponed, even if a situation is ambiguous. The same argument may explain lack of contribution of OBSE. Concerning referent information, it is often provided to an employee up-front. (i.e., prior to task execution), and, as such, it does not account for process differences of the two leadership styles. Finally, the lack of OBSE predictive power for technical information seeking can be attributed to the fact that technical information seems to be most distanced from self as it explicitly refers to task-related matters, and as such is unlikely to implicate major consequences for one's self-esteem in the seeking process.

Only partial support was obtained for hypothesis 2. The results attested only to the significant difference in regard to social but not performance feedback, while the prediction was that the subordinates would seek more technical and referent information than both feedback types, from a transactional leader. It is plausible to suppose that obtaining performance feedback was a requirement too important for task continuation or completion, regardless of the costs or consequences involved in seeking it.

Lack of support for the direct relationship between the level of JRTA and frequency of seeking referent information and outcome performance feedback from transactional leaders can be partially explained by a small sample size (N=28). Also, the generally low average JRTA among subordinates might not have produced sufficient variance for multiple comparison analysis. Finally, the lack of support may also be explained by the possibility that the difference in importance of each information type may not be attributed to situational ambiguity, but to the tendency of transactional leaders to provide clarity. They simply know how to tell people what is expected and there may be no need for asking.

Strong support was provided for an argument that learning oriented subordinates would seek more process performance feedback when compared to their performance oriented peers, from both leader types. This finding is consistent with the results obtained for the process performance feedback seeking equation.

The findings concerning the influence of OBSE on the relationship between the leadership style and information seeking behavior suggest that subordinates with lower OBSE will take advantage of the developmental support they receive from a transformational leader, while subordinates with higher OBSE may be less influenced by the quality of their relationship with the leader and will not seek to take the same advantage. A suggestion that the relationship between the level of OBSE and the frequency of information seeking from transactional leader was not supported. Before any conclusions are drawn, one is reminded of the fact that the mean for OBSE across the subordinate sample was generally high. This may have reduced variance even further in an already small sample. Also unsupported was the proposition that the lower the subordinates' OBSE, the more technical and referent information they will seek as opposed to performance and social feedback, from both leader groups. While, again, we can speculate that this suggestion refers only to individuals with very low level of OBSE (Brockner, 1988), and that there were very few such individuals within our sample, larger issues related to the complexity of this construct remain.

In summary of the findings related to the individual difference main effect relationships, we conclude that work-domain goal orientation was the strongest of the three predictors. The findings on JRTA and OBSE need to be

tested on larger and more varied samples. These relations may also need more theoretical refinement before their true influence on the leadership style - subordinate information seeking behavior relationship is established.

Practical Implications

This study conveys important lessons to HRD practitioners. First of all, the results should broaden a practitioner's view of transformational/transactional leader categorization to include the role of an information source, and not just that of an information provider. To enrich the picture of an information seeking component it is necessary to develop and implement training efforts based on the pivotal assumption that subordinates are proactive in their search for adequate feedback/information.

If the results obtained in this study indeed hold after replications in a variety of other organizational settings, with different tasks at hand, then management training efforts should focus on the following objectives: 1)preliminary assessment of the existing leadership style (a shorter, 1996 version of the MLQ instrument is useful); 2) assessment of managers' perceived subordinate information seeking patterns related to the task and broader organization; 3) learning about subordinates' individual characteristics that play an important role in how they choose to seek/not seek information; and 4) understanding of differences in information seeking patterns depending on information type. Even if the training program is not directed at changing managers' leadership style, it should clearly establish the importance of their role as a source of a variety of information types for their subordinates.

OD interventions should first focus on a larger picture of information sources utilized by subordinates, within a broader organizational information environment. In today's complex design, typically encompassing flexible work schedules, virtual office practices, and part time work, this may prove a difficult task. However, only through systematic investigation of the information that employees need, and the assessment of the strategies they have used to get each information type in the past, can we truly assess the specific role of leadership style in this search process. We may well find that leadership training may not be the next logical step, but that structural interventions may yield better results in regard to leader accessibility in general.

Limitations and Future Research

For the reasons outlined above, this study focused on one organization, and a homogenous sample of employees, performing a highly similar task. The study should therefore be considered within such a context. The next logical step should assess the external validity of obtained results by replication of the study in other organizational settings, with other tasks at hand. Only after such extension of this research, can we place confidence in more general statements about the antecedents of information seeking behavior examined herein.

This study only investigated direct inquiry methods of information seeking, when a variety of other modes such as monitoring (Ashford & Cummings, 1983) have been rightly noticed. It has been found that inquiry, as compared to monitoring, is a more costly strategy as it exposes the individual's need for feedback. This need may be interpreted as a sign of uncertainty or insecurity (Ashford & Northcraft, 1992). Therefore, the decision to limit the measurement to inquiry may pose a limitation to realistically assessing feedback seeking patterns.

Naturally, most employees are likely to also seek information from sources other than their superiors. These other sources such as co-workers; task itself; and the organization, may vary in importance to employees in regard to different types of information. The findings on the importance of a supervisor as a feedback source may not hold equally for technical and referent information. Thus, any bias produced by the choice of a specific source is likely to be unequally distributed among the information types included in the study. It should be acknowledged, however, that this study's design was not conducive to collecting such information from subordinates as it would have made a recall activity at the end of the day a more uncertain and difficult process. Also not included in this study was assessment of the quality of acquired information. O'Reilly's (1982) attributes such as: timeliness, relevance, and specificity may be of future interest.

In conclusion, the results of the study suggest that, within the boundaries of the specific organizational setting described, superior's leadership style indeed has a unique effect on each of the five information types sought by subordinates. Exploratory in character, the study provides guidance for further efforts in investigating this salient antecedent.

An Empirical Study of Age Discrimination in Teacher Selection With Application to HRD

Jeffry S. Bowman
Columbus, Ohio

Kiyoe Harada
The Ohio State University

Research has suggested that age discrimination occurs in teacher selection, due primarily to decision-makers' behaviors. A study was conducted using matched ages for hypothetical elementary teacher applicants and elementary principals to determine whether principals' evaluations of applicants were influenced by principal and applicant ages. Results indicated the possibility of discrimination. The importance of principals' competencies in selection and implications of using the Analysis of Performance Improvement Model to improve their competencies in selection procedures are discussed.

Keywords: Selection, Age Discrimination, Analysis of Performance Improvement

Public education has always been a great interest to society and the business community. Particularly, the quality of elementary teachers is one of the most important issues in education because it can dictate the quality of the future workforce (Flesch, 1966; Los Angeles Times, 1992). To improve the quality of education, public elementary schools have undergone numerous changes, including not only educational methods, but also selection of qualified teachers. The recent strong interest in accountability of public education is related to competency and competency specifications of teachers. Harris and Monk (1992) state that if school personnel focus on the use of competence in teaching and competencies applied to teacher selection, schools can improve the quality of education. Selection is a decision-making process to match the capabilities of an individual with position requirements (Harris & Monk, 1992). This process involves gathering information about candidates (teachers), identifying qualified candidates for positions, and selecting those candidates who have the required levels of knowledge, skills, and abilities (KSAs) in teaching as well as the motivation and potential for performance improvement (Castetter & Young, 2000). In this respect, teachers are selected for their professional credentials, which meet position requirements (Young & Ryerson, 1986).

Within a school organization, teacher selection has been seen mostly as an administrative process, in which school principals are responsible for the entire selection process and decisions in hiring teachers. In other words, the quality of school principals is a critical factor in identifying and selecting highly qualified teacher applicants. This ability among principals lays in their competencies, knowledge, and skills in selection (Castetter & Young, 2000). Harris and Monk (1992) define competence as "demonstrated capability to perform" and competencies as "a description of behaviors and behavioral outcomes." In this regard, quality of competencies enables principals to select highly qualified teacher applicants. In addition, the selection system, including the process, criteria, legal requirements, and methods, also serves a critical function in selection, which contributes to developing the needed quality of school personnel (Castetter & Young, 2000). In summary, selecting qualified teachers is a function of competencies and KSAs of school principals and the selection system, which, when combined, ensure quality education in schools.

Problem Statement

In teacher selection, school principals are responsible for making decisions during the entire selection process. Consequently, the ability to select the best candidate from a group of applicants requires school principals to have high competencies in selection. Therefore, competencies and KSAs of school principals influence the quality of personnel in schools. However, Harris and Monk (1992) point out that principals often make decisions that are based on a combination of intuition, hunches, and behaviors, relative to success in teaching positions, rather than using scientific, legal, and job-related criteria.

Any selection system aims at ensuring the selection of the best applicant based on his or her KSAs and qualifications relative to position requirements, while meeting legal requirements which prohibit any type of

Copyright © 1999 Jeff S. Bowman and Kiyoe Harada

discrimination. However, studies have shown discriminatory selection decisions (Singer, 1986; Waldman & Avolio, 1986), particularly age discrimination (chronological age) taking place among school organizations, during the selection process, specifically during the screening phase. That is, older teacher applicants, who have KSAs and considerable experience, tend to have difficulty in getting positions, regardless of their teaching performance and qualifications (Young & Allison, 1984; Young & McMurry, 1986). If competencies and KSAs of school principals contribute to selecting highly qualified teachers, and if selection decisions principals make are not based on applicants' professional credentials, it is important to examine whether a selection decision might be interfered with by age discrimination and what might cause these behaviors by school principals during the selection process.

Purpose of the Study

The purposes of this study are to investigate (1) whether older elementary school teacher applicants are discriminated against during the screening phase of the selection process, (2) whether ages of principals evaluating teacher applicant materials during the screening process are influenced by applicant age information, and (3) to provide possible HRD solutions to improve the performance of the principals in the teacher selection process. The study investigates the following hypotheses, which are derived from Social Distance Theory (Bogardus, 1925) and the Attraction-Similarity Paradigm (Byrne, 1971). In these frames, age is conceived as a stereotype perception, as well as a shared similarity. Directed hypotheses were used because specific effects were expected to occur.

> H_{a1}: Younger hypothetical applicants for an elementary school teaching position will be rated higher on both dependent variables by elementary school principals than older hypothetical applicants will be rated on both dependent variables by elementary school principals.
>
> H_{a2}: Younger elementary school principals will rate hypothetical applicants for a teaching position higher on both dependent variables than older elementary school principals will rate hypothetical applicants for a teaching position on both dependent variables.
>
> H_{a3}: Older elementary school principals will rate older hypothetical applicants for ateaching position higher on both dependent variables than younger hypothetical applicants, and younger elementary school principals will rate younger hypothetical applicants for a teaching position higher on both dependent variables than older hypothetical applicants.

Literature Review

Early selection studies, termed "macroanalysis," attempted to establish the reliability and validity of the interview and its relationships with criteria, such as intelligence, cognitive tests, level of sociability and sense of humor. These criteria were considered to predict future performance. More recently, interview methods have been modified (e.g., semi-structured and structured interviews), which has resulted in the improvement of the validity of the interview. However, questions still remain about the interview, relative to its power of predictability for future on-the-job performance (Dipboye, 1992;Wagner, 1949). Later research studies, termed "microanalysis," have focused on the whole selection process, identifying factors related to decision-making in each phase. More recently, research has focused on the screening and interview phases (Singer, 1986; Young & McMurry, 1986). These studies have found that non-job-related factors, such as race, sex, age, stereotypes, and disability status, indirectly affect selection decisions. However, none of these characteristics are directly job-related. Therefore, if any of these characteristics influence a selection decision (hiring, promotion, transfer, training, retirement), that decision will be illegal, unless there is an acceptable job-related reason for the discrimination.

Federal legislation, such as Title VII of the Civil Rights Act of 1964, The Age Discrimination in Employment Act of 1967, The Vocational Rehabilitation Act of 1973, and the 5th and 14th Amendments to the U.S. Constitution prohibit discrimination in any job situation, relative to specific human characteristics (Young & Ryerson, 1986). This legislation and implementing guidelines from federal and state agencies created "protected classes" of individuals and violation of these statutes and guidelines can lead to federal or state prosecution and litigation against specific companies, government agencies, school districts, and schools.

As employees or job applicants get older, prospects for new jobs or significant promotions are perceived to decrease (Waldman & Avolio, 1986). Some studies focused on whether or not management decisions relative to

promotion, training, and physical capability, were influenced by age of applicants (Lee & Clemons, 1985; Rosen & Jerdee, 1976). Singer (1986) studied age as a stereotype perception relative to specific occupations, including accountants, university academics, police officers, medical doctors, and computer scientists, using hypothetical old and young candidates. Results indicate old applicants were not selected, regardless of their performance and their qualifications.

Research concerning age effects on selection decisions has not been limited to the private sector. Research in teacher selection suggests that discrimination takes place during the selection process, particularly, the screening and interview phases (Johnson, 1976; Young & Allison, 1982; Young & McMurry, 1986). Johnson (1976) conducted the first published study that showed possible age discrimination in teacher selection. He investigated relationships between teacher applicants' age and selection decisions. Results indicate principals and administrators prefer younger applicants to older applicants. Young & Allison (1982) investigated the effect of applicant age and teaching experience on selection. Teaching experience was varied by years; none, 3 years, and 8 years, and two ages (29 years and 49 years) of hypothetical applicants were manipulated. Results showed that regardless of years of teaching experiences, school principals and superintendents tended to select younger applicants. In succeeding studies, Young, in collaboration with other investigators, expanded the scope of his studies, including factors such as specific focal positions, professional qualifications, gender, and level of applicant skill obsolescence (Young & McMurry, 1986).Results show that age of the applicants, either alone or in combination with other factors, influenced rating scores during screening. The older applicants were rated lower than the younger applicants. Studies have focused on age as a factor in selection decisions, but not on reasons why age could be a factor.

Other research streams have attempted to determine what underlying influences affect teacher selection decision processes. In the literature, two theoretical models; (1) social distance theory and (2) attraction-similarity paradigm, have contributed to the studies in the selection process. Social distance theory, first put forth by Bogardus (1925, 1967), attempts to explain interpersonal relations from a cultural perspective. Social distance is based on the levels of comfort members of a culture experience relative to outsiders and is determined by various factors, such as race, religion, nationality, occupation, gender, educational level, etc (Bogardus, 1925; Triandis & Triandis, 1967).

The social distance theory suggests that people work more comfortably with co-workers when they perceive their social distance to be short (Rand & Wexley, 1975; Reis, 1996). Social distance characteristics within cultures or organizations have been shown to create stereotypes related to specific factors such as age or gender. A stereotype creates perceptions that influence the way people evaluate, react, and interact with others. An age stereotype perception can lead to discrimination when people make a decision about older people, not based on individual capabilities (Singer, 1986).

Another theory applying to selection research is the Attraction-Similarity Paradigm, developed by Byrne (1971), to explain interpersonal dynamics within organizations. This paradigm suggests that people who share common characteristics tend to be attracted to or perceive themselves to be similar to each other. Four characteristics influence interpersonal attraction and evaluation. These include: (1) need for affiliation, (2) overt physical characteristics, (3) propinquity (opportunity for close physical proximity), and (4) reciprocal reward and punishment (positive or negative aspects of a relationship-similarity or dissimilarity). Particularly, reciprocal reward (similarity) and punishment (dissimilarity) have a great impact on selection decisions (Rand & Wexley, 1975).

Several studies have investigated the influence of perceived similarity between supervisors and subordinates on characteristics, including competence, overall performance, support, judgment, and quality and number of suggestions. Results suggest that those supervisor-subordinate pairs that perceive themselves to be similar to each other rate each other higher on the factors being studied than do the pairs who perceive themselves as being dissimilar (Pulakos & Wexley, 1983). Studies in teacher selection have shown also that perceived similarity influences selection decisions between teacher applicants and evaluators, such as school principal and superintendents (Young & Joseph, 1989). These studies have had mixed results, with similarity affecting decisions in some studies, but not others. As the positive and negative perceptions about an applicant manifest themselves, through information in an application, resume, and interview, a decision-maker will discern similarity or dissimilarity with the applicant. This may have an effect on the ultimate selection decision.

Methodology

The sample for this study consisted of public elementary school principals of specific ages (39 and 59 years of age), from a midwestern state. Specific principal ages were used to amplify similarity and dissimilarity between applicant and evaluator ages, in keeping with the study's theoretical framework. Of the calculated sample size of 66 principals, determined through a power analysis, 47 useable sets of data (71 %) were obtained. Independent variables in the study are Applicant Age and Evaluator (Principal) Age. Applicant Age is manipulated at 3 levels: 39 years, 59 years, and a "No Age" Control. Evaluator (Principal) Age is set at two levels: 39 years and 59 years. This combination provides for a 3 X 2, fully-crossed factorial design.

Dependent variables are the probability of the applicant receiving an interview (10-point Likert-type scale) and the summation of responses related to 5 areas of teaching knowledge and abilities (4-point Likert-type scales). These included: (1) communication skills, (2) potential overall contribution to the school, (3) disciplinary ability, (4) potential for creating a friendly classroom atmosphere, and (5) professional growth potential (Stallard, 1990; Young & Allison, 1982; Young & Joseph, 1989). The study instruments consist of: (1) a hypothetical elementary teacher position description, based on an actual description, (2) a hypothetical applicant resume, based on an actual documents, and the Applicant Evaluation Form, adapted from studies by Young, et al. (1982, 1989).

A pilot study was conducted to assess the reliability of the Applicant Evaluation Form (Cronbach's Alpha = .86) and to check the manipulation of applicant ages on the resumes (Chi-square = 69.89, df = 2, $p < .01$). Subject packets were randomized so that a principal could receive a resume, with one of three applicant ages, relative to their own age: (1) same age, (2) different age, and (3) no age indicated. Subjects were asked to review the position description and the hypothetical applicant resume and to evaluate the applicant on the Applicant Evaluation Sheet. Follow-up calls and a mailing were made to minimize non-response.

Results

Descriptive statistics for the participating principals are shown in Table 1. The elementary school principals have significant teaching and administrative experience and of these principals, 45 out of 47 stated they used resumes as part of their formal selection processes.

Table 1
Subject Descriptive Statistics

Variable	N	Mean	SD	Range
Teaching Experience (Years)	47	16.93	9.63	4-38
Administrative Experience (Years)	47	10.05	7.44	1-34
Current School	47	485.98	190.71	150-1260
Total Males	25			
Total Females	22			

Results of the univariate analyses of variance and the multivariate analysis of co-variance performed on the study data, are shown in Table 2. To compensate for unequal cell sizes, the General Linear Model was used for data analysis, at the $\alpha = .05$ level. As a result of the experimental manipulations and subsequent analyses, all of the study hypotheses, *as stated*, were rejected at the Alpha = .05 level. However, a significant main effect was detected for Evaluator Age. In terms of practical significance of the result, Evaluator age was found to account for 16% of the variance in the summated score for teaching knowledge and abilities.

Table 2.
Analysis of Covariance Results.

Source	Specific measures of Teacher KSAs			Interview Probability			Multivariate Analysis
	MS	DF	F	MS	DF	F	F
Evaluator Age (A)	35.53	1	5.35*	5.55	1	.97	3.64*
Applicant Age (B)	11.97	2	2.79	14.58	2	2.53	1.54
Mailing (Covariate)	8.24	1	1.24	12.29	1	2.13	1.04

Total		46			46		

N = 47, * $p < .05$ Evaluator Age – $Eta^2 = .16$ (16%)

This study is of limited scope, using age as a single factor, relative to selection discrimination. Results indicate that the age of the school principal influences screening decisions. A significant main effect was found at the multivariate analysis level for Evaluator (principal) Age, in terms of measures of applicants' teaching knowledge and abilities. Younger principals rated applicants lower on this dependent variable than did older principals, regardless of the age of the applicant. No significant main effect was found relative to probability of an applicant receiving an interview. Based on these results, none of the hypotheses, as stated, were supported; age discrimination was not observed in the study. However, further analyses shows that, in comparing younger versus older principals in terms of ratings on measures of teaching knowledge and abilities, for younger and older applicants, principals of both ages rated younger applicants higher than older applicants. These findings show that age discrimination *could possibly* occur during the screening phase. This implies that stereotype perceptions that may be held by the elementary school principals might interfere with the screening decisions. To answer this question, future inquiry is necessary.

The nature of the main effect indicates a significant relationship between Evaluator Age and taking consideration of applicants' professional credentials (teaching knowledge and abilities). Younger principals tend to give less consideration to the professional credentials of both younger and older applicants, preferring, instead, to rely more on the interview. Castetter and Young (2000) provide a caution that selection is often seen as a single event, mostly the interview. If the interview is valid to select the best person for the job, nothing more need be said. However, studies have already shown that discrimination is most likely to occur during both the screening and interview phases of the selection process (Reis, 1996; Young & McMurry, 1986). These results suggest that younger principals should take more consideration of job-related information from applicants during screening and should prepare interviews based on job-related information and professional credentials.

Implications to HRD Issues

The results of this study raise critical issues relative to selection behavior of school principals at the screening and interview phases of the selection system, where selection decisions are most likely to be interfered with by age discrimination. In this regard, the performance improvement of school principals and the selection system is critical to bring a high quality of education into a school. To improve performance, Swanson (1996) states that performance diagnosis, a systematic method to identify a workplace problem and the desirable performance at three levels of performance: organization, process, and individual, is the first step in a performance improvement process. By applying this concept, performance improvement in teacher selection, for elementary school principals, can be provided at the screening phase of the selection process. This section focuses on providing critical performance factors that can help school principals diagnose their performance during the teacher selection process. The performance diagnosis process in this paper involves four phases: (1) articulating an initial purpose, (2) assessing performance variables, (3) performance measures, and (4) performance needs.

Initial Purpose

An initial purpose of performance improvement, for teacher selection during the screening phase, can be identified through examination of problem indicators, types of performance issues, and the target level of performance. Indicators of performance problems include a lack of independence between recruitment and selection, relationships with the board of education and the teacher 's unions, a lack of resources (selection tools and administrative assistance), inconsistencies between job descriptions and position requirements, and misapplication or non-application of selection techniques (Castetter & Young, 2000). Based on these indices, principals should be able to classify performance issues into (1) present problems, (2) improvement, and (3) future requirements, to be examined. The ultimate goal is the improvement of the quality of education in a school; therefore, a performance issue in teacher selection, for school principals, can be classified as improvement. This type of performance issue requires an internal expert, with cooperative efforts. The performance indicators discussed previously involve the three levels of performance: organization (school), process (selection), and individual (principal). However, considering that responsibilities in teacher selection (the entire process and decisions made) require principals to have high competencies and KSAs, and that they are also involved in establishing employment policies and school missions/goals, targeting the individual level (principals) of performance improvement is inevitable for the improvement of teacher selection.

Performance Variables

To assess performance at the screening phase for individual principals, performance variables in Table 3 provide a broad perspective in diagnosing performance. By examining these variables, the principals can identify and understand performance problems and interrelationships among categories at organizational and process levels.

Table 3. Performance Diagnosis Matrix for Teacher Selection Variables

	Organizational Level	Process Level	Individual Level
Mission/ Goal	Fits between Mission/ goals of school and selection.	Goals of selection processes allow principals to attain organizational and their missions/goals.	Congruence between professional mission/ goals and those of individual principals.
Systems Design	Structure and employment policies support desired performance.	A systematic and rational selection process operated independently from other systems.	Roles and responsibilities in selection support principals to achieve their desirable performance.
Capacity	Leadership, funds, culture of the community and the school, and legal requirements to select highly qualified applicants.	The selection process contains all critical factors, such as criteria, timeliness, tools, and administrative resources.	The individual principal's mental, physical, and emotional capacities to carry out tasks in selection.
Motivation	Employment policies (reward systems) foster desirable performance.	All necessary required teacher applicants' information, such as references, an application form, certifications, etc..	Motivation to attain high performance and desire to select qualified personnel into a school.
Expertise	Establishing personnel planning and personnel development programs.	Expertise development and its process responding to any change in selection (legal & position requirements, external labor market, etc.).	KSAs, experience, and competencies of individual principals. Knowledge of teaching positions in the school.

Performance Measures

According to Swanson (1996), specifying performance measures by identifying the related output units of performance at organizational, process, and individual levels, is imperative to change to improve performance. This phase involves three stages: (1) identifying outputs for performance levels, such as the number of highly qualified teacher applicants (school), adequate applicant information and data collected (process), and screening decisions for future interviews (principals). Actual units of performance measures can be the following: (a) time (how soon a position needs to be filled), (b) quantity (how many applicants applied for each vacant teaching position and different types of selection tools available), and (c) quality (highly-qualified applicants, reliable information from applicants, and principal's competencies and KSAs in selection).

Performance Needs

Determining performance needs helps specify needs and interventions for performance improvement, relative to organizational, process, and individual levels. The taxonomy of performance lays in two categories: maintaining the system and changing the system. The results of this study have already shown that quality education in a school can be a function of the ability to identify and select higher performers by individual school principals, through the selection process. The selection process is considered as a series of decisions (Castetter & Young, 2000), and these decisions should be based on teaching credentials and legal requirements. However, school principals sometimes take less consideration of applicants' teaching credentials and are influenced by age-related perceptions, which is implied in this study. However, school principals' decision-making behaviors should be improved to bring quality education into their schools. In these respects, changing the system to advance school principals' competencies and KSAs, as well as improving the selection method, process, and system to a better state or quality would best fit the purpose of this study.

Contribution to HRD Issues in Performance Improvement

Diagnosing school principals' performance has been discussed in this paper, based on a research study in teacher selection and age discrimination. This section summarizes issues in performance improvement for school principals. The diagnosis of performance improvement model contains the four phases: (1) the purpose, (2) performance needs, (3) performance variables, and (4) measuring performance, and each phase has provided particular elements for improvement. School principals have the most difficult position in a school, when solutions to issues rely on their performance improvement, because they are at the top of the organization. Even though numerous studies have focused on teacher applicants, selection methods and processes, there has not been adequate investigation of selection behaviors, specifying school principals. In this regard, this paper is considered to be a challenging study, which provides some insights into performance technologies.

Based on HRD issues discussed through this study, using information from the diagnosis phase should assist elementary school principals in understanding elements for performance improvement. In addition, performance technologists can identify types of interventions to solve performance problems at the organizational (school), process (selection), and individual (principal) levels. However, the results of this study specify general selection behaviors among school principals. In other words, it is difficult to assess actual numbers for performance improvement by applying the diagnosis model to only one small set of data. Therefore, the study focuses exclusively on identifying performance factors for principals and discusses them in the selection context. More importantly, as mentioned previously, this study contributes to expand the domain of HRD issues and performance improvement, specifically in relation to school organizations and school principals with their decision behaviors.

Partnership Research: Ensuring More Useful HRD Collaborations

Ronald L. Jacobs
The Ohio State University

This paper addresses the question of how to bring HRD research closer to practice through partnership research. It is argued that most HRD research has limited impact on practice because research problems are usually generated devoid of a practice context, which is a clearly undesirable situation. The paper presents the need for partnership research, a process for doing partnership research, examples of partnership research studies, and issues in doing partnership research.

Keywords: Research, Partnership, Collaboration

This paper focuses on making HRD collaborations between researchers and practitioners more useful through partnership research. Usefulness here means that the collaboration achieved the dual goals of addressing both an immediate organizational problem and extending the bodies of knowledge that support the HRD field. From this perspective, partnership research has importance to all segments of the HRD community, but it has particular importance to those HRD researchers and reflective practitioners who seek to work together to help improve practice, which is the ultimate test of the research. Simply put, effective practice depends on rigorous research. Partnership research is defined as the process of improving HRD practice through research (Jacobs, 1996; 1997). Numerous studies have been reported in the literature that can be classified as being examples of partnership research, including Jacobs and Moore (1998), Jacobs, Jones, and Neil (1992), Jacobs and McGiffin, (1987), among others. However, partnership research remains an emerging concept in the HRD field.

This paper has four major purposes: 1) discuss the need for considering partnership research, 2) describe a process for doing partnership research, 3) discuss examples of partnership research projects, and, 4) discuss issues related to doing partnership research.

The Need for Partnership Research

HRD research is now close to its limits in terms of influencing practice. In spite of increased research activity in the field, few advances in practice have been grounded in research. Previous authors have generally sought to address this issue by emphasizing the importance of integrating HRD research and practice (Leimbach & Baldwin, 1997) and reminding us of the need to have practice become more theory-based (Swanson, 1996), information which was clearly needed at the time. Yet, there is a lack of specific guidance on how to change the present situation. To some observers, the issue is not whether there are sufficient numbers of collaborations between HRD researchers and practitioners. Indeed, many examples of such collaborations can be found both those reported in the HRD literature and those described by HRD graduate programs. Rather, the issue focuses on the nature of most HRD collaborations. That is, merely having researchers and practitioners work together on projects does not necessarily ensure that both scholarly and practical contributions will result from the effort. As such, there is a need to consider alternate approaches to HRD collaborations.

As stated, partnership research seeks to improve practice through research. Underlying partnership research is the principle that practice will be enhanced when it is based on rigorous research. But, that research should be linked back to the practice. Thus, the present research-to-practice model seems largely inadequate and incomplete. Under this approach, too much research, especially dissertation research, is conducted devoid of a practice context at the beginning. The data may have been gathered in an organizational setting, but the research has little or no meaning back to that organization. The organization often exists as a matter of convenience to gather the data, not as an equal partner in the process. Instead, partnership research suggests a practice-to research-to practice model. The research comes from practice, and the results are directed back to practice. To be clear, partnership research is not about any particular form of research, such as the paradigm, theory, or methods used. Nor is partnership research meant to supplant action research as a means to guide on-going practice. Rather, partnership research suggests that HRD practice should play a more prominent role in determining HRD research problems. In partnership research, HRD practice becomes antecedent to research, whereupon research problems are drawn from

Copyright © 1999 Ronald L. Jacobs

872

issues that arise in the practice setting, based on the interests of the researcher and, of course, on the needs of the organization. As a result, partnership research suggests shifting the emphasis for identifying research problems.

The literature on research in adult education and human resource development suggests that several sources of information might be used to identify research problems. Unfortunately, none of the references emphasize the one source of information that influences research the most, and becomes the ultimate recipient of the research, namely practice. For example, Merriam and Simpson (1995) include practice as one source of information in their discussions, but they give it no special treatment relative to the other sources. The point here is that practice should be viewed as the major source of information for identifying HRD research problems, such that practice becomes part of the research process. This may be true whether the HRD researcher is actually involved in the practice or is observing the practice firsthand. Unless the research problem is grounded more from practice at the onset, the research will unlikely have much relevance to the practice in the long run.

Partnership Research Process

Table 1 presents the various steps of the proposed partnership research process. The process assumes that researchers and practitioners come together, at least initially, to serve the practitioner's organization in some way. This assumption provides the practice context from which research problems can be subsequently identified. The process also assumes that each partner should have a stake in the outcomes of the collaboration, even as the outcomes change over the course of the collaboration.

Table 1. Partnership Research Process

1. HRD researcher seeks-out practitioner partners to meet academic, scholarly, and professional development goals. HRD practitioner seeks-out researcher partners to meet their organization's needs.
2. Contract negotiated to determine the outcomes of the HRD collaboration, including a statement that suggests the possibility of doing research as part of the collaboration.
3. Project context analyzed continuously to identify potential research problems, based on interests of the researchers and the perceived needs of the organization.
4. Value of the research problem confirmed through discussions with client and subsequent review of scholarly literature.
5. Contract renegotiated to include research as a committed activity of the collaboration, including a listing of expectations and outcomes of both researcher and practitioner.
6. Results disseminated based on contract expectations, such as: presentations to management, summary memos, manuscripts for publication, or dissertations.
7. Implications of the research are synthesized and its usefulness determined for the organization and for the field as a whole.

The process shows that HRD researchers and practitioners have different reasons for wanting to engage in collaborations. Clearly, anyone who has attempted to do R&D in organizational settings knows this statement to be true. Indeed, the underlying goal of most HRD researchers is to generate information that adds to, disputes, or in some way contributes to HRD theory and practice. That is, the goal is to identify principles that apply to similar instances of HRD practice, such as, say, finding out the critical factors to consider when designing organizational mentoring programs. At the same time, the practitioner's goal is to generate information that helps solve an immediate problem or brings additional insight onto an issue, which enables someone to make a decision.

From the initial contacts, a contract is usually negotiated specifying the nature of the collaboration. In reality, few HRD collaborations ever start out as a research project from the beginning. However, the possibility of doing

research later on -- under certain mutually agreeable conditions – should be specified in the contract. Perhaps the most difficult aspect of the process is the step whereby the researcher continuously looks out for research opportunities and generates research problems from the opportunities. How to extrapolate a research problem from a practice context remains somewhat subjective, since researchers will likely look for different cues, based on their own scholarly interests. The research problem should be confirmed with the practitioner, since the practitioner should value the results as much as the researcher. In other words, the practitioner should know at the beginning the planned use of the results.

In the best case, the dissemination of the results should be a shared activity. That is, the researcher and practitioner should each support each other in accomplishing their outcomes. Yet, perhaps the most crucial step in the partnership research process is the final one, in which the implications of the research are derived for the benefit of practice. For the researcher, the challenge becomes how to translate the results of one study, or a series of similar studies, into useable principles for practice. For the practitioner, the challenge becomes how to change present practice in response to the research. Case studies have been helpful tools in both instances.

In truth, the proposed process represents a synthesis of the author's own experiences in developing HRD collaborations, not necessarily the ones that all researchers will experience. As a result, parts of the process will likely differ as collaboration opportunities differ.

Examples of Partnership Research

To be certain, no generally accepted criteria exist for identifying partnership research. Thus, following five criteria were drawn from the partnership research process, including: 1) the research study emerged from an on-going HRD collaboration; 2) both partners in the collaboration perceived the research problem to have value when the research was proposed; 3) the research was conducted parallel to the other activities of the collaboration; 4) both partners achieved at least some of their expected outcomes for the research; and, 5) attempts have been made to move the results from the immediate setting. Table 2 summarizes five case studies that have been determined to meet these criteria.

In truth, not all the examples meet the five criteria to the same extent. However, the purpose of presenting the examples is to show the range and nature of potential research projects.

Issues for Doing Partnership Research

Clearly, doing partnership research adds another level of complexity to an already difficult process, namely the research process. Yet, if the HRD field is to continue to provide benefits to organizations and individuals as promised, then research must have greater influence on practice. And partnership research seems instrumental for achieving that goal. Thus, the added difficulty caused by partnership research seems unavoidable.

Five issues seem important to discuss related to doing partnership research. First, there is the observation that not all attempts at partnership research are successful. Indeed, partnership research is not always successful, even when both partners make all efforts otherwise. At one level, success depends on the level of trust and respect between the partners. Even so, there is always the possibility that a suitable research study simply cannot be found within the practice context. Certainly, HRD collaborations cannot be judged in terms of their research productivity alone. But, there is no doubt that partnership research involves greater risk, especially for the HRD researcher who is investing resources with that promise in mind.

Second, there is the need for researchers to be more careful in selecting their practitioner partners. In a sense, good HRD collaborations may occur when the practitioner knows something about research. Those practitioner who have virtually no experience with research may not be a good choice in all instances. In fact, some inexperienced practitioners may agree to become involved in research, but in fact have little knowledge and the imposition this may make on their organizations. Third, as noted, the most difficult part of the partnership research process is extrapolating research problems from the practice context. Some HRD researchers apparently have skills to do this with some degree of success. However, the skill has not yet been systematically analyzed, assuming that the skill can be successfully analyzed, and then taught to others, perhaps during graduate courses in research. At best, extrapolating research from practice remains a worth notion, with uncertain behavioral components.

Fourth, there is the issue of maintaining the commitment to the other partner's outcomes, even when one set of outcomes has been accomplished. As stated, partnership research assumes that effective practice depends on

rigorous research. Yet, it is the fulfillment of the outcomes that ultimately gives partnership research its potential power to influence practice. If the respective outcomes are not achieved for each partner, then the collaboration cannot be judged as a success. In truth, however, there is the natural tendency for one partner or the other to leave the collaboration prematurely.

Finally, there is the issue of the proper relationship between researchers and practice. It is suggested that HRD researchers know practice better or at least seek to become more accomplished practitioners themselves if they are not already. Paradoxically, if HRD researchers are not effective as practitioners, then it is possible that their own research opportunities will be affected detrimentally. In effect, HRD researchers must view their own research agenda as being linked with the various practice opportunities that they take on. Research agendas may be influenced and guided by practice, as much as practice influences and guides research.

Conclusion

This paper introduces partnership research as a point of discussion among HRD researchers. The need to consider partnership research is based on the need to have research and practice become more dependent upon each other. Merely encouraging groups of researchers and practitioners to recognize this need does not seem sufficient for change. Partnership research represents an approach to that alters how researchers and practitioners collaborate together, for the broader purpose of improving the contributions of the HRD field as a whole.

Table 2. Partnership Research Examples

Organization	*Purpose of Collaboration*	*Organization Question*	*Research Problem*	*Outcomes*
International Recruiting Organization	Evaluate distance training program	Which version is more effective for training newly-hired recruitment specialists?	What is the relationship between the two training versions system and performance?	• Dissertation • Research funding • Evaluation report

A Discussion of the Methodological Appropriateness of Research Represented in the AHRD Proceedings - A Strategic Perspective For Journey Management

Christopher R. Hardy
INNOLOG, Inc.

The intent of this meta - study was to examine the methodological appropriateness of the types of research represented in the 1997 and 1998 AHRD Proceedings. It was intended to provoke thought and debate in regard to the strategic needs of HRD and could be useful in a reflective critique of ourselves, our institutions, our body of knowledge, and where we are going (journey management).

Keywords: Research Methods, Meta-Study, Strategic

Theoretical Framework and Expectations

Toward contributing to the academy's mission of *leading HRD through research*, the intent of this descriptive study was to examine the types of research as represented in the 1997 and 1998 AHRD Proceedings and the implications to the field from a strategic perspective. By presenting this analysis at the conference, I hope to provoke a scholarly debate, discussion, and dialogue as to the relative merits and appropriateness of the alignment with the general needs of the field. Additionally, to help frame the results of this study I constructed a general life cycle meta-research model collectively derived from Kerlinger (1986), Isaac & Michael (1990), Best & Kahn (1989), and Nunnally & Bernstein (1994). I used this strategic level construct for my assessment and evaluation of the results of this study (Figure 1).

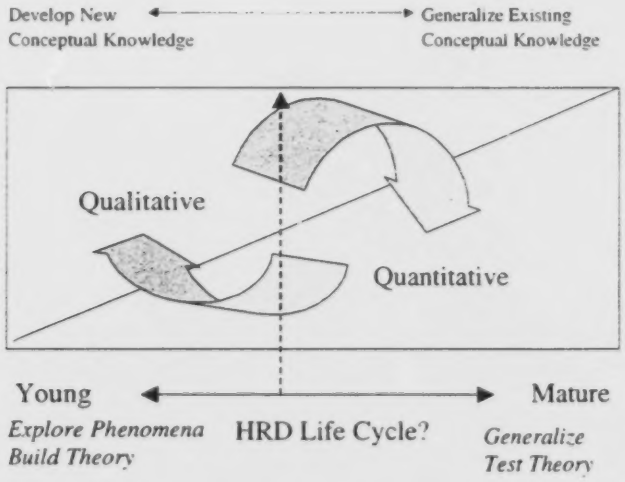

Figure 1. HRD Research Assessment and Life Cycle Model.

Research is a process of reflective inquiry; its components, *qualitative and quantitative*, are not mutually exclusive but can be viewed as inter-dependent (Best & Kahn, 1989 and Kerlinger, 1986). For example, qualitative research methods are helpful in developing new conceptual theory and better understanding the relevant aspects of

Copyright © 1999 Christopher R. Hardy

the social realities involved; quantitative methods can then be used to test and generalize this conceptualized theory, but the generalized results can in turn drive the need for further development of theory which to be employed must again be tested. This qualitative/quantitative linkage portrays one aspect of their interactivity and inter-dependency. Additionally, hybrid designs (utilizing the strengths of both types) can supplement and compliment the strength of design and the general robustness of the findings. But even in a hybrid study, ultimate usefulness is dependent on the comparative relationships (or lack) of the results, the researcher's conclusions, and its contribution to the body of knowledge. To fulfill the complete needs of a field, one must develop theory and test (evaluate, validate, and generalize) theory. Though not exclusively so, qualitative and quantitative research designs generally tend, due to their relative strengths and weaknesses, to functionally align their general utilities to theory and test, respectively. We need them both to complete a line of research.

But if one takes a strategic view of the proportional amount each method is being applied across our field and their aggregate, methodological appropriateness, a useful benchmark is the relative maturity of HRD as a discipline. In this regard, a mature field of study and practice with well established theoretical bases would tend to generate an aggregate balance of both types of research or maybe even an over-representation of quantitative studies to help test, evaluate, and generalize established theory linking it to practice. On the other hand a relatively young discipline, as psychology was in the early 1900's, would probably expend the majority of its collective energy developing a body of theory. If HRD is considered a fairly new discipline, I would expect to find more qualitative than quantitative methods being used in a general survey of the field. However, if I accept Gilley & Eggland's (1989) assessment and characterization of HRD as an emerging forty year old multi- discipline, I would place HRD somewhere in the early middle of figure 1 above and its depiction of HRD's relative life cycle. As such, I would expect a relative balance of the types of research methods depicted on the model.

I could go on to posit that even if considered a relatively new field, many of HRD's theoretical frameworks have strong and pronounced historical and/or parallel threads from other disciplines. As a result, much of HRD's theoretical bases are derived. (Figure 2).

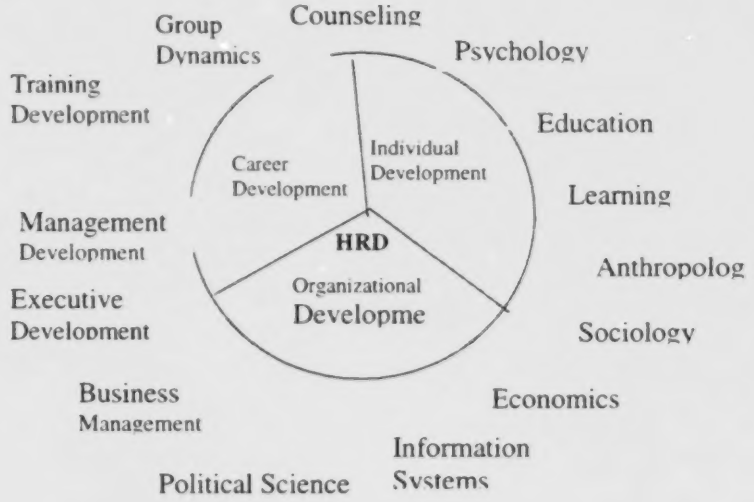

Figure 2 HRD's historical and parallel threads.

But from a maturation perspective, many recent HRD theories are not new, but only new within the context of considering the human capital issues driven by new business and learning challenges brought about by the information age with its profound implications on our societal and business processes and systems. The same wine (s), different bottle and label (and perhaps different combinations, distillations and consumptions). However, HRD still can be viewed as unique -- due to the integration of these threads into the fabric of our theories and practice.

In order to make a value judgement (for this study) as to relative appropriateness to the field, the articles published in the 1997 and 1998 AHRD Proceedings were categorized demographically and by general method of research. I believe that these articles are representative of and reflect the relative currency of thought and research being generated by our institutions, organizations, students, faculty, and practitioner. Previously, others have attempted to explore the typography of research appearing in earlier AHRD proceedings measuring the appropriateness to the needs of the field. Arnold (1996) conducted an earlier study of the 1994 and 1995 Proceedings and found a majority were descriptive in nature. As a follow-on supplement, van Hooff and Mulder (1997) continued the intent, but deviated in focus using research formats instead of methods for categories for the year 1996. However, both of these earlier studies did recommend additional longitudinal research should continue in the assessment of the methodological appropriateness of the types of research being generated by the Academy (Arnold, 1996; van Hooff & Mulder, 1997). My current study adds to their efforts, but more deliberately focuses upon the broad generalizations of *qualitative and quantitative* as a scale of methodological appropriateness in comparison with the longitudinal needs of HRD. These general categories, qualitative and quantitative depicted in figure 3 below, I found could be used to estimate the possible relationships between the relative life cycle of a discipline and the products of its endeavors. Though precise conclusions are not argued (nor advocated), this life cycle framework could be useful in a critique of ourselves, our institutions, our body of knowledge, and where we are going (journey management). *Finally I believe that, from a strategic perspective, the how determines the what or the* methodological appropriateness helps define and is irrevocably linked to the results.

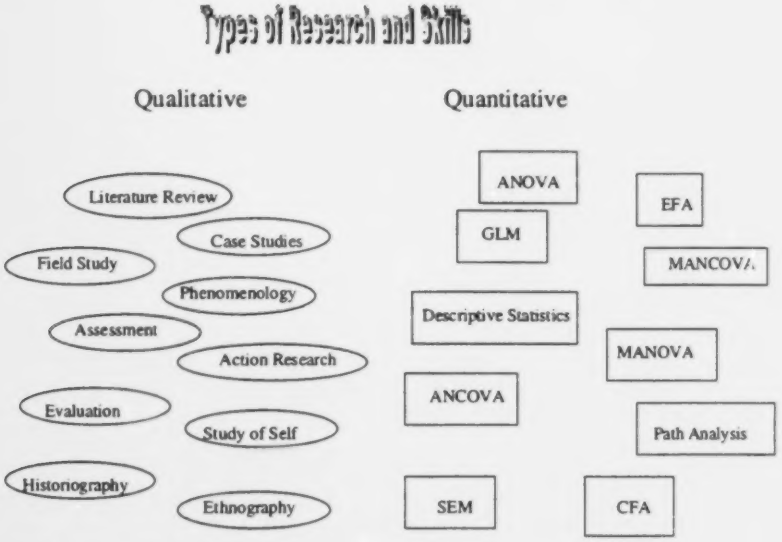

Figure 3. Types of research and skills.

Questions For Investigation

This study focused on the type(s) of research as characterized and grouped above and represented in recent (1997 and 1998) conference proceedings. From a strategic perspective, it questioned the proportional methodological appropriateness. The following research questions provoked this study:

1. Is the distribution of the types of research represented in the AHRD adequate and appropriate for our strategic needs?
2. If these results of this study can be generalized, what are the implications to the future of HRD as a body of knowledge and practice?

Method

Though Arnold (1996) analyzed 1994 and 1995 data, I felt that the last two years of research papers published in the proceeding would be a more stable and valid sample from which to base further inquiry and dialogue. As a early member of the AHRD, I have witnessed a marked improvement in the quality and the scholarship in the proceedings. Because of this apparent positive trend, I felt more comfortable with the representativeness of the data for 1997 and 1998. However, van Hooff & Mulder's (1997) results (123 papers) derived from the 1996 proceedings were useful for comparison.

Sample and Design. I examined and analyzed 241 papers - samples of 117 from the 1997 and 124 from the 1998 AHRD proceedings. Additionally, I compared results from van Hooff and Mulder (1997) derived from an additional 123 papers - totaling 364 representing the last three years.

Data (paper) categorization. The overarching categories of Qualitative and Quantitative were used to define and describe types of research. Figure 3 above depicts the relative groupings of research characteristics and methods comprising the two general categories. Papers were reviewed and sorted by research categories and selected demographics. Analyses were conducted using constructed visual representations of the relative distributions and descriptive statistics. The following target variables (Figure 4) were used in data collection and subsequent analyses:

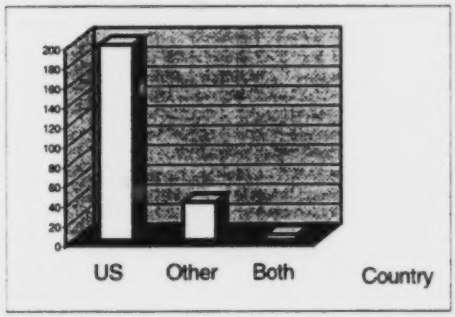
- Gender:	Female or Male or Both (Team)
- Sponsoring Agency:	Academic or Industry or Both
- Intended Focus Area:	Theory or Practice
- Country:	US or International or Both
- Type of Research:	Qualitative, Quantitative, Both, Multivariate

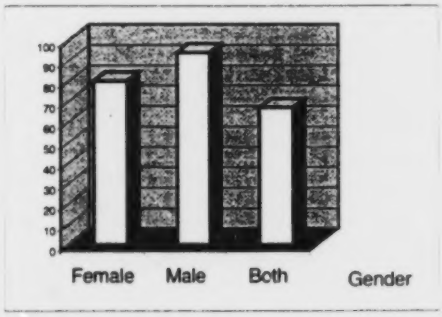
Figure 4. Research variables. Multivariate research papers were submitted by only 5 institutions represented at the AHRD.

Coding and Distributions. When apparent variable codings were determined as proclaimed within the research design of the majority of the papers. It should be noted however that I liberally coded quantitative or both when observing any quantification in the papers. A coding of multivariate research was more stringently awarded consistent with Tabachnick and Fidell (1989). Demographics of gender were determined by gender apparent first name (this procedure could of course create some error in the gender specific results). Other categories of research focus and national representation were also somewhat subjective judgements. Sponsoring agency category, academic or industry , was coded as stated in the individual paper reviewed. Frequency distributions were used.

Results

Results were graphically compared to the constructed life cycle research model. The 1997 – 1998 proceedings





yielded the following distributions in figures 5, 6, and 7.

Figure 5. Country and gender demographics. Most of the papers were predominantly from the United States, some 196 vs. 38 from other countries. The break out by gender was relatively balanced (80 Female, 94 male, and 67 both).

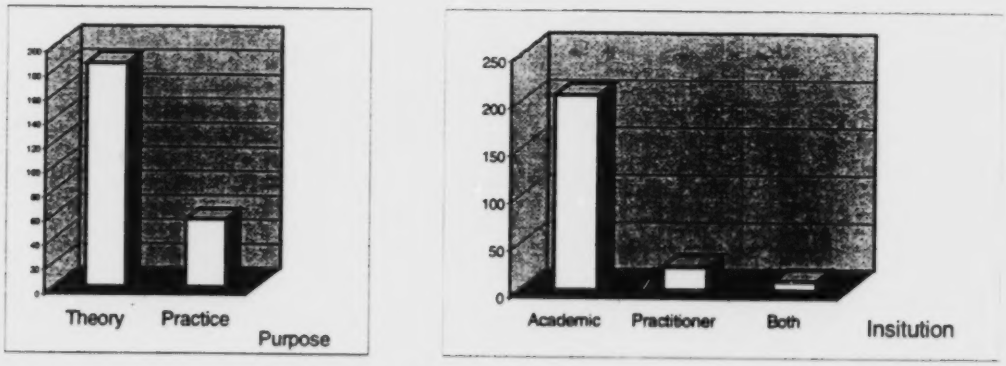


Figure 6. Research purpose and represented institution.

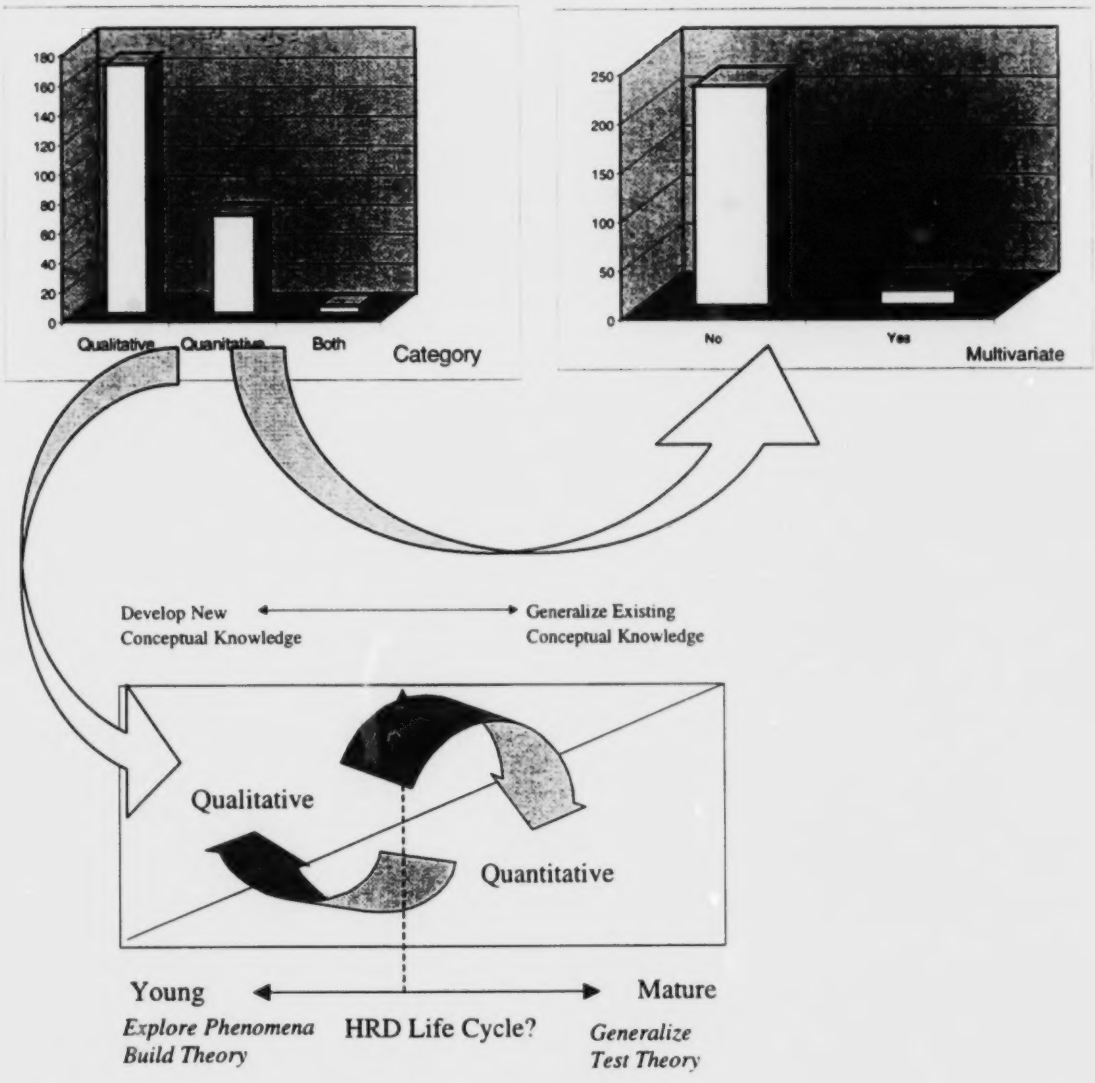

Figure 7. Results In regard to types of research.

The majority of the papers above were qualitative (169 versus 67 quantitative). Of the 241 total and 67 quantitative, only 16 were multivariate in design.

The orientation of most of the Papers focused more on theory than practice (185 theory and 56 practice). Institutions represented were academic verses industry/practitioner (206 to 25 - with 10 as partnerships between academia and industry).

Discussion In Regard to the Limitations of the Study, its Implications for Human Resource Development, and the Important Questions Remaining.

In this study (and in van Hooff & Mulder's, et. al.), there was a pronounced preference evident for qualitative methods of research. If these results reflect the research interests and products for our field, then an inordinate level of effort, resources, and investment are expended using qualitative methods. This could suggest that HRD needs to define itself and develop its theory and body of knowledge. This overrepresentation of qualitative methods could be interpreted as a fulfillment of the strategic need for intensive studies of background, current status, and environmental interactions of given social units, individuals, groups, institutions, or communities to better understand the social realities characterized by the emergence of a relatively new discipline (Issac & Michael, 1990; Kerlinger, 1986). Even if relatively new as some will argue (McLean, 1998) - though others will counter citing the abundant historic theoretical threads from education, psychology, organizational development, group dynamics, adult education, and business processes and management literatures, HRD as a forty year old discipline would benefit from a more balanced level of effort and research (Gilley & Eggland, 1989). More methodologically balanced research methods would allow for the generalization and operationalization of theory. Only then can we effectively deploy and link theory to practice (I would hope that we are not so much in our infancy that we need to continuously develop an endless stream of tentative hypotheses after tentative hypotheses for others to test at some future date). Additionally, advocating more quantitative research studies, especially multivariate analyses – *only 16 in two years of proceedings from five of our major institutions*, are methodological appropriate to push the field from theory to practice (and provoke subsequent follow-on inquiry - both qualitative and quantitative). We need both methods in abundance to address the full needs of HRD as a unique discipline.

Gary McLean, Editor for the HRDQ, indirectly summarized my own stance, though not deliberately, on this issue, "*Every academic field is marked by its literature*...the field of human resource development...has been well served with quality, practitioner-oriented journals an newsletters. The same can not be said of the scholarly or academic literature available to members to the profession"...he goes on to say that this situation is changing partly due to the publication of the HRDQ (McLean, 1998, p. 23-1). Strategically, an over-representation of either qualitative or quantitative methods (and the relative absence of multivariate methods) should raise a concern, unless the true needs of the field being targeted are based on some compelling rationale that demands the majority of our attention and efforts. The real question, not answered in this study but provoked by the overrepresentation of qualitative research methods used in the Proceedings, is why?

- ✓ Is HRD, as a young discipline, still lacking enough stable theoretical frameworks which would largely promote and require more qualitative developmental inquiries in a quest for definition?
- ✓ Are we still too early in our development as a discipline to generalize to the population and leverage our collective theoretical knowledge?
- ✓ Are we as a population of scholars and practitioners more interested in qualitative pursuits and generally adverse to statistics, quantification, and analytical methods?
- ✓ Do our research questions really drive our research methods or are there other reasons why HRD is overrepresented by qualitative research products and methods?
- ✓ Is there something in our cognitive style preference makeup that pre-determines our general bias toward more subjective vice analytic inquiry?
- ✓ Do we recruit faculty at our institutions with predominantly qualitative interests, backgrounds, and abilities... do we clone ourselves?
- ✓ Why do our graduate students gravitate within our programs to qualitative methods?

- ✓ Do our HRD faculty, graduate students and field practitioners have the requisite quantitative, multivariate research skills to fully test and evaluate theory?

- ✓ And finally, what individual and institutional strategies would be necessary to balance this alleged methodological inappropriateness?

Of course, the questions raised by this study are based on the assumption that the accepted papers within the 1997 and 1998 AHRD proceedings are representative in quantity and quality in regard to the distribution of research being conducted in the larger domain of HRD. However, the results of this study could provide useful insight for a brief reflective critique of our academy and the field in general, especially if viewed from a strategic perspective. If these distributions are truly representative of our field and interests when compared to the relative life cycle of HRD, it would be prudent to question the methodological appropriateness of the majority of our intellectual endeavors and investments. We must look at ourselves, our institutions, our policies, our faculties, interests and expertise, historical theoretical threads, and the relative needs of our body of knowledge – by seeking these answers we (the AHRD) may manage our journey.

Theory in "Theory to Practice": Voices of Practitioners

Wendy E.A. Ruona
University of Minnesota

Theory-to-practice is a prominent issue that is certain to affect the future success of HRD. Although many are discussing the topic, it has yet to be studied in any systematic way. A critical step in progressing on this issue is to further understand practitioners' views on theory in their HRD work. The purpose of this study was to describe and understand the experience of HRD practitioners in applying theory to practice using a descriptive qualitative approach.

Keywords: Theory-to-Practice, Qualitative Research

Human Resource Development is an applied field. Therein lies one of its most beneficial strengths and its most haunting threat. The field is driven by its practice—the interventions that are being implemented throughout organizations today. However, practice has remained the driver even as HRD's theory-base increases. Today, practice is increasingly criticized for not using theory to improve its effectiveness and for, in turn, producing shoddy interventions, fads, and unsubstantiated psuedotheories (Swanson, 1997). On the other hand, practitioners continue to criticize scholars for being disconnected from their challenges, slow in producing theory, and misdirected in the issues they address.

This issue has been increasingly discussed in HRD during the past few years. In fact, it is noteworthy that *Human Resource Development Quarterly* had an editorial on the topic once during each of the last four years (Watkins, 1994; McLean, 1995; Jacobs, 1996; Swanson, 1997) and the topic took center stage at the 1997 Academy of Human Resource Development.

Although there are quite a few key people discussing the topic, the issue has yet to be studied in any systematic way. Those who are discussing it speak from their guts, informed opinions, and informal polls of their networks. While this is valuable, it does not constitute "formal inquiry that helps us to understand and explain the meaning" (Merriam, 1998, p. 5) of the phenomena of interest.

Research and practice must be linked to ensure a stronger foundation on which the field can strengthen and be more successful in achieving its goals. It is possible that HRD professionals need new models on which to build a solid research and practice partnership. Carr and Kemmis (1986) urge us to take a praxiological view of theory and practice—meaning that theory does not stand alone only to inform practice. Rather, they are dialectically related. "They are to be understood as mutually constitutive, as in a process of interaction which is a continual reconstruction of thought and action" (p. 34). A critical step in fostering this view in HRD professionals—practitioners as well as theoreticians—is to further understand practitioners' views on theory in their HRD work.

Purpose of the Study and Research Questions

The purpose of this study was to describe and understand the experience of HRD practitioners in applying theory to practice in HRD using a descriptive qualitative approach. Specifically, this study was an effort to begin to uncover how theory and practice in HRD integrate and serve one another. To do so, this inquiry sought to understand the experience of practitioners using theory in their interventions and work. Three areas comprised the focus of the inquiry: (1) practitioners' impressions of research and theory, (2) the benefits and barriers of using theory in practice, and (3) what things are needed to enhance the theory and practice relationship (in HRD practice).

Methodology

This study used a qualitative approach with the intent to describe and interpret. This method provides a way to more fully probe the thoughts and perceptions of HRD practitioners as they relate to theory. The goal was to inquire into their opinions, hear their stories and experiences using theory in their work, and to gain some insight into the "real" world that they live in and that academics are so often critiqued for not understanding.

Five participants were selected and all were willing to describe their knowledge and experience with theory and practice. The participants were purposively chosen to foster some diversity of perspective, while still meeting a set of criteria for inclusion in the study (Patton, 1990). All participants were chosen based on these following criteria: (a) advanced degree in HRD or extensive experience in HRD, (b) active work in field of HRD for at least 5 years,

Copyright © 1999 Wendy E.A. Ruona

(c) involved in HRD work at organization(s) of over 300 people or in external consulting firms, and (d) held a position that involves a breadth of HRD work (training, OD, etc...). Three females and two males participated.

Semi-structured interviews were conducted with each participant after they had agreed to participate in the study. Each participant received a copy of 3-5 key questions that could serve as the basis for our discussion, although it was made clear that these questions would serve as only one basis for the interview. Each participant was prompted to reflect on, and raise, any issues they wanted to discuss about theory and practice in HRD. The interviews lasted approximately 1-1½ hours and were tape recorded while the researcher also took brief notes.

Analysis

Content analysis, analytic deduction, and a small degree of constant comparative method across subjects' responses (Glaser & Strauss, 1967) were employed during analysis. The interviews and interview notes were transcribed by the researcher soon after each was conducted. All transcriptions were sorted into tables that allowed for an initial sorting and coding into key themes being discussed during the interviews. After this initial sorting, the text of each interview was studied in-depth. Key quotes, examples, and stories that were particularly poignant or demonstrative of emerging themes were highlighted and color-coded. Finally, "organizer sheets" were created on a computer to assist in organizing categories of key themes that had emerged with supporting highlighted text. This was a recursive process of organizing and reorganizing information as more interviews were conducted and the researcher's understanding of the issues increased. To ensure some "dependability" (Lincoln & Guba, 1985, p. 288) of the results obtained from this data, a professor with extensive experience in qualitative research as well as a colleague were consulted to audit the trail of the research and authenticate that the results were consistent with the data collected.

Results

While three areas comprised the focus of the inquiry, a number of themes emerged. Ultimately, these were organized into four primary categories: (1) participants understanding of theory and research, (2) information about how participants judge the rigor of theory and research, (3) the perceived value of theory and research (at the individual and organizational levels), and (4) barriers and challenges in using theory in practice.

What is Theory and Research?

A basic understanding of what theory is and isn't represented a large area of ambiguity. This ambiguity was most powerfully expressed by one participant on a voice mail message as she was preparing for our interview (and later in the interview). She stated the following:

> What do you mean by theory in theory and practice? I think theory...do I operate from theory? Do you mean models? I thought of David Ulrich and the four roles of HRD...that's a model and I can see the quadrants and his components. Do you mean things like data...because when I'm working on the performance management and people rate themselves low I know to expect it because data shows that in a participative environment people are hard on themselves? So is that using theory? I don't know. Then, I think about theory and in school they say we should be doing something a certain way and is that theory? So data, advice, and models are three things I think of when I think of theory. What about best practices...is that a theory? How about trends of the day?

Practitioners interviewed for this study varied in their notions of what theory was, however most agreed that it was some sort of conceptual organizer or a model—visually memorable and model-like.

Practitioners interviewed were rather clear about the differences between theory and research. Research was thought of in terms of results. One participant stated that "research is the process to get at something" and another saw research as "validating theory—that's what I look for. When I say 'does this theory have some research behind it and what did the research show.'" Another participant echoed this response when he said:

> Research is the process by which theory results. I would argue that theory is the output of collective research. I would see that many people could provide research and over a period of time a theory begins to emerge that was sufficiently sound and that people felt was safe to adapt and reflect on to use.

For another participant, theory and research were also inextricably wedded. He explained that:

> Theory would be some kind of model for doing something based on people's good thinking...that has no real basis except it sounds good (pull out people's ideas etc...). Research is the application of theory and practice (real application) where we actually start looking at does this model help us to predict. Does this model actually do anything to really aid in getting to the outcomes?

Judging the Rigor of Theory

Although these practitioners' definitions of research and theory were aligned with what many theoreticians might say, participants tended towards less rigorous criteria by which to judge the quality of a theory and research. Most academic definitions of theory and research include a rigorous process that meets specific standards, regardless of the mode of inquiry. Practitioners interviewed here, on the other hand, used a variety of techniques to sift through the barrage of theories and models they are faced with in their work. One person admitted that there is no "high and mighty practice that I can tell you, although I sort of wish I could." The strongest thing that practitioners interviewed relied on was their own intuition, values and beliefs. This is displayed in the following quotes from participants:

- I will use the theory and put it in the brain and think about how that relates to my own experiences. If it doesn't relate at all, I will probably not use it. If it related some, I will adapt it to my own experiences. Very rare that I would take it all on board and do it as the book says.
- It's got to have face validity. I've got to know in my bones that this makes sense. Although I'm willing to read, some of these ideas sound crazy. But if the data and results are there I have to say "let me think about this a minute."

Most of the practitioners interviewed were also aware of the limitations of their intuition:

- Yes, but I'm also saying to myself that a lot of that (intuition) is based only on my experience. The theory has to overcome the intuition in some cases....my intuition is affected by built in biases.
- That said, there are certain times when now and again I'll read an article and say, "that isn't common sense to me because I've never thought about it that way." It's probably something that I haven't really thought about it, so I have to rely on something to produce some sort of response. Or, there's a level up from intuition...some sort of reflection....a sort of practicing theory that hasn't been tested out anywhere other than the fact that I've been through situations and I've then reflected on them and developed my own understanding of that.

Practitioners were proud of intuitive nature, and cognizant that their experience often lets them only grab on to things that corroborate with past experiences. Several of those interviewed recognized that they must work to keep their mind open to new ideas and theory—the ah ha's—and then p ssibly adjust their ideas and practice.

Practitioners interviewed wanted results, and use this criteria as central in screening theory. One person stated that she didn't "think of theory as something that somebody's proposing, but rather as something that someone's tried and can tell the results." Another said:

> The second strongest criteria by which we judge theory is who's doing it or who's saying it. I look at who's doing it and if they say Motorola is doing it and they have 238,000 employees and they seem to get a good response, I think, gosh, I should do what they're doing. So, if it's a Fortune 500 I kind of listen more. I look to see how long it has been around, what were the results.

This emphasis on "tried-and-true" results resonated throughout the interviews. One person stated that they know the model is sound "when it works." Another person described his process of evaluating the blockbuster hit books by Senge on systems thinking:

> Well, if people tried it and it worked, then it works. Whether he's done the due process on the academic side, I'm not going to make a deal about it. Go look, there is a bibliography, there are Ph.D. people who he is pulling from, he works at MIT, O.K. The point is that it's working.

Value of Theory and Research in Practice

Individual Value

The economist John Maynard Keynes (1936) reflected that "practical men, who believe themselves to be quite exempt from any intellectual influence, are usually slaves of some academic scribbler of a few years back." Although this divide between theory and practice seems to be a perennial issue dating back centuries, this quote reminds us that many practitioners find some degree of value in theory. This was underscored by the practitioners interviewed for this study. On an individual level, practitioners reflected that theory was necessary to "ground yourself in", thought it was something that could be counted on, and that it enhanced their credibility with their stakeholders. One person stated:

> To a certain extent it's about giving them some security in me. It gives me a certain amount of standing in their eyes. If I was to just put some recommendation in front of them and they turned around and asked me "why", then I would have more than my common sense way of doing it. Having the research allows me to cite when its been done, it provides me a safety net.

Practitioners interviewed for this study used theory and research to provide supporting evidence that what they are doing is right or to steer them in a direction. They also employed it to ensure consistency among their colleagues (especially within internal departments)—to "use shared models and theories so that regardless which one of us went into the problem we'd be using the most appropriate model or theory." In addition, most of those interviewed agreed that theory saves them time in their work. One person stated, "we're too busy doing it to think of how to do it. You can do your work or think and do your work, most of the time around here we just do our work. Theory helps us think *and* do our work."

Another distinct perceived benefit was the capacity of theory to question assumptions and mental models and force necessary reflection and thinking. One person expressed the need for theory to "prompt a discussion that enriches learning—to call into question some preconceived notions and foster exploration." Another woman stated that "theory gives me new eyes." Another individual described how theory pulls her into the future, "theory is often way out there and someone is pulling me towards something that I haven't thought of, towards a way of looking at things that I haven't thought of before."

Finally, a powerful theme that emerged from the interviewees was the role that theory can play in avoiding faddish and solely customer-focused practice that they perceived as typically ineffective and even dangerous. One person said:

> The people I have seen in practice are a grab bag, they don't have any conceptual models, what they have is a tool bag. With a tool bag, what you end up doing is bringing more and more baggage and pretty soon it's a suit case. With conceptual theory, it allows you to go with what you know and add as its necessary. For me to contribute at the business level, I need to be able to play business against not a bunch of tools, but play it against an integrated, theoretical base.

Another individual offered a powerful metaphor for this trend that he fights in his practice much of the time:

> We have to be customer-driven, but only to an extent. We can't listen to customers all the time. They come to us with their requests (those fads we all read about) and it's ridiculous! You know I don't go to a Doctor and tell them what's wrong with me and how to fix it. While we might do that to some extent, if the Doctor goes too far with our solution, we don't think that they are a competent doctor. That's what happens to HRD practitioners...we need to be customer sensitive but there's a limit if we want to maintain our competency and credibility.

Theory was viewed by most of those interviewed as beneficial towards achieving their goals of good practice.

Business Value

The business value of theory was not so heartily declared! Overall, clients and stakeholders of the HRD practitioners interviewed do not seem to value theory, and, in some cited cases, actually seem to disapprove of its

use in practice. This was exemplified in this statement from one participant who said, "I know my clients and they trust me to have expertise. However, use of theory can be over-delivery. There's always trade-offs between business specifics and clients needs and how I can enhance expertise or our solutions through tools and concepts." This was reiterated again when one participant blatantly stated that "they actually don't care a damn, they're much more interested in the 'is it going to work for me' than they are about the theory itself."

In this study, the value of using theory in practice was perceived at more the individual level than at the organizational level. One participant believed the use of theory was advantageous to organizations "because only by using the right theories and research that underpins them are they increasing their odds of actually getting success." However it was clear from many statements and examples provided by these study participants that organizations they work with trust that HRD professionals will have the knowledge to be effective and to use that expertise wisely.

Barriers

Of all the topics probed during interviews for this study, barriers to using theory in practice were undoubtedly the topic of most passion! Practitioners interviewed have all attempted to incorporate theory in to their work and have encountered many, many barriers that they were anxious to discuss.

Bad Reputation

One woman who works inside a rather traditional manufacturing company offered a story that, to her, epitomized the challenge she faces when using theory in her work:

> Theory often has, in my world, a bad connotation. The other day I was having a run-in because I suggested we pass around an 8-page booklet we put together to help the performance appraisal process be more effective....and it's based on some solid and well-respected theory. Nobody's got it! This woman I was talking with disagreed with my wanting to get it out to our managers. Why? As she stood up she said to me, "see you deal in theory and I deal in reality, and I have to clean up the messes you create."

Another practitioner interviewed for this study found that working under the guise of HRD and HRD theory was too limiting because of the reputation of each. He said, "I found myself spending more of my time selling, and convincing, and influencing. So I got out of HRD and got into business management." Then, he went on to cite examples of using very sound HRD theory cloaked in a different reputation that he felt had more respect.

Language

One significant component of the bad reputation discussed above was the language used in theory. It was unanimously and strongly critiqued for it's complicated wording and tone. One person stated that the language used in theory is "full of exclusivity and doesn't touch the human spirit." Another explained that most of the time his colleagues and employees don't even consult theory because of how complicated it is to read.

Another critique was that the talk of theory is not the lingo of business. The message from each of those interviewed is that HRD practitioners have got to speak the language of business better and speak theoretically less and less. An example was offered by one woman who recently read a proposal submitted by a colleague of her's. She said, "sometimes I read this psycho-babble stuff and I think this is just bunk! Anybody who reads this would say 'why are we paying you to do this?' It's spinning words. It was so disconnected from the world we live in."

Lack of Understanding Business and the Pace of Business

The language problem could be connected in some way to another major theme that emerged. The HRD practitioners interviewed clearly felt that theory was not connected to the demands placed on HRD practice. The problem, according to one participant, is "the slower-paced nature of academia." Academia was repeatedly criticized for not understanding the practicality of the problems out there, the need for solid, predictable outcomes/deliverables, and the pressure for application. For example, one practitioner explained:

> My problem is that someone will come to me with his issue and with my limited access to scholarly resources it can take 2-3 weeks to get the articles I want. The manager is not prepared to accept this delay! He will turn around and say 'stuff the research, let's just do it'. My cycle time to deal with problems is very short. I'm not saying that is right, but that's the reality of it.

One of the consultants stated that "business people need instantaneous application...if they don't see application within ½ hour they get upset—literally!" Furthermore, the problem is worsened by the lag time between when research gets conducted and when it gets published. McLean (1997) stated "by the time the research gets published (years), the best practice has evolved through real-time intuitive research, or the practice no longer fits the need" (p. 8). This was most certainly expressed by the practitioners involved in this study.

The Inadequacies of Theory and Research

Theory and research were critiqued in quite a few ways, too numerous to even discuss in-depth here. Table 1 provides some primary themes that emerged in this category, and just one, representative comment from the interviewees on the issue.

Table 1

Inadequacies of Theory and Research

Issue	Comment from HRD Practitioner
The "always something new phenomena"	"I don't care that it's not new. Use it enough that you can tell me that it really works. Creating it and testing it, not just spinning it. Prove to me that it works and that you're not just producing something new to get printed."
Too Micro	"Often that great thinking gets watered down when they start researching it. Research needs to be more macro, not so micro."
Focused on problems, not solutions	"Papers will endlessly look at the problem from a different angle. Meanwhile, no one comes out and says this is the solution. It's almost as if practitioners are expected to look at all these papers and come up with their own understanding...translate all this somehow...into something they can use themselves. I can understand why academics shouldn't be in the game of unbelievable or over-generalizable conclusions, but what practitioners really want is someone to say 'you should be doing it this way.' "
Assumes some level of pre-knowledge	"To really understand the issue you're reading about, you need another 20-25 articles that the one article cites. The articles tend to build on the existing understanding rather than saying that this is the existing and this is how it adds to it. Rather it says 'you will know from this author who wrote in 1992'), well most of the time I don't! As a practitioner it feels like I have to dig deeper and deeper to even begin to understand the issue."
Differing competence levels	"We've got a lot of senior trainers who floated up the training track and are now being told that they need to get out there and do some HRD consultancy work and they go out and all their training has been in delivery...they couldn't quote you 2 theories if you asked them. Every problem they see, they have to try to frame it in these two theories that they know. They would never think of going to do a literature review or of thinking around the subject."

Discussion

The goal of qualitative inquiry is to understand and interpret—to make things clearer—not to generalize. However, a deeper and more comprehensive understanding of just this small slice of the theory-and-practice issue offers much for HRD professionals to reflect on in terms of guiding future action. In this spirit, I have begun to reflect on some practical implications and encourage the reader to add their own reflections and scrutinize these preliminary ideas for thoughts that resonate with them.

Each component of the system bears some responsibility in addressing this theory and practice gap (McLean, 1997). Thus, there are implications that I see for both academia as well as for practitioners. Due to limited space available here, they are summarized in Table 2.

Table 2

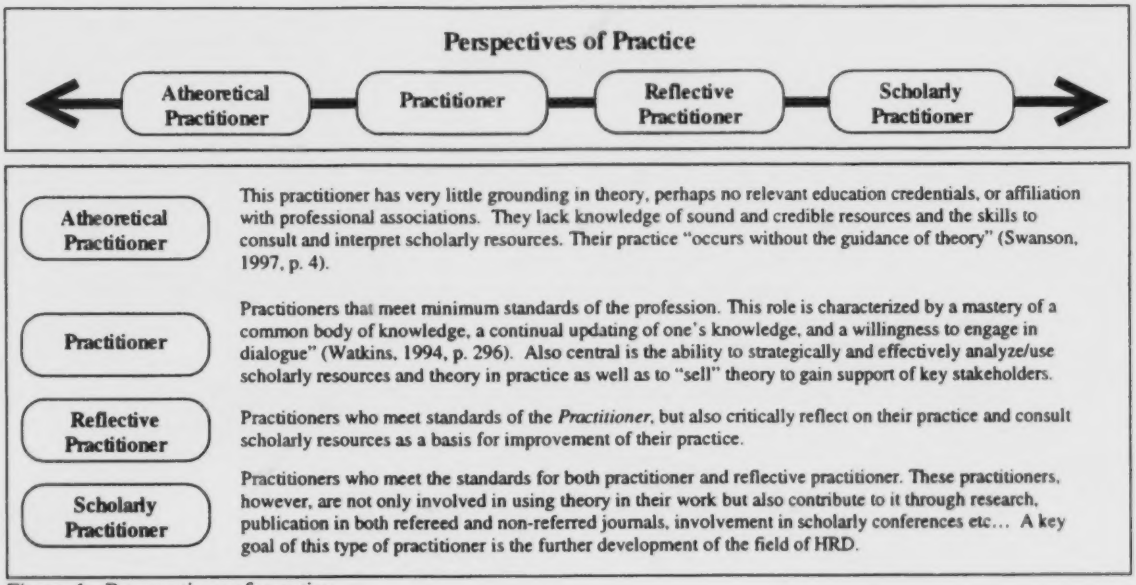
Recommendations for Improving Theory-to-Practice

Recommendations for academics	Recommendations for practitioners
• Refine definitions of theory and research. Identify and hold true to standards by which to judge theory and research. Teach practitioners this information! • Create and provide practitioners more tools to reflect and critique their own practice. • Acknowledge the pressure practitioners face to apply and create positive results. Help them to meet and manage this endeavor. • Maintain a high-level of involvement in business and performance problems organizations face. • Demonstrate the value of using theory in practice through case studies, articles, etc… • Work with stakeholder groups to help them recognize the value of HRD theory/research. • Package theory/research in language and formats that cross boundaries of understanding and appeals to a wide variety of people. • Check assumptions when writing-up results. Do you assume a level of pre-knowledge? Who is your audience? What is the relevance? • Align research agendas with practitioners, and undergo research with practitioners. • Actively foster a "translator" role to specialize in translating research and theory into concepts and words practitioners can resonate to. • Increase outlets for dissemination.	• Acknowledge value of theory as well as its limitations. • Increase knowledge and skills in understanding, judging, and using theory and research. • Work with your colleagues and others in your network to identify criteria by which to judge theory and research. • Identify what theory and models you currently use in your work. Scrutinize them for soundness. • Challenge yourself to consult at least three scholarly resources on the next HRD issue you face. • Contribute to theory by creating research opportunities in organization in which you work. • Partner with academics who are actively researching and engaging in partnership research. • Critically reflect on the HRD work you do. Use research/theory in that process. • Increase outlets for dissemination, as well as resources to consult

The final implication that I have reflected upon speaks directly to the issue of raising the standards of the profession. This must become a goal of *both* academics and practitioners. This idea actually came up in an interview with one of the participant's who commented that, "…there is no consequence for practitioners who don't use theory. The variables of successful practice are not linked to research/theory—they are about general intelligence, job experience, and personality." This cannot remain the norm if the gulf between theory and practice is to be bridged. The issue is about more than competence, although that certainly is a primary component. Watkins (1994) has written about "professionalizing" HRD and indicated an increasing need to ensure that HRD practitioners have education and qualifications to meet some minimum standards. However, she also called for a level of integrity and commitment to effectiveness that can be rooted in standards coming out of theory.

As a result of reflection and discussions I have had with the participants of this study as well as some of my colleagues, I have begun to envision a continuum on which practitioners can place themselves (or be placed) and that has helped me to reflect on this issue of setting and meeting standards in the profession. It is visually depicted and described in Figure 1. When I showed this framework to one of the participants of this study, he commented that what was key, then, was to:

> …shift practitioners along that continuum. Once they are sold on being reflective practitioners and valuing theory and research the next obvious step is to become scholarly practitioners because then they are the people who start thinking "I can't reflect on this stuff because there's no theory to educate me on this so what can I do to fill that gap?"



Perspectives of Practice
Atheoretical Practitioner
Practitioner
Reflective Practitioner
Scholarly Practitioner
Atheoretical Practitioner
This practitioner has very little grounding in theory, perhaps no relevant education credentials, or affiliation with professional associations. They lack knowledge of sound and credible resources and the skills to consult and interpret scholarly resources. Their practice "occurs without the guidance of theory" (Swanson, 1997, p. 4).
Practitioner
Practitioners that meet minimum standards of the profession. This role is characterized by a mastery of a common body of knowledge, a continual updating of one's knowledge, and a willingness to engage in dialogue" (Watkins, 1994, p. 296). Also central is the ability to strategically and effectively analyze/use scholarly resources and theory in practice as well as to "sell" theory to gain support of key stakeholders.
Reflective Practitioner
Practitioners who meet standards of the *Practitioner*, but also critically reflect on their practice and consult scholarly resources as a basis for improvement of their practice.
Scholarly Practitioner
Practitioners who meet the standards for both practitioner and reflective practitioner. These practitioners, however, are not only involved in using theory in their work but also contribute to it through research, publication in both refereed and non-referred journals, involvement in scholarly conferences etc... A key goal of this type of practitioner is the further development of the field of HRD.

Figure 1. Perspectives of practice.

Conclusion & Relevance to HRD

This paper represents a further exploration of the issue of theory and practice in HRD—from the voices of practitioners. The purpose of this study was to contribute to the HRD knowledgebase by moving beyond informal inquiries and informed opinions and conduct a formal inquiry to help us understand even more about the issue. In order to do this, the inquiry sought to understand the experience of practitioners using theory in their interventions and work. Three areas comprised the focus of this inquiry: (1) practitioner's impressions of research and theory, (2) the benefits and barriers of using theory in practice, and (3) what things are needed to enhance the theory and practice relationship.

I have attempted to offer some implications for HRD as a profession—both theoreticians and practitioners. The need to attend to this issue is only more potent as I draw to a close here. I am reminded of a powerful statement by a practitioner attempting to contribute to the narrowing of the gaps that exist between theory and practice:

> By definition, we are an applied science. Our theory development, processes, and success are derived from the relationship of HRD practice in organizations and the evidence that proves that the practice is sound and appropriate. Both practice and theory development are central to our discipline. As a result, we can ignore neither the art of application or the discipline of scientific rigor. (Leimbach, 1997, p. 13)

Indeed, in the words of one of the participant's interviewed for this case study, "each side is lop-sided. If you know enough, you know they're not complete without each other. So, theory and practice together make a whole."

The Status of HRD Research Literature in 1997

Judith A. Hixon
Oklahoma State University

Timothy R. McClernon
People Architects, Inc.

Human Resource Development (HRD) provides purposeful, organized development of adult workers to improve individual, group, and organizational performance. As the field matures, the quality and scope of the literature becomes increasingly important in shaping the profession. This study provides a qualitative analysis of the number and characteristics of HRD research articles published in the year 1997, focusing on research methodologies, analytical and statistical tools, organizational participants, and types of journals. Previous studies by Sleezer and Sleezer (1997) and Arnold (1996) are used for comparative analysis and to establish trends. Our study showed an increase in the overall rate of publication of HRD articles in journals from a broad cross section of related fields. There have also been measurable shifts in the types of studies and methodologies. This study also points out the need for further literature research studies.

Keywords: Human Resource Development, Research Literature, Journal Publication

Human Resource Development (HRD) provides purposeful, organized development of adult workers to improve individual, group, and organizational performance. At the individual level, HRD enhances the growth of workers within the context of their jobs, career paths, group interactions and overall organizational structure. At the group and organizational level, HRD enhances and improves work processes, outputs and capacities for future performance. As HRD has matured as a profession, it has developed a specialized body of research. However, little has been written about the body of HRD research (Jacobs, 1990; Sleezer & Sleezer, 1997), and what has been written and published is often not in the hands of practitioners (Swanson, 1998 a). Because of the links between HRD subject matter and other fields such as psychology, systems theory, education, economics, and organizational behavior, HRD articles are often published in journals that target other specialties (Jacobs, 1990).

Earlier studies on HRD research literature were provided by Sleezer and Sleezer (1997) and Arnold (1996). Sleezer and Sleezer identified the core journals that published HRD research. They searched the citations available through the ERIC, ABI/Inform, and PsycLit electronic databases using search terms that reflected key elements from various HRD definitions. The researchers used specific criteria to identify HRD research articles published between 1980 and 1994 in refereed journals. For example, educational institutions were excluded, as were studies involving individuals not already in an organization and those concerning nonadults. This study identified 18 journals as core sources for HRD research on the basis that each journal had published at least 15 articles within the study period. The Sleezers noted that further research is needed in categorizing core journals and understanding the scope of the HRD field.

Arnold (1996) took a different approach to understanding the emerging HRD field. He looked at the publications from one acknowledged source, the Academy of Human Resource Development Conference Proceedings for 1994 and 1995. Arnold classified the articles based on the type of research and the tools used to explain the findings. Arnold divided the studies into categories as follows: 37 library research or speculative, 57 descriptive case or field study, 8 field or laboratory experiment, and 5 theoretical model or instrument construction. He then categorized each study based on whether the method of analysis was qualitative or quantitative. Of these, 58 were qualitative studies, while the 49 quantitative studies consisted of 41 descriptive case/field studies and 8 field/lab experiments. Arnold concluded that the community of HRD scholars leaned heavily toward library and speculative works, and posited that the field might be better served by increasing the amount of systematic and experimental research.

By systematically examining the HRD literature published in 1997, the present study builds on the Sleezers' and Arnold's work. First, we describe the methodology used in this study to identify, select, and analyze research articles. Then we present the results and implications based on the analysis.

Research Methodology

The aim of the study was to gain insights about HRD research published in 1997. Accomplishing this aim involved surveying the literature, categorizing the articles, data interpretation and synthesizing conclusions. Each article included in the study was examined to determine (a) where the research article was published, (b) the context for the study, and (c) the methodology and tools used in conducting the study.

Surveying the Literature

Surveying the literature involved using a systematic process to identify articles relevant to a specific definition of HRD. The works which served as a basis for this study differed in their definitions; nevertheless, it was necessary to choose one in order to provide consistency in the selection and review of the articles. After considering various definitions, the authors settled on Swanson's (1998 b) definition, which follows:

HRD is a process of developing and/or unleashing human expertise through organization development (OD) and personnel training and development (T&D) for the purpose of improving performance. The domains of performance include the organization, process, and individual levels. OD is a process of systematically implementing organizational change for the purpose of improving performance. T&D is the process of systematically developing expertise in individuals for the purpose of improving performance.

The criteria used to select the articles from all sources for this study were: (1) the article was published in a refereed journal during 1997; (2) it addressed the practical implications of some issue of relevance to the practice of workplace learning and performance; (3) the article was in English; (4) it reflected systematic research; and (5) it fit within Swanson's (1998b) definition.

First, we followed the search methods of Sleezer and Sleezer (1997) to find sources of current research studies. Using the same electronic databases, 46 relevant articles were found. To identify references to HRD research studies that were not contained in the databases, we also obtained the appropriate issues of the journals and searched their tables of contents. Since the time of the Sleezers' study, additional search tools have become readily accessible. Previously, CD-ROM compilations offered the most complete and available means of indexing. Today, the internet includes a wide variety of searchable databases in real time for academic and professional journals. To broaden the scope of inquiry, we chose Article First because of its comprehensive nature and its ready access to the academic and professional community. The keywords that we used in the searches were derived from human resource development topics and subject matter. They included human resource development, human resource, training, change, self-efficacy, mentoring, organizational change, teams, performance, learning, intervention, profitability, evaluation, cognition, conflict, burnout, cynicism, interdependence, assessment, appraisal, commitment, decision-making, perception, volunteer, and transfer. Article First identified approximately 70 additional articles as potential sources of HRD research. Of that number, 20 were found to fit Swanson's definition, and were analyzed further. The data collection from all sources resulted in 66 relevant articles from 23 journals (see Table 1).

We used multiple resources to identify which journals were refereed. These included: The Serials Directory: An International Reference Book, (1995) 9th ed. Vol. V.; Ulrich's International Periodicals Directory (1998) Vol. 5; R. R. Bowker's Magazines for Libraries 9th ed.; Cabell's Directory of Publishing Opportunities in Education. Vol. II., 3rd ed.; Cabell's Directory of Business and Economics (1990) 5th ed. Vol. 1-3; and Cabell's Directory of Publishing Opportunities in Management and Marketing (1997-1998) 7th ed. Vol. 1-3. In addition, we examined some journals. For example, Performance Improvement Quarterly was not listed as refereed in any of these sources. However, examining the journal's contributor guidelines confirmed its status as a refereed publication.

Categorizing the Articles

The researchers read and classified each article according to its subject, research methodology, research participants, and publication venue. Next, the researchers (a) compared the journals for the collected articles with the list of core journals identified by Sleezer and Sleezer (1997); (b) classified the collected articles using the four types of research and the two tools cited by Arnold (1996); (c) classified the articles according to the organizational nature of the group studied; and (d) classified the articles according to their keyword identifiers. Choices were made about categories based on personal judgment. Disagreements on classification were resolved by consensus. The quality of the articles was not considered as a factor.

Data Interpretation

Completing this step involved considering the results of this study relative to Sleezers' (1997) and Arnold's (1996) work. Articles were also categorized based on the context for the study. First, we compared the journals that published HRD research in 1997 with the list of 18 journals identified by Sleezer and Sleezer (1997). Twelve of the 18 journals published relevant articles in 1997. These included: Human Resource Development Quarterly (HRDQ), Performance Improvement Quarterly, Journal of Organizational Behavior, Personnel Psychology, Journal of Applied Psychology, Organization Development Journal, Human Relations, Academy of Management Review, Academy of Management Journal, Public Personnel Management, Public Administration Quarterly, and the Journal of Applied Behavioral Science. Table 1 shows for each journal the number of articles published in 1997 and the number of articles published for the years 1990-1994.

Table 1.
Journals That Published HRD Research Articles

Journal	Number of HRD Research Articles Published 1997	Number of HRD Research Articles Published 1990-1994*
Human Resource Development Quarterly	7	23
Journal of Organizational Behavior	7	12
Journal of Applied Behavioral Science	5	2
Journal of Vocational Behavior	5	
Group & Organization Management	4	
Human Relations	4	7
Journal of Applied Psychology	4	10
Organization Development Journal	4	8
Performance Improvement Quarterly	4	14
Industrial Relations	3	
Organization Studies	3

National Productivity Review	1	
Organizational Dynamics	1	
Training Research Journal	1	

* Sleezer & Sleezer (1997) p. 188.

The reader should note that the table must be interpreted cautiously because the two studies differed in several important ways (e.g., they relied on slightly different definitions of HRD, looked at publications over different amounts of time and used different references in determining whether a journal was refereed). Nevertheless, the comparison is still suggestive. Over time some, but not all of the Sleezer's (1997) core journals continued to publish HRD research, although not necessarily at the same rate. Other journals were added to the original group.

Second, we classified the relevant 1997 articles using the categories identified by Arnold (1996) that included four types of research (i.e., field or lab experiments, descriptive case or field studies, library research or speculative, and theoretical model or instrument construction) and two tools (i.e., qualitative and quantitative). The results for the 1997 articles were as follows: 13 field or lab experiments; 43 descriptive case or field studies; 8 library research or speculative; and 2 theoretical model or instrument construction. Table 2 depicts the relative percentages for each category in 1997. In this study 12% were library research/speculative as compared to Arnold's finding of 35% for the Academy of HRD Proceedings; 65% were descriptive case/field studies as compared

Arnold's 53%; 20% were field/lab experiments as compared to Arnold's 7%; and 3% theoretical model or instrument construction as compared to Arnold's 5%. The table highlights differences in use of specific research methods, especially, the decrease in field or lab experiments and the increase in library or speculative and descriptive case or field studies. This table should be interpreted cautiously because of the differences in article selection and reviewer characteristics.

Table 2:
Percentages of Research Articles by Type

Research Type	Articles in Arnold's Study*	Articles in 1997
Field or Lab Experiments	7%	20%
Descriptive Case or Field Studies	53%	65%
Library Research/Speculative	35%	12%
Theoretical Model or Instrument Construction	5%	3%

*Arnold (1996) p. 819

Next, the articles were classified by their reliance on qualitative or quantitative tools. The classification revealed that 21 articles of the 66 articles, (32%) relied on qualitative tools and the remaining 45 articles (68%) relied on quantitative tools. The articles that relied on quantitative tools were classified according to Arnold's (1996) list of quantitative methods of analysis that included: factor analysis, Chi square, ANOVA, correlation, means, proportions, variance and none. Of the 45 articles that used quantitative methods, most included simple measures such as means and variance. Some used more than one complex measure. Thirty-two used correlations, seven used ANOVA (analysis of variance), three used factor analysis, and two used Chi square.

Third, the articles were divided into categories according to the type of participants in the various studies. Ten categories were identified: government; business/industry; education; military; medical; professionals; unknown; mixed across business, educational, and governmental lines; financial; and proprietary education. Analysis showed that the majority of the research focused on 22 business and industrial, 9 governmental, and 9 educational institutions. The remaining categories together accounted for only a total of 26 articles (see Table 3).

Table 3. Number of Studies by Participant Source

Business/Industry	22
Education	9
Government	9
Unknown	8
Mixed across business, educational, and governmental lines	5
Financial	4
Military	3
Medical	2
Professionals	2
Proprietary education	2

Discussion

This study provides a picture of the current state of HRD research. First, there is a broad spectrum of refereed journals which publish HRD research. Within HRD, numerous subspecialties overlap with such fields as industrial psychology and business management. Journals in these specialties are increasingly available sources of HRD research articles. Practitioners searching for practical information must be made aware of these sources if research is to get into their hands for application in the field. Likewise, HRD researchers may want to broaden their consideration of journals for article submission.

Second, the study results suggests that journals do not remain static in the number of HRD-related articles they publish. For example, when the Sleezers (1997) looked at the top five journals for publication between 1990 and 1994, they found that other than HRDQ, journals that focused on personnel and performance were prime sources for HRD articles. Even then, the numbers were not high. This study suggests a shift in the journals that lead in publishing HRD articles. It also suggests an increase in the number of HRD articles for most journals published higher numbers. There are a number of possible reasons for this shift. There may have been more research in specific areas (e.g., organizational development) than was previously conducted and consequently more submissions. Also, there may have been shifts in the popularity of certain areas of research. Using Arnold's (1996) categories, little theoretical research appeared in the literature in 1997. Field studies and experiments dominated, and different journals had preferences for certain types of subject matter and methodology. Their editorial policies in this regard were probably a factor in the number and type of articles they published in any given year. These findings point to areas for further research. It might be useful to conduct an annual analysis of HRD articles so that trends in research and publication can be reliably ascertained.

With regard to the criteria examined by Arnold (1996), there seems to be movement toward a "systematic observation" type of research. The dramatic drop in library or speculative articles suggests that empiricism and statistical quantitative studies are becoming used more frequently. More studies used complex measures, (e.g., almost half of the quantitative studies were correlational). It is possible that the differences are due to the nature of what is deemed appropriate for publication versus what is presented for conferences because of the interests and needs of the intended audiences.

One factor that must be considered in interpreting the data is the difference between the scope of the earlier studies and the present one. For example, the Sleezers (1997), because of their definition of HRD, excluded research studies which were conducted in educational institutions and those which involved participants who were not directly part of a specific workforce. This may account for some differences in the results. Our study did not exclude such research, as long as the scope fit Swanson's definition of HRD. While there were only 9 educational institutions out of 66 such articles, they account for approximately 14% of the total number of articles. To some extent, differences between the results for this study and previous studies may be attributed to the chosen definition of HRD, and the criteria and method used in selecting articles.

As in other types of disciplined inquiry, there are limitations to this study. The processes used to collect and analyze data influenced the results in number of ways. For example, a different definition or other search mechanisms might have produced another group of articles. A variety of definitions were reviewed before one was selected as the criterion for the study. The databases were also a significant factor. There are potentially other databases available either on-line or in CD-ROM which might have yielded additional articles. No attempt was made to specifically access international journals, although those which were referenced within the selected databases were surveyed. The databases themselves could not be assessed for accuracy, and they possibly contained omissions which could affect the results. Keywords are the means of accessing information within the databases, and there are other relevant keywords which could have been chosen. Some might have produced results that are missing here. In addition, there are unavoidably biases among the researchers themselves which affect the outcome.

Conclusions

As the profession increasingly comes into its own, it appears that more HRD research was published in 1997 than in previous years, and the research appeared in a wider variety of journals. In addition, it appears that the relative proportions of research types published in 1997 differed from Arnold's (1996) findings. Whether these changes represent a permanent shift remains to be seen.

As a result of reviewing the foundational studies on HRD literature and designing the current one, several issues arose which need further study or clarification. These include the change in rates of publication of HRD articles in various journals and the definition of HRD.

One issue is the observed change in the publication rate of HRD articles in journals from associated fields. This study pointed to the existence of the changes, but not the underlying reasons. Such reasons for shifts toward or away from HRD research are currently speculative. Future studies could determine why certain publications have increased or decreased their publication of HRD-related articles. For example, what role does editorial policy play in article selection? Is the change related to the quality of the articles themselves in terms of either the writing or the research? Are HRD researchers failing to submit articles to particular journals, or has the overall submission rate increased? If so, why? Answers to such questions would give greater depth to the insights contained in this study.

A premise of this study was that the field of HRD has coalesced from scattered beginnings within a variety of related fields. As a mature profession, HRD should now be subject to a more concise, coherent definition. In the opinion of the researchers, a useful definition must include the variety of subject matter and processes which make up the profession. It must also be able to exclude what is not relevant as well as delineate what is. This study used

Swanson's definition, although five other definitions were considered. Some definitions were far too broad, while others were too narrow. In particular, the Sleezers (1997) specifically excluded educational institutions. They reasoned that such research often concerned teacher or educational training, which is usually not considered to be within the purview of HRD (C. M. Sleezer, personal communication, September 8, 1998). This position, however, ignores the types of research studies conducted within educational institutions that deal with HRD processes. Our study showed that valid HRD research was conducted in educational institutions. For example, such research articles dealt with theories of learning styles in work settings, transfer of training, negotiation skills, and training issues. Consequently, we believe educational institutions have a role to play in HRD.

Another rationale for the exclusion of studies in educational institutions was that the subjects were students rather than adult workers. This ignores several realities of modern college education. In today's world, adult workers or managers are a greater part of student bodies. HRD subject matter and processes have direct carry-over to adult workers and applicability to the workplace. Also, educational institutions frequently have entire academic disciplines that deal with issues related to HRD. Business, psychology, and human resource development are departments where relevant studies are conducted. Some of these studies are done at the request of employers on work-related topics and use students or mixed groups as the subjects. The researchers do not suggest that every training study generated by an educational institution is within the scope of HRD. Discrimination is needed in looking at studies from educational institutions, but to exclude them wholesale is to lose an entire body of work which could benefit practitioners.

We have already noted that one of the results of this study is the conviction that a more concise and comprehensive definition of HRD might be developed. Based on insights derived from the range of topics in the literature and the various existing definitions, the following definition for HRD is offered to serve as a basis for further discussion and conceptualization of the profession:

> HRD is defined as the purposeful organized development of adult worker proficiencies for individual, group and organizational performance. The focus is on knowledge, skills and abilities which foster technical, business, interpersonal and intellectual competencies.

Only a few studies on HRD literature exist. More consistent and frequent research on HRD publication is needed in order to stay abreast of the profession's development. This study extended earlier studies, expanded the database, and added a new inquiry into participant source. Similar research conducted annually would be useful to the HRD profession.

Learning to Learn Strategies of Successful Real Estate Professionals: Implications for Learning in the Workplace

Margot B. Weinstein
Kingston Group, Inc.

This paper describes a multi-case study of how three successful real estate professionals learn to learn by using a model of the "Individual Learning System." This model adds to the concept developed by Robert Smith (1982; 1990). The professionals describe the strategies and resources they utilize to learn, and the type of organization, teaching competencies, and programs that professionals need to prevent professional obsolescence in the workplace.

Keywords: Learning, Professionals, Instruction

Constant changes in society and in technology will continue to create turbulent environments in the workplaces of the future. John Kotter (1995), professor of leadership at Harvard Business School, stated that it is essential for workers to aggressively seek learning opportunities at work to maintain job satisfaction and to ensure their employability in the turbulent economic environment of the 21st century. However, there is still a tremendous debate on how adults learn best in most professions. Professionals make up more than 27 percent of the current workforce in America, and they have a high degree of control and influence in the lives of people in society, Cervero, 1988. A real estate professional is a person "who is licensed by the state in which he/she practices, and abides by the code of ethics of the National Association of Realtors® (NAR) as well as all governmental laws" (NAR 's Membership Profile, 1996). Although several studies had been conducted during the last 20 years on how professionals learn and how to educate them for their practice in American society (Houle, 1980; Cervero, 1988; Curry, Wergin & Associates, 1993; Schon, 1983, 1987), until this research study, there was minimal research that had asked real estate professionals how they learn and how that information could be used to design training and education to aid them in keeping up to date with new information (Pajor, 1985; Sirmans & Sirmans, 1992; Chicago Association of REALTORS®, 1995). This study examined how professionals learn and what type of organizations, teachers, and programs are needed to enhance their learning in the workplace.

Theoretical Framework

The research study focused on the work of the late scholar Robert M. Smith. Dr. Smith wrote seven books and numerous articles on the topic of learning to learn. He developed learning to learn as an applied theory which he defined as the process by which people "possess or acquire the knowledge and skill to learn effectively in whatever learning situation one encounters" (Smith, 1982, p. 19). Smith's writings contain a comprehensive resource of all the literature, research, and theory on the subject of how children and adults of all ages learn in a variety of settings from classrooms to employee training workshops. Smith explored the subject through the works of several leading experts in the field (e.g. Tough, 1979; Erikson, 1968; Knowles, 1980; Cervero, 1988; Schlossberg, 1984; Schon, 1983; 1987). Smith used the information to design a course on learning to learn which he taught for many years at Northern Illinois University. This study advanced his theory by conducting research in the context of real estate. The themes that emerged supported Dr. Smith's assertion that learning to learn is context bound, and that it can vary /considerably from one context to another.

Research Questions

This research study attempted to answer four research questions:
1. How do successful professionals learn to recognize and react to complexities in their field?
2. What learning strategies do successful professionals apply to stay competitive in the profession?
3. How do successful professionals utilize resources as learners?
4. How might continuing professional education enhance the development of these learning strategies?

Copyright © 1999 Margot B. Weinstein

Method

The qualitative research methodology of interpretive case study was used for the research because an intensive description and analysis of the phenomenon would uncover the interplay of significant factors that are characteristic of the phenomenon (Merriam & Simpson, 1995).

Participants

Exemplar real estate professionals were purposely selected based on Yin's (1994) definition of an exemplar case and the definition of a successful professional by NAR's (1996) Membership Profile." Each respondent worked in one of the three major areas of real estate: residential sales, property management, and appraisal. Ruth L. Theobald was vice president and director of property management of Affiliated Capital Corporation in Wisconsin. Phyllis Kendall Rosen was the managing broker for the Highland Park office of the Prudential Burnet Realty, a residential real estate sales office located in Highland Park, Illinois. Myron J. Evanich, Ph.D., was director of Valuation Management Consultants, Inc., an appraisal company located in Chicago, Illinois. The first two of the respondents were women, and the third was a man. The ages of the respondents ranged from mid-40s to 60 years old. The respondents had practiced a minimum of 12 years in the business. The respondents had attended college; one had an associate's degree, and one had a Ph.D. All three had real estate licenses as well as several other memberships and designations in real estate. The respondents worked full-time in the real estate business. All respondents trained professionals, and two of the respondents also were certified teachers in their field to teach continuing education (CE) in real estate. CE is defined as real estate oriented educational sessions or courses intended to improve the skills of licensees, to keep licensees abreast of changing real estate practices and laws, and to help licensees meet the government imposed educational requirements for license renewal (National Association of Realtors® Task Force, 1978). The three respondents regularly took CE courses, and two of the three respondents published in their field.

Procedure

The researcher studied the respondents for nine months. Standardization was obtained by taping one formal interview with each respondent using questions that were designed in advance, and all respondents were asked the questions in exactly the same sequence and manner (Richardson, Dohrenwend, & Klein, 1965).

In order to examine the data from the formal interviews, tables were designed to display the data, and quotations from interviewees and further explanation were presented by the researcher as needed to explain the data. The characteristics that emerged from these in-depth interviews were validated through review of tapes, transcriptions, and field notes of the interviews. The researcher contacted the respondents several times during this study as well as reviewed all published information about their companies and themselves in order to obtain accurate information. The respondents also received copies of the final transcribed tapes and edited any personal information that they did not want in the final case study. The information was further validated through documents, journals, literature review, and discussions with other professionals and educators in the field.

After the completion of the data analysis process, another phase of data analysis, a search for themes, was begun. The process used "concept mapping" (Smith, 1990) as a diagnostic tool. "A concept map depicts in a diagrammatic form, ideas, examples, relationships, and implications about a particular concept. The center or core idea is placed at the center or top of the page, and radiating from it are a number of spokes or lines leading to other concepts related to, or indicated of the central idea" (Smith, 1990, p. 49). Concept mapping enabled the researcher to group similar examples of large concepts together, and smaller concepts were set aside until they could be integrated into the larger themes; this process allowed the dominant themes to emerge from the data. The similarity of the process of the information gained in the case studies made possible the rich, descriptive data needed to interpret the phenomenon being investigated as explained by Merriam (1988).

Results and Findings

The findings suggest support for all four research questions. The real estate professionals were able to present similar information about how they learn to learn, and how organizations, programs, and teachers should provide education and training in order to aid their ability to learn in the workplace.

Six Themes

Because of their nearly identical stories, six themes emerged from the research study. The first three themes were related to the learner: (a) the procedure the learners develop to learn to learn, (b) the strategies the learners utilize to learn, and (c) the resources they employ for successes. The second three themes are related to organizations that provided CE for these professionals: (a) working in open/learning-system organizations, (b) training of educators, and (c) developing improved programs. These six themes will be explained below.

Theme 1 - Systems Learning Model. The learning to learn process of the real estate professionals who were interviewed in this study operated as a model of an "Individual Learning System." The professionals described how they used all knowledge gained through their life experiences, strategies, resources, and other professionals to improve learning in each learning situation. The professionals used a model of learning that was always in motion, evolving, changing, reflecting, evaluating, and improving. The model was developed through understanding the three aspects of these professionals: (a) the procedure they employ to learn to learn, (b) the ability to improve their learning strategies to relate to the complexity of the context and environment of their business, and (c) the personal characteristics of the learners that enable them to adapt in all learning situations.

The individual learner operates as a general open system model in the same manner as described by Senge (1990) that workers learn in learning organizations. Open systems recognize that biological or social systems have a dynamic relationship with their environment. An open system adapts to its environment by changing the structure and processes of its internal components. The systems approach is conceptualized as a series of inputs that, when acted upon by a transformation process, results in certain outputs. The learner is in continual interaction with his/her environment and therefore achieves a "steady state" or dynamic equilibrium as he/she retains the capacity for work or energy transformation. Therefore, the learner's survival in the competitive business world depends on his/her ability to operate as a dynamic, open, "system." The learner must continually improve and adapt to new learning situations by incorporating everything he/she learns into his/her business life, personal life, and in society into the process of learning. Every day, professionals must adapt to the changing context of their workplace, the environment, and their personal characteristics as learners.

Although the procedure of learning to learn remained the same for all three professionals, the information led to the understanding that each learner is also unique. The professionals described how they learned differently based on their gender, age, culture, life experiences, and life transitions. The information supported research by several authors (Belenky, Chinchy, Goldberger, & Tarule, 1986; Erikson, 1968; Gilligan, 1982; Schlossberg, 1984, and others). The process involves a holistic model instead of a linear approach to learning, and it leads to new understanding of how real estate professionals learn to learn. The professionals were further able to explain how their differences should be interpreted to design more effective organizations and education programs for their professionals.

Theme 2 - Strategies for Learning. The respondents in this study explained 14 strategies that enabled them to stay competitive in the profession: using self-awareness, self-monitoring, reflection, reflection-in-action, self-direction, lifelong learning, expertise, networking, interpersonal skills, personal motivation, innovation, collaboration, technology and a 7-step continuous problem-solving model. In the literature review, several authors described similar problem-solving processes (e.g., Dewey, 1933; Lewin, 1948; Argyris & Schon, 1974; Schon, 1983, 1987; Kolb, 1984; Meyers; 1986; Redding & Catalanello, 1994):

Problem-solving Model. The seven steps in the continuous-action problem-solving model are:

1. Conceptualize plan in his/her head by reflecting on previous similar experiences;
2. Set down the problem on paper in a tentative plan of action;
3. Gather data: talk to professionals, read, etc.;
4. Analyze alternative approaches;
5. Develop more complete plan by redesigning plan to reflect new insight;
6. Act on plan; and
7. Evaluate results based on consequences of outcomes of action.

The professional continues through the process to reflect and refine the plan as new information on the problem is gathered. Professionals may continue to go through the entire process several times, or they may use only one or two steps to update the plan. The professionals used reflection continually throughout the problem-solving process. They stated that their problems involved cycles of problem solving because they seldom solved their problems in one or two cycles. They use iterations or cycles to solve their problems such as explained by Arygyris and Schon (1974, 1978), Schon (1983; 1987) and Redding and Catalanello (1994). However, this model

is comprised of more steps than most problem-solving models in the literature, because the professionals explained that their problems are usually complex, and take a longer period to solve than in many other businesses.

Theme 3 - Resources for Learning. The respondents stated that they used six major resources to learn: mentors, experts, professional associations, technology, relationships, and supportive organizations.

Three Themes to Enhance Education and Training

Three themes were suggested by the respondents that related to enhancing education programs for professionals: (a) organizations that provide CE need to operate as "TQM Learning Organizations," (b) organizations need to improve training of teachers, and (c) organizations need to improve CE programs for professionals.

Theme 4 - TQM Learning Organization. In order for professional organizations to respond to the needs of professionals, their customers, and the public, respondents suggested that organizations should be designed utilizing the ideas and strategies of a TQM Learning Organization described by Deming (1986) with the model of the "open organizational learning system" discussed by many writers (Redding & Catalanello, 1994; Senge, 1990; Senge, Kleiner, Roberts, Ross, & Smith, 1994; Watkins & Marsick, 1993; Weisbord, 1990).

TQM is defined as a company that holds its primary philosophy as to provide total customer satisfaction. To accomplish its goals , the company embraces all strategies, tools, management techniques, and planning activity that embraces the philosophy of providing the best products and services to the customer, Deming (1986). While a learning organization is defined as one where all the individuals within the organization work together across boundaries to solve problems. A learning organization must involve: (1) systems thinking, (2) personal mastery, (3) mental models, (4) shared vision, and (5) team acquisition of knowledge as described by Senge, 1990. Respondents were able to articulate the importance for organizations to embrace all aspects of both concepts discussed above.

Theme 5- Competencies Needed by Educators. The Fifth theme illustrated the need to improve the training of educators who provide CE to professionals:

1. Educators must also be practicing professionals who understand the business.
2. Educators should be competent in teaching. They must understand the needs, characteristics, motivations, diversity, and disabilities of students. They must be able to use a variety of teaching methods (e.g. technology, lap computers, dialog), and they should use evaluations effectively to obtain feedback from students.

Theme 6 - Education and training programs. The sixth theme explained ways to develop improved programs for professionals:

1. Programs must provide relevant information for the level of expertise and area of practice of professionals.
2. Programs should order courses in different levels (e.g. beginning, intermediate, advanced).
3. Courses should be divided into modules when material is too long to be adequately covered in one session.
4. Courses should incorporate Case Studies.
5. Courses should have experts teaching subjects.
6. A wide variety of subjects should be offered (e.g. diversity, age, culture, and specialty areas such as appraising).
7. Subjects should be updated regularly.
8. Some courses should teach professionals how to use new technologies. Since real estate transactions went on the Internet in November of 1995, there is a tremendous need for professionals to learn to effectively adapt to use this technology.
9. Courses should be offered using a variety of delivery methods (e.g. distance education, home study, on-line computer, etc.).
10. Some courses should offer a practicum "hands on" experiences.
11. All courses should require participants to fill out evaluation forms of courses and instructors.
12. Courses should contain better assessment techniques in MCE to reflect practice instead of a test for relicensure.
13. All courses should be cost effective and timely.

Several recommendations for further research were made, the most important was to study the differences between how men and women learn in the real estate business.

Limitations

Since the study was limited to three case studies, the study can not attempt to predict successful learning styles of all real-estate professionals. Although the case studies lead to a deeper insights into the area of the study, findings from

case studies cannot be generalized in the same way as the findings from random samples. For this reason, this study should be the first step to lead to further research on the subject.

How this Research Contributes to New Knowledge in HRD

This research builds on an important theme in adult and higher education, and HRD-How do adults learn to learn in the workplace? Although significant research has been conducted in this area, the theoretical foundations of how professionals learn to learn in HRD remains an open field for research. The information supports and adds to the knowledge in the field in several ways: First, the study adds to the research by focusing on a sub-set of professionals, real estate professionals. The research provides a better understanding of how real estate professionals learn. This research could be duplicated by others to expand upon it to build more knowledge and understanding on the subject in other professional contexts.

Second, the research makes the connection that successful, licensed real estate professionals learn in the same manner as employees continue to learn in "learning organizations," and that the process they use to learn is a "systems approach." Professionals explained the process of learning is complex and adaptive to change; as a result, they learn in a more holistic fashion than former linear approaches to learning. HRD professionals need to expand their view of how professionals learn.

Third, the respondents are self-directed learners as discussed by Tough (1979) , Knowles (1980), and Smith (1982), and they learn differently based on their age, culture, life experiences, gender, and life transitions as described by Belenky et al. (1986), Erikson (1968), Schlossberg (1984), and Gilligan (1982). Therefore, HRD professionals must be flexible in designing programs that are responsive to the specific needs of their audiences. HRD processionals need to conduct more needs assessments, and ask professionals continually, before, during, and after programs, how to meet their needs, and how to make the information relevant to their particular context. HRD professionals should possess the ability to facilitate learning by using a wide variety of teaching methods. The information could lead to the development of more meaningful education and training for real estate, as well as, for other professionals.

Finally, organizations should be designed that combine the ideas and tools of the TQM learning organization by Deming (1986), with the ideas of the "learning organization" by Senge (1990). This organizational design would: (a) provide the best customer service, and (b) keep employees up to date with latest information and technologies. The TQM learning organization can provide a win-win atmosphere whereby HRD professionals can provide education and training that is responsive to the needs of all audiences involved.

Conclusions

The data from the research study established the connection between how real estate professionals learn and the type of organization, educators, and education programs that would support and enhance their learning in the workplace. The objective of the model outlined here is to provide a better understanding of how successful, licensed real estate professionals continue to learn using a "systems model." Based on this model, HRD professionals must be more responsive to the needs of their learners. How professionals learn in the workplace and what are their needs that would enhance their education-these are important themes in HRD. This paper addressed HRD's role in enhancing organizational design and education for real estate professionals. If future research replicates and supports these findings, the information will lead to a vision for the development of a more comprehensive educational programs for professionals.

Vital Work: Spirit and Development Within the Natural Workplace

Terri A. Deems
DAI/WorkLife Design

What happens when we reframe work as a fundamental site of human development? This research explores two organizations where development becomes not a function of training but a way of conducting work as a whole. This study illuminates the lived experience of people who work within "natural" or "vital" workplaces. The educative function of the workplace is explored and principles for vital work are identified and defined.

Keywords: Organizational Development, Vital Work, Meaning-Making

Adults today spend more of their time and energy engaged in work than in any other wakeful activity; for the adult, work is the central domain for learning and for the development of our human capacity (Jarvis, 1992; Kincheloe, 1995; Watkins, 1991; Welton, 1991). Research presents a clear interrelationship between the structure of our work organizations and the psychological qualities and attitudes of the people who work within them (Balawajder & Popiolek, 1996; Mortimer, 1988; Pauchant, 1995; Riordan & Griffeth, 1995; Watkins, 1991; Williams et al, 1997); the everydayness of work serves as a context and source of learning and of self-knowledge. Work is, as Welton (1991) describes, a fundamental training site for a participatory and democratic society.

Such a perspective of the workplace moves beyond traditional ideas about the education and training of workers to enhance corporate profit. Rather, it brings us to consider the workplace itself as a curricular structure, an educative environment (Dewey, 1938) with the potential to stimulate or enhance, to restrict or distort, growth and development. Yet this educative function of work has been a largely neglected theme in the field of human resource development (HRD). In our efforts to ensure we are making "value-added" contributions to organizational performance, we risk losing sight of our field's tradition: to further the development of humans and to promote the growth and welfare of the larger society (Friedlander, 1996).

This research explores two organizations where development becomes not a function of training but a way of conducting work as a whole, and illuminates the lived experience within these environments. The educative function of the workplace is explored and principles for vital work are identified and defined.

The Organization of Work

Contemporary Workplace Reforms

We are experiencing today a pace, breadth, and depth of change unseen in any previous chapter in workplace development in the Western world. Innovations that emphasize the importance of learning and of personal and collective development can be seen in the emergence of less authoritative structures and more collaborative and democratic work processes (for example Briskin, 1996; Dew, 1997; Dirkx, 1996; Kofman & Senge, 1993; Marsick, 1987). Such efforts to reinvent the corporation depict a struggle to establish a vision of work founded on a more clearly articulated set of humanistic values and constructivist models (Aktouf, 1992; Dew, 1997; Dirkx, 1996; Meltzer & Wickert, 1976): shared rather than unilateral power; autonomous work groups; diversity rather than conformity. Within the margins of such change lies an implicit recognition of the interrelationship of the subjective life of the worker and the objective conditions of work (Aktouf, 1992; Watkins, 1991; Welton, 1991). Yet in spite of new reforms, technical-rational approaches to work continue to be the norm and reforms retain a distinct positivist flavor (Ketchum & Trist, 1992; Kincheloe, 1995; Pauchant, 1995). Reforms are appropriated or sanctioned in order to enhance worker quality, commitment, productivity, or morale. The extent to which such reforms add value to the organization is embedded almost exclusively within a capitalistic framework (Briskin, 1996; Dirkx, 1996; Morin, 1995). Contradictions and paradox exist. With increased democracy, there are increased surveillance technologies. With open sharing of information, heated debate over office Internet access. With increased participation, restrictions on cubicle "prairie-dogging."

The worker continues to be conceptualized as an object ruled by causes, whose subjective experience is separated from the objective conditions of the workplace (Watkins, 1991). Research indicates that such a fragmentation results in an experience of work which constricts and distorts, rather than enhances and enlarges the

Copyright© 1999 Terri A. Deems

human spirit (Aktouf, 1992; Watkins, 1991; Welton, 1991). This constitutes a miseducative experience (Dewey, 1938), a "false and stunted humanism" (Aktouf, 1992, p. 412). The centrality of work in our lives is generally relegated to work's role in creating a preferred lifestyle and there is little regard or consideration for how people develop, what people learn, what they come to know, outside the confines of sanctioned training.

The Natural Workplace

Reframing work calls for more than innovative strategies subtly inserted within the Taylorist paradigm (Aktouf, 1992; Block, 1997). It calls for deeper questions concerning our assumptions about the nature of work, how work is structured and organized, even the very purpose and meaning of work itself. In contrast to contemporary reforms, a "natural," more fully human workplace is emerging that ceases to artificially create, manage, appropriate or control the experiences of others (Aktouf, 1992; Semler, 1993). Grounded in a developmental view of work, the natural workplace appears to restructure the workplace around fundamentally different social, psychological, and economic assumptions. Named as radically humanist, democratic, mindful, conscious, even spiritual or soulful, this way of work is conceptualized as passionate, creative, nurturing, socially just, and more fully human, where profit and market share become not the goal but the by-product of vital or right work (for example Adams, 1984; Aktouf, 1992; Briskin, 1996; Clark, 1967; Dew, 1997; Dirkx & Deems, 1996; Fox, 1994; Hawley, 1993; Kofman & Senge, 1993; Meltzer & Wickert, 1976; Wenger, 1996; Whyte, 1994).

This sense of a more authentic, more fully human workplace appears to be qualitatively different than many other workplace reforms. The natural workplace is grounded in a particular view of human nature, a view supported within diverse bodies of literature (for example Aktouf, 1992; Dewey, 1938; Egan, 1994; Fox, 1994; Handy, 1994; Hawley, 1993; Jarvis, 1992; Kincheloe, 1995; Kofman & Senge, 1993; Moore, 1991; Pauchant, 1995; Wilber, 1995; Whyte, 1994). Primary to this view are the ideas that humans are (a) endowed with consciousness, right judgment, and free will -- we are actively involved in our own becoming; (b) fundamentally defined by our community and relations with others; (c) innately drive towards development and transcendence; and (d) share a common need for partnership and connectedness, for self-expression, and for meaning and purpose. Natural workplaces appear to structure and organize work in a way that facilitates the expression of this nature.

A growing body of literature (for example Bolman & Deal, 1995; Briskin, 1996; Fox, 1994; Hawley, 1993; Kofman & Senge, 1993; Whyte, 1994) presents an impressive picture of how work might be experienced within such environments: as vital, nurturing the human quest to embrace life fully with animation, meaningfulness, and purpose. Most of this work, however, consists of anecdotal evidence from proud CEOs (for example Fishman, 1996; Melrose, 1995; Semler, 1993). A relatively small body of ethnographic or anthropological research into more humanized workplaces or work units (for example Balawajder & Popiolek, 1996; James, James & Ashe, 1990; Massarik, 1976; Riordan & Griffeth, 1995; Schneider, 1990) describe a culture of work that embraces highly self-directed, participatory practices, community building, opportunities for friendship, recognized contributions, trust, and respect for humanity. They depict a strong corporate consciousness manifest by organizational members' engagement in the active processing of information, awareness of individual and collective strengths and weaknesses, awareness of the full environment in which the organization exists, and awareness of the interdependency of its systems (for example Massarik, 1976).

The idea of the natural workplace has been developed conceptually by numerous scholars, and the testimony of organizational leaders presents a rich and thought-provoking picture of what work might be. Within existing representations, however, there is a continued emphasis on the *perception* of work rather than on the *experience* of work (Briskin, 1996). There remains a distinct lack of research which presents the lived experience of workers within these sites, and we can only speculate on the extent to which people themselves experience these workplaces in an educative way. The purpose of this study is to explore how people experience and make meaning of the natural workplace, to build on our understanding of the qualities and characteristics of such an environment, and to investigate ways in which the natural workplace may contribute to growth and development.

Research Questions and Significance to HRD

This study explores the lived experience of people within two organizations working to create more humanistic, natural workplaces. It focuses on the nature of work and how people experience and make meaning of work within these environments. The following questions guided this inquiry:

1) How do workers experience and make meaning of organizational life within the natural workplace?

2) How is the natural workplace structured and organized? What are the qualities and characteristics of such an environment?
3) How and what do people learn, of themselves and of others, within the natural workplace? In what ways does the natural workplace facilitate growth and development of the individual and group?

Significance of the Research Problem

Argyris (1976, p. 405) described, "If the validity of the concept of the organization is to survive, the new designs will have to raise the level of the quality of life within the system and genuinely value high-quality living as much as efficiency." Conceptualizing the workplace as a fundamental site of learning and development offers this opportunity by creating experiences where "the purposes, driving forces, culture, behavior standards and results are more closely aligned to human needs, aspirations, and potential" (Koch & Godden, 1996, p. 173). An on-going and direct concern of organizational leaders lies with the objective conditions within the workplace in which interactions take place. Growing interest in such concepts as quality of work life, organizational learning and transformation, and work as vocation or calling, demonstrate a new focus on the establishment of working conditions that will "awaken in the worker the desire to work together in a spirit of community, creative energy, and meaningful purpose" (Aktouf, 1992, p. 419). The human spirit at work may be understood less as an object to be improved and much more as a force for collective creativity and innovation.

Human resource development practitioners are called to look more deeply into the ways in which the environment nurtures experiences that lead to growth, and how to utilize the physical and social environments "so as to extract from them all that they have to contribute to building up experiences that are worth while" (Dewey, 1938, p. 40). There is little agreement, however, as to what this means in a real and concrete way. This study contributes to our understanding of the workplace as a site for personal and organizational development, and illuminates conditions of work which are most conducive to a vital workforce. Developmental aspects of work will enhance our knowledge base of learning in terms of sociocultural, tacit, and self-knowledge. This study also contributes to our understanding of adult learning within the context of work as informal and incidental.

Research Methods

To understand another's experience, and to gain insights into the context which surrounds this experience, is to understand how a person makes meaning of a phenomenon. Meaning-making is the interpretive aspect of cognition and perceptions and, by definition, it is phenomenological (James, James & Ashe, 1990, p. 42). This study is grounded in Husserl's concept of phenomenology (as in Holstein & Gubrium, 1994; Moustakas, 1994; Sinha, 1969) a method that allows us to understand the ways the experiential world is produced and experienced by its members (Holstein & Gubrium, 1994).

Two midwest organizations participated in this study, having met the criteria for working towards a more natural work environment. This criteria were established based on a review of literature concerned with humanizing work environments (for example Fox, 1994; Hawley, 1993; Pauchant, 1995), and included:

- high levels of autonomy (e.g., use of participatory and democratic work processes, lack of dress code, and the commitment of the organization to an individual's personal goals);
- tolerance for ambiguity (e.g., lack of an employee handbook or task-specific job descriptions);
- relatively high levels of trust (e.g., lack of detailed policy and procedures, open leave policies, self-reporting time records, or full disclosure of financial information concerning organizational status);
- non-competitive recognition of employee contributions such as profit sharing plans maintained by employees;
- evidence of concern for the "whole" person (e.g., health/wellness facilities or programs, encouragement of educational development, social activities, or flexible time-off policies); and
- minimal hierarchical structure and evidence of individual power based on earnings or job title (e.g., office space determined by need rather than level of position, lack of reserved parking spaces, or open access to designated organizational leaders).

From these sites 20 self-selected people, representing a diverse mix of age, educational levels, gender, and positions within the organizations, participated as co-researchers. Data was collected through multiple methods

including non-participant observation, document review, focus groups, unstructured field interviews, semi-structured interviews, and follow-up interviews. Information was recorded with the use of detailed field notes and audiorecordings. The participants/co-researchers also participated in the analysis and the writing of the findings through member checks and providing feedback to the primary researcher on the written narrative.

Data analysis consisted of three major stages (Moustakas, 1994): phenomenological reduction, imaginative variation, and synthesis of meanings and essences. Audiorecordings were transcribed verbatim and each transcript underwent a process of horizonalization, establishing meaning units and themes, development of individual textural and structural descriptions, and the synthesis of meanings and essences across cases. From this synthesis a composite textural-structural description was constructed, representing the shared essence of the work experience. The composite descriptions were presented to participants to ensure they represented an accurate and rich portrayal of their experiences and meaning-making within their workplaces. Accuracy and trustworthiness of the data (Lincoln & Guba, 1985) was ensured through on-going contact with participants, triangulation of data, member reviews, and peer review.

Findings: The Experience of Work

Findings reveal these more natural workplaces as relatively unstructured, with open books and open systems of communication, fluid work groups, high levels of autonomy, ample opportunities for friendship, and de-structured work processes. Being here is "vital" and animating involving a pace that is both draining and energizing, and filled with contradiction and paradox, conflict and uncertainty, high emotion and "fun." Participants structure the experience of work in five universal ways, described in their own words below: Self and Self-Other Relationships, Connectedness and Relatedness, The Role of Past Experience, Individual Differences, and Meaning in Work.

Participants fill their days with activity which moves them and the organization forward. The days are both "too long" and "not long enough." When the roller-coaster is in motion, people are tired and supportive, teasing and resentful, hopeful and frustrated, excited and angry. "Fully alive." Pushing to be their best often demands that all their energies be directed towards a narrowly-defined product goal, subordinating equally important objectives and desires. It's frustrating. Work is depleting, yet somehow adds "life to the hours" both at home and at work. Work requires continual negotiation between both outward and inward projections: fulfilling your own needs in the challenge to learn more, do more, be "better" than last time, sometimes clashes with specific organizational needs and interests; personal time sometimes clashes with the need for overtime to complete a project or shipment date. A deep sense of safety comes in knowing that you are trusted, in conjunction with a darker sense of doubt in knowing that you are solely accountable within that trust.

Self in relation to others involves demands, interruptions, arguments. There is a sense that "I can be myself" in the midst of others, having no need to justify actions or to remain on guard lest someone misinterpret our actions. Interacting with others--in play, in dialogue, even in conflict--serves a generative function in the creation of new ideas and suggestions, new perceptions of others, and new perceptions of self. Within this environment, it is with great difficulty that people talk only of "I." Rather, it is "our" work, "our company," "our" project. This collective orientation frequently runs up against the personal valuing and significance of choice and autonomy at work.

The structures, processes, management, and directives of work--both explicit and implicit--make up a web connecting people, job tasks, goals, and meaning. Respect is a key foundation--respect for one's views and variations, for how you express yourself through your work, and for how you relate with others. This respect leads to the creation of work processes which encourage dialogue and innovation. To exclude someone from full participation within the workplace is an expression of disrespect or of "not recognizing humanity": not listening, not involving, not engaging, not making eye contact, making decisions which affect a work group without their input and insights, responding to one's ideas with ridicule, sarcasm, or silence. Inclusion demands participation and voice, which constitute "being a person" at work. Only through such participation and interaction will product quality be assured and improved, a sense of purposeful work be created, and interest and energy maintained.

As participants describe, respect is closely related to trust, because "when you respect another, you see your common humanity"--you see yourself within them. This implies high levels of trust from the first moment of relationship, given freely rather than following a testing period, trust which is maintained until actions occur which prove misplacement. "Empowerment" is a part of the human condition, rather than something that is granted or bestowed. Such trust is incompatible with tight controls, and implies such conditions as the personal use of company equipment, elastic timeframes for work, even the willingness to have others laugh with you at your own

mistakes and trust they have no hurtful intent. As one leader described, trust is the belief "that people want to perform at their peak," then providing what they need and getting out of the way so they can do so.

With trust comes responsibility: the group is responsible for the project, the person for their work, the company for the person. Connected to responsibility is a strong sense of both personal and collective accountability. When you hold the responsibility, you are accountable for the decisions you make, the work performed, the hours claimed, the copies made. Accountability recognizes, however, that outcomes are not always a matter of individual performance but the result of factors outside our control. The need for close interaction with others becomes necessary then, in order to support conditions which make accountability, responsibility, and understanding and empathy, realistic conditions of work.

Joking with co-workers, talking with the boss, examining a part, or taking time off to run the car into the garage become significant activities when framed against previous work experiences and our prior sense of what work is. Guilt lingers at times, "old tapes" claiming we should be more productive, or suggesting that people are watching, whispering, when we arrive for work 15 minutes late or leave a few moments early. Hesitantly, we sit for the first time among a work group, listening to heated debate and struggling to express our own ideas when that has never been invited until now. Escaping past bonds demands learning: learning to participate, learning to trust your instincts and judgment, learning to fight it out within the project room and still remain friends afterwards. The past loosens its hold as we come to know that we are valued and important here, that people will listen to our ideas. The construction of new meaning can be filled with frustration, though, and we sometimes insist on imposing the structures we are most used to as a way of confronting and overcoming the uncertainties before us.

A wide range of individual differences seem to influence the experience and meaning of work. Some people described a childhood upbringing they believed impacted their comfort or discomfort with their present workplace. Instincts for taking action may influence our sense of whether a system is too rigid or not rigid enough, provides too much structure or is chaotic, is safe or threatening. Other participants suggested age as a critical feature: younger workers believed their young age made them more flexible, adaptable, able to interact more authentically with others; older workers believed these same characteristics were attributed to their greater maturity and experience within the workplace. Individual differences, though frustrating at times, also serve to create a culture and work climate that are filled with the noise of life, the full range of sounds that accompany celebration and anger, joy and conflict, work and play. Some suggested it is the absence of such noise that reflects the more oppressive, restrictive work environment.

Within our society, the meaning of work will perhaps always be somehow connected with our ability to create and maintain a lifestyle. Yet within this environment there lie more fundamental meanings as well. According to these participants, work constitutes how we care for others and how we contribute to their lives. "It's a reason to create." Work means personal growth through the daily struggles and challenges, through expressive activity, and an ever-broadening perception of our presence in the world. It means the "thrill" and pride in "seeing something come from nothing," or in "pushing myself to do what I did not believe I could do." The experience of trust, responsibility, being connected with others, and recognition help to create meanings of value and of the awareness of one another's essential humanity. In the past, when these have been absent, participants present a reliance on financial outcomes to define meaning within work. While the material rewards as a meaning for work remain for all people, they increasingly dim as we engage more closely with others in purposeful work.

Discussion of Findings

Participatory or democratic social arrangements are more likely to result in experiences which arouse curiosity and strengthen initiative (Dewey, 1938), necessary conditions for continuous improvement. The natural workplace expresses its educative potential through interaction with others, structures and systems for communication which demand interpersonal competence and dialogue, movement from self-protective to ever-increasing autonomy, and the encouragement of postformal thought through processes which compel complex means of problem-solving. The "dark side" of work is balanced in part by ample opportunities for informal relationships which provide opportunities to re-energize and rejuvenate from the complexities present within the workplace. Participants indicated that interaction with others, and the nature of relationships which developed, affected not only the quality of the work but also one's sense of self. Cognitive development accompanies increases in social-cognitive experience as people are challenged to reflect on their beliefs or behaviors, to debate and dialogue, and to approach their work more critically (Sinnott, 1993). Increasingly complex ways of solving problems develop with social experience and encourage critical and postformal thought (1993).

The vital workplace depicts an organizational consciousness which values mindfulness--the active processing of information, differentiation, and always-present awareness of context. Langer (1989) proposes that human potential can be expanded through processes which demand an active rather than passive experience of work, cultivating individuals who continually create new challenges for themselves. Organizational goals are achieved by people who are originators rather than pawns, and expressive creativity encourages innovation rather than conformity and satisfaction with the status quo. Organizational leaders play a key role in removing barriers and developing mindfulness -- not by way of control and power but in terms of de-structuring work and the persistent and careful attention toward what will be of most use to the workers.

The idea of partnership, of interconnectedness, of holism, within the workplace leads us to appreciate that we are not separate from the world but a necessary and vital part of it. This interconnectedness, however, can and often does arouse conflict and contradiction. Rather than working to alleviate such uncomfortable conditions, leaders recognize that the tensions created can serve as originators of growth and development, opening avenues for new learning about self, about others, and about being a part of the work community. The natural workplace is as full of frustration as it is of joy, of angry emotion as it is compassion, of unpredictability as it is trust, of conflict as it is of happy and satisfied people. It seems to embrace all expressions of human nature, and values them each as sources of human animation and meaning. People, as one participant described, "live loudly" in their shared pursuit of business profits, relationships with others, and meaningful work.

Cultivating Vital Work: Implications for HRD

Participating workplace leaders involved in this study support the idea that *how* vital work evolves follows no set formula; there is no clear prescription of "steps" to take nor a clear point indicating when an organization has "become" a vital workplace. It is an on-going process of unfolding and learning; reframing organizations as sites for adult development begins not with a prescribed formula but with critical assumptions (see for example Aktouf, 1992; Bolman & Deal, 1995; Briskin, 1996; Dirkx, 1996; Welton, 1991) of human nature: that people are active constructors, not pawns, within the workplace; that we carry in us an innate drive to create something larger than ourselves; and that we are naturally motivated and empowered. When these are not expressed in our work it is less due to a deficit people hold but because of barriers embedded within the work context or our past experience. The findings of this study support the anecdotal evidence, prior research, and theory of the relationship betwee: work and learning in suggesting central principles for HRD and the cultivation of the natural or vital workplace. These principles guide the concrete ways in which work is structured and conducted. While these principles are not necessarily exhaustive, they do present an experience of work which focuses on a way of being and becoming, on presence rather than appearance.

Solidarity. It is imperative that people within the workplace be seen as active and willing participants rather than as instruments of production. We must abandon management based on authority and in its place create opportunities which nurture people's natural desire to belong, to contribute, and to engage in meaningful work. Managers are not "artisans of liberation;" rather, a culture of convergence and sharing must be inserted into actual practice where people act on their intentions through reasons, feelings, and choices rather than by "causes." Only then will we recognize a unity and quality of worklife based on community of interests, objectives, and standards.

Engagement. Participatory and self-directing work processes provide the necessary opportunities for development through autonomy, relationship, and engagement with others. This participation, however, must be unrestrained by channels of command and mechanisms of control. Rather than simply a symbolic participation, people must participate in a real way with the sharing of profits, power, property, and decisions. The *perception alone* of autonomy, of being valued, and of participation will not sustain the more humanized workplace. It must, as Aktouf (1992) describes, be a lived rather than appropriated experience, one which holds the human actor in high regard in an authentic way. We also know we cannot engage people simply by asking them to participate; based on prior experience, many people will have to learn what it means to participate. The quality of engagement within the workplace is enhanced when leaders foster dialogue, authentic relations, and reflection by modeling these behaviors, challenging people, asking questions, and offering opinion over directive. Dialogue and reflection are sustained when people can see positive outcomes from these exchanges--when they see their voices are heard, their questions answered, their ideas considered, when information is freely shared, and when understanding is viewed as an important part of work. People's sense of business literacy will be enhanced through the free sharing of information and business problems concerning all aspects of the business--hiring, orienting new workers, sharing in the evaluations of work completed, regular information concerning the company's financial performance. Engagement also demands recognition of people's contributions in order to sustain their efforts and energies. Just as

critical are opportunities to come together in informal ways which help cultivate a sense of solidarity and engagement with others: common eating or other socializing areas, company-wide events held, and organization-wide communication must be emphasized. These serve to enhance a real and meaningful sense of unity and connectedness.

Mindfulness. It is critical that an organization become willing and able to reflect on itself, to critique and question its own work relations, and to cultivate a more mindful or conscious orientation to the full environment in which it operates. Growth and development are fluid constructs, and there is never a point where either an individual or an organization has "made it" to a definitive evolutionary end. This more conscious and critical perspective provides the means for increasing both personal and collective capacity, to expand identity and embrace a larger view of ourselves in the world.

Connectedness. A greater sense of holism, of connectedness and interconnectedness, must be recognized as it pertains to the worker and the product, the person and the environment -- we must view work in its full complexity and multidimensional character. This includes, for example, the relation between language, meaning, and work, and the relationship between communication, information-sharing, and a person's ability to contribute in a meaningful way. Conflict and contradiction are inherent components of connectedness. Rather than rushing in to "fix" problems, to ease tempers, or to speed production, organizational leaders are instead compelled to prod and push, to challenge people towards resolution. In this way, "problems" become forces for learning and innovation. For this to happen, however, leaders must reframe their sense of "resistance," and be willing to sit with the tensions created rather than jumping in to resolve problems themselves. This holding of the tensions encourages people to break out of their comfort zones, to think more critically, and to transcend rather than concede.

Meaningful Purpose. Finally, the purpose of work based strictly on economic assumptions must be challenged. Where more traditional workplaces and many workplace reforms focus on profit and consumption as primary goals, the vital workplace understands these as natural byproducts of a more humanized environment and as a means to contribute to a greater cause. Work is not simply about money, but about satisfying our need for expression, innovation, community, and purpose. When we acknowledge the full function of work in our lives, we cannot help but begin to reshape our organizations. Begin by asking, If profits are important for us to survive as a company, why is that survival important? To what end are we, as a company, truly working? And then, How can we best reflect this focus in the ways in which we conduct work?

Conclusion

Reforms that are targeted to change the behavior of others are not reforms at all (Aktouf, 1992; Block, 1997). Such reforms oversimplify human nature and depict the worker as an object rather than as subjects in their own right. By continuing to objectify the human at work, we relegate development to that which happens only when authorized by someone else, embedded within traditional structures of power and control. This ideology fosters a narrow and restrictive growth -- a miseducative experience -- in both the individual and the organization (Dewey, 1938; Welton, 1991) because it fails to acknowledge the complex relationship between individual experience and the full organizational context.

In contrast, this study suggests the natural workplace holds a greater educative potential. This study suggests that by de-structuring work and through the manifest valuing of the whole person within the organization, the natural workplace removes the barriers which serve to restrict and distort growth. Real and fundamental change within the workplace evolves through dynamic and contradictory means, where development is not a function of training but a way of thinking about and conducting work as a whole. This study reveals characteristics of educative work environments which return the person at work to that of a subject who acts upon his or her world. Such a workplace is not a utopia; it demands of people greater flexibility, the development of new skills, and a high tolerance for conflict and ambiguity. Fortunately, these environments provide the necessary context and opportunities for developing these qualities.

Action Learning as a Strategy for Inducing Psychological, Cultural, and Organizational Boundarylessness

Verna J. Willis
Georgia State University

Robert L. Dilworth
Virginia Commonwealth University

A global, borderless marketplace; a new global citizenry; and an unprecedented demand for quickly mobilized, boundaryless responses to meet consumer and citizen needs are serious facts of life for today's organizations. At bedrock, the boundaryless condition appears to yield competitive advantage to corporations and at least potential humanitarian advantage for collaboration among governments, non-government agencies, and other international entities. Research data are beginning to show how action learning specifically provisions the journey to boundarylessness, as told by those who do the journeying.

Keywords: Action Learning, Boundaryless Systems, Psychological Freedom

Critical incident data from an on-going, comprehensive study of qualitative action learning effects, data from investigation into the nature of "boundaryless" organizations and individuals, and a noted absence of theory that connects action learning and boundaryless organizations has led to this non-positivist, multi-source inquiry. It has been triggered specifically by statements action learners make about how boundaries once present-- limiting their abilities to think and act--tend to disappear when they are engaged in action learning. In the critical incident data analysis, which has been facilitated by use of NUDIST software, feeling "boundaryless" emerged as a consistent theme.

It is in the research tradition of open systems thinking that a discussion of implications of this dominant theme is undertaken. When there are isomorphic relations between phenomena –in this case action learning and boundarylessness, then there is cause for examining the two together. Unfortunately----because no such definition exists -- this cannot begin with a clear definition of "the state of boundarylessness" that covers either the case of action learning as a group phenomenon or that adequately treats the case of the individual learner who moves from psychological constraint to psychological freedom. Yet as direct quotations cited later will show, moving from constraint to freedom is precisely what action learners say they do. Presumably, there is no boundaryless organization that does not expect to engender some degree of psychological freedom in its boundary-spanners, as well.

Searching the term uncovers a frustrating collection of assumptions about what it means to be in a *state of boundarylessness.* Most certainly these assumptions do not get a full review in the new literature of organizational change. A ruling assumption seems to be that it is an organizational, not an individual or personal issue. Another assumption implies that the term of newer mint --*boundaryless* --is somehow more explanatory and conducive to action than the older systems term, *open.* Just beneath the surface of the latter assumption lies a compelling call to throw open those boundaries that have traditionally and purposefully been closed, in the hope of now achieving greater flexibility of thought and action. Boundary-busting is expected to catalyze the removal of obstructions to the free passage of information throughout the organization.

Hastings makes such assumptions when he envisions the new organization as a loosely coupled organic network (1993, p. xvi). In his words, "boundary-busting" is a way to achieve this network state, involving:

> a systematic awareness and elimination of physical, personal, hierarchical, functional, cultural, psychological, and practical boundaries and barriers to such cooperation and communication as a continuing process that is necessary to perpetuate the ability of the new organization to stay flexible and adaptable.

This is his prescription for the boundaryless organization. It implicates people, but does not suggest how they can be helped to move toward boundarylessness on an individual level, to achieve the psychological freedom necessary for non-hierarchical networking.

Using Hastings work as one of many possible signposts for traveling further along this conceptual path, we can infer a pair of further assumptions the advocates of boundarylessness are making: that individuals will

Copyright © 1999 Verna J. Willis & Robert L. Dilworth

somehow learn to do and be whatever working in a boundaryless organization requires of them, and that this will be of general benefit. But holding to such assumptions could fly in the face of the realities of cultural differences, psychological readiness for open communication, individual adaptability, and the tendency everyone in or out of the work-place has to protect preferred comfort zones.

While companies like General Electric (Ashkenis, et al, 1995)seem to spend considerable time, money, and energy in the process of encouraging boundary-crossing, not every organization will be willing or able to make proportional investments. Will a new elite of individual boundary spanners emerge from the boundaryless companies, leaving behind those in the same or other organizations who are not enabled to join them by any organizational means? *Should everyone, to some as yet undetermined degree, learn to be without boundaries?* What is it that is let loose when employees encounter opportunities to rethink what their lives in organizations consist of, and what boundaries do or do not work for them? We believe that studying action learning is giving us some preliminary answers.

What Does It Mean to be Boundaryless?

Reviewing current literature makes it apparent that the language of boundarylessness is anything but precise. It is used assumptively and inconsistently, although it may represent earnest attempts to open up our understanding about what systems are, or are becoming. Just as there are relative values attached to degrees of openness, there are relative values attached to what is expected to happen at the boundary where crossings begin. Is the intention to eliminate the boundary altogether --as Hastings seems to advocate? To span it, permeate it, or simply ignore it as if it did not exist? Is the boundary sometimes a solid wall to be breached as if by assault? Is the boundary that we think we are seeing even there?

These are not inconsequential questions, for they have to do with both personal and organizational integrity. Is there □safe conduct□ across the borders for some but not for all? If there is selectivity, is it gendered or culture-bound? What gets handled at the boundary as free currency, and what does not?

Is boundarylessness ad hoc or temporary? If the boundary is real, what happens to it over time? What will happen to individuals, to the organization, and to its environment if any boundary in question goes away forever? There is no end to our lack of knowledge about such matters.

Some of these issues may come into clearer focus if we view the action learning set as a microcosm of the broader enactment of organizational and national boundarylessness. There are reasons to believe that a set of six to eight concerned individuals, fully engaged in learning about itself, its work, and about each member of the set is actually such a microcosm. It is *holographic*, with the whole represented in each of the parts; *heterarchical* and diffuse in power; *structurally unconstrained* and free-flowing; always ripe and tensile with the *creative variety and virtual latency* of the whole set and of every member in it. (Morgan & Ramirez, 1983; Ghoshal, 1993; Hastings, 1993; Willis, 1979)

How We Have Approached Our Study

Our research methodology is mixed, using history, conceptual modeling, critical incident analysis, and observation of action learning sets specifically but not necessarily confined to these. Certainly a phenomenological perspective is involved.

We have not found published research that makes explicit the nature and effects of action learning set boundarylessness (as the term is now being defined) and we have so far failed to find even a working definition of individual boundarylessness. In the search for allied concepts, we have come closest to what we are looking for in futurist literature, especially evolutionary systems theory; in the theories of psychology including research literature in small group behavior; in theories of community, social ecology and communication including cultural communication; and in existential theology, the epistemological source of most 20th century writing on the nature of dialogue (e.g., Bohm, 1990).

We have not found research that even asks the question of how differing degrees of individual boundarylessness in set members, or correlatively in set advisors/ mentors, may affect the degree of boundarylessness in the microcosm of organization that we call the set. While some literature on organizational readiness for action learning (Redding & Catalanello, 1994) has begun to emerge and the need for executive

sponsorship of and commitment to all organizational interventions is well known, what degree of boundarylessness is needed and what it looks like in individual leaders of macro organizations is not clear.

The absence of organizational trappings, including status differentials and prescribed ways of doing things, is a distinguishing feature of action learning. Because no one knows what will happen, the boundarylessness of the set is experienced powerfully, immediately, and potentially, long after a set is officially finished with its work. Significant short and long term changes are induced that, if mapped into the macro organization, could take it into genuinely new territory. The key to what to do in organizational turmoil runs deeper than the massaging of organizational boundaries, and individual psyches are involved whether we like it or not. This is overtly recognized in the action learning set.

Boundaryless: A Working Organizational Definition

There is a tone of urgency in the struggle for new language to describe new kinds of organizational and human possibilities. We say it repeatedly because we really feel it: we are in an era when waves of change occur so rapidly that before we have half struggled to our feet and accommodated to one, another and another breaker are upon us. In an earlier work, Dilworth has definitionally linked boundarylessness with the changing face and body as well as the chaotic movements of contemporary organizations. The following brief, with a quoted excerpt, are drawn from the detailed descriptive entry that first appeared in the 1997 edition of *The Encyclopedia of Public Policy and Administration.*

To a very large extent, our ways of understanding boundarylessness are limited to structural interpretations. There are three commonly understood types of structural boundaries: (1) lateral, between functional components, 2) hierarchical or vertical, between organizational layers, and 3) perimeter, demarcating organization from environment. A fourth dimension requires diagonal interactions that cross-cut other boundaries. These interactions are more typical of Japanese companies. All four types of structural relationships are considered malleable, or at least not sealed against tampering, as constant organizational restructuring in every corner of our lives reminds us.

Boundaries also form the edges of sharply or fuzzily defined mental □boxes□ of organizational members. Often invisible, these nevertheless may operationally define what occurs in any given organization. Some of these are boundaries bricked up by accrued (and often unexamined) experience; others are culturally derived, and still others may have roots in individual personality.

Public sector organizations and their employees are not immune from the necessity of questioning traditional boundaries. While political constraints are recognized, the problems of interagency, inter-government coordination are not insurmountable, and the increased capacity to provide services is a powerful incentive to loosen the bounded systems. All systems are presumed to have opportunity to become less constrained by visible and invisible boundaries. The following definition is therefore to be understood as independent of organizational context. To be *boundaryless* involves the

> ways in which organizations delineate themselves internally and with their external environment, with a goal of minimizing constraints to flexibility imposed by boundaries, whether functional, political, psychological, hierarchical, multicultural or related to professional specializations.

The appearance of both cultural and psychological boundaries in this definition returns us vividly to the problem of defining boundarylessness in personal as well as organizational terms. Again, there are assumptions to sort and peel off from the root concept.

What Does It Mean Personally to be Boundaryless?

Any conclusion that personal boundarylessness necessarily exists in a boundaryless organization may be erroneous. The converse may be equally suspect: just because a person appears to be exercising a high degree of psychological freedom (i.e., acting boundaryless) in an organization, it does not necessarily follow that the organization is boundaryless. It may be anything but, and the boundaryless person working there may easily be an unrecognized or unwanted anomaly in that organization. Further, if it is imagined that becoming boundaryless is highly valued by everyone, such an assumption is easily challenged. What actually happens is that the slightest hint of incipient

boundary freedom may evoke from any particular group of individuals a wide range of responses --from eager endorsement to cautious skepticism to pure terror and retreat. Thus the question of what boundarylessness means to each individual goes unanswered, and how much we can expect each to move in the direction of boundary freedom is also unanswerable, case by case. It may even be that some individuals are subject to considerable life disruption and unmanageability if boundaries are blurred or lacking. (Cloud & Townsend, 1992). Certainly every person reconsidering boundaries is courting vulnerability.

Correlatively, if persons do not learn and change in the direction of boundary freedom, can organizational boundarylessness be anything but the structural kind? In a world where we have come to recognize the inexorable influences of chaos, constantly deconstructing and reordering the universe, what choices do we have about living and working □boundaryless?□

Finding Boundary Freedom in Action Learning

Often the participants in our research on action learning seem naturally to seek and find boundary language to describe personal breakthroughs in their set evolution, their own unfolding of awareness, and their tackling of the problem in focus. Simultaneously they demonstrate considerate behavior toward those who are unready for such breakthroughs. Though occasionally in frustration they would like to throw a set-mate into the murky seas of boundarylessness, sink or swim, upon reflection they tend to see that learning to swim is an individual matter and needs to be individually paced. The implication is that boundarylessness is not something that can be forced in the organizational microcosm of the set.

To the best of our knowledge, none of the action learners who have left written records for us were working in organizations that claimed to be boundaryless. But in the context of the set they say they behaved in boundaryless ways. This confirms that there is a need to define personal boundarylessness as distinct from the macro-organizational context. It is doubtful, however, whether such a definition can ever separate itself from the milieu of close interpersonal relationships, i.e., the existence of a community sufficiently attuned to learning and personal growth so that responsible individualism and boundarylessness can flourish. It is because action learners experience a heightened consciousness of themselves in relation to others that existential thinking has relevance. It is a theory base perhaps less familiar to many readers than other sources of theory cited above, and for that reason it is highlighted here.

Existential Thought and Boundarylessness in Action Learning

Organization theorists know that reference groups are important to employees. The action learning set dealing with real problems in real time is certainly a reference group of a very high cognitive and affective order, involving high personal and organizational stakes. In an action learning set, the forming of community --i.e., set cohesion --is a critical factor in how learning takes place and work gets done. Though he certainly was not referring to action learning sets, a quotation from Paul Tillich helps our understanding of why sets operate the way they do:

> Participation is essential for the individual, not accidental. No individual exists without participation, and no personal being exists without community being. The person as a fully developed self is impossible without other fully developed selves [with whom it is in relation]. (1951, p. 176)

The extent to which bonding occurs in small group behavior --if the small group may be taken as a latent community --will also affect the degree of boundarylessness achieved by individuals in the group. Buber (1958) offers two warnings against the valuing of task performance over group process. Obviously from the quotation, Buber is speaking of group activity generally, but the warnings seem custom made for action learning sets that struggle with prioritizing work outputs and the requirements for learning through process and information exchange. In our research as well as in the findings of others, this difficult balancing act has emerged as one of the primary concerns of set members. They might find Buber's perspective helpful. His first warning is:

> In the view customary today, which is defined by politics, the only important thing in groups, in the present as in history, is what they aim at and what they accomplish. Significance is ascribed to what goes on within them only in so far as it influences the group's action with regard to its aims...

> By this simplified mode of valuations the real and individual worth of a group remains as uncomprehended as when we judge a person by his effect alone and not by his qualities. (p.204).

The second warning is against collectivity, which he defines as

> not a binding but a bundling together: individuals packed together, armed and equipped in common, with only as much life from man to man as will inflame the marching step. (p. 205).

What this reminds us is that there are times when action learning sets do not reach the desired state of community but instead remain a collectivity so totally devoted to conquering the task performance that the opportunity for learning is denied and any incipient psychological freedom suffers frost-kill. In contrast, Buber explains, the experience of community is being *with* one another with everywhere a turning to, a dynamic facing of the other. Collectivity, he says, is based on an organized atrophy of personal existence, [while] community [is based] on its increase and confirmation of life lived toward one another. (p. 205).

Buber insists that dialogue and community are matters of personal freedom and commitment:

> The life of dialogue...begins no higher than where humanity begins. There are no gifted and ungifted here, only those who give themselves and withhold themselves. (p. 209).

One more excerpt from this briefest of tours of existential thought refers directly to change in the structure of consciousness and change in the scale of values. Berdyaev (1958) asserts that

> in the fight for the freedom of man, for the manifestation of the free man [the] process goes deep and its effects can but slowly become apparent. It is a profound interior revolution which is brought about in existential, not in historical time. (p. 157)

The existential view is that attaining psychological freedom or boundarylessness (and in their most constructive sense these terms may be synonymous) is at once a communal (community-based) and a deeply personal act of choosing to see things differently. Results are seldom instantaneously visible, but are instead the product of reflection and dialogue over time.

This seems highly descriptive of what occurs for individuals in action learning sets. There appears to be a period of time when, on the surface, nothing seems to be happening, but when in the creative psyches of perfectly ordinary human beings, the variety available in the learning set community is being richly reconfigured into new thought patterns and often new values. Before these manifest themselves in new actions and attitudes, the set may be said to exhibit *virtual latency* (Willis, 1979, p. 381): *virtual*, because the dynamics of the personal and interpersonal transitions are unseen, and having *latency* because productions of these unseen dynamics are still waiting in the wings. The concept of virtual latency in human creativity may have potential for explaining some of the lag in concrete results that executives may initially expect from action learning, and may help to encourage a longer term view of the development of boundaryless people and organizations.

Boundaryless: A Working Personal Definition

The exercise of psychological freedom within community is not solely an existential ideal, of course. It is also rooted in the human relations movement where the practicality of working in small groups in an atmosphere of mutual trust and honest communication has been demonstrated over and over. It is from these dual and overlapping kinds of source materials, as well as from our research on action learning sets themselves, that the following working definition of personal boundarylessness is derived. It is intended, as in the case of organizational boundarylessness, to be a general definition, applying to individuals in any life circumstance. It is also proffered as an artefact to facilitate further research and discussion in action learning. *A person becoming boundaryless* engages in

> the personal working out of open, authentic forms of risk-taking in egalitarian interactions that allow an individual to push out the boundaries of the self and realize new levels of psychological

freedom, awareness, insight, and ability to act constructively, while valuing similarities and differences with which others approach the same process.

Cultural uniqueness is certainly one aspect of the valued differences and similarities. This is often a critical piece of the action learning endeavor, as unfamiliar problems are addressed in unfamiliar settings by people who do not know each other. People who do not know each other can be working side by side, of course, since organizations do not necessarily seem like good places to be yourself.

A Bifurcating, Borderless, Chaotic World

Since wanting boundarylessness has risen to the level of suggesting a conscious organization development strategy (Askenis et al, 1995) as well as a conscious career development strategy (Arthur & Rosseau, 1996), it is fair to ask what the origins of these strategies might be. We have mentioned some of the antecedents in psychological and existential theories and belief systems. If strategies designed to achieve boundarylessness are further associated with a particular world view or a particular concurrence of social, economic, political, religious, scientific, and intellectual histories, we ought to learn about this. The alternative is that we may decide blindly *whether* to engender boundarylessness without also understanding *why we should or should not.*

We have sought global insights from representative writers in fields ostensibly far from each other: the branch of philosophy of science that is investigating evolutionary systems theory where Ervin Laszlo and Ilya Prigogine are dominant figures, and the economics of global competition as viewed by Kenichi Ohmae, who has been called Japan's only management guru (book jacket). Each may have made contributions to the current strategic emphasis on boundarylessness.

The alien language of chaos theory, a derivative of dynamical systems theory which Progogine's work in chemistry set in motion, has been creeping into management literature and organization parlance for well over a decade. It is now acceptable to speak of chaotic organizations as not necessarily behaving randomly, but instead responding to a new set of attractors that will launch them on new courses of action and establish new kinds of order. The task of management then becomes (in vastly oversimplified terms) to grow agile enough to catch the wave of change and then somehow get out in front of it in a reasonably logical, forecasting way. This, says Laszlo in *The Age of Bifurcation* (1991), is a sign of our new dependence on intelligence --rather than fight, flight, or camouflage --for our very existence.

He calls this reliance on intelligence a fateful gamble, for now our collective survival, and that of the whole biosphere hangs in the balance (p. 95). Laszlo is by no means sure that human intelligence has evolved sufficiently to choose forks in the road that will advance humanity and not lead to its destruction, but he thinks there is hope if qualitative, intensive development on the scale of entire human populations can occur (pp. 102-3). What he views as essential to this undertaking is a holistic alliance of science, art, religion, and education in a unitary process that would seek the cultivation of new forms of consciousness. (pp. 93-94). Bifurcation is now a common experience of all people regardless of their location on a global map. They have come to that turning point where their histories do not afford the means to predict their futures, as systems --nations and ethnic communities --move close to the threshold of their stability. They live dangerously in part because they are required in the passage of time and evolution to become more complex than they are ready to be. Laszlo considers this an unsustainable situation. He sees that we may yet gather our wits and act to bring about a global society that is integrated yet diversified, dynamic and complex, and organized on many levels, from the grass roots to the global. The alternative he sees is continuing on present course, to our own destruction.

Ohmae, in *The Borderless World* 1990) sees an interlinked economy sweeping across national boundaries to serve consumers who can travel and see what they want, or who can view a vast choice of products on the internet. In Ohmae's opinion, the new access to information creates global citizens whose awareness puts pressure on nations and companies to respond in boundaryless ways. He believes that, For managers, this flow of information puts a high premium on learning how to build the strategies and organizations capable of meeting the requirements of a borderless world. (p. 22).

According to at least one branch of the philosophy of science conversant with the new science of complexity, and according to at least one assessment of consumer boundarylessness, as sampled here, we are collectively and separately destabilized by bifurcations, without the comfort of historical precedents to guide us and without scouts who have been to the territory ahead of us and returned. There are no landmarks. This is not to say we have no recourse. Laszlo points us toward boundarylessness in developing new consciousness of our human interdependence. Ohmae has us recognizing that the whole world is everyone's uncarved-up marketplace. This is a

useful backdrop for envisioning ways in which action learning can help to develop the new consciousness of which Laszlo and the existentialists have spoken, as well as the new economic order that is already on its way.

Boundaryless: An Action Learning Set Definition

Throughout our ongoing study of critical incidents, now in its third year (Dilworth & Willis, 1997; Willis & Dilworth, 1998; Dilworth & Willis 1998; Willis, 1998) the unleashing of freedom to think and act is found to be characteristic of the action learning experience. Freedom has opened in two directions, upward toward potential behavior in the macro organizations and national-to-global entities set members will encounter, and downward into the heart of the set and the dynamics of change in persons. The freedom is intensely felt and finds its way into several additional domains in the data: personal growth, new insights, unprecedented learning, and finally into a category sufficiently distinct to be called boundarylessness.

There is high variability in action learning sets and in those who start them in motion. This is to be valued if for no other reason than the provision it makes for the airing of many opinions, surfacing tacit knowledge, and encountering of cultural assumptions so different that set members find a need to revisit their own. The presence of this variety precipitates the individual process of pushing out the boundaries of the self, encouraging new perspectives and new possibilities for action. On the other hand, an over-stressing from volatile interpersonal dynamics in high variability situations can cause retreat of participants (and in some cases retreat of their mentors) from the self-regulatory principles on which action learning is based. Boundary issues will surface, early or late. Examining how they are handled, by whom, might tell us as much about ourselves as set mentors as it does about the set. But this is research that is still to be done. What is intended here is merely to point out that the degree to which set members are allowed to experience *boundarylessness* may sometimes be constrained by a mentor's own discomfort with it.

The functioning of action learning sets does not occur in splendid isolation. In the real world of the real problem, perceptions of how much boundary-pushing the client organization is willing to absorb have their effect. If the organization clearly understands what boundarylessness entails and is prepared to capitalize on such liberation strategies, this raises the ante in favor of set engagement in personal and organizational boundary experiments. If set participants themselves understand and embrace the risks involved, and if set mentors in turn are able to deal squarely with potential negative fall-out in their own professional lives, then the odds dramatically increase that boundaryless ideation and behavior will be seen in set activity.

In the words of set members who provided us with critical incidents we have found support for defining boundarylessness in this particular way:

> Being boundaryless means feeling freedom; liberation; having accountability without burden. We care deeply about the problem, or about someone's behavior, but we don't own it.

Deeply embedded in this set-derived definition is an expressed positive value in crossing organizational and psychological boundaries at will. There is, however, an attending caution that it must be accomplished ethically, *without invading or usurping power belonging to others.*

The definition allows neither a cop-out on responsibility nor a subscription to the liberty of doing whatever one pleases. Obviously, these were sets working on the problems belonging to external client organizations, not on problems they themselves had brought to the table. A disclaimer of ownership of someone else's problem seems appropriate even in each one bring one kinds of sets, however.

Set members clearly understand that, in crossing boundaries (and perhaps oceans), they have evicted themselves from what they thought were relatively safe experts boxes and chosen to wander among others from whom they may learn and with whom they may find solutions. As one reported, Seven heads are better than one --if you can stand the seven! This stepping out from the enclosure of their own knowledge comes to them as a great relief. They feel liberated to learn, liberated to challenge assumptions and ask questions that never would have occurred to them before, and finally even the heavy burden of being found intelligent enough to pin down causes and solve arcane organizational mysteries all by themselves drops like a dead weight from their shoulders.

They also understand that boundarylessness has its costs: the down-playing of hard-won expertise and the relinquishing of cherished but no longer tenable beliefs being foremost among these. Set members talk about both gains and losses in boundary terms, as in these brief excerpts:

I definitely [and uncomfortably] stepped outside my boundaries at that point. I am a non-confrontational person by nature. I was proud of my set. I think there were quite a few of us that pushed our boundaries. If learning cannot take place in a vacuum, as one set member wrote later, then the need for boundary snapping must be inherent in all learning. Surely it may be accepted as a given in the challenging air of a self-regulated set.

Boundarylessness and Set Mentoring

Perhaps each of us has a different threshold of tolerance for boundary freedom and its costs, and this tolerance may vary internally under different kinds of duress. If lives depend on caution, we tend to be cautious. However, if we are able to view our lives as worth risking for some improvement in life quality or some vision of a greater good, then we will tend to devise ways to get over, under, or around our personal and professional Berlin Walls. Risking certainly implies that not everything we might wish for is actually within our own control.

There is always a danger in set mentoring that we will tend to predispose a set in one direction or another if we have not completely understood our own power and boundary needs. Revisiting records of one set recently, we remembered that set members had chosen to work without a mentor. Control of the process (non-stop for two weeks) and of the final presentation to the client resided entirely within the set. Though some had had misgivings about this complete autonomy, the set was notably successful. Again reviewing our data, we noticed that there was a relatively low volume of comments in the five sets studied about mentor influence, if any. There may be situational reasons for this. But the relatively low reliance on set mentors among these five sets is also a signal that the next generation of research may need to look more closely at how sets and mentors learn --for good or ill□ from each other.

Closing Remarks: What Boundarylessness Means to HRD

In the final analysis, what we see happening in sets and where we place ourselves on the continuum of high to low intervention in set activity become deeply entangled with larger questions that we may already be asking ourselves. Potential disconnects between structural freedom and psychological freedom are of concern far beyond the action learning set and its environment, for organizations claiming to be boundaryless are already among us and are likely to increase markedly in number over the next few decades. Serving such organizations may require that we confront for ourselves a series of difficult questions like the following:

Are we, ourselves, as firmly attached to the rewards of short-term results as we perceive our client organizations to be? Are we required to be, in order to serve the client? Do we look for evidence of subtle change in mental operations as readily as we do for visible change in performance? Do we look for and value boundarylessness?

What does boundarylessness mean to a world, a society, an individual? What does it mean to us as adult educators and HRD professionals? Can the general definitions and the set-derived definition cited above hold up well in other circumstances? Do these have implications for human development on a global scale or is boundaryless a localized, largely western phenomenon? We have sketched out only a handful of the possible lines of inquiry.

To what extent does a set mentor, working either pro bono or for pay, have an obligation to prepare organizations and individuals for boundaryless futures? Are there limits to boundarylessness, or should there be? What if, in jettisoning boundaries, we begin to jettison a sense of ourselves, or our ability to perform tasks efficiently?

In our fervent embrace of organizational change and continuous learning,do we really know what we are doing? If we are flying blind, how can we improve our vision? Perhaps our own engagement in action learning –as participants, not mentors – could help us there.

Contextual Learning of Owner-Managers of Small, Successful Romanian Companies

Maria Cseh
Oakland University

This study examines critical learning experiences of owner-managers of Romanian small private companies, which enabled them to lead successfully in the transition to a free market economy, in order to determine what triggered their learning, what strategies they used and what lessons they derived from their learning experiences. The lenses through which managers saw their world framed their critical incidents and learning experiences. The findings as well as their practical and theoretical implications are discussed.

Keywords: Managerial Learning, International, Informal and Incidental Learning

The decade of the 1990s brought dramatic political and economic changes to the countries of Central and Eastern Europe. As Child and Czegledy (1996) noted, "Since 1989 the area has been experiencing economic and political reforms of immense proportions. It has become a 'living laboratory' in organizational transformation within a context of profound institutional change" (p.167). After the collapse of these countries' former communist systems and centrally planned economies, a free market order is viewed as a quick and efficient way towards recovery. Shrader & Collins (1991) have also underlined that:

> Economic growth is bound to be slow unless there is an adequate supply of entrepreneurs looking for new ideas, and willing to take the risk of introducing them. Thus a private enterprise economy will be retarded if it has not enough businessmen, or if its businessmen are reluctant to take risks, whether because they cannot raise the capital, or because they are timid by nature, or because the differentials for risk taking are inadequate. (p. 66)

As most growth in this area is at present coming not from current or former state behemoths but from dynamic start-up firms (Anonymous, 1995a), the study of the ways owner-managers of these companies learn the skills necessary to lead their organizations is important. In the Romanian context, Anton, Danciu, and Mitu (1996) found that "the private sector proved it was capable of absorbing a large share of the labor force made available by public enterprises and of offering equal or even higher salaries to its employees. Private owners are an economic force that is proving to have better skills in administering their assets." (p. 72). A review of the current literature has revealed that insufficient attention has been given to the managerial concerns implied in the transition process to a free market economy in Romania (Nicolescu, 1992; Cseh, 1992). No evidence of managerial learning studies was found in this country. Thus, the problem addressed in this study is the lack of research in management learning in Romania, research which could shed light on ways in which managers learn with the potential of opening doors to the creation of a management development infrastructure.

According to Burgoyne and Reynolds (1997), "The learning part of management learning refers to both what is acquired and how this acquisition takes place, when individuals and social groupings acquire the ability to manage" (p. 5). Talking about the role of situated learning theory in management learning, Fox (1997) draws our attention to the fact that "formal management education and development are but the tip of a learning iceberg and that most learning to manage and managing to learn occurs 'on-the-job' in tacit, culturally embedded ways through people's work practices within organizations, groups, and other communities of practice" (p. 35). Wagner and Sternberg (1985) propose that tacit knowledge (knowledge that usually is not openly expressed or taught) plays an important role in intellectual competence in real-world pursuits. According to the authors tacit knowledge is a specific component of intelligent behavior that is important for occupational success, which is informal rather than formal and practical rather than academic. It is the tacit attributions, beliefs, and assumptions which make up the informal and incidental learning. As Stuart (1989) described, it is important to acknowledge that learning is taking place all of the time--even implicitly and haphazardly--as part of a manager's day-to-day work life and activities. Learning from experience, trial and error, social learning, self-directed learning were just a few of the modalities surfacing in the reviewed studies (Burgoyne & Hodgson, 1983; Lombardo, 1985; Zemke, 1985; Stuart, 1986; Akin, 1987; McCall, Lombardo, & Morrison, 1988; Dechant, 1989; Stuart, 1989; Marsick & Watkins, 1990; Verlander, 1992; Kops, 1993; Young, 1994; Burgoyne, 1995; Geppert, 1996; Simon & Davies, 1996; Soulsby & Clark, 1996).

Copyright © 1999 Maria Cseh

In the wake of all of the above evidence, the main assumption of this study was that Romanian owner-managers of private companies learn their jobs primarily through informal, incidental means. The theoretical framework of this study was therefore based on Marsick and Watkins (1990, 1997), Watkins and Marsick's (1992) seminal work on informal and incidental learning in the workplace. In their models, when learning takes place from experience, under non-routine conditions, people frame the situation they encounter by using their judgment based on their previous experiences and knowledge. In order to develop a strategy to deal with the situation, they assess the constraints and limitations of the context against the feasibility of each solution. Thus, the context is used to test possible solutions. Once a strategy or invention is formulated, people may need to learn how to produce that strategy. The implementation of the strategy leads to consequences which may be the intended ones or sometimes unintended ones. People then embed into their consciousness assumptions or generalizations about whether or not the strategy worked. Thus, out of the consequences, meaning is made of the experience and what is learned from the experience is retained. Marsick and Watkins' models were used as a point of reference for this study. This study was not designed to empirically test these models, but through thick description using a qualitative methodology, to elaborate on their components related to Triggers, Learning Strategies, and Lessons Learned.

Research Questions

The purpose of this study was to examine the critical learning experiences which enabled owner-managers of small private companies in Romania to lead successfully in the transition to a free market economy, to determine what triggered their learning, what strategies they used, and what lessons they learn. In order to attain the purpose of the study, the following research questions were investigated:

1. What triggered the owner-managers' engagement in the learning activity?
2. How do owner-managers of small Romanian private companies learn what they need to know to run their businesses successfully in the new free market economy?
3. What lessons do owner-managers derive from their learning experiences?

Methodology

In order to answer the three research questions of the study, information rich cases were collected through in-depth, face-to-face interviews with owner-managers of successful (on the top list of companies compiled by the Chamber of Commerce at county and country level) small (2-99 employees) Romanian private companies. The interviews were conducted by the researcher in Romania at the end of 1996 beginning of 1997. Managers were asked to describe at least three critical incidents from their managerial practice according to an interview guide which they received at the time they agreed to participate in the study. The interviews lasted between one and two hours and 72 critical incidents were generated.

Although 18 in-depth interviews were conducted, upon further study of the respondents against the sample selection criteria, 15 interviews were finally selected for this study. All but one of the managers interviewed were owners of their companies. In order to maintain confidentiality, the researcher assigned each of the managers participating in the study a numbered letter P1 to P18. These numbered letters were used by the researcher in the narrative and analysis of this study's findings. The 15 managers selected for this study were between 28 and 62 years of age. They were selected to represent both genders and the nationalities (Hungarian and Romanian) specific to the two regions represented. There were six ethnic Hungarians and nine Romanians, and four female managers selected in the sample. The managers were highly educated and obtained their degrees and certificates from Romania. All but three of the managers had a university degree and one of them had a doctorate degree.

Although this research study was conceptualized and reported in English, the data was gathered either in Romanian or Hungarian depending on the participant managers' mother tongue. The researcher transcribed verbatim all the recorded interviews and translated all but six of them. She is native Romanian of Hungarian nationality, speaking both languages at mother tongue level. She is multilingual and in the last fifteen years she has used English, which she learned in childhood, extensively in her work by translating, interpreting, and tutoring from English to Romanian and Hungarian, and vice-versa. Working with three translators, all knowledgeable of these languages and cultures, the validity of the translated materials was verified through back translations and re-translations of parts of the data. Although only small differences in the choice of words and translation of idioms

were noticed, the translators consulted on the issues and a decision was made on the best translation. Although it is impossible to achieve a word-for-word translation an attempt was made to keep the rendering as consistent as possible and still convey the meaning of the original message.

Content analysis with the sentence and paragraph as basic units of text were used in coding and analyzing the data of this study. The first step in the analysis was to clearly identify the critical incidents, the unit of analysis of the research. The second step was the coding of the data into categories. The researcher began the preliminary sorting of the data in the following three mutually exclusive categories: Triggers, Learning Strategies, and Lessons Learned. These categories were predetermined based on the study's theoretical framework. During this process a new category clearly emerged from the data. This category was called by the researcher Framing the Business Context and it was defined as the constraints and opportunities perceived by the managers in the context in which they operated. A total of 511 data strips were categorized in this way.

The third step in analyzing the data was the open coding of the data inside each of the categories to obtain specific themes through close examination of the data. As a result of this process, seven themes emerged under the Framing the Business Context category, Triggers and Learning Strategies each had six themes, and Lessons Learned had five themes. The four categories with their themes are presented in Figure 1.

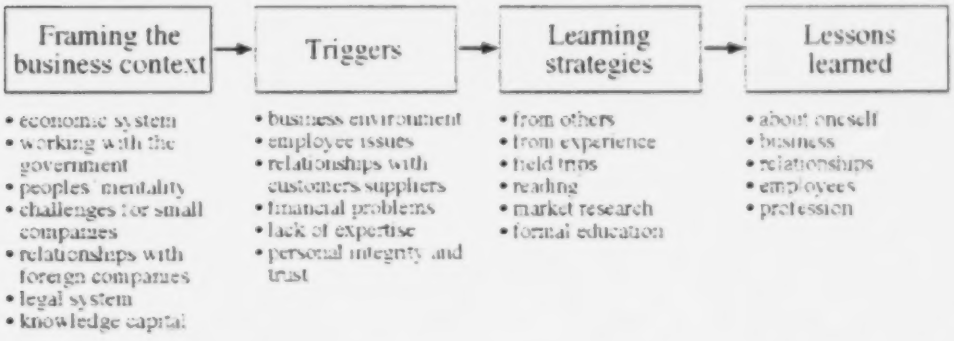

Figure 1. Contribution of the study to the theoretical framework

Both Weber (1985) and Miles and Huberman (1994) contend that the reliability of human coders should be assessed. Intercoder reliability is suggested to assess the extent to which content classification produces the same results when the same text is coded by more than one coder. This was accomplished in this study with the help of the researcher's major professor, a practitioner in the field, and a doctoral student whose valuable insights helped clarify the category definitions and opened new ways of looking at the themes.

Results and Conclusions

The learning of the owner-managers was stimulated mostly by the ambiguity of a quasi-market economy. This study sheds light on what a critical impetus to learn it is for owner-managers of small private companies when state and privately owned companies coexist in the same market, a market which was centrally planned and completely dominated by state-owned companies and institutions for over forty years in Romania and since 1990 it is slowly transforming into a free market environment. This specific, unprecedented transformation characterized by instability and uncertainty adds a new dimension to the complexity of learning by doing when even banks, suppliers, and border guards, to name just a few, are not predictable and shows that there is still a long way to a well defined market oriented environment. The findings of this research showed that the managers participating in this study learn mostly informally what they need to know in order to run their businesses and that courses offered by Western trainers, although interesting, were not valuable to them as the concepts were not embedded in the country's context.

The critical importance of the social, political and economic context to learning. The lenses through which managers saw their world framed their critical incidents and learning experiences. All the managers participating in this study gave detailed accounts of their perception of the economic, political and social context in

BEST COPY AVAILABLE

which they worked and their learning experiences were all embedded in this context. The fact that 111 data strips represented by sentences or phrases emerged from the data as related to the managers' business context strengthens the argument that learning is embedded in the context of the learner and that triggers of learning are selected based on this framing of the business context. One of the most frequently mentioned themes of the seven themes which form this category, was framing the business context in terms of the economic system (no help from the banks, the impact of high inflation and high taxes, uncertainty and instability) followed by framing the business context in terms of working with the government and state-owned-companies (no help and support from government and problems in dealing with state-owned companies). P7 described this instability in the following way:

> Well, this is the cancer of the Romanian society - instability - you don't know what tomorrow will bring, you have no idea. Eh, you don't know what will happen tomorrow, I will die, my business will be taken away, another government will come that will do things differently. People are afraid. There is no such thing as security, stability as it is in developed countries where tomorrow will be like today or a little bit worse or a little bit better, but there is a stable environment. If I open a business I do it thinking that my son will have a chance to take over and hopefully his son will be also there, but here, here it is not possible. (p. 7)

The economic system and the government institutions in place offered very little support or sometimes even seemed to raise barriers in the way of the small private businesses. Speaking about the helplessness in front of all the barriers raised by the government to keep private companies at bay, P17 described how:

> You have moments when you just want to quit. When you run into so many obstacles and so many people are slowing you down even though you want to do something good, nobody wants to help you, quite to the contrary...You have people from urban development, from constructions, from telecommunications, and on, and on, all requiring signatures and they have a kind of envy thinking that you have money to build a factory and they don't have money to buy a car for example...I don't understand, is this the future? For a better society you ought to help people with initiative to do something. Why delay them? And unfortunately we all run into these things. (p. 11)

Framing the business context in terms of people's mentality (old [regime] mentality/business work ethic of employees, managers, and people in general) was another major theme derived from the managers' accounts. P10 described his problems caused by his employees' old mentality in the following way:

> I had to explain to my workers, that those times when you could take home a reel of thread, or anything else is over [referring to some habits in the old regime], and now if you take something, you take it from the private property of somebody. Unfortunately in the 'old times' people got used to that, nobody can deny that,...so people took home anything available just to supplement their income...But to change people's mentality is the hardest thing to do...Time and education is needed, just like the communist system developed in fifty years its own kind of people. I am not saying that fifty years are needed to change people but at least a minimum of twenty five years is needed to develop a new generation who can really live and work in a democratic society. (pp. 1-2)

Framing the business context in terms of challenges for small companies and their managers (lack of resources and market realities, the professional challenge) was another theme echoed in the managers' stories. The account of one of the managers from team P11 eloquently presented the challenges of some of the entrepreneurs in this unprecedented turbulent context in the following passage:

> In my opinion the biggest problem in this transitional period was that people needed to change profiles, to forget their old specialty and learn a new one. In fact, we also went through this. We had our specialty, probably it would still be our source of living if Ceausescu were alive, and we were forced to forget it and learn a new one plus the management part of it. I believe this is a big problem and everybody had to go through it. It's hard to explain it. In the past there were no unemployed people on paper, but there were inside the gates. They had no work at the workplace. They didn't do anything, because they didn't know or didn't want to. They got paid anyway. So, it was unemployment inside the gates. In these days it's getting harder and harder to do that. People

> are forced to change profiles, or in some cases to learn a totally new specialty. The transition is still going on. (pp. 7-8)

The managers perceived their context in its larger entity by emphasizing the whole political, economic, and social context in which they conducted their activities more than the internal context of their own organizations. Deriving from the managers' accounts of their context, this is understandable in an environment where rules and laws are continuously changing and where government institutions try to find their identity in a new order of things. The context was sometimes interpreted as a macro level trigger of critical incidents, as a barrier in finding solutions to their problem, or sometime as offering potential opportunities. Thus, the framing of the context emerged as a critical dimension in this study and permeated every phase of the learning process.

Enhancing the Meaning of Triggers of Learning, Learning Strategies, and Lessons Learned

The thick, rich descriptions of learning incidents offered by the studied owner-managers enhanced the meaning of these three components of the model. Ninety four triggers, the stimulus that initiates the managers' process of learning, were identified as presented in Figure 1. All of these triggers arose from specific contextual situations perceived as unsolvable at that time by the managers. From this point of view, the nature of these triggers is not different from that presented by Watkins and Marsick (1992) and Marsick and Watkins (1990, 1997). In several studies (Marsick and Watkins, 1990; Howe, 1991; Kops, 1993; Lessard, 1994; Villinger, 1996; Simon and Davies, 1996) triggers of learning were not specifically discussed as it was implied that learning experiences were embedded in the changing organizational context. In the few studies where triggers were analyzed (Akin, 1987; McCall, Lombardo and Morrison, 1988; Dechant, 1989; Mumford, 1993; Ellinger, 1997), they were mostly related to the internal context of the managers' organization (e.g. first supervisory job, new project/task force assignments, problem solving within a group, line-to-staff switching, starting from scratch, business mistakes, subordinate performance problems). Most of the triggers in this study were embedded in the external context of the managers' companies while only a few of them were related to the internal context of the company. Thus, this study expands on the findings of studies describing triggers of learning experiences in the literature.

One hundred seventy seven learning strategies, defined as the methods used by the owner-managers to go about learning to deal with their critical incident, were also identified as presented in Figure 1. The managers' learning strategies were informal and incidental in nature and expanded the findings regarding learning strategies in the literature by shedding light on some of the same strategies, but used in a context of radical political, economic and social change. One of the learning strategies frequently mentioned in the literature was learning from a mentor (Akin, 1987; McCall, Lombardo and Morrison, 1988; Lewis, 1995). This learning strategy was not mentioned at all by the managers in this study which might be explained by the unprecedented change in the environment in which these managers conduct their activities where everybody is trying to learn the new rules of the game amidst the old rules still in place.

The 129 lessons learned identified in this study, as presented in Figure 1, also expand on the findings in the literature. The managerial studies conducted in the United States and Western Europe addressed the issue that managers should continually adapt their strategies, tactics, systems and behaviors to remain effective in their changing environments. The assumption was that those managers already had not only the basic knowledge of how to run a business or a department in a market economy, but also managerial experience on which to rely in that economy. In this study that assumption did not hold as most of the managers started from "grass roots" and first had to learn the basics of conducting and organizing a business in a radically changed environment. Thus, the findings paint a different view of similar lessons as embedded in their context and, by this, expanding their meaning.

One of the major lessons learned by the owner-managers participating in this study was that although many changes took place since the collapse of the communist regime, little has been changed in the way human relationships in conducting businesses were governed. Thus, those managers who did not have managerial experience in the previous regime had to learn how to work with the government and state-owned companies while those who had previous experience did not have a chance to forget or unlearn previous practices. Managers also learned that it will take time until the mentality of the majority of people will change in order for them to understand the way a market economy evolves and works. It will take time until the new rules of the game will take over the old ones and new relationships between businesses and their customers and suppliers will be forged based on ethical principles.

Implications for Research and Practice

The findings of this research show that the managers participating in this study learn informally what they need to know in order to run their businesses and that courses offered by Western trainers, although interesting, were not valuable to them as the concepts were not embedded in the country's context. According to Nonaka and Takeuchi (1995), tacit knowledge deriving from close familiarity with the Central and Eastern European context could be of utmost value for Western partners who lack this familiarity and sureness of touch, yet it could easily be unrecognized or dismissed as inappropriate by those who assume that their competence is necessarily superior. For global human resource development practitioners the findings of this study show how critical it is to invest the time in understanding the historical, political and social dimensions of the country in which the interventions will take place. The learning accounts of managers in this study also shed light on ways of learning when few resources (e.g. financial, technological, educational) are available to support learning. Thus, this study may help practitioners faced with tight resources craft innovative ways to learn and develop training and development programs.

The findings of this study extend Marsick and Watkins (1990, 1997) and Watkins and Marsick's (1992) theoretical framework and model of informal and incidental learning in the workplace. As the authors' framework and model was developed based on empirical research in the United States and Western Europe, which enjoy political and social stability and, in spite of globalization, a relatively stable economy, it did not include the learning models of managers living and working in a volatile political and economic environment. The managers' learning studied in United States and Western Europe was based on already established professionals working in well-defined organizational structures and corporate cultures. The owner-managers in this study and their organizations, the newly-founded small companies in Romania, are witnessing an incubation period when the organizations' structures and culture are developed by trial and error in the same time as the managers' profession is established. This context as well as the owner-manager group which was not represented in the studies on which the model was built contributed to the extension of the model.

During the data analysis process it also became apparent that the language used in Marsick and Watkins guiding models (1990, 1997) was too abstract or parsimonious compared to the language used by the participants in this study. Although this study added thick description to the three components related to triggers of learning, learning strategies, and lessons learned, the question of what is not captured in the models seems worthwhile to explore. Thus, an empirically grounded re-conceptualization of the models into a model which incorporates the learning process as people in this study described them is recommended and it is addressed in another paper.

The learning models of managers operating under the volatile environment of the countries in Central and Eastern Europe deserve further exploration. Global human resource developers can determine how to offer innovative approaches to learning and to create a learning infrastructure to serve the population of managers in this region from studies such as this one. Additional studies addressing how managers learn in companies with different ownership patterns, and the relationship between the learning styles of these managers and the nature of their learning would extend this study. Nevertheless, the portraits given here of the learning of managers facing turbulent change, and a level of constant chaos, chart new territory for management development.

Are Careers What They Used To Be: A Factor Analysis Of Schein's Career Orientations Inventory

Gerri Mukri
CAPT, Nurse Corps, United States Navy

Sharon Confessore
George Washington University

This study provided a statistical analysis of Schein's 40 item Career Anchor Orientation Inventory Tool. Participants were randomly selected and data collection accomplished by mailed survey (n = 268). Eight reliable factors were identified that closely matched the eight factors identified by Schein as career anchors. Eigen values were all greater than 1 and reliability testing, using Cronbach alpha was good. Overall, Schein's tool was found to be statistically reliable and valid to, in part, determine career anchors.

Keywords: Career Anchors, Career Orientation Inventory, Evaluation

Career development has been identified as a life-long process, which involves the development of attitudes, values and capabilities that lead to future occupational choice (Super, 1990). Today, there are profound changes occurring in the workplace and within organizations worldwide. "These changes in the occupational environment have implications for career development in the future" (Schein, 1996, p. 80). Everyone who works is experiencing changes never imagined. Technological advances and globalization are but two major factors that have revolutionized the workplace. Recent changes have introduced a whole new vocabulary to describe and define what is taking place in the workplace. Activities and business initiatives such as rightsizing, downsizing, job sharing, downshifting, re-engineering and the virtual office are commonplace. As adults mature, a major consideration involves the changes in self-concept and identity when the individual faces marriage, parenthood, career advancement, decline, retirement, illness and widowhood. Factors such as age, gender, race, personal characteristics and economic condition influence the extent to which various life roles are fulfilled, and the recognition of the interconnectedness of these life roles has begun to change the nature of career and life planning.

While individuals have always been focused on career development, the past ten years has seen a major shift in the way that people view their careers, with increasing emphasis on an interconnectedness between their personal values, their work life and career goals. Many organizations are scaling back or eliminating their career planning and development activities as a way to cut costs, and expecting the individual to take on more of the responsibility for career management. A frequently cited condition in today's workplace is that no employment is constant, and organizations, as well as individuals, must be always ready to meet the changing needs of today's work culture. With less career support from organizations, self-assessment vehicles are vital to helping individuals understand their relationship with their careers, organizations and personal commitments.

One means for framing career development is through the use of Schein's Career Anchor Instrument (1990). The career anchor concept is based on developmental principles of career choice. Schein asserts that as an individual progresses through the developmental stages of a career and enters the establishment state, which is generally after 10 years of working life, one develops a clear occupational self-concept. Schein labels this occupational self-concept as a "career anchor." It is composed of the self-perceived talents, motives and values of the individual and:

> ... embraces some explicit answers to the questions:1) What are my talents, skills, areas of competence?; What are my strengths and what are my weaknesses?; 2) What are my main motives, drives, goals in life? What am I after?; 3) What are my values, the main criteria by which I judge what I am doing, whether I am in the right kind of organization or job, how good I feel about what I am doing? (Schein, 1982, p. 8).

Once an individual clearly recognizes these talents, motives and values, the need for congruence makes one seek consistency and integration among the different elements until a complete self-image is realized (Schein, 1982).

Copyright © 1999 Gerri Mukri, Sharon Confessore

While the individual's occupational self-concept matures, it begins to function as a guide in career decision-making as it drives, constrains, or stabilizes the person in making career choices, thus, the anchor metaphor (Schein, 1978).

Problem Statement

Overall, the importance of understanding the way individuals view their careers is increasing, but research in the area of careers has not kept pace with, and has even been hindered by, the rapid changes in the workplace. Much of the early discussion of careers dealt with the concept of fit between such things as the individual's skills, personalities and abilities and those required by the job or environment/organization (Holland, 1985; Parsons, 1909; Williamson, 1965). However, the work environment is changing so rapidly that these conceptualizations may not well represent contemporary career development.

Specifically, career counselors have incorporated use of Schein's career anchor instrument career anchors, into their practice of advising individuals and organizations as they address individual career goals and organizational employment needs. Unfortunately, while Schein's Career Orientations Inventory is widely used as a self-assessment tool, little research has been done to validate that instrument. Thus, there is little empirical evidence to draw on to help people make these decisions, a problem exacerbated by the sweeping changes in the workplace over the 15-20 years since Schein's initial work, and subsequent follow-up studies were completed. Thus, the problem to be addressed is whether the constructs represented by the career anchors inventory are valid and reliable.

Research Question

Is the Career Anchors Orientation Inventory Scale, developed by Schein, a valid and reliable tool to determine the career anchor for particular individual's within a selected sample and population?

Theoretical Framework

The multidimensional approach to career development took shape as researchers incorporated the broader dimensions of personality variables with developmental theory. Particularly important was the multidimensional approach to careers evidenced in the work of Super (1957). It is commonly accepted that Super's developmental self-concept theory of vocational behavior has been credited as uniquely successful in integrating the occupational psychology approach with the evolutionary process approach of developmental career psychology.

Flowing from the work of Super, other researchers have adopted a multidimensional approach to career development which extends career development theory to include later career stages and new relationships. Schein devised an integrated approach to career development using a description of nine career stages (Schein, 1975, 1978, 1980, 1982, 1987, 1990). These are an adaptation and elaboration of the career stages introduced in the seminal work by Super. The nine stages are: (1) growth, fantasy, exploration; (2) education and training; (3) entry into the world of work; (4) basic training, socialization; (5) gaining membership; (6) gaining of tenure, permanent membership, mid-career crisis, reassessment; (7) maintaining momentum, regaining it or leveling off; (8) disengagement and (9) retirement. Career stages 4, 5 and 6 are seen to be of particular interest to the study of career development as they relate to the organization and the individual. It is during these stages, which are generally characterized by an individual's establishment in the organization, that a person develops an occupational self-concept which has been termed by Schein as a "career anchor" (1975).

As an integrated model of career choice, the career anchor concept is considered unique in that it represents a synthesis of an individual's self-image and work experience. Concerning this uniqueness, Schein (1978) emphasized five central factors, which are inherent to the career anchor concept. The career anchor concept is:

1. Broader than the concept of job value or motivation because it accounts for the individual's self-perceived abilities and talents based on actual work experience and the individual's motives/values.
2. Not possible to predict from tests because the emphasis is on actual work experience that allows for the evolution, development and discovery of individual career anchors.
3. A gradual integration of values, motives, and abilities into the person's total self-concept.
4. Only discovered over a number of years during the early career when real-life situations indicate how the person's abilities, values and motives interact with and fit the career options available.

5. Identified with a growing area of personal stability without implying that the individual ceases to grow or change in other areas.

These career anchors describe how the individual views his/her career. The original study that formed the basis of the career anchor concept was a longitudinal study reported by Schein (1974). That research project was conducted to gain a better understanding of how managerial careers evolved, and how managers were socialized into the work setting. Subjects were 44 male graduates from the Sloan School of Management, who were monitored via periodic interviews over a 10-12 year time span. Although the job histories of the alumni differed, there was a high degree of consistency in the reasons given for their individual career decisions. On the basis of this consistency in career decisions, the following five career anchors were identified: managerial competence; technical/functional competence; organizational security; creativity (entrepreneurial); and autonomy. In a final report on this study, Schein stated that "careers are motivated in different ways and organizations must consider these differences in planning career development" (1975, p. 1). Because of the demonstrated stability in the participants' career anchors, Schein (1978) posited that career anchors would become increasingly stable over time. Over time and with further research, such as that performed by Applin (1982) and Burnstine (1982), who identified lifestyle as a potential career anchor, the original five career anchors have been expanded into eight classifications which now include, in addition to the first five: service, pure challenge and lifestyle (Schein, 1990, 1992). To date, Schein's career anchors have been utilized with many diverse populations including federal managers (Barth, 1993), teachers (Delong 1982), and certified public accountants (Hardin, 1995).

Methodology

This study tested the reliability and validity of Schein's Career Anchor Orientations Inventory instrument scale. This scale is the first part of the process that Schein describes to determine an individual's career anchor. A tentative career anchor can be identified by using the inventory scale alone, but must also be compared with the findings in the other steps in the process to determine an individual's true career anchor. While the original concept of the career anchor was developed based on individuals in the business administration field, subsequent refinement of the concept was achieved by studying subjects from a variety of career fields. The sample subjects for this study were drawn from a randomly selected group of nurses who had 10 or more years of work experience and, according to Schein, should have developed a sense of their career anchors. Nurses were selected as a convenience sample. Further, this population was selected to see if their career anchor selection had remained constant in the 1990's when compared with what had been described earlier in the 1980's. The participants were mailed a survey which contained: (1) a demographic survey, (2) a short answer questionnaire focused on career choices and preferences based on Schein's interview format; (3) Schein's Career Orientations Inventory (40 questions organized around a six-point Likert scale), and (4) a career anchor description list for the subjects to prioritize, based on the individual's personal perception of job importance. There was an overall return rate of 60.2% (271 surveys), and of those 268 (59.6%) were usable.

Questions on Schein's Career Orientations Inventory scale were answered based on a six-point Likert scale. Respondents were asked to indicate how "true" each item was for them personally using this scale. A "1" corresponded to the statement never being true for them, while a "6" indicated the statement was always true for them. Following the information provided by Schein (1990), after the 40 items were answered, individuals were then asked to go back over their answers and to circle three of the items which they had awarded the highest point value, and which they deemed were the most applicable to themselves. These three items were then weighted by assigning them four additional points on the coding sheet. Using the scoring sheet provided, the column with the highest point value initially indicated the individual's potential career anchor.

To provide additional insight and understanding of career development in the 1990's respondents were also asked to complete several short answer questions. These questions were designed to correspond very closely to the developmental questions provided by Schein in his Career Anchors publication. Participants completed questions related to career goals, demographic characteristics, and general information regarding the career anchor concept. These answers were analyzed qualitatively after the factor analysis had been completed.

Because the Career Orientation Inventory has had limited validation, a factor analysis with varimax rotation, and a reliability analysis using Cronbach's alpha as a model of internal consistency were also performed on the data. The statistical analysis was performed using the computer statistical package SPSS.

Results, Conclusions and Limitations

Eleven factors were identified, but only eight had high eigenvalues. Questions loaded on six factors that corresponded very closely with the questions that Schein identified for six of the career anchors, with moderate to high factor loading. Questions also loaded on another 2 factors, which closely reflected Schein's structure. The rotation converged in 10 iterations. Tables 1 and 2 display the career anchor structure, associated questions and absolute value scores.

Table 1 Confirmed Career Anchors Using Schein's Structure

Factor 1	*Eigenvalue 5.295*	*Absolute Value Score*
Autonomy	Question 3	.549
	Question 11	.673
	Question 19	.699
	Question 27	.771
	Question 35	.570
Factor 2	*Eigenvalue 3.617*	
Challenge	Question 7	.667
	Question 15	.736
	Question 23	.711
	Question 31	.632
	Question 39	.508
Factor 3	*Eigenvalue 3.038*	
General Manager	Question 2	.400
	Question 10	.620
	Question 18	.820
	Question 26	.659
	Question 34	.701
Factor 4	*Eigenvalue 2.670*	
Lifestyle	Question 8	.619
	Question 16	.631
	Question 24	.666
	Question 32	.505
	Question 40	.471
Factor 5	*Eigenvalue 2.306*	
Security	Question 4	.500
	Question 12	.501
	Question 20	.707
	Question 28	.641
	Question 36	.627
Factor 6	*Eigenvalue 1.972*	
Service	Question 6	.434
	Question 14	.588
	Question 22	.686
	Question 30	.675
	Question 38	.664
Factor 7	*Eigenvalue 1.713*	
Technical	Question 1	.436
	Question 9	.528
	Question 17	.516
	Question 33	.357
Factor 8	*Eigenvalue 1.527*	
Entrepreneurial	Question 5	.707
	Question 13	.764
	Question 37	.835

Table 2 Other Identified Factors

			Questions are identified by Schein as related to the following career anchors
Factor 9	Question 21	.437	Entrepreneurial
Eigenvalue 1.317	Question 29	.434	Entrepreneurial
Factor 10	Question 6	.405	Service
Eigenvalue 1.051	Question 30	.339	Service
Factor 11	Question 25	.644	Technical/Functional
Eigenvalue 1.000	Question 34	.308	General Manager
	Question 40	.309	Lifestyle

Factor seven, which corresponded to the technical/functional career anchor, only moderately loaded on four of the five questions, and factor eight (entrepreneurial) loaded high on only three of the five questions. The other two questions, (#21 and 29) identified by Schein as relating to the entrepreneurial career anchor, also loaded on the factors related to autonomy and challenge career anchors. In addition, those two questions identified a separate factor (factor #9). The other two factors (#10 and #11) identified very weak or weak factor loadings, except for Question 25 (.644). The eigenvalues, which refers to the ability of all the questions in a particular factor to better explain the construct instead of a single item, were all above 1 which is the accepted value to demonstrate the contribution of the factor to the total communality (Ferguson, 1981). Due to low eigenvalues and low factor loading, factors 9, 10 and 11 were not considered in this study. The results are displayed in Table 2.

As a check for internal consistency and reliability a Cronbach Alpha was performed. This is the most appropriate type of reliability for survey research when there is a range of possible answers for each item (McMillan and Schumacher, 1997). Results of the reliability assessment are summarized in Table 3, and were very consistent with an earlier study done by Hardin (1995) that looked at certified public accountants. Technical/Functional career anchor scale has a moderate reliability coefficient while the other scales have a high degree of reliability. In summary, the factor structure for this data is very similar to Schein's (1990), and the reliability is good and acceptable.

Table 3 Internal Consistency Reliability Test Results

Career Anchors	Coefficient Alpha
Technical/Functional	.5297
General Managerial	.7589
Autonomy	.8009
Security	.7251
Entrepreneurial	.7788
Service	.7428
Challenge	.7989
Lifestyle	.7323

Thus, it was determined that the Career Orientation Inventory could be utilized with confidence as there was a good degree of consistency, and meaningfulness of design with Schein's overall factor structure for the eight career anchors. Even though the entrepreneurial career anchor had only three questions loaded within that factor, the loading was very high. There was also a high degree of reliability on seven of the eight career anchors, and moderately high on the other career anchor.

While factorial invariance was not completely achieved, the overall factor structure of Schein's instrument was proven to be sound. Perhaps the inability to achieve closer factorial statistics could in part be attributable to the difference in populations as well as the fact that this is a constantly evolving and changing environment. All eight career anchors were found to have reliable internal consistency. Overall, Schein's Career Anchor Orientations Inventory is statistically a fairly reliable and valid tool to determine career anchors.

However, the changes in the workplace, and in language usage would seem to have an impact on the individual's ability to complete the inventory, and a concern with specific terminology is noted. Many of the terms used in the inventory, or to describe the career anchors for prioritization, are emotionally charged words which seem to elicit a response which may not be consistent with the original intention of the intended item. The items from the short answer responses indicated that the verbiage used to describe the career anchors might have an impact on the individual's choice of answer more than the actual concept behind the description. An example of this difference follows: in today's work environment, the terms "flexibility" and "risk-taking" are considered more desirable attributes than they were in the 1980's. Also, certain words seem to have taken on new meanings in that words such as empowerment, risk-taking, innovation and other highly charged words are used during motivational speeches, and appear on slogans or performance appraisals. All of these terms tend to provoke a response that may not be in keeping with the career-related concept intended. Some of the possible distortion may be due to an organizational or ethic cultural interpretation, a change in the contemporary use of a word, or a change in today's workplace perspective. Another consideration is that the wording on the questions, in particular #33 which refers to using your skills in your job, may be too general for today's specializations. In today's workplace, all individuals are required to have some type of technical competence in order to do their jobs, and thus should perhaps be accounted for in the Schein Career Anchor instrument.

This study furthered the developmental theory of careers by confirming the existence of career anchors, as well as providing additional evidence of construct validity and reliability for the Career Anchor Orientation Inventory established by Schein (1990). While this study confirmed the career anchor construct, there is still much room for speculation and controversy surrounding the construct and in particular the lifestyle career anchor. The findings from this study support the existence of the lifestyle anchor. They also suggest that the instrument can continue to be used, with caution, as people formulate their careers in the late 1990s.

That, within this population, the lifestyle was the predominate anchor supports the increased interest and emphasis in the literature on integration of life and workplace values. The respondents, who identified very strongly with their organizational culture, clearly articulated the importance of family and revealed a strong concern with the meeting the needs of the family while maintaining careers. Most surprising was the interest and value individuals gave to a "higher being" in determining the value in their lives, and assessing which career choices would be best for themselves and their families.

It should be noted that the results of this study are limited due to the specific pool from which the subjects were drawn (the Navy and nurses) and their voluntary participation in a survey process. Further, while the concept of the career anchor is firmly established in the HRD field, the factor structure for the Career Orientation Inventory has not been widely tested.

How This Research Contributes to New Knowledge in HRD

Career decisions and planning, while ultimately the responsibility of the individuals involved, have become a significant function of HRD professionals, and the organizations they serve. This increased emphasis is due, in large part, to downsizing efforts and associated job placement counseling/services, and job reengineering. Part of the process that HRD professionals employ is self-assessment. This is a critical component of career strategies that is geared toward professional self-fulfillment. Over 16 years ago, Yankelovich (1981) stated that "new-value" workers search for self-fulfillment in their work, rather than simply working for pay. This study of career anchors, which is based on an individual's self-assessment of their values, skills and goals, further describes and defines "worker" characteristics. This study demonstrates that the career anchor concept appears to be a tool which HRD professionals can use to guide individuals in learning more about themselves, and lead organizations to better utilize and understand their employee assets.

Career planning and development of the individual are key factors in HRD functions. The ability to integrate the individual's needs, values, talents and self-awareness into the requirements and structure of an organization is the work of the HRD professional in order to develop the maximum potential of the individual while seeing to the greatest functionality of the organization. The identification of an individual's occupational self-concept, the career anchor, is an effective career strategy that can facilitate enlightened career decision-making and planning for career development in keeping with the interests of the individual and the organization.

From an individual perspective, and in conjunction with HRD professionals and researchers, a career can not be managed effectively if an individual does not know his or her needs, biases, or motives (Schein, 1990). Individuals seeking employment must decide what type of career to pursue and the type of setting in which to work (Dilon and White, 1988). Each employee should perform a self-appraisal and evaluation of themselves in terms of their

perceptions about careers. This should contain a systematic approach to data collection and analysis so that the individual has a clear understanding of their needs with respect to their career (Hodgetts and Kroeck, 1992). The career anchor assessment tool can be a vital part of this process. This tool offers the individual the ability to identify what values, skills and abilities are most important to them. While not a panacea for career choice and all career decision, it offers a useful approach from which the individual can evaluate career choices in terms of core professional identity through the career anchor, and in so doing enhance organization and individual job harmony.

Women's Professional Organizations: Their Potential Role in Women's Careers

Sheila Barry-Oliver
Sharon J. Confessore.
The George Washington University

The purpose of this exploratory qualitative study was to investigate the potential role for women's professional organizations in women's career development and advancement. Sixteen women in leadership positions in diverse career fields, organizations, and career stages participated in the research. Five potential career benefits were described as occurring on the individual and interpersonal levels: self-esteem, skills, support, networking, and giving back. These benefits were obtained over the long-run from active participation in professional organizations.

Keywords: Woment's Professional Development, Professional Organizations

Women began to enter the U.S. workforce in significant numbers in the 1960s and 1970s. However, recent data tell us that women are not succeeding to the most senior levels in organizations to the same degree as men. Although women represent 46% of the U.S. workforce and 40% of all management and supervisory positions, they represent less than 5% of senior management. Extensive research has focused on the causes of this low representation and on potential solutions. Morrison and Von Glinow (1990) proposed that the differences resulted from gender differences, gender discrimination, or structural systemic discrimination.

If developmental opportunities for women within their work organizations are limited, then perhaps external activities should also be considered as possible avenues for developmental opportunities. Professional organizations are prevalent, and have been identified as possible sources of external visibility, competence acquisition, mentors and role models (Rusaw, 1995), which are associated with women's career advancement. Anecdotal information suggests that women's professional organizations provide unique developmental opportunities. In Adams' (1979) study of 60 professional women, the participants indicated that women's profession organizations enabled them to find others who live with the same pressure, to better evaluate where they were in their careers, to get emotional support, to balance the isolation of work, and to find mentors and sponsorship.

Professional organizations have been found to be a common factor in the career histories of women in management or leadership positions (Bruegman, 1995; Rusaw, 1989). To the extent that professional organizations are a reflection of the profession, gender issues present in the professional work context may also be present in professional organizations. Perhaps this is why more than 500 women's professional organizations have been established since 1980. The Business Women's Network Directory lists 900 professional women's organizations--either national or local--that individuals can join.

Statement of the Problem and Research Questions

The need for strategies to promote women into and through the ranks of management is well established. To date, the strategies that have been examined are internal to the work organizations. It has been generally assumed that professional organizations are beneficial to one's career and there is some evidence that career development can occur in external professional organizations (e.g., Bruegman, 1995; Rusaw, 1989). Though internal single gender organizations have been proposed as one remedy (Catalyst, 1991), external single gender organizations have not been specifically addressed in research addressing the career needs of women.

The purpose of this study was to investigate the potential role for women's professional organizations in women's careers and in their advancement--into and through the ranks of management. There are a significant number of women's professional organizations: some are membership organizations, some might be classified as learning communities, some are based on professional areas of expertise (e.g., information technology), some are based on functional role, etc. There have been very few studies of professional organizations and the research that has been conducted has been from the perspective of the organization and its role in staff development programs and in encouraging non-traditional careers for women. However, there has been no study of women's professional organizations and their career development contribution using the lens of women's career development theories as a base for study.

Copyright 1999 Barry-Oliver and Confessore

This study focused on professional women who achieved leadership positions in their careers and who have participated in women's professional organizations. The study sought to understand the benefits of participation and how participation contributed to their careers. Since women do not appear to be getting the development they need to progress into management, the question that is addressed is: What role can single gender mechanisms, such as women's professional organizations, play in women's career development and advancement? Specifically, what benefits accrue to women who participate in professional women's organizations that are of relevance to their careers and to their development and advancement?

This study is important because it investigates a previously unresearched strategy for contributing to women advancing into and through management. This study is an exploratory qualitative study designed to begin to understand a phenomenon not previously researched. This study assumes that career advancement means promotion, as to a higher rank or level, and/or progress or furtherance in one's career, as in additional responsibilities; career development means career growth, building up, becoming better (often career development is associated with skills building and gaining competence, either through training and education or specific assignments); and a professional organization is an entity whose goals are the furtherance of its members' profession(s) and the advancement of their professional interests (often termed "association" or "society").

Theoretical Framework

Career theory research has been identified as career development, career advancement, career paths, career success, career strategies, career achievement, career choices, career psychology, paths to power and upward mobility, to name a few. Of all these variations, career development seems to be the most general term for addressing the progress of one's career, with positional advancement, increased title, or additional responsibility as the measure of one's progress. Numerous studies have found differences in the careers of men and women (Adams, 1979; Larwood & Gattiker, 1987; Ohlott, Ruderman, & McCauley, 1994). Morrison, White and Van Velsor (1987) identified five organizational experiences and conditions associated with the demonstrated career progress of women: support and encouragement, training and development opportunities, feeling accepted, challenging and visible job assignments, and an absence of tension. Burke and McKeen (1995) examined the relationship between the work experiences identified by Morrison and the career success of managerial and professional women. They found that women who received more training and development, received more support and encouragement, felt more accepted, and were given more visible challenging work assignments were more satisfied, involved and successful in their careers.

Recent models of career development that have specifically focused on women's career development and advancement have taken a systems approach. The models contain multiple variables and address both person and situation explanations. These models of career development do not accept the traditional assumption that one's career is continuous and the authors incorporate non-work personal variables (e.g., marital status, parental status) as components necessary to understand women's careers. Research suggests that women interweave work and family in a way that men do not (Fitzgerald, Fassinger, & Betz, 1997) and have different views of occupational achievement and the balance of work and family. Certainly there is a proliferation of career development theories being applied to women today, with no consensus on the variables.

Ragins and Sundstrom (1989) focused on the career paths to power, which have implications for advancement. Morrison (1992), building on her earlier work, proposed a framework for career development that includes three elements: challenge, recognition and support. Tharenou and Conroy (1994) evaluated the relative importance of situation-centered variables and person-centered variables in women's advancement. Tharenou, Latimer and Conroy (1994) evaluated the relative importance of situational and individual influences in women's and men's managerial advancement and found that separate models for women and men were more explanatory--male hierarchy and home status contributed negatively to self-confidence, career encouragement, work experience, and training and development for women, while contributing positively for men.

Two areas frequently mentioned in women's career advancement are mentoring and self-confidence. Research has repeatedly shown the importance of mentors and sponsorship to career advancement. Mentors can often be role models, but for women this becomes problematic when there are no women in senior positions to be mentors. Role models are most effective when they are personally relevant to the observer. Likewise, cross-gender mentoring relationships have been found to create problems. The notion of one-on-one mentoring relationships was expanded to also include peer relationships (Kram & Isabella, 1985). Peer relationships were found to fulfill both career enhancing and psychosocial functions.

Self-confidence is mentioned often in connection with women's career development. When addressing the development of women managers, Burrow (1978) found that the principal development needs of women were self-

confident attitudes, education to expand general management skills, and the opportunities to develop management skills. Self-confident attitudes encompassed self-awareness, self-image, confidence, assertiveness and leadership. Burrow's survey found that women had more affiliation needs and less opportunity to satisfy them. The isolation of being a woman in a male-dominated environment often creates uncertainty over one's self-esteem. Bruegman (1995) found that the internal factors of self-confidence, values, and communication were the major influences affecting women's career advancement and that women continue to struggle with self-confidence. Self-esteem appears to be more strongly related to achievement motivation for females than males (Betz & Fitzgerald, 1987).

The dynamics in affinity groups are different from those in heterogeneous group settings. Homogeneous groups have been shown to have more cohesion, trust, satisfaction, security, and freedom. Cohesion is particularly fostered in homogeneous groups. Attitude similarity is positively reinforcing and evokes a positive affective response (liking). Homogeneous groups are assumed to have more attitude similarity, which increases the satisfaction and trust among the group members. Women's groups have been shown to enable intimacy among women, lessening the tendency toward competition. This kind of sisterhood enhanced bonding in the group and increased a sense of responsibility among members, which facilitated disclosure and honesty. Women have been shown to self-disclose more to women than to men.

A strong case has been made for providing single-gender environments for learning, i.e., a safe environment for women to discuss and address gender-related issues in the workplace. Single-gender leadership development programs have been shown to have unique benefits including: reducing isolation, building support groups and networks, and confirming that differences can be assets. Participants can experiment with new ideas, skills, and behaviors in a less threatening environment and build their individual strengths without having to represent all women.

Methodology

Research participants were drawn from a women's leadership organization that "recognizes, educates and connects accomplished and diverse women to increase their individual and collective impact globally." All program participants held leadership positions in their work organizations or their community and all have college degrees (43% have masters degrees and 22% have doctorates). The 16 research participants had considerable diversity in profession (4 in management, 4 entrepreneurs, 7 executives, and 1 attorney), organization type (8 in corporations, 4 in small businesses, 2 in education, 1 in nonprofit, and 1 in a partnership), organization size (4 in organizations with less than 10 employees, 2 in organizations with 250-500 employees, 6 in organizations with 1,000-10,000 employees, and 4 in organizations with 50,000 or more employees), female representation in management (8 in organizations with less than 15% and 8 in organizations with 15% or more), and age (1 in the 20-34 range, 8 in the 35-49 range, and 7 in the 50 and over range). Demographically, 63% are married and 37% are single or divorced; 64% have children and 36% have no children. Of the nine with children, two had a break in their career to spend time with their families. From a career perspective, 75% have been in the same career field continuously while 25% have changed career fields; in addition, 63% have had one or few employers while 37% have had several employers. Of the four research participants who are in small businesses, three participants spent part of their careers in corporations; thus 11 of the 16 research participants spent part of their careers in corporate work environments. The study participants come from multiple organizations (16) in different industries (13) with multiple functional disciplines (13). Professional organization participation also varied, ranging from 1 to 8 organizations and 1 to 28 years of participation in each. In summary, the research participants represent a broad range of experience and situations.

Three methods of data collection were used in this study: in-depth interviews, document review, and questionnaires. The screening questionnaire was sent to 115 individuals, with a 48% (n=55) response rate, of which 44 volunteered to be interviewed. Literature suggests that individuals work on different developmental tasks at different ages and career stages (Hudson, 1991; Levinson, 1996). Three career age groups were identified as the most likely to represent individuals in early (20-34), middle (35-49) and late (50+) career stages. The interviewees were initially selected based on career stage and demographic group. After the first several interviews, it became apparent that the interview was much richer if the interviewee had significant participation in multiple professional organizations. Therefore significant participation in multiple professional organizations became an additional selection criterion. Two of the three non-white participants canceled their interviews and the remaining non-white volunteers did not have significant professional organization participation; thus the final group of research participants did not have significant ethnic diversity.

Two interviews were conducted with each interviewee: the first served as the primary data collection interview and the second as a confirmatory interview. General exploratory questions based on existing literature in women's career theories were used for the first interview with three areas addressed: work environment, career progression and professional organization participation. Prior to scheduling the second interview, a copy of the transcript from the first interview and a listing of preliminary findings were sent to each participant. The second interview was used to confirm the researcher's interpretation of the first interview as well as provide the interviewee with an opportunity to elaborate on her original statements. The preliminary findings were reviewed with each interviewee for the purpose of identifying relevant areas that may not have surfaced in the first interview. The in-depth semi-structured interviews lasted 1.5 to 2 hours in total for each interviewee for both interviews.

The second data source was information from or about professional organizations. A total of 68 professional organizations were contacted: 35 mixed gender and 33 women's. Of these, 32 professional organizations (21 mixed gender and 11 women's) responded. Additional information was obtained from professional organization directories and Internet web sites. The organizations that were not professional organizations were excluded from the analysis. A final set of 46 professional organizations (27 mixed gender and 19 women's) were included in the analysis. The third data source was information on the screening questionnaires: reasons for participation in the leadership development program, benefits of participation, and how the participant's experience differed from expectations. In addition, the respondents identified the mixed gender and women's professional organizations in which they participated and the extent of their participation.

The transcribed interviews, the professional organization documents and the data from the questionnaires were content analyzed for common career development topics. These topics were then grouped by category and organized around themes to understand the role for women's professional organizations. The organizing of the data was done on an iterative basis with the data providing the organizing system. The research participants indicated overwhelming agreement with the collective comments and attested to their reasonableness. The preliminary findings were also reviewed with several independent researchers to confirm the credibility of the results.

Results

There were strong overlaps between the career benefits identified by the research participants and the professional organizations themselves, but also some clear differences. Both the professional organizations and the research participants identified networking and knowledge as the key benefits of participation. Annual meetings sponsored by the professional organizations provide the opportunity for both of these benefits. Knowledge, as described by the professional organizations, also included publications, newsletters, information networks, workshops/seminars/conferences, subscriptions, and exchanging ideas. The mixed gender professional organizations also identified legislative advocacy as a key benefit, though this was barely mentioned by the research participants and mentioned only by a limited number of women's professional organizations. Accreditation and certification was mentioned only by mixed gender professional organizations. One-third of the professional organizations mentioned financial programs, such as discounts, insurance, and credit cards, though these programs were not mentioned by any research participants. A small number of the professional organizations mentioned benefits such as scholarships, leadership opportunities, recognition, research foundations, and direct career assistance as benefits. The benefits portrayed by the professional organizations did not differ significantly between the mixed gender and the women's professional organizations.

Career Benefits of Participation

The key career benefits obtained from participation in professional organizations can be described as occurring on the individual, interpersonal, and organizational levels (see Figure 1). These benefits were obtained over the duration of their participation.

Figure 1. Career Benefits from Participation in Professional Organizations.

Individual level	Interpersonal level	Organizational level
• Self-esteem	• Support	• Business development
• Skills	• Networking	
• Knowledge	• Giving back	

Research participants reported some career benefit being gained from participation in both mixed gender and women's professional organizations, but five benefits appeared to have unique dimensions when acquired from participation in women's professional organizations: self-esteem, skills, support, networking, and giving back. These five are discussed below.

Self-esteem

Self-esteem had several dimensions: motivation, inspiration, self-confidence, self-promotion, and recognition. The motivation and inspiration came from both the content of the programs and the interaction with other members. The programs often addressed topics that the women did not have occasion to think about in their daily workplace. Exposure to such topics was seen as motivating and inspiring. Likewise, interaction with the other participants was inspiring. The motivation and inspiration had a beneficial impact on their career aspirations. For example, "It brought home to me the fact that I have limitless potential."

The professional organizations enabled the women to gain self-confidence, through leadership positions and through positive interactions with other professionals, particularly in the women's professional organizations. This self-confidence was translated back to the workplace in several ways. Sometimes it resulted in direct action, which resulted in more visibility and recognition in the workplace. Sometimes it resulted in more self-confidence at work.

The professional organizations provided an environment for promoting oneself, as a business person and as an individual. For those from corporate environments, it was an environment free of politics and power; for those in business for themselves, it was an environment independent of business development and delivery. The emphasis was on individual, not business, development. In some cases the professional organization promoted its members as candidates for new opportunities in work organizations, which provided additional emphasis to the candidacy. Participation provided recognition. For some women, participation provided the opportunity to be visible and to receive recognition that was not available within their work organization. The professional organizations provided the opportunity to have their skills publicly recognized. For some women, recognition translated into enhanced stature and opportunities at their work organization. Leadership positions in the professional organizations conveyed importance to the woman in that position.

Participation in the professional organizations also provided a balance to the isolation the women felt at work. The women described participation in the women's professional organizations as enabling them to interact as whole persons, not just business persons, and as enabling them to better cope with the pressures they encounter as women in the workplace. As a result, the research participants reported being better able to deal with the pressures of work, to be more engaged in their workplace, and to tackle the obstacles they faced at work, all of which contributed to their ability to advance in their workplace.

Skills

The skills most often identified were leadership skills and communication skills. Participation in leadership positions enabled the participants to develop the management skills of planning, budgeting, organizing, staffing, delegating, and controlling and the leadership skills of setting a direction, motivating, and inspiring. Communication skills included both formal presentations and informal interaction, as well as written communication.

When these opportunities happened early in careers, they were described as learning experiences. When these opportunities happened later in careers, they were described as refining and enhancing skills. Often the opportunities for leadership in the professional organizations came before such opportunities in the work organization. Thus it was an opportunity to develop skills before they were needed at work and to be better positioned for new opportunities. The research participants believed that the professional organizations provided an opportunity to develop skills in a penalty-free environment; a mistake did not damage one's career--a mistake could be a learning experience. When the women discussed the learning environment in the women's professional organizations, it was from the perspective of the other members encouraging them to take on new challenges and asking them to do something--a supportive learning environment. The professional organizations provided some of the same opportunities to learn that developmental assignments in the work organization might have provided, without the potential downside.

Support

Support was described by the research participants as emotional support, encouragement, nurturance and friendships. The women often found themselves isolated at work with few other women in their work organizations, particularly those who entered the workforce in the 1960s, and many of the women described their work environments as male-dominated. Participation in the women's professional organizations provided some balance to the isolation, which enabled the women to better confront the isolation and gender bias they encountered in their workplace. Lessons learned about how to handle work situations (particularly interpersonal or token situations) were shared, which again enabled the women to better handle the situations they were confronting.

Professional organizations could be an anchor during times of transition, could facilitate relocations, and enabled the women who had a break in their career to maintain professional contacts and to remain functionally current with their profession. Professional organizations were viewed by the research participants as a safer environment than the work organization, safer for learning and safer for seeking guidance and support. There were no penalties to expressing a lack of knowledge or for self-disclosure. There was a sense that the research participants self-disclosed more in the women's professional organizations and that the level of trust was higher there than in mixed gender professional organizations or in the workplace. Thus the support could be more meaningful to the individual.

Networking

Interacting with others, making personal and professional contacts, finding mentors or sponsors, and developing relationships were all part of what was described as networking. Networks in the context of the professional organizations had the same characteristics as networks in the context of the work organizations, that is, both formal and informal networks and both instrumental and expressive networks existed.

The expressive networks provide personal relationships. Particularly for those in male-dominated workplaces, these networks filled a gap in their work networks. Instrumental networks involve the exchange of work-related information, expertise, advice and potential access to resources. Some women viewed the professional organization networks as an extension of networks they had already developed in their work organizations. Sometimes the women found mentors (both male and female) through the professional organizations. The cross-sex mentoring relationships did not suffer from the same potential pitfalls as those found in work organizations, for example, resentful co-workers. Some women were able to have same-sex mentoring relationships, when this was not feasible in their workplace given the limited numbers of women in senior positions.

The contacts the women made opened new doors for them. Overwhelmingly the research participants described networking as the major benefit of participation in professional organizations--both instrumental and expressive. As one woman said, "By far the collegial relationships are the biggest benefit."

Giving back

For the research participants in their later career stage, giving back to others in their profession was a key benefit identified by them. This was specifically discussed in the context of helping younger women in their careers, but was also clearly an element of their own development as adults. Giving back occurred through mentoring and guiding others. Even when the women believed that they were no longer obtaining the same degree of benefit from a professional organization, they felt an obligation to continue to participate so that other women might benefit in the same way that they had when they were in earlier career stages.

These women also felt an obligation to mentor younger women in their work organizations, but were concerned about the dearth of senior women in their work organizations and the time constraints imposed upon them by mentoring others with no direct recognition or career benefit to them. Even though the women expressed concerns, they also indicated that they mentored younger women whenever possible. The research participants felt personal fulfillment and were able to help the careers of younger women. There was a sense of a "community of women," conceptually if not in reality, that was important to care for--that women needed to reach out to one another.

Overall Perspective

There were three overarching observations about participation in professional organizations. First, the benefits obtained from participation in both mixed gender and women's professional organizations were obtained over the long run, though some could be obtained faster in the women's professional organizations. Second, there was a strong belief among the research participants that "gender issues are alive and well"--in the workplace and in society--and thus there is a real need for women's professional organizations. The research participants believed that it was important to share lessons learned and to help younger women understand these issues. Third, mixed gender professional organizations were important too because women work with men. "We don't live in a vacuum, we don't operate or work in vacuums, and we need to interact with both sides." According to the research participants, participation in both mixed gender and women's professional organizations provided the best path for contributing to one's career development and advancement. However, there were some differences in the career benefits described by the research participants between women's and mixed gender professional organizations.

Perceived Advantage of Women's Professional Organizations

Although the research participants saw career benefits from participation in both mixed gender and women's professional organizations, they believed there were differences in the benefits obtained. These differences resulted primarily from their experiences that women interacted as whole persons whereas men interacted only on a business level. As one woman said, "The women's groups tend to take a more holistic approach." Thus both the content and the context of the interactions were different.

The women shared stories with one another about how they coped with different situations (e.g., balancing work and family, dealing with difficult interpersonal work situations, handling being a token). There were more conversations about family issues and the women got to an intimate (i.e., more personal) level more quickly in the women's professional organizations, which they did not do in mixed gender professional organizations. The women found it easier to connect and to identify with the women than in the mixed gender setting.

The general perception was that women started from a position of trust in the women's professional organizations, which was not true in the mixed gender professional organizations. The interactions were described as "more relational" in the women's professional organizations, and the women were perceived to be more supportive. For example, "Women were more willing to help you when you're down and to cheer you when you're up." This was in contrast to the women "measuring their words a little more carefully" in mixed gender professional organizations.

The research participants also viewed the level of participation to be different. Typically the women viewed their participation as greater in the women's professional organizations due to their greater comfort level with women, as well as to other female members reaching out. The camaraderie and openness described in the women's professional organizations contributed to this greater comfort level. This contrasted with the mixed gender professional organizations where the women tended "to sit back and watch to get a feel for the flow before jumping in." The perception was that you had to promote yourself to take advantage of opportunities in the mixed gender professional organizations whereas others reached out to you and encouraged in the women's professional organizations.

The result of the differences between women's and mixed gender professional organizations was that the women moved more quickly into active participation and leadership positions in the women's professional organizations than in the mixed gender professional organizations, which enabled leadership and communication skills and self-esteem to be developed more quickly in the women's professional organizations. Emotional support and encouragement were described as present in the women's professional organizations, but not in the mixed gender professional organizations. The expressive networks and the female mentors described by the research participants were found in the women's professional organizations, but not in the mixed gender professional organizations. And giving back to others was manifested only in the women's professional organizations.

There were some potential negative differences between mixed gender and women's professional organizations. Some expressed concern that the women's professional organizations were more cliquish and that women could be more critical of each other. Because the women's professional organizations were often established to address a perceived problem, there was a belief among some that these groups required a constant emotional reconfirmation of one's commitment to their ideals, which could be emotionally draining.

Conclusions

The purpose of this study was to investigate the potential value of women's professional organizations for women's careers. This study results indicate that there is a potential role for women's professional organizations, but that role will vary depending on the needs of the individual. There were seven potential career benefits for women from participation in professional organizations, of which five were gained predominantly from participation in women's professional organizations: self-esteem, skills, support, networking, and giving back. Although the women clearly saw benefit to participation and they were able to identify transference of those benefits from the professional organizations to their workplace, they were unable to make the connection between those benefits and their career development and advancement.

The benefits to be obtained from participating in professional organizations were seen as complementary to experiences in the work organization. Sometimes participation was able to fill in the career development gaps found in the workplace. Participating in professional organizations is not equivalent with belonging to professional organizations, that is, one must actively participate and take on leadership roles to gain the full benefit of participation.

This study was a preliminary exploratory study with a limited number of study participants who were all American professional women in leadership positions. The data collected was retrospective and thus potentially limited by the interviewees' recollections and by their ability to objectively evaluate the factors contributing to their own career development and advancement. This study explicitly restricted itself to the study of the role of women's professional organizations in women's careers and its findings may not generalize to other external professional activities nor to other single gender organizations. This study was limited to the experiences of the participants and the organizations to which they belong. There appear to be differences in the career benefits across career stage and among participants from different work environment, but these indications warrant further study. This study focused on women and did not ask whether benefits could be obtained by men participating in professional organizations or whether the benefits obtained by women differed from the benefits obtained by men.

Contribution to New Knowledge in HRD

The three primary audiences for the results of this study are work organizations, women in the workforce, and women's professional organizations. First, with women representing nearly 50% of the entrants into the workforce, work organizations are interested in how best to develop and maximize this large resource, resulting in development and advancement for women. This study asked whether benefits might accrue to a woman's career from participation in a women's professional organization and when this avenue of career development might be beneficial for a work organization to support. Second, with evidence of less than a level playing field (i.e., the presence of the glass ceiling), women are interested in how best to improve their chances for advancing in work organizations. It appears that women's professional organizations may be a vehicle to enhance career development and advancement. Finally, with professional organizations vying for members, women's professional organizations would be interested in studies that articulated the benefits to potential (and current) members of belonging to their type of organization. This study contributes to the body of knowledge in HRD through the investigation of the role and purposes of women's professional organizations for women's careers.

Non-profits and Women CEOs' Careers

Jenny Harrow
Veronica Mole
South Bank University, London, UK.

This paper explores questions of the development of a 'new balance' between the self-interests of women chief executives in British non-profits and the organisational interests of non-profits in retaining able women. Two contrasting theoretical frameworks are used. That of 'career development', emphasising the primacy of the individual; and that of 'capacity building', in which organisational needs predominate. Implications for human resource development in smaller non profits are identified.

Keywords: Women, CEOs, Non-Profits

There are currently tensions within the non-profit sector in Britain between individual and organisational aspirations for career development for women and the needs of non-profit organisations, (especially smaller organisations), for long term worker commitment. Women senior managers predominate among the smaller organisations, where organisational survival may depend upon the retention of these key women postholders. Their individual careers, (if regarded as an organisationally upward trajectory) may be on hold, neglected or abandoned. Smaller organisations have difficulties in planning strategically for human resource development and change. Yet many are under pressure to convince funders that they will not collapse if key workers (often women) leave. The sector appears increasingly driven by asking 'what do funders want?', and in this case, "what do they want in terms of our HR policy and practice?" However this is circumscribed by what women CEOs want themselves and what they have been able to achieve.

This paper draws on three studies: two completed and one ongoing, to illustrate this issue. The first shows women CEOs in Britain as over-represented in the smaller organisations. The second highlights the organisational survival tactics of smaller voluntary organisations, faced with a range of demanding funding regimes, and involving heavy reliance on one woman CEO staying with the organisation through thick and thin. The third, on which the paper concentrates, moves away from context to take cognisance of the people at the centre of the issue. It examines women's CEOs perceptions and experiences of their career development and transitions, through an ongoing series of in-depth interviews, using biographical research methods. Drawing on the prior research, this biographically-based study asks whether women CEOs in this sector are remaining organisation-centred (by choice or by necessity as career options are limited) or are becoming self-orientated in terms of career development?

Some early implications for human resource development in this sector, arising from this question of relative balance of interest, are discussed. These include the extent to which this sector "wants things both ways" - to be seen to be developing career-friendly environments for women, where their all round ability can be demonstrated (in one respondent's terms,"doing what it takes"); but also making heavy demands on women's commitment when the organisation is struggling and known to be surviving against the odds (from another respondent's perception, when the organisation is to all intents and purposes, "running on empty").

The Theoretical Framework - 'Career Development' and 'Capacity Building'

With the research focus that of the individual career perceptions and experiences of *existing* women CEOs in non-profits, the literature from career theorists is central. Thus, Evetts (1992) examines the prescriptive notion of rationally planned careers as 'upwards moves', where deviation from this norm is seen as imperfect. For women, careers might be 'interrupted'; for both men and women, their careers might be 'blocked' or 'opted-out of' or 'time-serving' (Evetts 1994). Men's and women's career success tends to be assessed in terms of movements up through organisational ladders. Yet, many women and indeed many men appear to want things other than 'advancement' from organisational career structures. This is especially pertinent to careers in non-profits where the size of organisation and the insecurity of tenure may preclude advancement through an organisational hierarchy, and where well structured internal career paths scarcely exist, apart from within the very largest organisations. For many CEOs

Copyright ©1999 Jenny Harrow and Veronica Mole

in non-profits therefore career success may be seen more in terms of 'making a difference' than career advancement as an end in itself.

Career development is seen by Arthur et al (1989) as influenced both by the individual and external institutions. Inkson (1995) points to the themes of "..order., progression and proactivity" as underpinning much academic theory on career development. In reviewing the effects of changing economic conditions on managerial job changes, Inkson argues that a "better approach" (for organisations) might be to "encourage organisational newcomers to be realistic about the endemic and increasing uncertainty of future occupational progress" (1995, 1993). Hirsch et. al. (1995) argue that organisations are relying more on 'self development' on the part of employees because the pace of change makes it ever more difficult to provide well-structured career paths and development. The increasing emphasis on self-development is a major culture change, implying as it does that everyone can develop and progress. In this context personal development plans, mentors, and networking are all indicative of a self-development approach to careers.

This literature has provided an overall thinking and language framework for the women CEOs' career perceptions study although it draws mainly on employment worlds other than those of non-profits. The challenges for the research include the extent to which the changing environment of non-profits contrasts with that of the for-profit world, inasmuch as the needs for human service work during periods of recession may be expanding rather than contracting. Thus, more traditional notions of 'career' may still be legitimate in this sector. Since the women CEOs study began, an organisational explanation of "what's going on" has been articulated by Adamson, Doherty and Viney (1998): "..what we mean when we talk of the *death* of the career is simply that the rules of the career game have changed". How, if at all, this applies in the non-profits sector, is under exploration.

What of the organisational interest in this area? The concept of 'capacity building' has made the transition from the fields of economic and technical development to those of social and organisational development (Harrow, 1998). In the international and national NGO fields, funders seek to promote non-profits' organisational "capacities", with the assumption that with improved capacity comes improved and sustainable performance. The development of human resources of these organisations is seen as a core component. Ohiohenuan and Wunker (1995) concentrate on the understanding of organisations' internal capacity through examination of four key areas - those of human resources, organisational processes, physical resources and external support.

Hilderbrand and Grindle define "capacity" as "the ability to perform appropriate tasks effectively, efficiently and sustainably"(1997, 34). Their five-fold framework for assessing 'dimensions of capacity', to aid capacity-building interventions, includes (as the final 'dimension'), that of "human resources". Here the emphasis is on the retention and utilisation of individuals in organisations; and importantly for this paper, "the extent to which training and *career trajectories (our italics)* affect the overall performance of a given task". Hilderbrand and Grindle go on to argue for the inter-connectedness of organisational performance and human resources. In case study research, they discovered the relative importance of "effective utililisation" of human resources as a contributing factor in organisational performance, rather than the 'recruitment' or 'training' aspects of human resource management,. (op. cit., 53). They found "professionals very sensitive to whether their jobs were meaningful"; with "retention highly sensitive to performance rewards and job satisfaction". Although this model is public sector-oriented, its application to non-profits is signalled strongly. Public funding for this sector is extensive; and the feature of 'resource constraints', which affect public services, manifestly are also a feature of non-profit organisational life.

These areas of the literature provide the underpinnings for the accounts of the research which follow. Intriguingly, the HR component in the 'capacity building' literature appears to imply a strong coincidence of organisational and individual interest in career development processes; whilst some of that in the individualistic field of career development (especially the self-development work) does not. In this sense, the over-arching research question in this paper, whether women CEOs see themselves as moving towards individualised or organisationally-rooted career perspectives, or in maintaining these pressures in some sort of balance, appears particularly important.

Prior Research (I) The UK ACENVO survey

A survey investigating the relationship between gender, CEO position and size of voluntary organisation was carried out by the Association of Chief Executives of National Voluntary Organisations and the Centre for Public Services Management, during 1994/95 (Dawson, 1998). The survey was sent to all 540 ACENVO members, with a response rate of 59% (321). By chance, the profile of the respondents closely reflected the then gender split of the ACENVO membership: 60% men and 40% women. Again by chance, the organisations in the sample reflected the range of organisations in ACENVO, in relation to total income.

A direct relationship between the size of the voluntary organisation and the gender of the CEO was found. Male CEOs were found in 75% of the larger voluntary organisations, defined as possessing incomes of £5 million and over. Nearly 80% of the smaller voluntary organisations, with incomes of less than £100,000 had female CEOs. Just over 50% of organisations with incomes between £100,000 and £1 million and fewer than 20 full-time equivalent staff have female CEOs. The proportion of female CEOs declined to 30% in organisations with an income between £1-5 million, to 25% in organisations with an income between £5 -15 million, and to 20% in organisations with an income over £15 million.

Thus of the CEO posts held, women were more likely to head smaller organisations, with budgets of less than one million pounds, and fewer than 20 full-time equivalent staff. Where the staff were more than 80% female, then a woman was likely to be CEO. No relationship was found between gender and type of organisation, although 'umbrella' organisations were more likely to be run by women, with men CEOs predominating in international organisations. Whilst men and women CEOs in this sector headed every kind of organisation, and had similar qualifications and similar work patterns, a key difference was their location. Here, one explanation could relate to age groupings. There were similar numbers of men and women in the 40-49 age group. In larger organisations CEOs were likely to be over 50, and there were more male CEOs than women in the 50-59 and over-age groups. As quantitatively oriented research, this study did not address CEOs perceptions, (men's or women's) of their organisational location vis a vis their career, their organisations' relative prestige and power, nor the extent to which they were developing personal career plans, in which their organisation might, or might not, figure. Given the imbalance of men and women in location terms, a subsequent qualitatively-oriented study was indicated.

Prior Research (II) London and Sheffield (UK) Study on Funding Regimes and Capacity Building.

Concurrent research in the Centre for Public Services Management, funded by the Joseph Rowntree Foundation, during 1997/98 studied selected small voluntary organisations' responses to a variety of funding regimes (for example, survival, collapse, sustained or patchy growth); including an exploration and assessment of these organisations' capacity building abilities or strategies. Although the study did not set out to focus on the pivotal role of CEOs, it used the Ohionenuan and Wunker (1995) model of the constituent elements of 'capacity building', including that of human resources. From case studies of sixteen organisations, tracking back over ten years of their organisational histories, findings linked organisational viability to factors including organisations' networking skills and ability to manage (or good fortune with) their share of human resources. Among the latter, both an organisational strength and potential weakness was the heavy reliance on the senior manager or CEO. "Even in thriving organisations, skills deficits were acknowledged and were often compensated for by the abilities, energy and in some cases near superhuman performance of the chief worker". Predominantly, these postholders were women. For both men and women CEOs, organisational 'over reliance' on them was increased where funders failed or declined to fund 'deputies', and where the project-driven funding environment appeared to exclude many opportunities for developing the 'general management' human resource potential among other existing staff of the organisation.

The study was commissioned to help identify good practice for funders; and was not gender-directed. Its findings pointed to organisations' (and funders') responsibilities to recognise risks of 'over dependency', and develop succession planning strategies for these key posts, however limited. Succession planning had been seen throughout 15 of the 16 organisations as a luxury which ruefully they were unable to indulge in, rather than a necessity which their small size and scale made the more vital. The extent to which organisations in the study were going so far as to exploit their CEOs willingness to stay and work creatively, often on the brink of organisational demise, was recognised implicitly by the researchers; but not developed as a major research theme. Hence the case was strengthened further for a CEOs "perceptions" study, in which their, rather than the organisational 'stories' could be told.

Research in Progress: Women CEOs' perceptions of careers in the non profits

Primarily as the qualitative 'next stage' of the ACENVO/CPSM survey, a study entitled *'Voluntary Sector Chief Executives: Careers, gender and organisation, 1998 -2000'* began in CPSM in January 1998. This research investigates careers in the voluntary sector by undertaking career history/ researched biography interviews with a cohort of 25 women and 25 men chief executives of medium-sized organisations. The purpose of the research is to establish career histories of men and women CEOs in the non-profits sector showing how careers are made, and

pathways to the top of the organisation, drawing on the actors' "voices" as the information source. The choice of medium-sized organisations will eventually allow equal numbers of female and male participants to comprise the study sample, enabling comparisons to be made of women's and men's careers in this sector. Lengths of time in post will vary. The study sample is being obtained from organisations listed in the The Voluntary Agencies Directory 1997/1998.

Research Design Issues

The research design is exploratory and qualitatively oriented (Patton 1980, Marshall & Rossman 1989). The research question concerns whether CEOs' career 'patterns' or stories in this sector show them as either (a) remaining organisation- centred or (b) becoming self-orientated in terms of career development? Face to face interviewing with chief executives is being undertaken, using the approach of 'researched biographies/career histories' as advocated by Torbert and Fisher (1992), who argue that autobiographical writing is an indispensable process in social science research; and acts as a catalyst for managerial and organisational development. In this way the researchers hope that the 'giving' relationship implied by respondents' participation in research activity can be in a two-way form, with interviewing sessions providing a limited basis for self-reflection and learning by those respondents. The research approach which encourages the use of 'narrative research' as a means of drawing out meaning from respondents' language (Lieblich, Tuval Mashiach and Zilber, 1998) has also been drawn upon. Career histories gather data on individuals from their own perspective. The interviews are guided by four broad topic headings: the job and organisation, career history, working in the non-profit sector and future career aims and objectives. The research question is not posed directly.

Thus far, research among women respondents has been undertaken, with 15 interviews with CEOs analysed for thematic patterns which confirm findings for an overwhelmingly '(b)' position, as described in the research question. In particular, career history and future career aims and objectives sections of the data have been analysed in order to identify the career strategies of this sample of women CEOs. As the study progresses an appropriate software package (NUD.IST) will be used to aid data analysis.

A number of methodological problems are encountered using the career history method. Firstly, there is the problem of retrospective recall of information by participants in the study. Memories are fallible. However, since changes of job are significant events, the accuracy of the data collected is likely to be reasonable. There is also a tendency to ascribe some sort of pattern to a career looked at with hindsight. The issue of selective recall lends support to the argument that career history research is inevitably subjective. Notwithstanding, Dex (1991) in her review of research work on recall suggests that it can be reliable for certain topics, thus the claim that career histories are purely subjective goes too far. For this study we were concerned with matching the scientific reliability of survey research with the rich ethnographic data provided by career histories. In this way we gain a more detailed picture of careers in the voluntary sector.

The Research Sample

The women chief executives taking part in the career history interviews are working in a variety of non-profit organisations including professional associations (3), social services and healthcare (3), research, education and training charities (5), an intermediary organisation, housing advice, community development and law/advocacy organisation, respectively. The size of the organisations spans an income range between £80,000k and £2.5 million. The smallest organisation employs 2 staff members and the largest employs 30 staff members. Lengths of time in post vary from 8 months to 21 years. The women have a variety of functional backgrounds and experiences inside and outside the not for profit sector. Two women are aged between 25-34, three are between 35-44, eight are between 45-54 and two women are 55 and over. Eight of the fifteen women have two or more children.

The Research Findings

Findings from the career history interviews to date show women CEOs pursuing careers more predominantly within a context of 'self' than an organisational orientation.

> "... I would say that I have not been encouraged, at the same time people have not been unhelpful, but you have to do it yourself." (CEO, professional association)

Eight of the women interviewed described an overt career strategy of moving around within small and medium sized organisations, to gain experience, moves variously prompted by boredom or in one case by an external, temporary (male) 'mentor:

> "The person from Charity Appointments (an executive search agency) said I should apply. He said it would be a challenge and that I should have a go." (CEO, community development organisation)

Five of the women CEOs looked for new challenges by growing the organisation from within, especially findings new ways for the organisation to adapt to environmental change. This however prompted organisational dissatisfaction also; most marked by the respondent who reported awareness of organisation (or individual) exploitation:

> "There is no guaranteed income so that if the funding runs out we will lose our jobs. This makes for anger and frustration because we know that there are statutory organisations that should be funding us and they can get away with it because in the end ... people are taken advantage of because of their need to ensure that the organisation is there, so if we apply for funding and are defeated we will keep going. And I feel angry about that. ..." (manager: social services organisation.)

Two of the women interviewed may be described as occupying a space somewhere between organisation- self-orientation. Mindful of developing themselves and their careers they are also committed to growing the organisation. Thus

> "Work is very important to me and I want to do well but I am quite interested in growing this organization. I do not really want to run a big service provider, I'm more interested in research /policy-led organisations and that is what I want to do here." (CEO, community development)

Thus far in the interviews, a career in non-profits has been chosen by the women chiefly because it provides opportunities for meaningful work and the ability to 'make a difference' to the world in a socially-useful way. One respondent saw her needs and the organisation's needs as matched rather than in tension, whilst drawing apparently on what she saw as gender-specific qualities:

> "..I have always seen myself as a person who is good with people and in the voluntary sector this is an area that is very important, not only with service-users but also in terms of campaigning e.g. have to use charm, talk with judges and so on. This makes me feel good...." (manager, social service)

However, the question about their over-representation in the smaller organisations remains; with respondents somewhat apologetic rather than irritated or annoyed:. Thus

> "I would not have credibility applying for a bigger organisation because prospective employers will see that I'm leading a small organisation..."(CEO, professional association)

> "A lot of the support work, mentoring, trouble-shooting does not show on the CV and I wonder how credible that makes me for jobs in organisations employing 50 people but I have been doing the same in terms of managing and keeping all the plates spinning. A lot of the work is enabling others to do things and that is not so easy if you're trying to shift into the mainstream"(CEO, intermediary organisation).

To return to the overarching research question, are women becoming more career oriented or remaining organisationally focussed? Whilst strong claims for a new generation of women CEOs more committed towards self-oriented careers cannot be made using such a small sample alone, findings from the career history interviews show that over half of the women interviewed are developing this career strategy. Factors pushing this development may include the very existence of (relatively new) specialist executive search agencies; the normalisation of mentoring /networking (for example, six women were actively involved in action learning sets run by ACENVO) and eleven mentioned the importance of positive (and negative) role models, and supportive relationships. The career history interviews suggest so far that an individualist mood prevails. As the study progresses, more evidence to support

or refute this claim will be collected. However, women's representation in the larger organisations and movement between smaller organisations and larger organisations appears to remain a barrier to overcome.

Conclusions

Preliminary analyses of the women CEOs' perceptions of career development in this sector are suggesting a shift towards the 'me' and away from the 'us' view of work in the UK non-profits that seems to have prevailed in the organisational versions of their 'stories' of survival and growth. This confirms the view from the literature that "the rules of the career game" are changing for this group; whilst challenging the view that individual 'self development' is equally valuable for the host organisation. Such a development is in contrast to the London and Sheffield case studies, where women were reporting strong awareness of how much their organisation relied on them; and their apparent decision to continue commitment at a high level. The positive linkages between individual feelings of their value to their organisation and the quality of that organisation's performance (the 'capacity building' dimensions model) appears to be supported from the interviews to date. However, the research design itself may encourage this; and a case for developing some 'objective' measures of organisational success, alongside the 'stories' can be made.

A number of the women's accounts are beginning to suggest a picture of a 'caring sector' that does not actually 'care 'for its own people, in the sense of recognising and supporting career aspirations. In the smaller organisations, where there is heavy reliance on key postholders, this may be equated less with a full scale 'exploitation of women' situation; and more with a less clear cut exploitation of 'the feminine'. Thus, women's believed nurturing roles, and close commitments to colleagues are drawn upon to 'hang on' to key workers and to draw very high levels of performance from them. These kinds of experiences from the interviews, parallel strongly the accounts gained from the earlier case study work. Exercising a guilt-based hold on would be career- movers has appeared - the 'what would we do without you?' syndrome. At the same time, a handful of women CEOs may also be exploiting the 'feminine' in their plans to advance or at least sustain their careers.

As research in progress, this work is a long way from contributing to new career theory or at least to its adaptation, to take account of the particular employment world which the non-profits encompass. However, the chosen theoretical frameworks have already pointed to the potential for mismatch between the assumptions of organisational capacity building (where HR improvements leads to gains all round) and those of the career self-development literature, where organisational needs are necessarily set aside. What has been appearing as a running theme throughout the interviews, where interviewees have opted for the self- rather than organisational orientation in their career ideas, is the possibility that their organisations have yet to 'wake up' to this situation.

In other employment sectors, where traditional career routes are known to have ceased and diminished, both parties tend to possess this knowledge and act accordingly. Thus far, in this research, the non profits sector appears one where that sense of balance has not yet occurred. Put bluntly, the 'new balance' discussed at the start of this paper, is one where self-orientation among CEOs is developing well ahead of organisational awareness that high and enduring loyalty levels may no longer be expected from senior staff. With responsibility for HR planning and development in the hands of volunteers rather than professionals - the organisations' boards of trustees - this may be inevitable and the impending organisational 'hurt' as job change among CEOs in the sector occurs more and more may be unavoidable.

For the 'rules of the game' to have been fully shifted, women CEOs will need not only to be able to sustain their self orientation in their careers but to gain posts in the larger and largest non-profits. However, when the studies of men CEOs are underway, a similar pattern to the women's experiences may be presented (or at least recounted to the female researchers). For HRD practitioners and academics, these developments point to the need for increased awareness in the tensions facing smaller non-profits organisations, often exhorted to enhance their 'people policies'. In a period of recession and decline, when the need for human service organisations increases, it is ironic that the notion of 'upwards' career development may still be taking place in this sector when it is diminished or gone in the for- profits fields. Yet the opportunities for non-profits to capacity build in this area is limited. Funders seeking enhanced organisational performance from non-profits are urged to support, the HRD aspirations and opportunities of women as well as men in this sector; and to recognise the possibility of more volatile performance from those organisations, where women CEOs are giving primacy to their own rather than their employing organisation's career needs.

Career Development Of Expatriate Managers: An International HRD Issue For Singapore-Based Companies.

AAhad M. Osman-Gani
Gerald Z.D. Huang
Nanyang Technological University, Singapore

Expatriate human resource development is poised to play a major role in determining the success or failure of companies seeking to do business across national borders. This has become more critical with the onset of the knowledge economy. For Singapore companies, the regionalisation drive initiated a few years ago, and the eventual integration of the ASEAN market makes it imperative that companies begin to focus on developing human resource for the regional and international web. In the international HRD literature, expatriate career development did not receive proper attention, although it is a significant issue for effective expatriate performance. This paper presents some empirical information from a recent study conducted on expatriate development in Singapore.

Key Words: Expatriate Career Development, Singapore, Asia

Today, people create national and organizational competitiveness, compared to earlier suggestions of classical economic theorists that mere access to advantageous factors of production can make the difference (Kindleberger, 1970; Porter, 1990). People invent and utilise technology, people formulate and implement strategy and people design and build organization structures. In today's global marketplace, to get the right people with the right skills inventing and utilizing technology, formulating and implementing strategy, and designing and building organization structure at the right place and at the right time, movement is needed – movement of people across national borders (Black, Gregersen and Mendenhall, 1992). Yet, human resource systems remain one of the major constraints in implementing global strategies. This is more significant for multinational companies (MNCs) operating in today's global business environment. Although much has been written on international human resource management, very little research has been done on international HRD, specifically on career development of managers responsible for international business operations (Tung, 1988; Harvey, 1989; Black, Gregersen & Mendenhall, 1992). From a review of the literature, career can be defined as "the pattern of work-related experiences that span the course of a person's life" (Greenhaus, 1987) and career development looks at the long-term career effectiveness and success of organizational personnel (Cenzo and Robbins, 1994). According to French (1994), career development programs represent efforts to increase the organization's present and future ability to meet its goals by providing educational and development experiences for managers above and beyond the immediate technical requirements of their jobs.

As companies extend their international reach, the increasing importance of such overseas operations can place the success or failure of their international initiatives in the hands of their expatriate managers (Bennett, 1993; Foxman and Polsky, 1991; Mendenhall and Oddou, 1991). To become truly global, MNCs need to begin linking their HR practices to company-wide strategic objectives. Evans (1993) suggests that international HR practices may serve as 'glue' which can be used to link the management of personnel to the development of the organization as a whole. The linkage of global strategy and international HR practice should be born out of the realisation that the power to become a truly global firm rests with the organization's HRM. Studies show that a significant number of expatriate managers fail in their duties, to the great expense of their employers. Tung (1987) found that, of the 80 US MNCs surveyed, half had expatriate failure rates exceeding 30 per cent. The average cost of each failure to the parent company was estimated 10 years ago at between $250,000 to $1 million (Copeland and Griggs, 1985). As a result, American firms may lose at least $2 billion a year (Caudron, 1991). These figures suggest that in order to be successful in the international business arena, corporations must begin addressing the HR issues which accompany the use of expatriate managers. In most instances, positive changes in skill levels experienced by the expatriate even went unnoticed and unused (Adler, 1986; Bennett, 1993; Mendenhall and Oddou, 1991; Tung, 1984). This can lead to negative consequences for the organization and MNCs may deprive themselves of excellent resources to aid them in the globalization process (Bennett, 1993). As such, career development planning, involving global and cross-cultural training, becomes necessary for managers in today's organizations, regardless of their domestic or international assignments (Osman-Gani, 1996; Marquardt and Engel, 1993; Odenwald, 1993; Reynolds and Nadler, 1993; Johnston, 1991; Rhinesmith, 1991).

Copyright © 1999 Aahad M. Osman-Gani and Gerald Z.D. Huang

Reviewing the literature on international HRD, very little work could be identified in the area of expatriate career development. Naumann (1993) suggests that the extent to which MNCs provide well defined career paths for expatriates may serve as a signal of the organization's commitment to them. Evidence indicate the extent to which expatriates saw their assignment as benefitting their careers was significantly related to their intent to leave the firm. Communicating the recognition that the expatriate assignment is vital to both the success of the MNC and to the expatriate's career, the MNC can provide validation of the expatriate experience (Adler, 1986). The more the MNC allows its expatriates to see a clear relationship between consecutive job assignments, the more time and energy they will be willing to invest on behalf of the organization (Feldman and Thomas, 1992). Furthermore, the use of expatriate experience in the creation of logical career paths is an important way in which MNCs can utilise the development of international experience among its human resources as a mechanism for fulfilling globally-oriented corporate strategies.

Survey results of 46 US multinational corporations (Handler, Lane and Maher, 1997) indicate that expatriate career-planning issues are salient concerns, consistent with literature establishing that such issues should be of major concern to MNCs (Adler, 1986; Bennett, 1993; Feldman, 1991; Feldman and Thomas, 1992; Nicholson et al, 1990; Mendenhall and Oddou, 1991). The results also suggest that few MNCs have policies to assist with expatriate career planning and that much of the assistance currently offered falls short of the needs of the MNC's expatriate HR. Findings reveal a gap between the importance of career planning issues and the level of career-planning policy currently available.

As expatriate development is becoming a key HRD issue in the dynamic Asia Pacific region, this needs to be accorded much more importance (Osman-Gani and Tan, 1998). Until the recent financial crisis (since the last quarter of 1997), East Asia was one of the fastest growing regions in the world. According to the UN World Economic Survey, East Asia grew by an annual average rate of 4.5% during the last decade, while ASEAN's (Association of South East Asian Nations) average was at 6.8%. The comparable rate for the US was 1.4% and 1.7% for Europe. ASEAN member countries were ranked among the world's largest hosts of foreign direct investment inflows. At the same time they are becoming significant foreign investors themselves, mostly in other less-developed Asian countries. The OECD has projected the Asia-Pacific to grow by 5-6% to the year 2010. On the other hand, the comparable rates for North America and Europe were set at 2-5% and 3-4% respectively. While much has been written on expatriate selection, training and development in general, very little was documented on career development of expatriates from different national and cultural backgrounds working in Asia. With Asian economies ready to take centre stage in the twenty-first century, despite the recent financial crisis, it is logical that we should have a better understanding of the expatriate development issues, for effective expatriate performance in Asia. Furthermore, no empirical study could be identified that investigated expatriate career development in the Asia Pacific region. There seems to be a research gap in the international HRD literature from this perspective.

This paper presents some empirical results from a recent study conducted in Singapore. The study investigated expatriate career development, from the perspective of multinational corporations based in Singapore and local companies with overseas operations. Singapore plays a key position in the agenda of most multinational corporation's planning to do business in Asia, and is one of the sought after locations for siting regional headquarters. Additionally, this issue is particularly relevant to local companies because of the regionalisation drive that is being promoted by the Singapore Government.

Research Questions:

This study attempts to address the following research questions:

1. What is the status of companies using career development plans for expatriates in Singapore?
2. Where does responsibility for the planning and designing of career development plans for expatriates reside in the organisation?
3. What are the key features of an expatriate career development plan?
4. How frequently are such career development plans reviewed?
5. .How does repatriation issues feature in the career development plan?

Research Methodology:

This study used an exploratory research design and followed a survey methodology. A national survey was conducted on a sample of MNCs based in Singapore and local companies having overseas operations. A

questionnaire was developed based on the findings of an extensive literature review and the feedback from sample interviews with selected managers of Singapore-based companies. The questionnaire was pilot tested on a group of 40 managers, of whom 25 were from MNCs. The questionnaire was tested for reliability and validity using the responses from the pilot sample, and using a panel of experts consisting of faculty members in the Nanyang Business School, Nanyang Technological University. The final questionnaire was administered using local mail and personal administration procedures. Two follow-up measures used were, telephone calls and facsimile system. Using proportionate stratified random sampling procedure, a sample size of 400 companies was selected from the "Singapore 1000 database; comprising 300 MNCs and 100 local companies with overseas operations. The overall response rate was 23%, which is considered to be normal for this type of study in Singapore.

Results

Respondent's Profile

Respondents of this study are senior managers from MNCs and local companies based in Singapore. About 77% of the respondents are from MNCs and a large proportion (39.3%) came from the manufacturing sector, followed by the financial and business services sector (21.4%). The respondent companies, by country of parent company origin, can be classified as American (12.1%), European (24.2%), Asian-excluding Singapore, (45.5%) and Singaporean (18.2%). A large percentage of the Asian companies are Japanese firms. The majority of respondents falls into the age group of 30 to 50, with 41.2% aged between 30 to less than 40 years' old, and 38.2% aged between 40 to less than 50 years' old. In terms of service, 47.1% of the managers have been with the company for less than 5 years and 26.5% of the respondents having served between 5 to 10 years. The respondents are quite evenly distributed among the various levels of management: 35.3% in top management, 44.1% in the middle and 20.6% in line management.

Research question 1: What is the status of companies using career development plans for expatriates in Singapore?

Table 1 presents the findings in order to respond to the above research question.

Table 1
Percentage of Companies (By Continent) With Separate Expatriate Career Development Plan

Expatriate Career Development Programs	America	Europe	Asia (-Sing)	Singapore	Total
Yes	8%	12%	33%	9%	62%
No	4%	12%	13%	9%	38%
Total	12%	24%	46%	18%	100%

It can be observed from the above table that 62% of the companies have a separate career development plan for expatriates, of which about 42% were Asian MNCs (Japanese, Korean and Singaporean). This appears to contradict general expectations that the Western MNCs have more established career development plans. The high percentage registered by Asian MNCs could be the result of the increased internalisation drive while the Americans and Europeans, on the other hand, scored low probably because they had longer experience in the international scene and had already started their localisation program.

Research question 2: Where does responsibility for the planning and designing of career development plans for expatriates reside in the organization?

The research findings to respond to the above question are presented in Table 2.

Table 2
Responsibility of Planning Expatriate Career Development (By Continent)

Management Level	America	Europe	Asia (-Singapore)	Singapore	Total
Top Mgmt	0%	14%	24%	10%	48%
HR&Functional Mgmt	0%	0%	4.5%	0%	4.5%
Top Mgmt & HR Mgmt	9.5%	0%	14%	0%	23.5%
Top Mgmt & Functional Mgt	4.5%	0%	0%	0%	4.5%
Team Mgmt*	0%	5%	9.5%	5%	19.5%
Total	14%	19%	52%	15%	100%

*Denotes the combined effort of top management, human resource management and functional management.

It is clear from the above table that expatriate career development receives high level attention, with close to half the respondents citing top management involvement. Again, the percentages do suggest a higher rate of participation by Asian and Singaporean top management due probably to the recent internalization drive. For the Americans, because of the long experience in expatriation, the planning function has been delegated to the Human Resource and functional department managers. Also worth noting is the high percentage (23.5%) registered jointly by top and human resource management in planning expatriate career development. It could be a possible indication that human resource practitioners have begun to be involved in strategic management areas. Another interesting finding from this study revealed that MNCs from Europe and Asia tend to develop their career development plans at the overseas subsidiary locations. This could be due to the fact that companies begin to realise that to be global, they must also be 'local' and accord due importance to the national context.

Research question 3: What are the key features of an expatriate career development plan?

Table 3
Major Features of Companies Career Development Plan for Expatriates (By Continent)

Features of Expatriate Career Development Plans	America		Europe		Asia (excluding Singapore)		Singapore		Overall	
	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation
Extensive cross-border relations training	4.00	1.00	2.00	1.15	3.27	1.27	2.33	2.08	3.00	1.41
Promotion before overseas assignment	2.00	1.00	2.25	0.96	2.55	1.51	2.33	0.58	2.38	1.20
Promotion to key positions upon repatriation	3.67	1.15	3.25	1.26	3.36	1.21	3.00	1.00	3.33	1.11
Higher authority and responsibility	4.00	1.00	4.00	0.82	3.64	1.43	3.67	0.58	3.76	1.14
Other overseas assignments	3.67	0.58	3.25	1.71	2.91	1.14	3.67	0.58	3.19	1.12

(* 1= least frequently used..... 5= most frequently used)

The above table presents the findings in response to the above research question and show that cross cultural training (cross-border relations) featured prominently in the expatriate career development plan. A list of five features was given to the companies and they were asked to rate the features from a scale of 0 to 5, where 0 means not used, 1 means least frequently used and 5 means most frequently used. As we can see from Table 3.0, the two most common features among MNCs and Singapore companies are promotion to key positions upon repatriation (3.00 to 3.67) and higher authority and responsibility (3.64 to 4.00). The companies from America and Asia are found to also frequently use extensive cross-border relations training as one of their career development features. Consistent with the origins of most researches, the Americans are aware of the great variety in cultures and thus provide cross-culture training. At the same time, Asian companies from a continental region where cultures differ greatly from country to country, have appreciated the need to provide such training for their expatriates. On the other hand, Singapore companies, like European companies, continue to utilize their expatriate's expertise in giving them more overseas assignments (3.67 and 3.25).

Research question 4: How frequently are such career development plans reviewed?

Table 4 Presents the findings in response to the above question.

Table 4
Frequency Of Expatriate Career Development Plan Review (By Continent)

Duration	America	Europe	Asia(-Sing)	Singapore	Total
Less Than 1 Year	0%	10%	14%	4.5%	28.5%
1 To Less Than 2 Years	14%	4.5%	4.5%	10%	33.0%
2 To Less Than 4 Years	0%	4.5%	29%	0%	33.5%
4 To Less Than 6 Years	0%	0%	5%	0%	5.0%
Total	14%	19%	52.5%	14.5%	100%

The above table shows that expatriate career plans are reviewed at different frequencies; 1 to 2 years for American companies, within a year for some European and Asian companies while others range from 2 to less than 6 years. These could be due to differences in emphases placed by various companies depending on the nature of business, or it could be reflective of the level of stability of expatriate development. However, considering the dynamic nature of international business in the Asia-Pacific region, expatriate career development plans should be reviewed more frequently. The Asian companies surveyed showed a significant percentage of 14% review their expatriate career development plans at least once a year which is indicative of the growing importance of the issue.

Research question 5: How does repatriation issues feature in the career development plan?

Table 5
Measures Used For Effective Repatriation (By Continent)

Repatriation Measures Used	America		Europe		Asia (excluding Singapore)		Singapore		Overall	
	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation	Mean*	Std. Deviation
Arranging proper job placement for expatriate before return to parent country	4.25	0.96	3.63	2.26	3.60	1.40	3.33	1.75	3.59	1.62
Allowing greater autonomy in decision-making	3.00	1.41	2.38	1.51	2.60	1.35	2.83	1.47	2.56	1.42
Arranging a homecoming event	1.25	1.50	2.00	1.41	1.87	1.55	1.50	1.64	1.71	1.49
Orientation programs to familiarize returning expatriates with changes	2.25	1.26	2.25	1.98	2.80	1.66	2.33	1.97	2.56	1.69
Offer repatriation counseling to family for ease of adjustment	2.00	1.63	1.13	1.13	2.87	1.73	1.83	1.72	2.21	1.68
Early notification of return to parent country	3.50	1.00	2.75	1.83	3.33	1.76	4.17	0.41	3.41	1.56
Exposure to career development plans before repatriation	3.50	0.58	2.63	2.26	2.93	1.67	2.83	2.23	2.94	1.77

(*1=least frequently used, 5= most frequently used)

From the above table, it can be seen that repatriation plans were found to be a major aspect of the expatriate career development program. Generally, all companies placed high emphasis on proper job placement before the expatriate returns to the parent country (3.59). It can also be noted that the European and Asian companies are also involving their expatriates in career development plans before repatriation. With the growth in globalisation, the implication for researchers and practitioners is that perhaps, it is time that greater attention is paid to this area. Existing literature are rooted in the American experience and for cultural and other reasons, may not be entirely appropriate for expatriate career development in Asia.

Conclusions

As expatriate assignments heavily impact on the bottom line of any overseas operations, they must not be viewed lightly. Moreover, the success of any international venture depends to a large extent, on the ability of the expatriate managers to contribute in different socio-economic environments and hence help grow the business. For this, expatriates should be provided a clear direction of their career development, from initial expatriate assignment to repatriation. Companies should begin to translate the importance of this issue into sound business policies in order to facilitate future success and growth of international ventures.

For future researchers, this study may provide the headway into the area of expatriate career development. Of special relevance, is a more focused study on the need to synchronise the strategic objectives of the corporations for overseas expansion with the career aspirations of the individual managers.

The findings of this exploratory study will help to contribute to the body of knowledge in International HRD by way of adding new dimensions of thinking for improving expatriate performance, especially in the dynamic region of Asia, through using the descriptive information (with relevant empirical data) presented in the paper. Results from this study will help in developing new research questions/hypotheses for future research. Future

researchers may find this paper useful for linking expatriate career development issues to other aspects of HRD for effective expatriate performance (specifically in the Asia-Pacific region). The theories of HRD drawn from various disciplines could be used in developing a conceptual framework for studying the expatriate performance improvement (linking training, career development and other non-training issues), which is not available in the current international management literature. This will be a demanding area for research as well as for professional practice in today's dynamic global business environment.

Limitations of the Study

As this study only covers MNCs and local companies based in Singapore, the findings may, to some extent, be influenced by the local environment and therefore may not be representative of progress in other countries.

Due to the current economic crisis in Asia, companies were not very willing to participate in this kind of study, citing reasons of time spent on damage control and confidentiality. The relatively small size of respondents hopefully does not affect the true representation of the population for making some generalisation.

Influence of Liking and Similarity on Multi-rater Proficiency Ratings of Managerial Competencies

Reid A. Bates
Louisiana State University

This study explored the predictive ability of liking and three forms of similarity for multi-rater proficiency ratings of managerial competencies. Liking and perceived similarity emerged as the strongest predictors of ratings for all raters. The pattern of correlations between raters, independent variables, and different competencies suggested there may be differences in rater reactions to certain types of similarity and that the nature of these reactions may vary with type of skill or performance that is rated.

Keywords: Multi-Rater, Proficiency Rating, Liking, Similarity

In recent years, organizations have increasingly turned to multi-rater appraisal as a means to better observe and measure job performance, increase perceived fairness, reliability, and ratee acceptance (Harris & Schaubroeck, 1988; Latham & Wexley, 1982), and buttress the legal defensibility of appraisals (Bernardin & Beatty, 1984). Multi-rater appraisal instruments, sometimes referred to as 360° feedback instruments, have also gained popularity as developmental tools (Noe, Wilk, Mullen, & Wanek, 1997). Multi-rater appraisals provide individuals with information about their job-related knowledge and expertise from several sources including themselves, their supervisors, peers, subordinates, and customers. As developmental tools, such appraisals 1) broaden the evaluative perspective on an individual by using multiple data sources; 2) complement organizational trends toward empowerment and teamwork; 3) promote individual accountability for development; 4) enhance self-awareness and self-objectivity (Tornow, 1993); 5) improve communication between supervisors and subordinates; 6) and are typically inexpensive and simple to use (Borman, 1991).

Some research suggests the use of multi-rater instruments and the feedback they generate can lead to significant improvements in management skills over time (e.g., Hazucha, Hexlett, & Schneider, 1993). In order to understand how multi-rater instruments produce changes in managerial skills, Hellervik, Hazucha, and Schneider (1992) proposed a model that outlines the crucial steps of the behavior change process. The steps include 1) accurately assessing needs; 2) assigning behavioral standards; 3) formulating intentions to reach these standards; 4) learning new knowledge, skills, and abilities; 5) generalizing and maintaining new behaviors in the work environment. These scholars note that, in order to maximize the potential for behavior change, critical requirements must be met at each stage in the model. Because of its inaugural position in the change process model, one of the most important requirements is that appraisal information be accurate and credible.

This study examines the relation between two interpersonal variables, perceived similarity and liking, on multi-rater proficiency ratings. The study of these variables is important because performance ratings in general are susceptible to both intentional and unintentional biases. Biased ratings can affect both the credibility and accuracy of appraisals and the developmental feedback resulting from those appraisals. When appraisal information is perceived as either inaccurate or not credible, the likelihood of its acceptance by the ratee, and its power to guide or motivate managerial development is limited. The increasing use of multi-rater appraisals as performance management tools underscores the importance of understanding how such appraisals may be influenced by factors other than performance.

Similarity and Liking

Recent models of both the appraisal process (Dipboye, 1985) and leader-member exchange (LMX) processes (Ferris, Judge, Rowland, & Fitzgibbons, 1994) have recognized interpersonal variables as potentially powerful factors influencing ratings. One important such variable is interpersonal affect. Affect refers to the degree of interpersonal attraction or like and dislike present in a relationship (Liden, Wayne, & Stillwell, 1993). It is a process distinct from cognition and has been cites as *the* major component of interpersonal relationships (Zajonc, 1980). Research has demonstrated that interpersonal liking can influence performance ratings in a direct and non-inferential manner (Alexander & Wilkins, 1982; Cardy & Dobbins, 1986); indirectly through the attributional processes of the rater (Dobbins & Russell, 1986; Mitchell, Green, & Wood, 1980); and through a schematic effect on the cognitive processing of performance information (Wayne & Ferris, 1990).

Copyright © 1999 Reid A. Bates

In addition, some research suggests that the degree of interpersonal attraction or liking may be influenced by the extent to which individuals perceive they are similar to others. That is, similarity implies a general agreement in views which people find rewarding (Byrne, 1971). Thus an individual perceived as similar is more attractive (and therefore more liked) and more apt to get positively biased performance ratings.

Recent research has begun to think about and assess similarity in three conceptually distinct ways. One conceptualization, demographic similarity (Turban and Jones, 1988; Zalesny & Kirsch, 1989), reflects the actual similarity of individuals along dimensions such as education level, gender, race, job status, job tenure, and so on. Although some researchers consider these factors unimportant to work relationships (Dienesch & Liden, 1986), others theorize they are critical to understanding organizational behavior (Schneider, 1987). From a cognitive processing perspective, demographic similarity can influence ratings because raters may use different schemas to classify information from similar and dissimilar ratees (Liden, Wayne, & Stillwell, 1993). If performance information is categorized on the basis of age, education, or gender similarity rather than actual performance, this may result in biased ratings. However, research examining the influence of demographic similarity on performance ratings is mixed. Some studies suggest a significant effect (Schmidt & Lapkin, 1980; Turban & Jones, 1988) whereas others indicate no effect (Cleveland & Landy, 1981; Wexley & Pulakos, 1983).

Another conceptualization of similarity, perceptual congruence, has been operationalized as the difference between an individual's self-description and other's descriptions of him/her (Wexley, Alexander, Greenwalt, & Couch, 1980); perceptions of communication frequency (Hatfield & Huseman, 1982); or behavior needed to obtain a merit pay increase (Turban & Jones, 1988). The limited research examining perceptual congruence has found higher levels of congruence related to job satisfaction and performance ratings. No research has examined the relationship between the perceptual congruence of required job competencies and performance ratings in multi-rater appraisals.

A final conceptualization of similarity refers to perceived similarity or similarity in attitudes, values, perspectives, and work habits between individuals. Research indicates perceived similarity can predict quality of LMX relationships (Liden et al., 1993), favorable treatment (Wexley & Nemeroff, 1974), and performance ratings (Pulakos & Wexley, 1983; Turban & Jones, 1988). Although little research has addressed this question, it has been suggested that perceived similarity, because of its attitudinal nature, may be the most potent factor influencing an evaluator's ratings of another individual (Schmitt, Pulakos, Nason, & Whitney, 1996).

Although research suggests liking and similarity may influence ratings, there is still little understanding of when and how these effects occur. The limited and often mixed results of previous research suggest, for example, the influence of similarity may vary by type of similarity, rater, or setting. Moreover, no research has examined the relationship between liking and different types of similarity in multi-rater appraisal settings. The present research examines the extent to which liking and three conceptually different forms of similarity can predict multi-rater proficiency ratings of managerial competencies. The following research questions were examined:

1. Are liking and the three types of similarity significant predictors of proficiency ratings resulting from a multi-rater appraisal?
2. Do liking or the types of similarity vary in their ability to predict proficiency ratings across different competencies?
3. Are there differences in the degree to which proficiency ratings from different rating sources (supervisors, peers, and subordinates) are associated with liking or similarity?

Method

Participants in this study were 142 mid-level managers in a state government agency. Positions included first-line supervisors (13%), second-line supervisors (12%), managers (57%), project leaders (5%), and other managerial positions (9%). Participants ranged in age from 29 to 66 with a mean age of 49. A little more than one-third of the participants (39%) had attained high school diplomas, 27% had some post-secondary training, 7% had associates degrees, 9% had bachelors degrees, and about 18% had graduate degrees. Twelve percent of participants had been in leadership positions in this organization for less than five years, about 30% between five and ten years, and the remaining 48% for more than ten years. The sample was predominantly female (64% female, 36% male).

Procedure

Subjects in this study were management and leadership personnel in a state government agency who had been selected to participate in a developmental assessment. The goal of the assessment was to identify competency strengths and weaknesses of management personnel as a first step in improving leadership and management in this agency. Participants completed a multi-rater managerial development instrument, the Leadership Effectiveness Inventory (LEI). A subset of target individuals (the ratees) rated themselves (n = 23), and were rated by immediate supervisors (n = 23), one or more peers (n = 44), and one or more subordinates (n = 53). Questionnaires were distributed during meetings held with the participants. The purpose of the meetings was to introduce the questionnaire, explain the developmental nature of the assessment, and to answer any questions participants may have had about the process or objectives of the assessment. Respondents were encouraged to complete the questionnaires within two days and return them to the researcher by mail.

Measures

All measures in this study were included in a questionnaire that employees were mandated to complete by the top administrator of this agency. Four independent variables were assessed. Raters responded to a measure of interpersonal liking and measures of three conceptually distinct forms of similarity. The liking scale adapted two items from previous research (Liden et al., 1993; Wayne & Ferris, 1990). These items asked "How much do you like this person as someone to work with" and "How much do you like this individual as a person?" Cronbach's alpha for this scale was .71.

Demographic similarity was measured in terms of discrepancies in gender, age, and educational levels between ratees and raters. Gender discrepancy was coded as the same (1) or different (0). Educational level was coded as high school diploma (1), post-secondary training (2), associate's degree (3), bachelor's degree (4), and graduate degree (5). Educational discrepancy was calculated as the absolute difference between rater and ratee. These scores were reversed so higher scores indicated greater similarity. Age was measured in years. Age discrepancy was calculated as the absolute difference between rater and ratee in years of age. Age discrepancy was transformed into similarity scores by dividing the difference scores by their respective standard deviation and reversing the resulting scores so that high scores indicated age similarity. All demographic scores were summed to yield a single score for demographic similarity.

A four-item scale adapted from Turban & Jones (1988) measured perceived similarity. Items included "This individual and I see work in much the same way"; "This individual and I are alike in an number of ways when it comes to work"; "This individual and I handle work problems in similar ways"; and "This individual and I are alike in terms of coming up with a similar solution for a work problem". The reliability estimate for this scale was acceptable (% = .93). Participants responded to these items along a five point Likert-type scale that ranged from 1 (not at all) to 5 (very much).

Perceptual congruence assessed the discrepancy between ratee and rater's perceptions of the proficiency levels required for technical competence (3 items) and interpersonal skills (5 items). For each competency item, respondents were asked to identify the proficiency required for successful performance in the ratee's job. Raters used a five point Likert-type scale that ranged from 1 (no proficiency) to 5 (very high proficiency). A sixth rating option (don't know) was also available but deleted from computation of congruence scores. Discrepancy scores were calculated as the absolute difference between rater's and ratee's required proficiency ratings. These scores were reversed so larger scores indicated greater congruence.

The dependent variables in this study were ratings of current proficiency for technical competence and interpersonal skills. Technical competence referred to an individual's ability to demonstrate technical proficiency, understand the nature of its impact in their areas of responsibility, and to appropriately apply policies and procedures. Interpersonal skills referred to proficiency in considering and responding appropriately to the needs, feelings, capabilities and interests of others, to provide feedback, and treat others equitably. These two competencies were assessed in order to explore whether certain types of competency ratings, such as those related to interpersonal skills, are more susceptible to affect or similarity influences than other, less person-oriented competencies (e.g., technical skills). For each competency item, respondents were asked to assess ratee current proficiency level using a five point Likert-type scale that ranged from 1 (no proficiency) to 5 (very high proficiency). A sixth rating option (don't know) was also available but was deleted from calculation of proficiency scores. Proficiency scores were combined to yield a single score, calculated as the sum of the ratings for each competency item.

The perceptual congruence and dependent variable measures were assessed using an adapted version the LEI, a leadership instrument designed to be used for management development in the public sector. The original LEI was developed by the U.S. Office of Personnel Management from a government-wide survey of over 12,000 respondents and was subsequently validated by teams of Federal executives, managers, and supervisors. The version used in this

study was modified slightly from the original version. Modifications, where necessary, were limited to changes in the wording of the items to better reflect job requirements and the culture of the agency. No items were added or deleted from the original instrument. This questionnaire required two ratings from respondents: current proficiency of the ratee and proficiency required for successful performance in the ratee's current job.

Analysis

Hierarchical regression analysis was used to examine how the variance in performance ratings was partitioned among predictors and to test the ability of the independent variables to explain the variance in the proficiency ratings. Independent variables were entered as shown in Table 1. Liking was entered first to determine how much variance the similarity variables could account for over and above this predictor. Of the similarity variables, demographic similarity variable was entered first because this represented actual as opposed to perceived or attitudinal similarities. Perceptual congruence was entered last, following perceived similarity, to determine how much variance this variable accounted for beyond the other similarity variables. Bivariate correlation analysis was used to investigate the question of differences in the associations of liking and similarity with different raters or on ratings with different types of competencies.

Results

Research Question 1

The dependent variable in this analysis was a single score representing the summed ratings for both technical competence and interpersonal skills. Hierarchical regression analysis results (see Table 1) indicated that:

1. Liking accounted for a significant proportion of the variance in proficiency ratings (R^2 = .48).
2. The addition of the demographic similarity variable did not increase the variance explained beyond that explained by liking (R^2_{Change} = .00, ns).
3. The addition of perceived similarity to the model increased explained variance 9%, a significant increase (p = .001). The total variance explained by the model at this stage, with liking, demographic similarity, and perceived similarity as predictors was significant (R^2 = .57, p = .001).
4. The entry of perceptual congruence into the regression model increased total variance explained by a 5.4% (p = .001). Total variance in proficiency ratings accounted for by the full model equaled 62% (R^2 = .62, p = .001).

Overall, results indicated that liking together with the three types of similarity accounted for a significant proportion of the variance in proficiency ratings. Significant beta values (p = .001) were found for liking (ß = .40), perceived similarity (ß = .45) and perceptual congruence (ß = .27).

Table 1: Results of the Hierarchical Regression

Step	*Predictor*	R^2 / *Adj* R^2	F_{model} *(df)*	□ R^2	$F_{increase}$ *(df)*	□□
1	Liking	.48	72.25**	----	----	.40**
		.47	(1,80)			
2	Demographic	.48	36.25**	.00	.61	-.06
	similarity	.47	(2,79)		(1,79)	
3	Perceived similarity	.57	34.12**	.09**	16.06**	.45**
		.55	(3,78)		(1,78)	
4	Perceptual congruence	.62	31.64**	.05**	11.03**	.27**
		.60	(4,77)		(1,77)	

□ Each successive model in the hierarchical regression analysis includes the variables previously entered.
□□ Beta values shown were calculated with all predictors entered in the regression equation.
* p □ .01 ** p □ .001

Research Question 2

Results in Table 1 indicate there are differences in the ability of conceptually different types of similarity to predict overall proficiency ratings. Liking in addition to both perceived similarity and perceptual congruence emerged as significant predictors while demographic similarity did not. Similar results were obtained in additional regression analyses examining the predictive power of these variables for the two separate components of the outcome variable (interpersonal skills and technical competence) (see Table 2). Liking, perceived similarity, and perceptual congruence all accounted for unique variance and were significant predictors of proficiency ratings for both competencies while demographic similarity was not. These results indicate there is no substantial difference in the predictive power of these variables across proficiency ratings of different types of competencies.

Table 2: Hierarchical regression analysis examining differential predictive power of liking and similarity types across competencies

		Interpersonal Skills			*Technical Competence*		
Step	*Predictor*	R^2 *Adj* R^2	$F_{increase}$ *(df)*	□□	R^2 *Adj* R^2	$F_{increase}$ *(df)*	□□
1	Liking	.45 .45	66.46** (1,80)	.36**	.35 .34	46.87* * (1,88)	.38**
2	Demographic similarity	.47 .46	2.42 (1,79)	-.12	.35 .34	.50 (1,87)	.07
3	Perceived similarity	.57 .55	18.57** (1,78)	.48**	.40 .38	6.78* (1,86)	.35*
4	Perceptual congruence	.61 .59	8.35* (4,77)	.21*	.45 .43	8.56* (1,85)	.24*

□ Each successive model in the hierarchical regression analysis includes the variables previously entered.
□□ Beta values shown were calculated with all predictors entered in the regression equation.
* p □ .01 ** p □ .001

Research Question 3

The question of whether there are differences in the degree to which developmental ratings from different rating sources (supervisors, peers, and subordinates) are associated with liking, perceived similarity, perceptual congruence, and demographic similarity was explored by bivariate correlation analysis. This analysis correlated ratings for interpersonal skills and technical competence from each rater with the independent variables. Results are shown in Table 3.

Table 3: Correlations between rating by source and independent variables for each competency rated

	Interpersonal Skills				*Technical Competence*			
	Liking	Similarity	Congruence	Demographic	Liking	Similarity	Congruence	Demographic
Supervisor	.56**	.88**	.47*	.01	.47*	.58*	.26	.28
Peer	.60**	.67**	-.18	.10	.47**	.58**	.03	.01
Subordinate	.64**	.60**	.05	-.29*	.55**	.48**	.13	.03

All correlations are one-tailed
* p □ .05 ** p □ .01

Correlations are based on responses from 22 supervisors, 43 peers, and 25 subordinates. The resulting correlations ranged from .47 (p □ .05) to .64 (p □ .01) for liking, .48 (p □ .01) to .88 (p □ .01) for perceived similarity, -.18 (ns) to .47 (p □ .05) for perceptual congruence, and -.29 (p □ .05) to .27 (ns) for demographic similarity. These results indicate the relationship between both liking and perceived similarity and proficiency

ratings are consistent across source of rating and type of competency rated. The results for perceptual congruence and demographic similarity are less straightforward. Perceptual congruence was positively correlated with supervisor ratings of interpersonal skills but not with technical competence. In addition, it had no significant correlations with ratings from either peers or subordinates for either type of competency. Demographic similarity also had no significant positive correlations but showed a negative correlation with subordinate ratings of interpersonal skills ($r = -.29$, $p < .05$). Overall, these results suggest there may be differences in reactions to certain types of similarity and that the nature of these reactions may vary by rater/ratee relationship and type of skill or performance being rated.

Conclusions and Discussion

This study compared liking and three forms of similarity with multi-rater proficiency ratings of managerial competencies. Liking and perceived similarity emerged as the strongest predictors of ratings for all raters, explained unique variance in both interpersonal skills and technical competence, and were strongly correlated with all supervisor, subordinate, and peer ratings of both interpersonal skills and technical competence. The regression results and relatively high correlation ($r = .63$, $p < .001$) between these two variables support the similar-to-me association between liking and similarity. It is possible these two factors may combine to form one 'perceptual package' for raters appraising skills or performance. Results also support observations that perceived similarity may be the most likely type of similarity to influence ratings (Pulakos & Wexley, 1983). In general, these findings were not unexpected given previous research. However, this study did extend the findings to multi-rater proficiency ratings of qualitatively different kinds of competencies.

Although not as strong as either liking or perceived similarity, perceptual congruence was also a significant predictor of ratings and accounted for unique variance in the two competencies rated. This finding supports research cited earlier indicating that similarity in perceptions of job demands is associated with supervisor ratings. On the other hand, correlations between congruence, supervisor, peer, subordinate ratings, and the two competencies rated were mixed. Data showed that 1) perceptual congruence was associated with supervisor ratings of interpersonal skill but not for technical competence; and 2) it was not associated with peer or subordinate ratings for either competency. The findings indicate variations in how different rater react to congruence and suggests these variations may interact with type of skill rated. One possible explanation may be that supervisor-subordinate perceptual congruence about job requirements functions to increase task clarity. This allows subordinates to identify which job behaviors are most important (and most likely to be rewarded), and to focus their energies appropriately (Turban & Jones, 1988). The fact that perceptual congruence was associated with interpersonal skills and not technical competence could therefore reflect the relative importance of interpersonal skills in these managerial jobs. This interpretation further suggests the non-significant associations with peer and subordinate ratings indicate that the views of these individuals about what is important for job performance are not as critical as those of the supervisor in determining ratee behavior. On the other hand, one could expect perceptual congruence to play a larger in predicting ratings in team-oriented or other settings in which peers and subordinates are more involved with identifying and rewarding good performance.

Demographic similarity was not a predictor in any of the regression analyses although is did show a significant negative correlation with subordinate ratings of interpersonal skills. The inverse relationship between demographic similarity and ratings is perplexing. Although some research has found that older ratees are rated less favorably than younger ratees (Rosen, Jurdee, & Lunn, 1981), there was no significant age differences between subordinates and ratees to account for this finding. Nor were there significant differences in age or gender that might explain these findings. Moreover, it is difficult to speculate on the causes of this finding given current research and theory on the role of similarity perceptions in performance ratings. The absence of a similar relationship with technical competence suggests the possibility this finding may be an artifact of the data or a result of common method variance. In any case, these results add to the mix of findings with regard to demographic similarity and argue for further research directed at understanding if, how, and why this type of similarity influences performance judgments.

Summary

Little research has directly examined the interactions of potentially influential interpersonal variables on different raters and types of performance or skill being rated. The present research attempted to explore these issues. Findings

supported previous research identifying liking and perceived similarity as powerful predictors of performance ratings. Data also indicated that supervisor ratings are more closely associated with perceptual congruence than ratings of peers or subordinates. This, together with the pattern of correlations for both perceptual congruence and demographic, suggests (1) there may be differences in raters reactions to certain types of similarity; and (2) that the nature of these reactions may vary with type of skill or performance that is rated.

These findings are important when viewed in the context of multi-rater appraisals. Multi-rater appraisals are increasingly becoming a key component of an organization's performance management strategy (Church, 1998). The central rationale for the use of multi-rater appraisals is that job-related, behaviorally based performance information from multiple sources is a potent force for performance improvement. A key assumption underlying the application of these appraisals is that information from multiple sources will provide more valid and reliable information about an individual's job performance. However, the present research has shown that liking and different kinds of rater-ratee similarity can influence ratings and that this influence by vary by rater or rating task.

In practice, liking or similarity influences on the appraisal process may be difficult to control. For example, it is unlikely that a rater would ever encounter a rating situation in which his or her liking or perceptions of similarity were completed unrelated to ratees or ratings. Because interpersonal factors appear to be intertwined and inseparable from the rating process, it is important to understand that these factors are at work and how they may influence the appraisal process and the resulting information. The implication is that, to better manage the appraisal process, it may be more fruitful to approach raters as individuals in social roles whose feelings and interpersonal perceptions are significant influences on the rating process. In addition, the results of this and other research suggest the value of maximizing rater-ratee perceptual congruence about job requirements. In multi-rater appraisals, facilitating discussions between employees, supervisors, peers and subordinates with the explicit goal of verifying and reaching agreement on job requirements would enhance the credibility and utility of appraisal information. To the extent discrepant views on what is important for job performance have been reduced or eliminated, appraisal information will be better able to direct and motivate performance improvement efforts. Although enhancing perceptual congruence might not eliminate the influence of liking or perceived similarity in the appraisal process, it may help balance the effect of these factors on performance or skill ratings.

A Cross-Case Study: Revisiting Implementations of the Performance Analysis for Training (PAT) Model

Catherine M. Sleezer Ph.D.
Oklahoma State University

Dale E. Kunneman Ph.D.
Meridian Technology Center

Five case studies are reported in the literature that describe systematic needs analysis using the Performance Analysis for Training (PAT) model. Using evidence from these reports, this cross-case study seeks more compelling and robust insights about needs analysis. The results of this study highlight differences and similarities in PAT model implementations. The results also provide insights into: (1) the correspondence between the PAT model and the actual needs analysis processes and results; (2) the influence of the organization, the decision-maker, and the analyst characteristics; (3) future practice and research needs.

Keywords: Needs Analysis, Performance

The usual starting point for HRD and training efforts is the analysis of performance needs. The labels for this process include needs assessment, needs analysis, front-end analysis, and performance analysis (Rossett, 1992). The particular meanings of these terms have been debated (Moseley & Heaney, 1994), but each identifies a similar intent: To ascertain performance improvement problems or opportunities. Determining and then addressing performance needs is expected to produce benefits such as increased productivity, profit, satisfaction, and innovation. Given its importance, understanding and improving needs analysis is one strategy for improving HRD and organizational effectiveness.

Problem Statement and Theoretical Framework

Practitioners have available many models that detail processes for analyzing needs (e.g., Goldstein, 1986; Gupta, 1996; Sleezer, 1991; Swanson, 1994). However, the literature contains few systematic studies that describe actual assessment practices in the workplace (Lewis & Bjorkquist, 1992; Tannenbaum & Yukl, 1992) even though many authors have indicated that such knowledge is needed. For example, Hatcher and Ward (1997) stated that because of the rapidity of organizational change, performance improvement professionals need innovative ways to analyze issues affecting performance. Also, Sleezer and Maile's (1997) study of needs analysis showed that HRD professionals used diverse practices and concluded by calling for additional research and model-building aimed at practical needs analysis tools.

A theory-based needs analysis model that has been tested in practice is the Performance Analysis for Training (PAT) model (Sleezer, 1990). Directed toward identifying the organization's performance needs that should be addressed with training, the model includes three components: (a) a conceptual framework with three elements that affect decisions about training needs, (b) a list of the phases and steps involved in the process of determining training needs, and (c) a set of worksheets that detail the phases, steps, and activities involved in determining training needs. The literature contains five case studies that each describe implementation of the PAT model in a functioning organization. Each study provides insight into one needs analysis effort and its context. Table 1 summarizes each case including the impetus for the needs analysis, the analysis level(s), the decision maker role and the analyst. Research-based case studies were implemented in four organizations: a financial services firm (Sleezer, 1991), a vehicle manufacturing division (Sleezer, 1996), a business forms manufacturing division (Kunneman & Sleezer, 1998) and veterinary medicine college (Knorr, 1997). The fifth case, which is a descriptive "how-to" case for practitioners, was implemented in a chemical manufacturing firm's strategic business unit (Sleezer, 1995). The levels of analysis varied across the five cases: one focused only on the organization level, two focused on the organization and the work-behavior levels, and two focused on the organization, work-behavior, and individual levels. Three analysts implemented the cases: Knorr, Kunneman, and Sleezer. Note in one case Sleezer led a team of analysts. As highlighted in Table 1, the combination of organization, decision-maker, and analyst characteristics is unique for each case. Each study served as a single case and resulted in an individual case report as specified by Yin's (1988) case study method.

Research Questions

This cross-case study reexamined the five case reports of PAT model implementations to answer the following research questions: (1) What is the correspondence between the PAT model and the actual needs analysis processes and results? (2) Whether the characteristics of the organization, the decision-makers, and the analyst influenced the analysis of needs? (3) What insight do the cases provide for future practice and research?

Research Methodology

This study relied on multiple-case design as described by Yin (1988). The methodology has three phases:

1. Design, which involves developing theory, designing data collection protocol, and selecting individual cases.
2. Single-case data collection and analysis, which involves conducting individual cases and writing individual case reports.
3. Cross-case analysis, which involves using the individual case reports to draw cross-case conclusions, modify theory, develop policy implications, and write the cross-case report.

This study focused on the final phase, cross-case analysis. To provide a context, we briefly overview the first two phases, which were completed prior to this study.

The design phase began with developing theory. As detailed in Sleezer (1990), the process included creating a needs analysis model that synthesized both theory and practical knowledge. It also included having three experts in training needs analysis evaluate the model's face and content validity. The outcome, the Performance Analysis for Training (PAT) Model, articulates needs analysis theory, operationally defines a needs analysis process and expected outcomes, and can serve as a logic model for case study research. A logic model stipulates a complex chain of events for an intervention over time and provides a basis for analyzing the data from a case study (Yin, 1998). Yin notes that the conceptualization "reflects the theory of the intervention" (p. 253). In the PAT model, the theory of the intervention is contained in the list of phases and steps involved in the process of determining training needs and in the set of worksheets. Conducting a needs analysis according to the list of phases and steps and the worksheets is expected to produce the following specific outcomes: (a) involve the organization's decision makers in the training process; (b) provide the organization's decision makers with accurate and sufficient information for making decisions about the contributions that training should make to the performance needs of the organization; and (c) provide information useful for the design, development, implementation, and evaluation of training. Rivals to this theory are that the phases, steps, and actions specified in the PAT model are impossible to follow, need to be modified, do not produce in the intended outcomes, or produce unintended consequences. A second theory is specified in the PAT model's conceptual framework: the analyst, the decision-maker and the organization characteristics interact to influence the needs analysis process and results. A rival to this theory is that the characteristics of one element dominate.

The design phase also involved creating a case study protocol and selecting individual cases. The PAT model Worksheets contain the protocol. The worksheets overviewed the project, and contained the procedures and general rules for implementing the PAT model in a functioning organization, and provided a template for organizing needs analysis notes. The case study sites and the analysts were selected based on feasibility and access. Individuals within each organization had negotiated with an analyst to conduct a needs analysis and also had indicated willingness for the project to serve as a case study. The analysts were knowledgeable about the topic. Sleezer had implemented many needs analyses, instructed needs analysis courses, and published articles on the topic. Kunneman and Knorr were doctoral students. Each had an association with the organization. Also, each analyst was willing to conduct the needs analysis using the PAT model and to participate in the research project.

The second phase of the research methodology was single-case data collection and analysis. This step involved conducting individual cases and writing the case reports. With this research method, each case that documented a holistic application of the PAT model in a context with distinct organization, decision-maker, and analyst characteristics tested the model and its theoretical base. Systematically studying needs analysis while implementing one required the analyst to engage in two on-going streams of activity. In one stream, the analyst implemented the needs analysis as prescribed by the PAT model. In the other stream, the analyst collected documentation and impressions about the process and results relative to the research questions and propositions.

The case study methodologies specified by Yin (1988) and by Miles and Huberman (1984) guided the data collection and analysis for the individual cases. While implementing the needs analysis, the analysts recorded notes

Table 1: Description of the Five Cases

Case	Impetus for the Needs Analysis	Needs Analysis Levels	Decision Maker(s)	Analyst 's Name
Specialty Chemical Unit (SC): A strategic business unit of a chemical manufacturing firm.	Decision-makers wanted to identify future training needs for technical workers. The firm's strategic goal of quickly implementing new technology was the driving force for the needs analysis.	Organization Work Behavi Individual	Manager of Human Resources Plant manager	Sleezer
Veterinary Medicine College (VMC): A college in a US land grant university.	Decision makers responded to calls for action to all veterinary educational institutions from professionals writing in journals and speaking at conferences. They wanted to use a needs analysis as the first step in designing a curriculum that reflected customer needs.	Organization	Curriculum developmen t committee consisting of nine faculty members and the associate dean	Knorr
Business Forms Division (BF): A division of a worldwide manufacturer of business forms and business systems design.	Decision makers were implementing an ISO quality system designed to improve performance. The decision-makers requested the needs analysis as the first step in setting up an orientation program for new and current workers.	Organization Work Behavi	Plant Manager Chemical Dept. Manager	Kunnem n
Vehicle Manufacturing Division (VM): A division of a US manufacturer of vehicles.	The decision-maker was planning to implement integrated manufacturing throughout the division. He perceived that middle managers and supervisors knew that changes were eminent, but did not know how to manage in the new environment. He requested a needs analysis that would determine the critical needs for these employees.	Organization WorkBehavio	Director of Manufacturin g	Sleezer, project manager and tw project assistant
Financial Services Firm (FS): A US firm that sold financial processing products and services nationally.	The new training and development manager intuitively knew the training needs and thought that a formal training needs analysis might convince those in power to provide funding for training.	Organization Work Behavior Individual	President VP of Finance VP of Human Resources Training Manager	Sleezer

relative to both streams of action. These notes provided the basis for the individual case reports. The cases emphasized different areas of interest based on the foci of the research questions and propositions. Four cases examined whether using the PAT model in the specific organization produce the predicted results. For three studies, implementing the PAT model was predicted to produce the results specified in the model. The VMC case examined the inclusion of the customer as an element in the PAT model and the usefulness of the project findings for making changes in the veterinary curriculum. Two cases focused on the correspondence between the PAT model and the actual analysis process, and two cases focused on whether the interaction among the model's elements influenced the needs analysis.

Cross-case analysis involves synthesizing the information from the individual cases, modifying the theory, developing policy implications, and writing the cross-case report. This study synthesized individual published case reports to examine multiple implementations of the PAT model in functioning organizations. Systematically examining evidence across cases indicates the extent of the replication logic. According to Eisenhardt (1989), Lee (1985), and Yin (1989), if cases are purposefully selected and multiple cases confirm predictions, then the propositions are supported. However, if a case contradicts the predictions in some way, then the initial predictions must be revisited and retested (Yin, 1989).

Synthesizing the information from the individual cases involved many steps. The first step occurred soon after the all the cases were complete with final reports written. The three analysts met and for the first time discussed the similarities and differences among the cases and the subtleties that they had encountered. Copious notes were taken during the meeting. Then to gain some distance, we allowed six months to elapse. The next step involved going through the files to get them in order. The data for the cross-case analysis consisted of the individual case reports and the notes from the analysts' meeting. After the data were ordered, we took long amounts of undisturbed time to review the information. The previously developed theories provided a template for comparing the empirical results of the case studies. We also developed coding categories based on the research questions and propositions, and we coded the data contained in the individual case reports. Then, we synthesized the coded data, searched for additional patterns to discover what could be learned to share with others, and compared conclusions from the individual cases to determine which information was replicated by other cases. Finally we used our notes to write this manuscript. Throughout the process, we checked and rechecked each other's work.

Findings

We begin this section by examining the findings relative to the PAT model implementations and results. Then we examine the influence of the organization, decision maker, and the analyst characteristics on the needs analysis process and results. We conclude by identifying adaptations to the PAT model.

PAT Model Implementations and Results

In all the cases, a decision maker within the organization determined the importance of a needs analysis project. A key event was the initial meeting between the decision maker(s) and the analyst. The project process and results were negotiated and agreement upon including such specifics as the use of the PAT model, data collection processes, time lines, resources, and reporting results. In some cases, the agreement included what would constitute a needs analysis. For example, in the BF and VM cases, the decision maker and the analyst agreed to begin the needs analysis project by implementing two PAT model phases and to table the third phase until after they obtained results from the first two phases. The VMC case revealed that the group of decision makers responsible for using information from the needs analysis to create a new curriculum was smaller than the group responsible for implementing the changed curriculum.

The iterative nature of the needs analysis process and the involvement of decision makers is apparent in the case reports. Four case reports (VMC, FS, SC, and VM) noted that the needs analysis process was iterative rather than strictly linear. For example, an external reviewer for the VMC case commented "There are multiple ways in which data are solicited. The assessment is an iterative rather than a cross sectional process, and this is good" (Knorr, 1997, p.73). Also, in all cases, decision makers participated in the process. For example, the VM Director commented that he had been involved in planning the analysis, had received in-process reports, and was "on top" of this project. He also appreciated not having to be the subject expert on performance analysis and having his time used wisely.

All three analysts used the worksheets as a guide and a framework for organizing information. For example, the SC team members individually filled in the worksheets and then met to compare notes. "This comparison produced many insights, as team members shared new information, revealed tacit assumptions, and clarified perceptions" (Sleezer, 1995, p. 247).

In each case, the analysts adapted the PAT model and used it to successfully implement a needs analysis project. One VMC adaptation was to add the customer to the PAT model elements. BF and VM adaptations included using information from the second phase of the PAT model to decide where to place the training emphasis. In both cases, the data gathered and synthesized about specific job behaviors resulted in transforming the decision makers sensed need into specific, delineated, and documented needs. The BF and VM cases also began Phase 2 before Phase 1 was complete. For example, the VM Director worked on clarifying perceptions from Phase 1, while the analyst began implementing Phase 2. Also, in the BF and VM cases, the need to implement Phase 3, individual capabilities analysis, was obviated by information that was gained during the first two phases. And in the BF case, the analyst expanded the PAT model's phase 2, Steps 2 and 3 by using a Valpar-2000 job profiling system rather than an analysis method that had been identified by Swanson and Gradous (1986).

The remaining adaptations focus on the PAT worksheets. The BF analyst commented on contextualizing the performance analysis tools and changing the order for actions. He noted that a question in Phase 1, Step 1, "Do the decision makers agree about the purpose and parameters of the analysis? was problematic because the parameters changed with the input of new data. The question was finally answered after Phase 2, Step 3. Similarly, the VMC analyst had insufficient information to complete the worksheets while the needs analysis was in process and so used an iterative approach that involved frequently reviewing previous responses to worksheet actions and expanding or recasting them when additional data or insight was received. He also contextualized the PAT worksheets, which were designed for use in business, to be appropriate for an educational situation. For example, he changed the terms 'training' and 'bottom-line' to 'curriculum revision' and 'goals'.

In all cases, the analyst and the decision maker (s) agreed that the expected results were produced. In three cases, BF, VM, and FS, the organization's decision makers explicitly stated that they were involved in the training process. Further, they received accurate and sufficient information for making decisions about the contributions that training should make to the performance needs of the organization, and information useful for the design, development, implementation, and evaluation of training. For example, the Vice-President of Finance at FS commented that he was ready to deliver the training in-house or find a vendor to deliver the content that had been determined. In the VMC case, the PAT model was modified to include the customer. The needs analysis project was expected to be useful for determining deficiencies in a professional curriculum, to involve the institution's decision makers in the process, and to result in changes to the curriculum. The analyst, the decision makers, and an external reviewer rated the project and determined that the results generally met expectations. One area of interest is the usefulness of the needs analysis findings for making changes in the curriculum. The decision makers rated the aspect as somewhat useful. However, the analyst observed the curriculum change process after the needs analysis project was complete and noted that the decision makers actually made few references to the information gathered from customers. He noted that while the modified PAT model was successful in guiding a needs assessment that produced the requested information; the decision makers made little use of the information; so the needs assessment findings contributed only slightly to changes in veterinary curriculum.

The analyst (s) and the decision maker (s) agreed that the implementation of the PAT model produced positive unexpected results. In three cases, BF, VM, and FS, the organization's decision makers reported that the needs analysis had changed their views of the role of training within their respective organizations. For example, the President at FS commented that he received information indicating a need for organizational restructuring to place training at a more strategic level within the organization. Another unanticipated result was the continued commitment from decision makers to implement the PAT model as a performance tool. The decision makers in the BF and SC cases commented on the usefulness of the analysts as future resources for performance analysis and training and requested the implementation of similar projects at other locations. Finally in all business cases, the decision makers concluded that the performance issues were more complex than they had initially thought and that providing training without considering other work place constraints would likely result in little use of the skills and knowledge.

The analysts in all cases concluded that the PAT model is most economical for guiding large-scale projects, such as reengineering or quality improvement, or for guiding affective projects, such as labor disputes. In such projects, awareness of diverse issues or feelings is critical to a success process and results, and the time and resources needed to implement the PAT model are appropriate given the high costs of poor performance. The PAT model may not be the best choice in less complex situations or when the performance results are relatively unimportant.

Influence of organization, decision maker, and analyst characteristics on the process and results

In each case the organization, the decision maker, and the analyst characteristics interacted to influence the needs analysis process and results. In the BF case, the analyst's experience with the Valpar-2000 job profiling system and his profiling certification influenced the method used to analyze jobs. In the VMC case, two organizational characteristics were influential: the veterinary medicine program had no established goal and the individuals who decided on and made curriculum changes held different perspectives about what the program should accomplish.

In all cases the interaction was as important as the element characteristics in producing effects. The BF case provides an example of how the context influenced the thinking of the analyst and decision maker, who in turn shaped the context: " the first phase, determining where the training emphasis should be placed, was influenced by the addition of new production operators to the organization. The analyst and the manager agreed that the training should be targeted at the production area because it had the most potential for individual and organizational performance" (Kunneman & Sleezer, 1998, p. 9). Interaction was also important in helping the individual stakeholders reach consensus. Such interactions occurred in all the cases. Two decision maker characteristics that interacted in important ways with the analyst and organization were the decision makers' support of the performance analysis and their power to implement both the training and non-training solutions influenced the project. In the VM, SC, BF, and FS cases, the interactions were positive. However, interactions were more problematic in the VMC case when individuals who were not members of the curriculum development committee had little influence on the needs analysis process, but significant influence on the curriculum revision.

Adaptations to the PAT Model

The case studies revealed aspects of the PAT model that worked well and adaptations to make it better reflect actual needs analysis processes and easier to use. Aspects that worked well include the model's components and its transparence. The analysts used the PAT model's conceptual framework, list of phase and steps, and worksheets to guide the needs analysis project. The worksheets provided direction for and a means of recording the needs analysis process and content. Further, they facilitated on-going reflection as the basis for insight. The PAT model components were virtually transparent to organizational decision makers who appreciated the wise use of their time. They were able to participate in the needs analysis projects without the burden of knowing all the details of the PAT model.

Adaptations to the PAT model include changing its name to Performance Analysis Tool, adding a "key population" element and the corresponding worksheets, and adding action planning as specific final step in the process. Another adaptation is to specify that a needs analysis does not necessarily include all three levels and that a work behavior analysis may be needed in order to determine where to emphasize performance. Yet another adaptation is to provide additional descriptive information on how to use the PAT model. The information could include the kinds of iterations to expect in implementing a needs analysis, strategies for gathering the information to complete each phase, strategies for adapting the sequence of actions in the PAT model to fit the context, use of the PAT model on large-scale or affective projects, and the probability of unexpected outcomes.

Answering the Research Questions

The cross-case results provide insight for answering the research questions and for modifying the theory and the PAT model. First, what insight do the findings provide on the correspondence between the PAT model and the actual needs analysis processes and results? In all cases, the analysts adapted the PAT model and used it to guide the analysis process. The adaptations varied across cases, but common themes emerged. One theme was that the process was more iterative and less sequential than indicated in the model. Another theme was that the worksheets were helpful in guiding the project and that they need to include additional information about strategies for using and adapting the PAT model. Yet a third theme was to include 'Key Population' as an element in the model. The PAT model implementations in all cases produced the expected results according to assessments by the analysts and decision makers; however, they also produced unintended positive results. Therefore, the theory of the intervention that is articulated in the PAT model should be modified to reflect the findings. Modifications should also include highlighting the iterative nature of needs analysis, providing additional information on using and

adapting the PAT model, adding 'Key Population' as an element, and describing the unintended results that can occur.

Second, what insight do the findings provide on whether the characteristics of the organization, the decision-makers, and the analyst influenced the analysis of needs? The findings confirm that the interaction of the organization, the decision maker and the analyst characteristics do influence the needs analysis process and results. The interaction was as important as the characteristics. No element dominated. The findings also identified two important characteristics: the decision maker's support for the needs analysis and power to implement solutions.

Third, what insight do the findings provide for future practice and research? Based on the cross-case findings, the PAT model should be modified so practitioners can use it to better guide their needs analysis projects. Future research can provide insights to continue honing the model. Future research could address the limitations of this study by using different research methodologies, researchers, and organizations. Areas that deserve research include determining when it is most feasible to use the PAT model. Because the PAT model requires extensive investigation, information is needed on when an organization benefits by investing in a PAT model needs analysis rather than a traditional, linear model needs analysis, or in taking no action at all. From a broader perspective, research on needs analysis effects from different perspectives is needed. The cases for this study provided information about the short-term results of needs analysis when assessed by the analysts and decision makers. What are the long-term results when assessed using concrete organizational performance measures or external evaluators? Future research could also examine how the capacity that is built while implementing a needs assessment is used. For example, consensus building among employees was an important aspect of needs analysis in the cases that were studied. How can those who are involved capture the process or shared insights to produce additional results?

Conclusions

This study used evidence from five case study reports to obtain more compelling and robust insights about needs analysis. Systematic research on needs analysis can facilitate the continued improvement of needs analysis theory and practice with the ultimate goal of improving HRD and organizational effectiveness.

Large-Scale Training Needs Assessment of State Government Office Support Workers: A Case Study

Donna H. Redmann
Louisiana State University

This paper reports on a case study of a large-scale, state-wide training needs assessment of office support/clerical employees in Louisiana state government. To identify the felt training needs, 11,016 surveys were distributed in a single mailing resulting a return of 7,117 completed questionnaires, a 65 % response rate. The paper□s focus is on the methodology, survey instrument development and administration, and how the resulting data was tabulated and analyzed to provided useful reports for HRD.

Keywords: Office, Training, Assessment

Workplace demands for more competent and skilled employees have led to an increased need for training in both business/industry and state government. Numerous studies have been conducted that have assessed the training needs of, competencies required by, and tasks performed by office workers in business and industry. However, little has been done to examine the training needs of government office employees on a large scale (Alexander, 1996; Arney, 1998; Chalupa, 1997; Davis, 1991; Davis, 1992; Davis & Chaney, 1993; Marino, 1993; McEwen, 1997; Zhao, 1996).

Employees of the State of Louisiana are emerging from a long period during which little funding was available for employee training. A new state administration has recognized the strategic value of well-developed human resources. In 1997, the governor of Louisiana established work force development as one of the priorities for his administration. To achieve this objective, several groups were established: the Workforce Commission within the Governor□s office, a Task Force on Post-Secondary Technical and Adult Education, and the Occupational and Training Information System in the Louisiana State Department of Labor. The mission of the Occupational and Training Information Systems is to collect work force data for the Workforce Commission to use in setting priorities and funding decisions regarding training programs.

The first step required in any effective training intervention is a thorough and systematic assessment of workforce training needs. Successful needs assessments provide the basis for establishing the performance improvement value of subsequent training. Because of the highly varied nature of agencies and units in state government and the large volume of needs assessments that have to be conducted, Louisiana State University was contracted to assist in assessing and prioritizing training needs. During the initial funding period (the first six months), this needs assessment project consisted of two phases. Phase I was to identify the current training needs of approximately 12,000 incumbent office support/clerical employees in the state civil service system for all department and agencies throughout the entire state. Phase II was to develop a method for conducting needs assessment for all employees within a state department and to pilot this methodology with two departments (Holton, Bates, Redmann, Wilson, Naquin, & Burns 1997a,1997b, & 1997c.). The second period of funding (a two year period) is a continuation of Phase II which involves identifying the performance training needs of Louisiana state government employees for individual departments based on the methodology developed during the pilot study.

The focus of this paper will be on the large-scale training needs survey of state government office support/clerical workers that was conducted during Phase I of the initial funding period. The paper will cover the objectives of Phase I, the methodology employed to accommodate those objectives, including how the survey instrument was developed and administered, how the resulting data was tabulated and analyzed to provided useful reports for personnel managers. The paper will also explore the implication for Human Resources Development (HRD) training in government and business/industry. Only minimal emphasis will be placed on the actual findings of this large scale, state-wide survey.

Phase I Objectives

The objective of Phase I of the Louisiana State Needs Assessment Project was to conduct a needs assessment to identify current training needs for office support/clerical employees within the state civil service system. The specific objectives were to identify the felt training needs of office support/clerical employees: (1) for all office

Copyright © 1999 Donna H. Redmann

support/clerical employees, (2) by job clusters, (3) for each state department, and (4) for each agency within the departments.

Methodology

Instrumentation

As a first step in the design and implementation of a training needs assessment program, it is essential to properly appreciate and understand the scope of the problem that was to be addressed. To this end, a preliminary series of meetings was held between the Phase I Project Coordinator and various State officials that were identified by the Director of the Comprehensive Public Training Program (CPTP), Division of Administration. These meetings were instrumental in exposing the complexity of job titles, job descriptions, GS levels, and other intricacies of the State Civil Service System. Furthermore, they helped form a foundation upon which the task of identifying office worker classifications that should be surveyed for possible training needs. The overall process required an examination of specifications for office/clerical job titles associated with series 4000 registers (no typing test required of applicant) and with series 4002 registers (typing test required of applicant). Ultimately, 45 job titles were selected for the training needs assessment survey of office support/clerical employees. Based on job descriptions and GS levels, these 45 job titles selected were subsequently grouped into the following eight clusters: Accounting, Administrative, Office Management, Clerical, Secretarial, Transcription, Word Processor, and University Admission.

The next step involved identification of the appropriate content of the survey instrument. Focus groups were employed to determine important areas for inclusion in the training assessment study; a total of eleven focus group meetings were conducted These focus groups consisted of state office/clerical workers representing multiple state agencies and encompassing a wide range of job titles. As a result of the 11 focus group meetings, it was discovered that there was considerable commonality of identified training needs across the groups. Therefore, it was decided that a single questionnaire should be developed. Also, it was anticipated that having one questionnaire would reduce the complexity of managing the distribution, collection, and tabulation of multiple versions of the instrument across the various state government departments and groups of office workers.

Based on the information obtained from the focus groups, a draft of the questionnaire was developed. A panel of experts was employed to review the questionnaire for content and design. A field testing of the survey instrument was conducted with 16 office/clerical workers from the Department of Environmental Quality (DEQ), representing a wide range of job titles and various agencies within DEQ. The volunteers were asked to provide any suggestions or recommendations that would improve the instruments, to check the wording of the items, to make sure the directions were clear and understandable, and to keep track of their time in order to estimate how long it would take the typical respondent to complete the questionnaire. The average time to complete the survey instrument was 15 to 20 minutes.

The final draft of the survey instrument contained a total of 67 items covering nine training topic areas, 3 questions dealing with computer and related technology, space for writing open-ended recommendations and comments, and a section on demographics. The nine topic areas consisted of oral communication, written communication, files/filing, general skills, human skills, personnel issues, understanding general state procedures, understanding one□s own department/agency, and work management skills. For each of the 67 training topics listed, the respondents were asked to use the following scale to indicate how much their job performance would improve if they were to be provided training in the topic listed: 1 = None, 2 = A Little, 3 = Somewhat, 4 = A Lot, 5 = A Great Deal, and N = Not Applicable. The frequency response to this scale was employed in the ensuing statistical analysis to provide a ranking of the relative importance of the various training topics addressed.

In addition to the □pure□ training topics covered above, the survey instrument included a section on computer and related technology wherein respondents were asked to identify the version of listed software used in performing their job. Further, they were asked to indicate their training needs for basic computer literacy, mainframe, a wide range of application software (e.g. WordPerfect, Lotus, PowerPoint), electronic mail, and the Internet by using the following scale: 1 = Don□t need training, 2 = Completed basic training which was adequate, 3 = Need basic training, and 4 = Need more advanced training. The respondents were also asked if they would be interested in being trained to be an in-house resource person to help co-workers with computer software/hardware problems. Finally, in

the demographic section of the questionnaire, the respondents were asked to identify their job title from among the list of 45 job titles surveyed. Additional questions dealt with work location, number of years spent working for the Louisiana state government, the number of years in current position, and level of education.

To reduce overall respondent error rate and encoding errors, a Scantron sheet format was employed for the four-page survey instrument. The respondents were instructed to use a number two pencil to bubble in their responses. A side benefit of using a Scantron sheet format was that the respondents□ time to complete the questionnaire would be lessened somewhat, therefore, it was anticipated that they would spend less time away from their job and would be more likely to complete and return the survey.

To ensure anonymity, respondents were asked to identify their department, agency, and work location only. Upon receipt of the completed questionnaire, the CPTP staff assigned the appropriate organization I.D. number to a questionnaire I.D. code sheet. This Scantron I.D. code sheet was designed to accompany the questionnaire for the purpose of associating the individual questionnaires with the appropriate organizations.

Administration of the Survey Instrument

The staff at the CPTP distributed the questionnaires to contact persons (human resource director or related person) at 272 state agencies. These contact people then distributed the questionnaires to all their office support/clerical workers. The contact people were asked to return the completed questionnaires within 3 weeks. Due to a time limitation, a questionnaire follow-up was not conducted. Of the 11,016 questionnaires distributed statewide, a total of 7,117 completed questionnaires were received. The overall response rate for the State was 65%.

Analysis, Interpretation, and Format of Survey Results

For the eight job clusters representing the 45 job titles, statistical analysis software (the SAS System for Windows, Release 6.11) was employed to: (1) tabulate the scale response frequency for each questionnaire training topic; (2) rank order the 67 questionnaire training topics, based on an assigned score which is the percentage of the respondents that rated that item in either of the two categories of highest importance to job performance (□□Lot and A Great Deal); (3) generate frequency and percentages responses for basic and advanced computer training needs, for training as an in-house resource person, and for demographic information.

To recommend training for the 67 topics, the following criteria were used: If the ranked order score received was 60 % or higher, then there was a perceived Widespread Need for training related to that item; if the score was between 40% and 59.9%, then there was Selected Group Need; and if the score was below 40%, then there was Individual Employee Need for that training item. For example, a score of 66.3 indicates that 66.3 % of the respondents rated the item either as of A Great Deal or A Lot with regard to its importance relative to their job performance. Therefore, this training item would be identified as a widespread need for training.

For the basic and advanced computer training needs recommendations, the need basic training and the need more advance training response categories were reported separately in rank order with the highest need listed first. The demographic information for the global responses (all 7,117 responses) was reported by the eight job clusters and for the 272 individual agencies, the 45 job titles were used. For example, 24 job titles were reported for the Department of Revenue and Taxation; 17 for the Department of Public Safety Services.

Due to the comprehensiveness and large scale nature of this state-wide training needs assessment of office support/clerical employees, the survey findings were delivered to CPTP in the following formats:

1. Global responses, based on all 7,117 completed questionnaires received
2. Per job cluster, based on the eight different groups of job titles
3. For each of the 272 State organizations as identified by organizational I.D. number.

The information provided in the first two formats were for use by CPTP in planning statewide and/or multi-agencies training. The third format was provided to each of the 272 agencies/organizations with a guide/key for interpreting the results.

During the initial funding period (the first six months) two organizations, Department of Public Safety Services and Department of Revenue and Taxation, participated in Phase II where an in-depth performance-driven training needs assessment methodology was piloted (Holton et. al., 1997a & 1997b). The pilot study resulted in a multi-level, multi-dimensional strategic approach that employed both a top-down and a bottom-up strategy. The individual agency reports of the results from the office support/clerical employees survey from Phase I was one of the multiple data collection methods used in the Phase II agency in-depth training needs assessment pilot study.

Findings and Procedural Recommendations

Due to the sheer magnitude of this large scale needs assessment, the findings based on the above analysis will be highlighted in terms of the methodology.

Return Rate

A 65 % return rate (7,117 out of 11,016) is considered to be successful for a one-time mailing of the questionnaire with a 3 week turn-around. Several factors may have contributed to the high response rate. First, the 11 focus groups involved 93 office support employees representing the different job clusters and different governmental agencies. Since the members were asked to provide input in the development of the survey instrument, there was tremendous buy-in. These same employees may have helped to motivate their fellow workers in completing the questionnaire. Second, the instrument was designed to be read and completed easily and efficiently. By having the respondents bubble in their responses on the Scantron sheet format instrument, the actual time to complete the questionnaire was reduced. Third, the rationale section of the instruments was written to motivate the employees to complete the questionnaire by stating that they were being given the opportunity to express their perception of what type of training would help them in improving their job performance. Fourth, insuring anonymity may have also contributed to the return rate. Fifth, advance notice of the survey was sent to those individuals responsible for distributing the questionnaire at their agency.

Examining the return rate for the different job clusters, the largest number of global responses (all 7,117 respondents) were received from the largest cluster of office workers, the clerical group (2,700 questionnaires received). The highest global response rate by cluster was office management, 70.3 % (433 out 616) (See Table 1.). In comparison to the two pilot agencies, the Department of Revenue and Taxation and the Department of Public Safety, the highest number of responses were from job titles representing the administrative cluster. Variation from agency to agency is expected due to the individual mission of each organization.

Table 1
Questionnaire Response Rate by Job Clusters

Job Cluster	No. Sent	No. Received	Response Rate	No. of Job Titles
Accounting	326	182	55.8 %	1
Administrative	1,016	655	64.5 %	10
Clerical	4,274	2,700	63.2 %	8
Office Management	616	433	70.3 %	6
Secretarial	3,217	2,024	62.9 %	8
University Admission	99	46	46.5 %	2
Transcription	86	4	4.6 %	1
Word Processing	1,382	912	65.9 %	9
Missing Titles	161			
Total	11,016	7,117	64.6 %	45

Training Topics

Based on the ranking of assigned score for the 67 questionnaire items dealing with training topics from all 7,117 responses received, the respondents indicated that there were no topics that would have widespread need (a rank order score of 60 % or higher), but did indicate 20 training topics that had selected group need (a rank order score between 40 % and 59.9 %), and 47 training topics that had individual employee need (a rank order score below 40%). The 20 selected group training needs represents the following 7 topic areas: written communication, files/filing, general skills, human skills, personnel issues, understanding your department/agency, and work management skills. The 47 identified individual employee training needs represent all 9 training topic areas.

If statewide, multi-agency, and or individual agency training is to be offered to office support staff in similar job titles, then providers of performance improvement training activities may want to examine the survey findings per job clusters. The findings, from the 7,117 completed questionnaires, indicated that widespread training needs were identified for 5 of the 8 job clusters and these needs were grouped into the following 3 topic areas: human skills, personnel issues, and files/filing. Table 2 list the widespread and selected group training needs by topic areas for all respondents and for each job cluster. The human skills topic area was rated most frequently as a widespread training need. Stress management training, one of the 10 human skills training topics, was ranked first for 4 job clusters (accounting, clerical, university admission, and transcription) and fourth for office management. Oral communication appears to be the least needed training topic for the selected group needs. The identification of training topics by job cluster, as presented here, can also be useful to curriculum planners at vocational business and office training institutions.

Table 2

Widespread (W) and Selected (S) Group Training Needs Identified by All Respondents and by Job Clusters

Topic Area	All	Acc□t	Admin	Clerical	Office Mgmt	Secr	Univ Admis	Tran-script	W.P
Oral communication					S			S	
Written communication	S	S	S	S	S	S		W	S
Files/filing	S	S	S	S	S	S	S	S	S
General skills	S	S	S	S	S	S	S	S	S
Human skills	S	W-S	S	W-S	W-S	S	W-S	W-S	S
Personnel issues	S	S	S	S	W-S	S	S	W-S	S
Understand general state procedures			S		S		S	S	
Understanding one□s own agency	S	S		S	S			S	S
Work mgmt skills	S	S	S	S	S	S	S	S	

At the agency/organizational level, the recommendations for training may differ from the global findings as illustrated in Table 3. The table lists the top 5 items for all respondents, for the Department of Public Safety, and for the Department of Revenue and Taxation.The respondents from the Department of Revenue and Taxation indicated that there were 5 training topics that would have widespread need, 31 training topics that have selected group need, and 31 training topics that have individual employee need. For the Department of Public Safety, 5 training topics were identified as having widespread need, 17 topics as having selected group needs, and 45 as having individual employee need. The two training topics where there appears to be agreement on the rank order (within the top five rankings) are related to human skills: stress management and dealing with difficult people who are co-workers. The remaining top-ranked topics are related to personnel issues, understanding your department/agency, and work management skills. At the other end of the scale, there was agreement that oral communications skills training was required only at the individual employee need level. Overall, these findings would tend to indicate that there is not a strong need to provide the same training to all agencies throughout the State. Therefore, the agency level of rank ordering of employees felt needs for training should be given a higher priority than the global ratings when identifying the appropriate performance improvement intervention at the department/agency level.

Table 3

Rank Order of Selected Training Topics by Office Support Workers

Training Topic	Global	Public Safety &	Revenue Taxation
Stress management/stress relief.	1	2	3
General knowledge of Civil Service Rules.	2	34	1
Dealing with difficult people who are co-workers	3	3	5
Computerized filing systems	4	12	25
Dealing with difficult members of the public	5	34	21
Cross training to fill in for other employees in your department.	13	34	2
How to locate and retrieve information	16	1	8
How to handle multiple tasks.	18	4	4
Decision making skills	14	5	6

Software Usage

With regard to the type and version of software being used by the office support employees in their jobs, the two pilot departments appeared to agree in general with the global responses. When asked what type of computer training they need in order to perform their jobs more effectively, they indicated a need for basic training regarding the departmental mainframe and in some of the newer technology, such as the Internet and e-mail. All three groups of employees agreed on their perceived need for more advance-computer training on one application software, WordPerfect. The remaining 15 advanced computer training needs varied widely; therefore, computer training needs should be identified at the department/agency level. It is interesting to note that the survey revealed that many employees were still using DOS and original versions of Windows. Since these technologies are changing so rapidly and the fact that State government is committed to upgrading technologically, it is recommended that computer training needs be assessed more frequently.

In-House Trainers

To determine whether any of the office support workers would like to be trained as an in-house resource person helping co-workers with computer software/hardware problems, a question to this effect was included in the survey instrument. Almost forty percent (39.6%) of the 7,117 respondents indicated they would like to receive this type of training. Over a third (38.6 %) of the respondents were not interested and 21.8 % responded in the negative because there was someone already trained in their department to serve in that capacity At the departmental level, over half

(50.5 %) of the Department of Public Safety and 28 % of the Department of Revenue and Taxation respondents expressed an interest becoming an in-house resource person.

Implications

The approach utilized and the unique problems encountered in this case study of an unusually large- scale need assessment of office workers may be useful to other organizations in their move to performance driven human resource development. Examples of the unique problems associated with this state government needs assessment were:

- ALL employees throughout the entire state were to be given the opportunity for input.
- 45 different job titles and civil service job descriptions were to be included.
- The reading levels of the office support staff had to be considered.
- Political implications, e.g., all state government departments though out the entire state had to be included in the study.
- This state-wide needs assessment had to be conducted within a six month period.

Effective performance related need-assessments should to be linked to multi-dimensional strategies that include both top-down and bottom-up approaches to collecting information. The wide-scale survey used in this case study did offer an efficient means for surveying an extremely large number of employees in a short period of time. According to Holton (1995), large-scale □felt needs□ training assessment can be effective at boosting morale, but may have minimal success in improving performance. Therefore, the results from a large-scale felt needs survey should not be the only source used for identifying performance improvement training.

Results Assessment System: From Evaluation to Assessment

Richard A. Swanson
University of Minnesota

Elwood F. Holton III
Louisiana State University

Critics and scholars note that the HRD profession is stuck on a 4-level evaluation model that still doesn't work after 30 years. Practitioners know about the importance of evaluation and, yet, are not evaluating the results of their efforts. As an alternative, the Results Assessment System is firmly grounded in Human Resource Development theory and research. This paper describes the system and critiques it from the perspectives of credibility and practicality.

Keywords: Evaluation, Assessment, Results

Human Resource Development (HRD) professionals achieve results in organizations by developing or unleashing expertise in individuals for the purpose of improving performance-- at the organizational, work process, work group, and/or individual levels. The *Results Assessment System* allows researchers and practitioners assess those results (Swanson & Holton, 1999). More specifically, it directs the assessment of performance, learning, and perception results from HRD interventions and other development efforts sponsored by leaders, managers, and workgroups.

Assessment Problem

Critics and scholars note that the HRD profession is stuck on a 4-level evaluation model that still doesn't work after 30 years. Practitioners know about the importance of evaluation and, yet, are not assessing the results of their efforts (Swanson & Holton, 1999)

HRD has not been a serious performance partner in most organizations, and thirty years of the 4-level evaluation model has done very little to change this condition. This condition leaves top managers and clients typically asking for nothing more than participant reaction evaluations-- 'smile sheets' that do not correlate with either learning or performance. When top managers finally decide to do a serious assessment, it is usually in response to a crisis or to their own judgement that "things have gone awry," and invariably comes too late.

Background

Go to any bookshelf of management or organizational books and look up the word "evaluation" in the index. How often do you think the word is mentioned? We can't find it. Yet, members of the HRD profession consistently talk about evaluation while rarely practicing it in the field. What is going on here? One clue is in the terms found in the indexes of most business books-- words like performance, assessment, and measurement. In contrast, evaluation professionals tend to be consultants who study educational and government programs rather than focus on core organizational performance and processes. We have come to realize that the word "evaluation" evokes a negative schoolhouse picture and the idea of assigning grades to ill-defined activities.

In contrast, the *Results Assessment System* is about assessing results, which is different than evaluation. *Assessment* of results is a core organizational process. In contrast, surveys of evaluation practices in HRD clearly show that HRD practitioners view evaluation as optional (Bassi, et. al., 1996). The well-known 4-level evaluation model (Kirkpatrick, 1994) has failed the profession for a number of reasons (Alliger, et. al., 1989 & 1997; Bassi, et.al.1996a & 1996b; Dixon, 1990; Holton, 1996; Newstrom, 1996; Swanson, 1997). A key failure is its emphasis on "reactions" versus the fundamental performance results of the host organization.

Readers will feel initial comfort with the *Results Assessment System* relative to the familiar *4-Level Evaluation Model*. At first glance they are not radically different from one another. A second glance reveals fundamental, substantial differences in (1) their evaluation and assessment priorities and (2) the completeness of the practical research-based process and tools offered in the *Results Assessment System*.

Copyright © 1999 Richard A. Swanson and Elwood F. Holton III

Purpose of the Paper

The purpose of this paper is to overview the *Results Assessment System* and to critique it in terms of its credibility and practicality in assessing results from human resource development efforts. The *Results Assessment System* claims that it can be applied to any HRD program in any organization.

Overview of the Results Assessment System

One of the reported strengths of the *Results Assessment System* is that it is an integrated system that is firmly grounded in Human Resource Development (HRD) theory and research. The purpose of this section is to provide an overview of the system, and frame it in the larger HRD development and improvement process. These core concepts provide the foundation for each chapter that follows.

Human Resource Development Process

The process of change and improvement within organizations, work processes, and individuals is fairly universal. While each specialization may have its own vocabulary and variations, the core process does not change much. Human resource development can be characterized as having the five phases (Figure 1).

Almost all of the models of HRD or organizational performance change contain a final phase in which outcomes are assessed. Unfortunately, the final phase is the one most often ignored. It is the final phase upon which this paper focuses.

Figure 1: The Human Resource Development Process

Phase	Description
1-Analyze	*Determine performance requirements and their relationships to HRD interventions.*
2-Propose	*Design strategies and propose appropriate interventions.*
3-Create	*Create intervention components-e.g., design, logistics, program, materials, etc.*
4-Implement	*Implement the intervention-e.g., organization development and/or training.*
5-Assess	*Determine if desired results have been achieved.*

It is also critical to recognize that HRD professionals work their HRD process in context of a host organization. This is illustrated through a 'world view' model of HRD in which the five-phase HRD process is laid in the organization and parallels other organizational processes.

This systems world-view model has value for clarifying the important role of results assessment in HRD. HRD is a means to achieve some larger result in an organization. It is for this reason that results assessment is not optional, for it is the results that impact the organization, and ultimately provide outputs desired by customers. For HRD to be a core organizational process, it then follows that results must be assessed. This model also has utility in keeping the big issues surrounding results assessment in perspective in that the world does not begin and end with HRD.

Familiar models of improvement, change, and development are variations of this core development model. For example, Lewin's organization development model (unfreeze, move and refreeze) is an elementary view of the journey of change with assessment driving the process. It is fun to think of this and related HRD processes from both the individual perspective and the total organizational perspective of moving from and existing place to a new place. Almost all of the HRD models are variations of the core five-phase HRD process and call for assessment of results.

Results Assessment System Components

Results assessment reflects the last phase of the five-phase HRD process. Results assessment can be defined *as determining if desired outputs have been achieved by the HRD interventions.* This book presents a system for assessing results from HRD interventions, called the *Results Assessment System.* The system has four basic components: a *process*, result *domains*, a *plan*, and *tools*. As shown in Figure 2, the process describes the general steps necessary to conduct a results assessment in an organization. It is described in more detail below. Domains define the possible range of results that can be assessed. The plan identifies all the key decisions that must be made to design a results assessment. The tools provide the means to actually measure results.

Figure 2 - Components of the Results Assessment System

PROCESS	What are the general steps necessary to conduct a results assessment in an organization?
DOMAINS	What domains of outcomes should be assessed within HRD?
PLAN	What are the key decisions that must be made to design a results assessment, including outcome domains to assess?
TOOLS	How are results measured?

Results Assessment Process

The core process of the *Results Assessment System* is illustrated in Figure 3. This five-step process view of assessing results provides a simple and direct journey from analysis inputs to decision outputs.

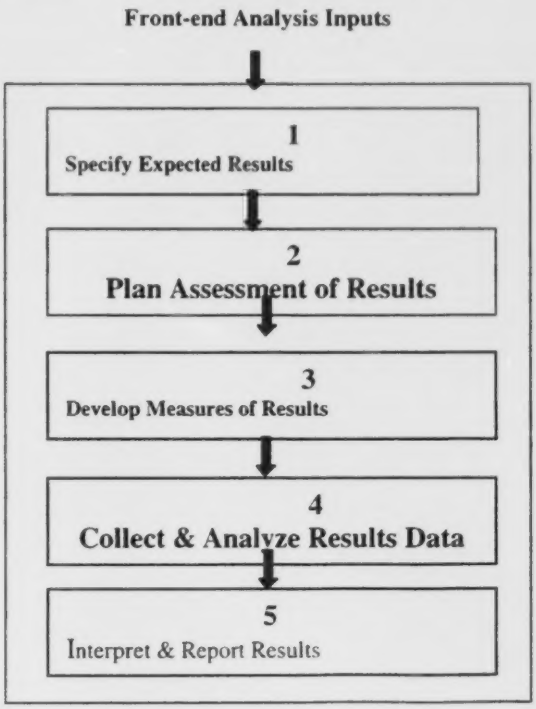

Figure 3

Results Assessment Process

Decision Outputs

Several aspects of this process are worth noting here:

1. To be most effective, results assessment requires strong front-end analysis. It is hard to assess outcomes if the goals are not well defined.
2. This process has an action orientation in that the final outcome is presumed to be decisions about HRD interventions and actions taken to maintain, change or eliminate programs. The purpose is not research.
3. The five steps present a simple and logical progression of activities essential to effective results assessment.

Considerable emphasis is placed on defining expected results and properly interpreting them, in addition to the issues of developing good measures.

Results Domains

The *Results Assessment System* is capable of measuring results within three domains: *performance*, *learning*, and *perceptions*. Each domain has two options within it. These domains and options within *the Results Assessment System* are specified below.

Performance Results are defined as:

System: The units of mission-related outputs in the form of goods or services having value to the customer and that are related to the core organizational, work processes, group/individual contributors in the organization.

Financial: the conversion of the output units of goods or services attributable to the intervention into *money and financial interpretation.*

The assessment of system, mission-related outputs are bottom-line talk. Things like 50,000 cars made; the patient lived, or 5,000 service contracts sold. Those pursuing improvements in an organization face a key dilemma--mission-related outputs. While the focal point is the output goal, the means or driver of that goal may look very different. A simple analogy would be a sporting event in which the goal is to win by getting the ball through the hoop more times than the opponent-- scoring points.

While scoring points and enough to beat the opponent is the mission-related output, there are a wide variety of development actions-- *performance drivers*-- that could be pursued by the coach, assistant coaches, the team owner, the offensive players or strategy, the defensive players or strategy, and/or individual players. Connecting the performance drivers to the system outputs of performance is critical to truly understand performance results.

Without front-end analysis, decision-makers in complex organizations will often implement simple-minded and/or invalid performance drivers that have no real connection to the system performance goals. The book "Witch Doctor's: Making Sense of Management Gurus," by Micklewait and Woolridge (1996), is an extended analysis of the false promises made by well meaning people about their "special brews" *(performance drivers)* without any substantial evidence of their connection to the system outputs *(performance outcomes)*.

Learning Results are defined as:

Knowledge: Mental achievement acquired through study and experience.

Expertise: Human behaviors, having effective results and optimal efficiency, acquired through study and experience within a specialized domain.

Knowledge, an intellectual or cognitive result of learning experiences, is the basic learning result. It is lodged in a person's mind. Measures of knowledge confirm the level of knowledge held by individuals within a particular subject area. In terms of being both effective and efficient, paper and pencil tests are the primary means of measuring knowledge.

Human expertise is the second category of learning -- the more complex learning result category. People with expertise have knowledge and are able to act upon that knowledge. The effective and efficient ability to act upon knowledge generally comes from experience beyond core knowledge. Measuring human expertise requires that an individual demonstrate their behavior in a real setting or a simulated setting. When assessing learning

results, we generally recommend that both knowledge results and expertise results be measured. And, it is logical that knowledge can be measured some time before expertise in that the learner needs time to gain experience. The span of time will vary depending on the complexity of the area of expertise being developed.

Perception Results are defined as:

Participant Perceptions: Perceptions of people with first-hand experience with systems, processes, goods or services.

Stakeholder Perceptions: Perceptions of leaders of systems or people with a vested interest in the desired results and the means of achieving them.

Of the three domains, perceptions have the lowest cost and lowest return. It is lowest in terms of cost in the sense that simple, short, and standardized perceptions rating forms can be produced for participants and stakeholders. It is lowest in terms of return because it provides the least valid information about performance outcomes.

Perception results are perceptual states held by human beings that you are concerned about. Measures of perceptions systematically access this information from selected groups of people. The mantra for perception results domain should be (1) get the data, (2) do not spend a disproportionate amount of resources to get it, and (3) do not over-interpret it. It is recommended that you get this data only as long as it is not used as a substitute for measuring learning results and/or performance results. For example, people self-reporting that they have learned something is not a measure of what they learned. It is also recommend that perception results data from both the participants and the stakeholders be obtained.

Critique of the Results Assessment System

Many times, results assessments that are practical turn out not to be credible (and vice-versa). The challenge is to plan an assessment that is *both* credible and practical. This section discusses the credibility and practicality of the *Results Assessment System* from the perspectives of researcher and practitioner.

Credibility can be thought of as the power to elicit belief. For HRD the *belief* in the Results Assessment System process and outcomes must be elicited from both assessment experts and organizational practitioners. Practicality can be thought of the ability to be used. For HRD the *usefulness* of the Results Assessment System process and outcomes must be elicited from both assessment experts and organizational practitioners. The Results Assessment System purposefully addresses the difficult issues of gaining credibility and practicality approval from both camps.

Framing the System

Big-picture credibility of the Results Assessment System is framed by a four component assessment system (see figure 2) and the positioning of assessment as a 5-step process (see figure 3) that details the last phase of the 5-phase human resource development process. While the presentation of the conceptual integrity of this framework is lean and will likely be criticized by assessment experts, we estimate that it will withstand their criticism. It is important to note that their intellectual reach is from in-depth assessment expertise. With little knowledge of assessment, the critical lens of the practitioners will most likely concern itself with *face validity* and *simplicity*. Practitioners that do not view their work from a process orientation will either have a new realization about the systems nature of their work or experience consternation when they consider the *Results Assessment System*. The popular options for practitioner's are Phillip's overwhelming 18-phase model (1983) and Kirkpatrick's shallow 4-level model (1998).

Consistency and Accuracy

Measures have to possess two key characteristics to be of value: they must be *accurate* and *consistent*. Measurement experts call these two concepts validity and reliability. Measures are said to be accurate if they measure what they are supposed to measure. For example, self-reported measures of performance on the job tend to not be very accurate because people tend to overrate themselves. A consistent measure is one that yields the same results every time it is used. A measure can be very consistent but not valid (measure inaccurately or the wrong thing). For example: a person may be quite consistent in his or her performance rating, but not very accurate.

Measures used to assess performance, learning, and perceptual results need to be both reliable and valid to be of any value. Both reliability and validity are dealt with in the Results Assessment System. In contrast, Kirkpatrick's latest book does not deal with either issue (1998). Neither reliability nor validity are even in his table of contents let alone dealt with dealt with in the text. This is one of the several fatal flaws in the Kirkpatrick model of evaluation. Evaluation practices that do not consider reliability and validity are irresponsible and reckless.

Measurement experts talk about reliability as a pre-condition to actual validity. There are general rules for building in reliability and statistical means of checking it out. The *Results Assessment System* informs readers how to build in reliability and provides minimal guidance as to how to statistically calculate reliability. The guidance in building in reliability should satisfy the critical eyes of both assessment experts and practitioners. As for the statistics, the system defers to the use of standard data analysis programs and this slim presentation will not likely satisfy assessment experts.

Measurement experts talk about three common types of accuracy (or validity). The minimum and most important requirement is that the content of your measure matches the content of what you are trying to measure (content validity). For example, for a performance-rating instrument, the items on the instrument must minimally match what is really required to do the job. This is usually established by subject matter experts and is done logically, not statistically. The *Results Assessment System* provides simple and direct guidance in this realm to gain support from both assessment experts and practitioners.

A higher-level accuracy check is to ask whether the measure really predicts the dependent variable that it is supposed to predict (criterion validity). Thus, we would expect a performance-rating instrument to be able to predict, or distinguish, high performers from low performers. If we find that high performers in an organization have widely varying scores on the performance-rating instrument, then it would not have good criterion validity. An instrument could have accurate content (appear to have the right content) but not be a good predictor, probably because important things were left off the instrument. Again, the *Results Assessment System* informs readers how to establish such validity and provides minimal guidance as to how to statistically determine it. The system them again defers to the use of standard data analysis programs that will not fully satisfy readers who are assessment experts.

Planning Practical Assessments

It is actually easy to plan an assessment that is expensive, difficult to use, and is ultimately not executed and/or utilized. There are so many rival ideas about evaluation and measurement that it can very quickly become confusing. In fact, the primary reason for the six-option results menu of the *Results Assessment System* is to reduce the overwhelming number of options that experts in measurement and evaluation put before us. This framing of the options to six makes assessment work manageable from the very beginning. Creating an endless assessment options list causes confusion that almost immediately threatens the principles of practicality and credibility.

Many professional evaluators forget that the job is not evaluation, but that job of measurement and assessment to be help in getting something more fundamental done—producing results. Having too many options partially explains why many newcomers to measurement say that "it costs too much" or "it takes too much time" and why simple, inadequate schemes are attractive and usually selected by them. The 1-page *Results Assessment Plan* of the *Results Assessment System* chapter guides the basic decisions that will help researchers and practitioners build a measurement system to meet their desired ends. This critical tool, as much as any in the *Results Assessment System*, is pivotal in getting the in reining in both scholars and practitioners through the thinking and doing aspects of assessment. This important tool will contain assessment experts and be a stretch for practitioners.

Use of Existing Measurement Systems

Typically HRD professionals begin an intervention assuming that everything they need has to be created from scratch. According to the *Results Assessment System*, the truth is exactly the opposite, particularly in the performance domain.

The *Results Assessment System* works under the assumption that if the intervention is targeted at real performance-related needs that are important, the chances are very good that someone in the organization is already measuring it. The closer assessment systems are to established organizational measurement systems, the more likely they are to last. This practical feature of the system should be received positively by both assessment experts and practitioners.

Degree of Accuracy Required

According to the *Results Assessment System*, the purpose of results assessment is to enable the organization to make sound decisions about interventions. The level of accuracy needed for organizational decisions is considerably less than that needed for research. The task is to find the "sweet spot" on the accuracy continuum so as to buy enough accuracy to slightly exceed management expectations needed to earn maximum credibility. If you buy more accuracy than that, you are wasting resources.

For example, consider an organization development program that is likely to return the typical financial return of 800% in a year or less (Swanson, 1998). Will it really matter to management if your measure is off by 50 percentage points, that is, you report 750% or 800%? Will you make any better decision about the program if you knew the return was actually 800%? If the answer is yes, then pay for that degree of accuracy. If the answer is no, accept less. Often, giving up a modest amount of accuracy will save considerable resources.

This concept of degree of accuracy will be discomforting to both assessment experts wanting "accuracy" and practitioners fearing "mistakes." In both cases, experience will likely be the mediator.

Results Versus Formative Measures

Evaluation professionals may assess inputs, processes, or outputs. For example, evaluators conduct formative evaluations during program pilot tests to assess effectiveness of a revised work process. While this is very valuable, the point is that evaluation models allow evaluators to skip measuring results! In fact, a popular 4-level evaluation scheme in clearly gives permission to practitioners to not measure results (Kirkpatrick, 1998).

To the organizations in which development is embedded, it is results that are paramount. All of the learning process and in-process perception measures are important, but are only important to organizations if they are *combined* with result measures. Thus, the *Results Assessment System* does not incorporate more formative measures because they are well handled elsewhere, not because they are not valued. Both assessment experts and practitioners should value the system's focus on the commonly overlooked domain of results.

Conclusions

The *Results Assessment System* is a fully developed assessment system for the Human Resource Development profession. It provides a theoretically sound alternative to the atheoretical tools and models that presently dominate professional practice. While the *Results Assessment System* is essentially a guide for practitioners, it holds promise as a useful research tool.

Examination of Critical Issues for Development and Implementation of Online Instruction

Scott D. Johnson
Nilda Palma-Rivas
Chanidprapa Suriya
Steve Downey

University of Illinois at Urbana-Champaign

This descriptive and exploratory study examined several critical issues affecting the development and implementation of online instructional programs. The intent of the study was to (a) help online program instructors, administrators, instructional designers, and technology developers understand the unique challenges and opportunities presented by online instruction; and (b) expand the base of knowledge regarding this new form of instructional delivery. The study has direct implications for online program development in HRD.

Keywords: Distance Learning, Online Instruction, Instructional Design

A primary goal of university level Human Resource Development (HRD) programs is to prepare professionals for leadership roles in HRD. HRD units in corporate America are responsible for employee training and professional development, with billions of dollars spent each year on education and training services. The importance of HRD has heightened in recent years due to technological advances in the workplace, concerns about the quality of education possessed by entry level employees, and the change toward more participatory organization structures and management practices. Efficient and effective training and development of the workforce is critical for helping corporations of all sizes adapt to change and remain competitive. Consequently, demand is high for well-trained HRD professionals who can effectively manage a wide variety of HRD roles and functions.

As the importance of private sector training continues to grow, a parallel growth in the need for professional development opportunities is evident. While most university HRD programs offer master and doctoral degrees in HRD through on-campus programs and traditional off-campus delivery means (e.g., distance education using television or audiographic systems), there is an increasing need to reach prospective students who are unable to commute to campus or participate in traditional remote offerings. To better serve the large numbers of working HRD professionals who desire professional development and advanced degrees, graduate programs are starting to create Internet-based courses that reach the widely distributed off-campus audiences not being served through traditional delivery methods.

Numerous issues must be addressed when developing and implementing online instructional programs. Some of these issues include factors that directly affect learner performance such as the knowledge and skills one brings to the instructional environment and the technologies used to deliver and support the instruction (Rothwell & Kazanas, 1998). Other issues of equal importance are the need to develop faculty skills in instructional design and technology use (Threlkeld & Brzoska, 1994; Willis, 1994), providing instructional technology training for the students who enroll in online programs (Willis, 1993), and establishing a technical support system to address the needs of both the instructors and the students (Willis, 1993, 1994).

Problem Statement

Although online instruction is gaining prominence in the delivery of advanced HRD degrees, little theoretical or empirical research has examined the critical issues affecting the development and implementation of online HRD graduate programs. To address this need, a descriptive and exploratory study of an online HRD Master degree program at a large Midwestern university was conducted in 1998. The purpose of this study was to (a) help online program instructors, administrators, instructional designers, and technology developers understand the unique challenges and opportunities presented by online instruction; and (b) expand the body of knowledge regarding this new form of instructional delivery.

Research Questions

The following questions guided this examination of critical issues for online instructional development and implementation:

1. What technologies are used for online instruction?
2. What technical knowledge and skills are needed by students, instructors, and program developers to successfully participate in online programs?
3. What training is needed by students and instructors before and during their participation in online programs?
4. What are the technical support needs and requirements of online programs?

Review of Literature

Rapid developments in information technology have made possible a new method of distance education called *online instruction*. Online instruction can be defined as an innovative type of instruction that is delivered to remote audiences over the Internet (Khan, 1997). The Internet provides an opportunity to develop new learning experiences that were not possible previously (Alexander, 1995). One of the advantages of online instruction is that information/content can be delivered to any computer that has access to the Internet, anywhere and at any time. Harasim (1989) argues that online education is more than a new delivery mode. It is a learning domain that enables learners to engage in learning interactions more easily, more often, and perhaps more effectively, but also results in qualitatively new and different forms of educational interactions (p. 62). Even though online instruction is being rapidly adopted by many educational institutions and businesses to deliver instruction (ASTD, 1997), little is known about the critical issues that affect the development and implementation of online graduate programs. From the program developers perspective, a new understanding of these issues is critical for the development and implementation of quality online instruction.

One important area of online development and implementation neglected by research is the degree of technical knowledge, skills, resources, and support needed by students, instructors, and program developers. Even though technology is becoming very popular, the use of computers for instructional purposes is still not widespread and the lack of knowledge and skills in relation to hardware and software issues can create much frustration (Hill, 1997). The lack of knowledge and skills for online participation and development leads to the need for training. In this respect, the training of students and instructors has received some attention from researchers. Instructors must be trained, not only to use the technologies, but also to apply the technologies to their instruction (Franklin, Yoakam, & Warren, 1996). Also, because technologies must be updated to capitalize on new capabilities, skills must also be systematically updated to maintain the user's ability to employ the evolving technologies. Franklin, Yoakan, and Warren (1996) conclude that instructor development and training contributes more to an online system's success than any other factor. Beyond the instructors, the program developers and technical support staff also need to be well trained because the quality of an online program depends greatly on the expertise of the development team.

Methodology

This descriptive and exploratory study examined critical issues affecting the development and implementation of an online HRD masters degree program offered by a large Midwestern university. Started in June, 1998, the online program consists of a series of eight courses in human resource development and is being taught to a geographically dispersed cohort. The online graduate program was designed for individuals currently working in, or aspiring to, positions in human resource development.

Program Participants

A total of 23 individuals, mainly HRD professionals from corporations in the Chicago area, comprised the student body for this online cohort program. Though most students were from the Chicago area, one resided in Connecticut and a second was based in Georgia. Most students had considerable work experience in human resource development, with an average of over 4 years HRD-related employment. The participants had strong educational

backgrounds with some of them pursuing their second masters degree. Demographically, the students were a very diverse group (i.e., 17 females/6 males; 5 minority students; age range from 25 to 50).

Data Collection and Analysis

A multi-method approach was used to identify issues affecting the development and implementation of online instruction. Data were gathered in this study using a wide range of methods including in-depth interviews, surveys, observations, and document analysis. Specific data sources included personal notes from participants, minutes and notes from project team meetings, and electronic data records (e.g., e-mail messages, WebBoard archives, IRC Chat logs, and synchronous activity logs).

Technology resource analysis. An examination of the technology resources required by online students featured analysis of hardware, software, and support systems necessary for participation in the program. The analysis of this area included a comprehensive "environmental scanning," a canvassing of comparative software reviews conducted by independent organizations, an inspection of computer system requirements for the software chosen for the online program, and testing of various hardware configurations to assess respective performance levels.

Technical knowledge and skill requirements. One goal of this study was to determine the technical knowledge and skills needed by instructors, program developers, and students who are involved with online instructional programs. To identify the technical knowledge and skills required by online instructors and program developers, two different methods were used: "environmental scanning" and in-depth open-ended interviews with key informants. Online programs identified through the environmental scanning were analyzed from a variety of perspectives, including the type of technology and communication tools used, instructional design approaches, synchronous and asynchronous activities, and course web design and navigation interfaces. Data regarding the knowledge and skills needed by instructors and program developers were supplemented with data obtained from open-ended interviews conducted with program participants, instructors, and developers.

Two methods were used to determine students' needs: observations and open-ended interviews. Three beta testers were observed while they navigated the course web site, completed exercises, and participated in synchronous and asynchronous activities. A checklist guided the observation process. This observation instrument was developed based on an in-depth analysis of the class web site and a list of tasks and procedures students would follow to participate in the online class. Once the beta testers finished reviewing the online course, they were interviewed to assess various aspects of their experience. Data from the observations and open-ended interviews revealed the knowledge and skills needed to successfully perform in the online program.

Training needs analysis. Structured surveys and document analysis were used to identify the training needs of students. The structured survey was used as a diagnostic tool that was completed by students prior to the start of the online class. Data from the structured survey of student training needs were analyzed using common statistical analysis. Documents collected during the program delivery were analyzed using a document analysis form. The researchers coded the related documents by relevant topic and different training needs. Observations and open-ended interviews were used to identify the training needs of the instructors. Specifically, the "participant as observer" approach was used (Creswell, 1994). Data revealing the training needs of instructors prior to and during the online delivery were obtained from observation notes kept by the researchers.

Technical support analysis. Strongly related to the analysis of technology resources is the technical support provided by the program. The difference in these variables, however, lies in the depth of analysis being conducted. During this phase of the study, the focus was on the forms of support services provided by the online program, how they were used by the stakeholders (e.g., toll free phone support, chat spaces, e-mail, Instant Messenger, personal visits, etc.), and the nature of the problems encountered (e.g., types of problems and their solutions). These data were in the form of descriptive narratives, frequency counts, recurring theme/category depictions, and frequency of occurrence mapping.

Results and Discussion

The results of this study are summarized in four sections that address critical issues for the development and implementation of online instructional programs. The issues deemed most critical include the technology resources used in online programs, the knowledge and skills needed to participate in online programs, training issues that need to be addressed by program developers, and the type of technical support that should be provided. Collectively, the following information can guide the development and implementation of online instructional programs.

Technology Resources Used in Online Programs

Appropriate technologies must be selected in order to achieve full and effective participation by online students and instructors. Based on a combination of (a) environmental scanning, (b) canvassing of software reviews, and (c) hardware requirement inspections and configuration tests, the following analysis identifies key technologies that support online program development and utilization.

A comprehensive analysis of online programs implemented by universities located in the United States and abroad was conducted. An analysis of over 150 online instructional programs and courses was carried out to identify common practices for course design and technology utilization. Based on this review, several conclusions can be made:

1. Email and web-based technologies form the core of most online courses.
2. Few online programs currently utilize audio and video conferencing technologies.
3. Few online programs use proprietary technologies in the delivery of their courses.
4. Most sites use technologies that conform to open industry standards (i.e., W3C standards).
5. On the minority of sites that utilized them, a blend of multimedia technologies were employed, such as streamed video clips and a modicum of animation and applets.

Once the basic technologies were identified from the environmental scanning, an analysis of independent software was conducted to determine the best software for utilizing these technologies. Based on that analysis, it was possible to conclude that the most applicable software for future online programs are:

- Eudora Pro 4.0 (e-mail)
- RealPlayer 5.0 (multimedia)
- Netscape 3.x or Internet Explorer 4.x (web browser)
- AOL Instant Messenger 2.0(paging/messenging)
- Winsock FTP LE 95 (file transfer)
- Microsoft Office 97 (production)
- Acrobat Reader 3.0 (document sharing)

To further identify technology resources appropriate for online programs, technology reviews in online and paper-based industry publications were examined. Several trends from these reviews were apparent:

1. With little surprise, industry standard software, such as Microsoft Office and Netscape's Communicator, are viewed as the best, or near the best, in their respective categories.
2. Cross-platform availability, reliability, cost, ease of use, and customizability are central factors common to most technology review/selections.
3. Compliance with accepted industry standards, accessibility support, and advanced features are occasional factors in the reviews.

Hardware configuration requirements. To ensure that students use computer systems capable of supporting the technologies selected for use with online programs, all technologies listed above were reviewed for hardware specification requirements. These requirements were developed based on tests using multiple hardware configurations to measure performance levels and to develop final recommendations and requirements. The minimum and recommended specifications for a Windows-based system are shown in Table 1.

Table 1
Minimum and Recommended Systems for Participation in Online Programs

Minimum Configuration	Recommended Configuration
• 486process running at 100 MHz	• Pentium 166 MHz Processor (or faster)
• 16MB RAM	• 32MB RAM
• 200MB available disk storage*	• 200MB available disk storage*
• 14.4 modem	• 28.8 modem
• 16-bit sound system	• 32-bit sound system
• 4x CD-ROM	• 12x CD-ROM

Note. * Storage space estimates the amount of space required to store all of the applications (Microsoft Office, etc.) and the work/data files generated by the students during the course of the program.

Technical Knowledge and Skills Needed to Participate in Online Instruction

Building on the technologies identified for online instruction, key informants, instructors, and program developers were interviewed to determine the knowledge and skills required to use the selected technologies to support their role as instructor, program developer, or learner. Also, three beta testers were observed and interviewed. Results are presented below in two parts: (a) the knowledge and skills required to develop and conduct online instruction and (b) the knowledge and skills required to participate in online programs.

Knowledge and skills required by developers and instructors. The development of online instruction requires that both the instructors and the program developers know basic operation of word processing and presentation software, multiple web browsers, and HTML editors. In addition, program developers need advanced knowledge and skills for creating multimedia files, to transfer files from development machines to servers and, for some online programs, the ability to design database systems using software such as ColdFusion or Microsoft Access. For synchronous activities, developers and instructors also need to be able to broadcast and archive live audio and use text chat to interact with students. Additional skills include the management of e-mail and threaded discussion group software as well as chat functions. Possessing the knowledge and skills needed to implement these functions are very important for program development, management, monitoring, and troubleshooting. Table 2 provides a summary of the specific knowledge and skills required by instructors and program developers, by phase and by application.

Knowledge and skills required to participate in online programs. Data from observations and open-ended interviews conducted with the three beta testers revealed that to fully participate in an online instructional program, including both synchronous and asynchronous sessions, students should have basic skills in using web browsers, threaded discussion groups, and e-mail applications. Table 3 presents a summary of the specific knowledge and skills needed to effectively participate in online delivery.

Training Needs of Online Students and Instructors

The following description of training needs of students and instructors was derived from data collected through use of a structured survey, interviews, and electronic data archives. In addition, numerous experiences were gained through the development and implementation of an online degree program in HRD over the past year. The following section identifies the training needed by both the students and the instructors of online programs.

Training needed by students. An analysis of the online students' technology resources and capabilities was conducted to determine if the students in the program had adequate computer resources and the skills needed to participate in online instruction. Based on this analysis, technology training was clearly the type of training most needed by the majority of the students. For example, most of the students did not have the skills necessary to download software from the Internet or use a Web Browser to conduct searches or install plug-ins to play multimedia files. Specifically, training was needed in advanced uses of web browsers and use of communication tools such as e-mail and WebBoard. In addition to providing training on the use of the new technologies for online instruction, the students needed to be trained to install software and troubleshoot problems when they occurred.

The necessary technology training was provided in several forms First, an orientation session was designed and implemented during the first class session. Computer applications and tools used for the online instruction were presented and explained in order to familiarize the students with the technology. Second, before the beginning of the course, the students were required to complete an orientation assignment located on the course web site. The assignment included tasks that helped the students gain the necessary skills needed to participate in the online class, such as sending e-mail attachments, posting messages in WebBoard, and listening to audio files. The third form of technology training involved hands-on practice with the specific technologies to be used by the students. Step-by-step explanations were integrated into the instruction early in the course and students were encouraged to practice using the new technology.

Technology training was perceived as a way to avoid frustration, wasted time, and potential dropouts. Technology training was also perceived as a critical event to be accomplished before presenting actual course content. Training is critical because the online students want to be confident in using technology before they engage in the learning the content. The students perceive technology training as a way to be better prepared to learn the content.

Training needed by instructors. The instructors and teaching assistants involved with the first two online courses in the program were asked to identify the type of training they needed prior to and during their participation in the online program. Different types of training needs were identified prior to the start of the online program, including (a) orientation training, (b) communication-skills training, and (c) technology usage training. The

instructors indicated that if a good orientation training program was offered prior to the start of the online program, training during the courses would not be as necessary unless there are changes or updates in the technologies being used.

Table 2
Technology Knowledge and Skills Required by Program Developers and Instructors

Software Function	Software Applications	Specific Knowledge and Skill Requirements	
		Program Developers	Instructors
Document Creation	Word Processing	Create and format documents using tables and borders. Convert documents to HTML file	Create and format documents using tables and borders Convert documents to HTML file
	Presentation Software	Create instructor presentations, use templates, add clip art, print, and record narrations. Create presentations for use on the Internet	Create instructor presentations, use templates, add clip art, print, and record narrations. Create presentations for use on the Internet
WWW Access	Web Browser	View and navigate WWW, use search tools and bookmarks, use plug-in to play multimedia files, and download programs from Internet.	View and navigate WWW, use search tools and bookmarks, use plug-in to play multimedia files, and download programs from Internet.
Communication & Collaboration	E-mail	Create, forward, and reply to messages and send attachments. Sort incoming mail and create mailing lists	Create, forward, and reply to messages and send attachments. Sort incoming mail and create mailing lists
	WebBoard	Post, delete, and attach files to a message and participate in chat sessions	Post, delete, and attach files to a message and participate in chat sessions
	RealEncoder	Broadcast live audio and archive audio files	Broadcast live audio and archive audio files
Web Page Development	HTML editors	Create and edit Web pages. Use templates, forms, images, multimedia files, and advanced HTML tags	N/A
	Database	Write and test scripts to create and maintain online grade books	Provide grades and feedback and download students' assignments
	File Transfer	Upload and download files to the course server	N/A
Multimedia Development	PhotoShop	Create and edit images	N/A
	Digital Video	Create and edit streaming video	N/A
	Scanning	Scan texts and images	N/A

Table 3
Technology Knowledge and Skills Required by Program Participants

Software Function	Software Applications	Specific Knowledge and Skill Requirements for Participants
Web Access	Web Browser	View and navigate WWW, use search tools and bookmark, use plug-in to play multimedia files, and download programs from Internet
Document Creation	Word Processing	Create, format documents using table and border functions
Communication and Document Exchange	E-mail	Create, forward , and reply messages, and send attachment
		Sort incoming mail and create mailing list
	WebBoard	Post, delete, and attach files to a message and participate in chat rooms
	Various Software	Install, use, upgrade, troubleshoot software
	Database	Submit assignments and access instructor feedback and grades

An orientation training session for online instructors and teaching assistants was considered an essential element to the success of an online course. The following five essential components of an orientation training program were suggested by the instructors:

1. *General overview of the online program.* The first component of an online orientation training program should provide instructors with a general overview of the program, processes involved in using the online instructional system, and how they are supposed to work with instructional designers, web designers, database developers, and technical support. In short, there should be a clear orientation so the instructor understands the structure of the entire program and can better determine their roles and responsibilities. Another element considered important is the organization's vision of the online program as well as its importance to the organization.
2. *Description of the differences between online and face-to-face instruction.* Regarding the differences between these two types of delivery formats, instructors felt that those who have not experienced teaching online should be provided with an introduction to the differences between online and face-to-face instruction. Specifically, the level of detail needed for online delivery and the importance that details play in this type of instruction need to be emphasized. The instructors felt they should be trained on how to adapt face-to-face strategies to online environments. Also, because of the environment in which instruction is delivered, instructors felt they should be introduced to more innovative teaching strategies. In other words, the orientation-training program should provide them with a set of varied teaching options that can be effectively carried out in online environments.
3. *Differences between synchronous and asynchronous delivery.* Training should help instructors better prepare for synchronous and asynchronous delivery formats. For the synchronous sessions, they should be informed about strategies that promote individualized instruction and encourage active participation. For asynchronous sessions, instructors felt they should be prepared to manage time more effectively, learn how to be instructionally flexible, how to provide timely feedback without getting burnt out, and how to create and manage virtual teams.
4. *Communication skill training.* The online instructors felt that oral and written skills are probably much more important in online instruction than in face-to-face instruction. The lack of personal contact and the inability to see people's gestures puts a major burden on oral and written communication. The instructors felt that some information should be provided on how to effectively address online students and how to provide feedback and constructive criticism without being perceived in a negative way. They felt that good online communication skills are necessary because mistakes are more likely to be noticed by online students than face-to-face students. Finally, they suggested that this type of training should provide them with information on how to develop their skills to better interact with students, both formally and informally.
5. *Technology use training.* The instructors and teaching assistants stated that it is essential to know how to use the technology and be able to diagnose and solve common problems. They felt it was necessary to have technology training to get them to the level of feeling comfortable using the technology to interact with people. The instructors felt that they should be provided with many opportunities to gain "hands on" experience. They felt

that the best training is the one that most closely simulates the reality of online instruction. The instructors and teaching assistants recommended that they be provided the opportunity to practice in simulated environments until they attain the level of confidence necessary to perform naturally. One-on-one training was found to be effective in learning to master the new technologies.

Other topics that were mentioned as important for an instructor training program included copyright and fair use issues, institutional intellectual property rights policies, how to foster and assess deep learning, strategies for better preparation and time management, and how to facilitate collaborative learning online.

Technical Support Needed for Online Programs

Technical support is a critical aspect of any online program. Without a mechanism for supporting online instructors and students, frustration is sure to occur. The following listing of technical support for online programs was developed based on an analysis of the types of problems faced by instructors and students as they participated in an online program. This information is organized according to (a) the nature of the technology problems confronted and their resolution, and (b) the forms of technology support offered within the program—both initially and currently.

Nature of technology problems. An analysis of e-mail messages, technical support logs from a toll-free telephone support line, and archives from Instant Messenger communications provided a clear picture of the types of problems encountered by students and instructors, their frequency, and the reporting methods used. During the first online course, 90% (n = 34) of the requests for assistance occurred during the first half of the course. E-mail was the most common method used to report problems and request technical assistance (86% of all requests). Approximately 50% of the students used the technical support services, with an average of 3.5 support requests per student. Regarding the type of problems being reported, the most common problem was associated with an organizational firewall at a students' place of work that affected the delivery of audio and video files and prevented access to collaboration tools such as WebBoard and IRC chat. Other frequently reported problems were related to the lack of web browser skills, inaccurate use of e-mail functions such as attachments, and server problems due to external causes such as severe weather conditions in the form of storms and lighting. During the development of the first course, a total of 11 different types of problems were reported. These were problems related to email, browsers, WebBoard and its chat function, RealPlayer, server malfunctions, technical terminology, acknowledgment of messages and document submissions, and PowerPoint presentations.

An analysis of technical problems during the second online course revealed similar results. In this case, 92% of the support requests were for assistance during the first half of the course. The number of students requesting assistance increased slightly from the previous course, from 50% of the students in the first course to 61% in the second course. During the second course, access problems due to firewall constraints at a student's work location was a common problem, followed by problems with RealPlayer, and difficulties associated with uploading assignments to the course database. The uploading feature of the database was a new feature in the second course. During the development of the second course, there was a decrease in the types of problems reported. A total of 9 different types of problems were reported. These were problems related to the introduction of a new database for uploading documents to the instructor, server malfunctions, PowerPoint files, access to the we site, and access to the WebBoard and ChatBoard due to changes in IP numbers. Three other problems came from new students joining the cohort. These problems were related to the use of speakers, volume, and printers.

Forms of support offered. Given the types and frequency of technical problems from the first two online courses, as well as the prior expectations of potential obstacles, multiple support features were implemented in an effort to reduce the number of technical problems experienced by the online instructors and students. As a result, a comprehensive support system was created for the online program. Initially, only e-mail support and a toll free telephone line to provide access to online staff during normal business hours was provided. While these forms of support were adequate for most technical problems, there were instances where immediate assistance was required during non-business hours. To that end, additional support features were developed and implemented, including a set of Frequently Asked Questions (FAQ) that contain solutions to various problems, the availability of Instant Messenger for 1-to-1 and small group conferencing, and 24-hour chat-based support provided through a "Help Desk" manned by the university's Web Technology Group. With these five support options in place, virtually all of the technological support needs of the online students and faculty can be met satisfactorily.

Summary

This paper examined a variety of critical issues related to the successful development and implementation of online instructional programs. While many of these issues are taken for granted when planning traditional face-to-face instruction, they must be carefully considered when venturing into the realm of online programs. Programs delivered entirely online cannot simply be modifications of existing courses, rather, they must be viewed as completely new delivery systems that present different and unique problems. Online program developers need to carefully analyze the context and source of problems that arise and design appropriate interfaces, technology solutions, and support mechanisms to resolve the difficulties that will be faced by both the instructors and the students.

The Relationship of Psychological Preferences and the Human Resource Development role of Instructor/Facilitator: A Qualitative Analysis

Rafael Martinez
Barry University

Douglas H. Smith
Florida International University.

The purpose of this ethnographic study was to describe the congruency of psychological preferences identified by the Myers-Briggs Type Indicator (MBTI) and the human resource development (HRD) role of instructor facilitator. This investigation was conducted with 24 HRD professionals who worked as instructors/facilitators in job-related contexts. The study was conducted using such qualitative strategies as purposive sampling, open-ended interviews, group interviewing, participant observation of the subjects at their work sites and while conducting training sessions, field notes, and contact summary sheets to record field encounters. Two major themes emerged in relation to the congruency of psychological preferences and the role of instructor/facilitator: (1) designing and preparing instruction/facilitation, and (2) conducting training and managing group process. These themes were analyzed through the combination of the four Jungian personality functions: sensing-thinking (ST), sensing-feeling (SF), intuition-thinking (NT), and intuition-feeling (NF).

Keywords: Instructor Characteristics, Myers-Briggs Type Indicator, Qualitative Research

As the trend of professionalism in the field of human resource development (HRD) continues to increase (Gilley & Eggland, 1989; McLagan, 1989; Nadler, 1984; Prior, 1994; Sredl & Rothwell, 1992), it becomes crucial that we understand the congruency between the personality characteristics of the HRD practitioner and the practice of HRD. The practice of HRD includes a system of roles, competencies, ethical issues, work outputs, training styles and quality requirements (Bennet, 1994, McLagan, 1989; Sredl & Rothwell, 1992). Despite this increased professionalism reflected in the multiplicity of HRD functions, there is limited research that reports on the topic of personality factors impacting on HRD practice, specifically the instruction/facilitation role

One widely recognized instrument that assesses individual differences based on the personality theory of Carl Gustav Jung is the Myers-Briggs Type Indicator (MBTI). Jung's theory identifies two basic attitudes or direction of energy focus: Introversion and extraversion and four problem-solving orientations or personal styles: Intuition, sensing, thinking and feeling (Fordham, 1975; Hall & Nordby, 1973; Hyde & McGuinness, 1993; Jung, 1971). This study refers to each of these attitudes or orientations as psychological preferences.

Personality research using the MBTI has been extensively conducted in the fields of law enforcement, management, counseling, and other professions (Briggs-Myers & McCaulley, 1985; Hennesy, 1995; Lawrence, 1993). However, no research study was identified that would focus on the congruency or compatibility of psychological preferences and the instruction/facilitation role.

The purpose of this study is to describe and explain the congruency of psychological preferences as measured by the Myers Briggs Type Indicator (MBTI), and the HRD role of instructor/facilitator. The study observed, assessed, and documented how the psychological preferences of HRD trainers influence the way they experience their role and how they demonstrate the role-specific outputs, competencies, qualities and ethical issues.

This qualitative study utilized two sets of theoretical orientations to structure the collection and analysis of data. The first theoretical orientation was the Jungian theory of personality types and the identification of psychological preferences through the MBTI. Jung's (1971) type theory proposed that all humans focus their energy by choosing between two attitudes (introversion or extraversion). He also proposed that a person chooses from two ways of perceiving (intuition or sensing) and two ways of judging what is perceived (thinking or feeling). Myers and Briggs (Briggs-Myers & Myers, 1980) expanded on Jung's theory and formulated a fourth personality dimension to explain how each person deals with the external world. They called these preferences perception or judging. The combinations from these four dimensions reflect a complex dynamic of 16 relationships among the four functions (i.e., sensing, intuition, thinking and feeling), the two attitudes (i.e., extraversion and introversion) and the two orientations to the outer world (i.e., judgment and perception) (Myers-Briggs & McCaulley, 1985). The most important result of this dynamic interaction is that one of the functions becomes the dominant for that particular type

Copyright © 1999 Rafael Martinez and Douglas H.Smith

combination. In addition, an auxiliary, a tertiary and an inferior function play significant roles in the development of a healthy and balanced personality.

The second body of theoretical orientations referred to HRD roles and competencies and the dynamics of adult learning. The practice of HRD is based on learning. Competent HRD practitioners incorporate the principles of adult learning into all phases of training and development activities. A holistic analysis of the training and development context must include the characteristics of adults as learners and the complementary techniques and strategies that should be employed by the training professional in facilitating the learning process.

HRD is a system of key competencies, roles and quality requirements. McLagan has defined competency as an area of knowledge or skill that is critical for producing outputs. Competencies are internal capabilities that people bring to their jobs; capabilities which may be expressed in a broad, even infinite, array of on-the-job behaviors (1993). A role, on the other hand, is linked to outputs (i.e., products or services). McLagan (1993) defines role as "...a functional groupings of outputs. A job title may match a role title, but a job often encompasses more than one role" (p. 77). An example of a key role is that of instructor or facilitator. Selected work outputs of this role include: presenting information, providing feedback to learners, facilitating structured learning experiences, and managing group discussion and group process (Sredl & Rothwell, 1992). Selected corresponding competencies are: coaching and feedback skills, presentation skills, objectives preparation skills, etc.

Furthermore, quality requirements refer to the characteristics of an output. McLagan (1989) states that "quality requirements answer the question What must be true of this output in order for its users and HRD professionals to approve it?" (p. 77). Examples of the quality requirements linked to the learning environment (an output) are: individual differences are respected, the facilitator models behavior consistent with the goals of the program, self-esteem is maintained or enhanced, or individuals feel safe to try new skills and behaviors (McLagan, 1989).

The congruency of psychological preferences and the HRD role of instructor/facilitator can have significant repercussions on the way adult learning experiences are structured and delivered. Thus, HRD practitioners with certain psychological preferences, are attuned to responding to adults as learners in differing ways.

Research Questions

This ethnographic study utilized a general a "grand tour question" (Creswell, 1994; Werner & Schoepfle, 1987) consistent with a qualitative research design. This question was posed as a general issue so as not to limit the inquiry or prevent the researcher from following valuable leads that emerged as the data were collected (Creswell, 1994). The grand tour question of this study was: What is the congruency of psychological preferences measured by the MBTI, and the HRD role of instructor/facilitator?

Two related sub-questions and issues followed this general grand tour question. The sub-questions were more specific but did not put necessary limits on the open-ended nature of this qualitative design. The first sub-question related to the grand tour question was: What psychological preferences (or combination thereof) were more often associated with the competencies and work outputs in this role? Why? The second sub-question for this study had to do with interpersonal relationship skills and the role of instructor/facilitator: What psychological preferences, or combinations thereof, were associated with interpersonal competencies and work outputs? (e.g., negotiation skill, questioning skill, relationship-building skill, etc.).

Methodology

This study utilized a qualitative methodology to compile information on the congruency of psychological preferences and the HRD role of instructor/facilitator. The research design had two major phases which included data collection and analysis. The data collection phase utilized ethnographic fieldwork strategies that included: (1) purposive sampling, (2) administration and scoring of the MBTI form G, (3) participant observation, (4) field notes and contact summary sheets, (5) open-ended interviews and (6) informal group interviewing and discussion. The data analysis phase consisted of examining the data collected in the interviews and field observations through the use of a text-based software program called Folio Views, Version 3.1 for Windows. A total of fifty two (52) codes were used to classify the data collected. These codes were created and evolved as the research progressed and distinct categories of data emerged.

The purposive sample used in this study consisted of 24 HRD professionals who conducted instruction/facilitation in their respective organizations. The sample criteria required that these professionals would currently perform as instructor/facilitator in a staff development or training unit on a full-time basis. Initial contact

was made with 37 HRD professionals for possible participation in this study. The final sample included twenty two participants who worked for the public sector and two that worked for private organizations.

Each study participant was explained the nature of the MBTI and given instructions on how to complete the instrument during a brief interview. An average of seven days was given to each subject to complete the MBTI at their own convenience. The completed instrument was personally collected from each subject and another brief interview was conducted to explain or answer any additional concerns. The scoring and presentation of the MBTI results took place after each research subject had been interviewed and observed during a training session(s). The reason for the researcher and the subject not knowing the MBTI results beforehand was to ensure non-bias in the interview and participant observation process.

This study included direct observations of selected HRD professionals conducting training and/or interacting in the respective work sites. The technique of participant observation proved to be indispensable to observe the interaction between trainers and trainees during actual staff development activities. It also provided the researcher a direct method to validate information obtained during the interviews regarding preferred training strategies and group facilitation preferences. Direct observations of the physical facility and the training environment were also conducted during these visits.

Every encounter between the researcher and the subjects in the study was recorded in the form of field notes. A contact summary sheet was completed for brief interactions such as telephone contacts or brief informal face-to-face encounters. The most productive source of information for this study were the face-to-face open-ended, tape-recorded interviews conducted with the study participants. These interviews were transcribed by a professional transcriber and incorporated as text in the Folio Views program. The 52 codes used to organize and analyze the interview contents were represented as Folio Views "fields" that marked words or strings of words. This coded text was subsequently retrieved for content analysis and for further refinement/regrouping of different categories of data. For example, all paragraphs describing a Sensing (S) subject's ideas of what's important when delivering a training session would be marked with unique codes such as #8 Sensor and #43 Training style – self description. All subsequent observations, interview descriptions, informal group interviews and discussions, etc., related to Sensing types' perceptions of what's important when delivering training would be marked with the codes #8 and #43. The researcher could then do a "search and retrieve" operation where all instances of the combination #8 and #43 will be retrieved from the universe of text entered in the InfoBase.

A variety of data sources (e.g., interviews, participant observations, literature sources, informal group interviews/discussions) were triangulated to achieve a meaningful interpretation of the findings. For example, the findings of the interviews and the actual observations of the subject while conducting training were used to establish congruence between psychological preferences and preferred instruction/facilitation practices. The literature on psychological types as applied to specific professions such as law enforcement, management and teaching also helped in defining and establishing unique areas of concern for human resource development practitioners. Specifically, the literature helped the researchers to identify concrete behaviors which reflected psychological preferences such as focusing on details or the large picture, applying facts to practical results, thinking or feeling approaches to classroom interactions, etc.

The analysis of the data for this study was reported through direct quotations from research subjects or descriptions of situations made by the researcher. The quotes are selected to exemplify and summarize particular aspects of the congruence between psychological preference and training approach. For example, in describing an Intuitive-Feeling subject's approach to conducting training, the following quote captures the personal, people-involved enthusiasm characteristic of the feeler type:

Subject #18 (on conducting the training session): *"So, my approach is very It's mostly I sell myself. **I don't sell the course so much. You are not only getting the course, you're getting a piece of me. So, when I teach any course, I cannot just teach a subject matter. I teach my life. And when you finish, you'll know a little bit about the topic... you'll know here I was born, where I was raised, what I did..."***

Another feeler summarizes her focus on people and not facts:

Subject #20 (on starting a training session): *"I usually my process involves getting to know my audience right away. I ask them what is it that they want to get out of the particular session. And from there, I can even establish my agenda. As a matter of fact, this is my favorite thing. I'll give them a particular topic area and I'll say What is it that you want to learn about this...And then from there, I can be honest about the things hat I do know about it and then use that as my agenda"*

In another example, an Intuitive-Thinker's tendency to be creative and ingenious is captured as follows: Subject #5 (on designing and delivering training): *"I like taking an otherwise boring topic and attempt to sell it to others... It feels good to convince those who are resistant to change, that a particular policy or program is good for the organization..."*

Results, Conclusions, and Limitations

Table 1 shows the distribution of the eight psychological preferences (i.e., extraversion/introversion; sensing/intuition; thinking/feeling; judging/perceiving). Also, shown on this table are the combinations of preferences (e.g., sensing/thinking; intuition/feeling, etc.) that will form the basis for the analysis conducted on the data.

The Four Functions and the Role of Instructor/Facilitator

The combination of perception (i.e., ways of taking in information) and judgment (i.e., ways of coming to conclusions) will now be used to describe and interpret behaviors and perspectives associated with the HRD role of instructor/ facilitator. Extensive documentation of individual behaviors and comments was made to validate the general descriptions presented below. The page limitation of this paper prevented inclusion of this documentation, but is available from the authors upon request.

Sensing-Thinking (ST) Instructors/Facilitators

In this study, a total of nine (39%) instructors/ facilitators scored as sensors/thinkers (S-T) on the MBTI. According to statistics reported by CAPT (1995), 25% of the U.S. population score with a sensing-thinking preference in the MBTI.

Designing and preparing instruction/facilitation: the sensing-thinking (ST) orientation. Trainers with a sensing orientation prefer to process/intake information from the environment using their five senses and focusing on what is real. Those with a thinking preference make decisions and reach conclusions by using objective, cause and effect reasoning (Briggs-Myers & McCaulley, 1985). STs (as they are called) are practical, matter-of-fact individuals who prefer and enjoy working within a structured plan that follows specific outlines, procedures and/or routine tasks.

Sensing/thinking trainers in this study who described their way of preparing and designing instruction/ facilitation, emphasized behaviors and attitudes characterized as concrete, direct, thorough, structured and factual. Meeting practical needs in a matter-of-fact way was their foremost concern when designing training courses.

Conducting training and managing group process: the sensing-thinking (ST) orientation. The process of conducting training or facilitating learning experiences in an HRD context was the area most intensively explored in this study. The data collected through interviews and observations revealed clear differences and/or similarities among subjects with varying combinations of psychological preferences. Competencies such as presentation skills,

group processing skills, and feedback skills emerged as key elements to understand and explain what goes on in the training context in relation to psychological preferences.
The practical, organized, matter of fact, ST trainers showed a preference to use diverse presentation strategies to get their message across. The use of audio-visual equipment or tools that conveyed a 'real' sense of the material being presented was favored by the STs. Their training style was observed to be structured, detailed and focused on practical applications of the materials.

Sensing/Feeling (SF) Instructors/Facilitators

In this study, a total of two (8%) instructors/ facilitators scored as sensors/feelers (SF) in the MBTI. According to statistics reported by CAPT (1995), 29% of the U.S. population scores with a sensing-feeling preference in the MBTI.

Designing and preparing instruction/facilitation: the sensing-feeling (SF) orientation. Like the STs just described, SF trainers prefer to take in and process information through their senses while focusing on what is real, in the here and now. (Briggs-Myers and McCaulley, 1985). However, their feeling preference leads them to make decisions based on subjective, values-based reasoning. SFs make decisions with consideration to people, values and feelings.

The two sensing/feeling trainers who participated in this study described their way of designing and preparing training by emphasizing facts, details, concrete reality and organization. However, they also demonstrated a concern for practical help and services for people.

Conducting training and managing group process: the sensing-feeling (SF) orientation. As mentioned, sensing-feeling individuals process information through the five senses, focusing on what's real and come to conclusions based on human values and subjective reasoning. The two training professionals in this study who scored as sensors-feelers gave descriptions and displayed behaviors congruent with their psychological orientation.

In summary, sensing-feeling instructors/facilitators tended to emphasize a balance between details, facts and attention to the here-and-now with personal warmth and practical help for people (i.e., trainees). SFs tended to the immediate needs of the training participants and maintained practical and friendly interactions in the training setting.

Intuitive/Thinking (NT) Instructors/Facilitators

In this study a total of six (26%) instructors/ facilitators scored as intuitive/thinkers (NT) in the MBTI. According to statistics reported by CAPT (1995), 18% of the U.S. population scores with an intuitive-thinking preference in the MBTI

The trainers with an intuitive orientation prefer to process/intake information from the environment using possibilities, relationships, a "sixth sense", and a futuristic/long range outlook (Briggs-Myers & McCaulley, 1985). The decision making process of the NTs (i.e., thinking) is similar to the STs previously discussed. That is, they decide using logic, cause and effect and objective reasoning. NT trainers enjoy challenges and complex projects but tend to neglect routine tasks, details, and practicality.

Designing and preparing instruction/facilitation: the intuitive-thinking (NT) orientation. Whereas ST trainers in this study were detailed and focused when describing how they went about designing and preparing a training program, NTs were general and at times gave the impression of being disorganized and scattered in their descriptions. Hennessy states that intuitive-thinkers "communicate in global terms, often skipping steps and appearing to talk in circles" (1995, p. 19). From the interviewer's perspective, it proved a challenge to obtain sequential and detailed descriptions from some NTs, regarding the process of developing training courses or programs.

In summary, when intuitive-thinker trainers described how they designed and developed training courses, the emphasis was on conceptual and detached procedures. They also tended to minimize details and focused on possibilities and the big picture.

Conducting training and managing group process: the intuitive-thinking (NT) orientation. In general, NT trainers resembled STs in their logical, cause and effect, and detached style of conducting presentation. Intuitive-thinking trainers showed a preference for general concepts, theoretical discussions, and the analysis of possibilities and interconnections. In opposition to STs who made themselves and the message they presented real and in the here-and-now, NTs had a tendency to be general and detached. NTs general characteristics have been discussed as

"the etherial mind" (Lawrence, 1993, p. 191). Instead of details and facts, NTs prefer mental models, blueprints or cognitive maps to guide them in their actions.

A final observation about the NTs' style of conducting training and managing group process relates to their global outlook. A tendency was observed among NT trainers to provide general overviews of the training course without mentioning detailed objectives or exact outcomes. Also, the presentation of materials appeared unorganized, however, in the end, all of the intended contents were covered.

In summary, NT instructors/facilitators revealed great similarities with STs in terms of their logical, cause and effect ways of reasoning, judging and coming to conclusions. The unique characteristics of the NTs were their ability to conceptualize and organize information in global and general ways. NT trainers displayed behaviors and perspectives characterized as detached, conceptual, and theoretical.

Intuitive/Feeling (NF) Instructors/Facilitators

In this study a total of six (26%) instructors/ facilitators scored as intuitive/feelers (N-F) in the MBTI. According to statistics reported by CAPT (1995), 28% of the U.S. population scores with an intuitive-feeling preference in the MBTI.

Designing and preparing instruction/facilitation: the intuitive-feeling (NF) orientation. Like the NTs just described, the NF trainers in this study preferred to take in and process information in a global and conceptual manner. When using their 'sixth sense' approach, NFs rely on hunches, speculations and possibilities (Briggs-Myers & McCaulley, 1985). The decision making process of intuitive-feelers is based on social values and concern for people. NFs come to conclusions by emphasizing the personal and humane dimensions of the situation at hand.

Long range training issues and conceptual training schemes and designs caught the attention of NF trainers. The data collected showed that they tended to enjoy people-related issues rather than policy or technical concerns. NF trainers can be insightful and capable of conceptualizing long range goals for the training unit.

In summary, intuitive-feeling training professionals in this study presented themselves as conceptual, future-oriented individuals who were responsive to people needs. These trainers showed real concern for people's feelings and opinions.

Conducting Training and Managing Group Process: the Intuitive-Feeling (NF) Orientation. NF trainers in this study preferred interaction and discussion when conducting training. NFs conducted training from a very personal perspective. Instead of focusing on immediate and concrete situations, they presented the total picture. They also showed enthusiasm and insight by not discussing things that happened in the past but that could happen in the future. The NF style of managing group discussion and interaction was focused on harmony, understanding and personal warmth. NF instructors/facilitators demonstrated a tendency to be creative, expressive and insightful. Understanding and communicating with people was their main concern. The NFs in this study were the type of professionals who attempted to make their respective institutions responsive to its people. Of the four groups discussed in this dissertation, NFs were the most enthusiastic and outgoing when conducting training or managing group discussions.

In conclusion, this investigation established the congruency of specific combinations of psychological preferences with behaviors and perspectives connected to designing, preparing and conducting training and managing group process. The analysis of the data revealed that individuals with similar combinations of perception and judgment (i.e., sensing-thinking – ST, sensing-feeling – SF, intuitive-thinking – NT, and intuitive feeling – NF) had the tendency to perceive and enact training activities in certain uniform ways.

Figure 1 depicts the congruency of the four functions combination (i.e., ST, SF, NT, NF) and the two themes that emerged from the data (i.e., designing and preparing instruction/facilitation and conducting training and managing group process).

Figure 1
THEME 1: DESIGNING AND PREPARING INSTRUCTION/FACILITATION
THEME 2: CONDUCTING TRAINING AND MANAGING GROUP PROCESS

SENSING-THINKING (ST) TRAINERS *Facts, details, reality-based, objective analysis, logic, step-by-step approach*	**SENSING-FEELING (SF) TRAINERS** *Facts, details, reality-based, subjective analysis, personal approach, people oriented, values*	**INTUITIVE-THINKING (NT) TRAINERS** *Interest in meanings & understanding, focus on possibilities, hunches, objective analysis, logic*	**INTUITIVE-FEELING (NF) TRAINERS** *Interest in meanings & understanding, focus on possibilities, subjective analysis, personal approach, people oriented, values*

How the Research Contributes to New Knowledge in HRD

The uses of the MBTI in the field of human resource development offer excellent prospects for personal development and career enhancement in training and development. Specifically, the professionals involved in the field can explore their psychological preferences and match their personality tendencies to the requirements of the training field. This self-awareness can result in the identification of potential strengths and weaknesses thus resulting in improved training performance.

This study focused on the specific role of instructor/ facilitator as it was fulfilled through a number of competencies and work outputs. Training professionals who conduct instruction/facilitation may use the knowledge of their type preferences with diverse applications such as:

1. developing and using multiple training strategies to meet the learning needs of trainees with particular psychological preferences and personality types;
2. designing curricula that are sensitive to the different ways employees perceive (i.e., sensing/intuition) and judge (i.e., thinking/feeling) their job duties and responsibilities;
3. understanding what motivates trainers with different psychological orientations when conducting learning activities (train-the-trainer context);
1. teaching other trainers how to facilitate and manage group discussion with an understanding of how instructors/ facilitators with different psychological preferences and personality types perceive and interpret thoughts, concepts, feeling and values (train-the-trainer context);
2. building coaching skills in trainers that would help them guide others (i.e., trainees) to recognize and understand personal needs, problems, alternatives, etc. in light of Jungian personality preferences (train-the-trainer context);
3. helping trainers work in teams that are psychologically diverse and therefore, rich in variety of perspectives;

Lastly, recommendations for future research using qualitative and/or quantitative approaches are encouraged. The following are some topics/areas that would add to the knowledge base of the HRD field and the MBTI-related research:

- Congruency of psychological preferences and any of the other HRD roles discussed by McLagan (1989);
- Training and development practices and the expression of the sixteen personality types in the different roles proposed by McLagan (1989);
- Management and communication styles of HRD managers/administrators and the four Jungian functions (i.e., perception and judgment).

HRD Competencies and Roles for 2000: A Pilot Study of the Perceptions of HRD Practitioners

Toni Powell
Betty Hubschman
Barry University

This study examined the perceptions of HRD practitioners, all of whom were alumni of an HRD graduate program. The researchers asked the respondents to rank the extent to which 48 competencies and 15 roles were important. Competencies and roles included those in the McLagan 1989 study as well as HPI skills suggested by ASTD in 1996. Forty-one of the 48 competencies and 10 of the 15 roles were considered important by our respondents. In this paper, the researchers discuss some implications and recommendations derived from these findings.

Keywords: Competency Model, Professional Development, Future Trends

Recently, there has been a myriad of studies and articles noting the corporate paradigm shift emerging from globalization and new technology (McLagan, 1996; Rhinesmith, 1994; Robinson and Robinson, 1995). Kaeter (1995), after interviewing corporate training directors and HRD university faculty, suggested that the problem lay in differentiating between what the practitioner does and doesn't need to be able to do. Gill (1995) supported this conclusion by recommending that the HRD profession examine its "mental models if it is to re-invent itself and become instrumental in the new learning organization" (p. 26). If as many experts indicate, HRD practitioners still cling to an old paradigm that supports the belief that training departments are tangential to the organization's business function or that training is the sole responsibility of trainers (Gill, 1995), what part does the formal preparation of these professionals play in this dilemma? Are university graduate programs adequately preparing future HRD practitioners for the new performance-focused paradigm? Are today's university alumni prepared for tomorrow's learning organization?

Many HRD graduate programs base their curricula on the competencies and roles identified in McLagan's (1989) Models for HRD Practice. Some studies (Dare and Leach, 1998; Leach, 1993) have investigated the extent to which graduate programs actually utilize these competencies. These studies asked faculty from vocational and industrial education programs to determine the importance of 25 competencies and the extent to which they were adequately covered in the curricula. The findings of the more recent study (Dare and Leach, 1998) indicated that faculty considered all of the competencies to still be important to the training profession. However, the respondents believed that some of the "business competencies," defined as having a "strong management, economics, or administration base" (McLagan, 1989, p.56) should be given more attention and focus in the graduate curricula. These findings are not surprising considering the recent shift in interest from training to performance improvement and the integration of many HRD practices into the strategic and operational framework of the organization (Phillips and Pulliam, 1997).

In this study, we were interested not only in the extent to which the 1989 competencies, defined by McLagan (1989) as "knowledge and skills" (p.6) are still important, but also whether HRD roles identified in that study have changed as well. McLagan's (1989) study indicated that the fundamental HRD Roles, or "key outputs" (p. 6) were: administrator, evaluator, HRD manager, HRD materials developer, individual career development advisor, instructor or facilitator, marketer, needs analyst, organizational change agent, program designer, and researcher. Are HRD practitioners still assuming these roles or are they, instead, working in new roles with titles such as HPI evaluators or intervention specialists (Rothwell, 1996)? Or are they assuming the same roles and taking on the same tasks, while holding positions with new titles? Harrison (1997) points out that as a result of globalization and the technological revolution our language has changed considerably, leading, in turn, to changing perceptions of the processes and responsibilities involved in training. Is this new language sometimes being used to describe old roles and old behaviors?

To determine whether there are, in fact, new responsibilities and new skills which should be mastered by HRD practitioners, the investigators in this study asked alumni from a university HRD graduate program to (1)

Copyright © 1999 Toni Powel and Betty Hubschman

assess the extent to which the 1989 and 1996 competencies and roles are still important in their jobs and (2) identify any new competencies and roles which are an integral part of their professional lives today.

Review of the Literature

Innumerable articles in the past few years have addressed the dramatic changes in America's workplace and how these changes impact on the HRD profession. Marquardt and Engel (1993) identified 16 interpersonal and cultural competencies that HRD practitioners need to be effective in cross-cultural settings. Included among these are five attitudes: respect for other cultures, tolerance of ambiguity, commitment to HRD principles and practices, initiative, and a sense of humor. All of these, it could be argued, are valuable tools for HRD practitioners in all settings. In fact, the authors concluded this article by noting that "even among domestic HRD practitioners, many are ignorant about their own firms' or clients' corporate cultures -- their histories, rituals, structures, strategies, communication processes, and symbols" (p. 65). Mager (1996) supported these recommendations for additional global competencies by suggesting that the all trainers enhance their language skills and increase their understanding of other cultures. The 21st Century trainer, he noted, must be performance oriented, technically and socially skilled and self-employable and added that trainers who prepare themselves to be "performance professionals will be filled with far more exciting opportunities than those who limit themselves to the narrower world of training" (p. 54). One implication which could be drawn from articles such as these is that the competencies and roles identified in the 1989 study may not adequately reflect the knowledge, skills and attitudes necessary to be effective in cultures other than the U.S.

Some studies have investigated the impact of performance improvement on HRD competencies and skills. An ASTD survey (Bassi, Cheney & Van Buren, 1997) indicated that trainers will play a major part in the performance improvement process if they keep abreast of technology advances and new delivery approaches. McLagan (1996) updated her 1989 study's findings in an article in which she applauded the new trend toward the boundary-less organization, noting that it was more democratic, flexible and competitive. She also predicted the demise of traditional HRD Departments and training roles. Phillips and Pulliam (1997) reported that, among other changes, the HRD field must link training program delivery to organizational performance need. Other studies have investigated the impact of performance improvement on HRD competencies and skills. Writers such as Robinson and Robinson (1998) and Rothwell (1996) have identified new competencies and roles that HRD practitioners must master to be effective players in the new performance improvement revolution. These writers pointed to the need for all HRD practitioners to be accomplished consultants and possess the budgeting, contracting and entrepreneur skills required for a consultant.

Some doubt remains, however, about the extent to which the new competencies and roles identified by these writers require learning new skills and acquiring new knowledge bases. Dare and Leach (1997) argued that "even amidst a contemporary educational environment rampant with the search for standards of performance at all levels, *no clear model seems to have emerged to replace the competencies as they were defined in earlier studies*" [italics added] (p. 255). With no better model available, Dare and Leach decided to base their research on the findings of the 1989 McLagan study. In this study, we utilized a similar approach to that of the Dare and Leach (1998) study by asking HRD practitioners which of the 35 competencies and 10 roles listed in the 1989 McLagan study are still important to their profession today. In addition, we included 13 competencies and 4 roles identified by ASTD in 1996 as integral to the new human performance improvement process.

Research Questions

The purpose of this study was to determine the extent to which HRD practitioners who studied in a graduate program which utilized the competencies and roles identified in McLagan's 1989 study as the basis for its curricula are currently practicing these competencies and performing in these roles in their profession. Specifically, the researchers asked respondents the following research questions:

1. To what extent are these competencies perceived as important to HRD practitioners?
2. *To what extent are these roles perceived as important to HRD practitioners?*
3. Do HRD practitioners identify competencies other than these as important? If so what are they?
4. Do HRD practitioners identify roles other than these as important? If so what are they?

Research Procedures

Participants

Participants selected for this study were alumni of an HRD Master's degree program that used the 1989 Competencies and Roles as the framework for its curriculum. In October, 1998, a survey instrument was sent to 167 alumni from four regions of a southeastern state. This number reflected the entire population. Although a few of these were not working in the HR or HRD field, we felt that respondents not working in the field would eliminate themselves from participation in the study.

Instrumentation

The instrument, which was adapted from the Dare and Leach study (1998) asked participants to identify the extent to which they perceived a list of competencies and roles as important or not important. Competencies and roles identified in the 1989 study, as well as additional ones identified by the ASTD Models for Human Performance (1996), were combined rather than separated. The instrument was divided into three sections. In Section One, in the first column, the competency was identified and defined. The respondents were asked to indicate the extent to which they saw the competency as important. In Section Two, respondents were asked to use the same 4-point rating scale to evaluate HRD roles. Section Three added a qualitative dimension to the study by asking the respondents three open-ended questions. In this section, Question One asked respondents to list other competencies than those listed above they perceived as important and how prepared they felt to perform this competency. Question Two asked respondents for the same information regarding any additional roles they had assumed. Question Three asked respondents to list any competencies on this questionnaire which they found to be the same or overlapping, and why. Question Four asked respondents to list any roles on this questionnaire that they found to be the same or overlapping, and to explain their response.

Data Analysis

The researchers used a four-point Likert Scale, with (4) indicating "very important," (3) indicating "somewhat important," (2) as "not very important," or (1) as "of no importance." Competencies with a range of 3.0 to 4.0 were considered important. The significance level was set at .05.

Findings

Section I: Competencies

The findings of the Instrument are illustrated in Table 1. The means of the competencies ranged from 2.57 to 3.85, with 1 indicating of no importance, 2 as not very important, 3 as somewhat important, and 4 as very important.

The highest ranked competencies (with a mean of 3.85) were computer competence, interpersonal relationship skills, and industry awareness. Ranked in second place (with a mean of 3.83) were ability to see the "big picture" and feedback skills. The competency of leadership skills was ranked third (with a mean of 3.81). Adult-learning understanding and coping skills were ranked fourth (with a mean of 3.79). Ranked fifth was the competency of coaching skills (with a mean of 3.75). Sixth place was self-knowledge (with a mean of 3.74), while industry awareness, visioning skills, and relationship-building skills shared seventh place (with a mean of 3.7). Ranked in eighth place were competency-identification skills (mean of 3.68). Ninth place was shared by understanding functions of business and presentation skills (with a mean of 3.66). Organizational behavior (with a mean of 3.64) was ranked in tenth place. Our original premise was to consider a mean score of 3.0 as "important." This study indicated that 41 of the 48 competencies listed on the survey were considered important to HRD professionals.

Of the bottom five competencies ("systems thinking and understanding," "understanding power networks," "facilities skills," "contracting skills," and "model-building skills"), most were theoretical and conceptual in nature. We noted that "systems thinking and understanding" was rated with a 2.85, while "understanding the big picture" (having basically the same meaning) was rated with a 3.83. Perhaps the respondents related to "hands-on" terminology more than they did to the more abstract-sounding competencies.

Table 1
Importance of Competencies to HRD Practitioners

Competency	Importance of competency	
	Mean	Standard deviation
Computer competence	3.85	.36
Interpersonal relationship skills	3.85	.41
Industry awareness	3.85	.50
Ability to see the "big picture"	3.83	.38
Feedback skills	3.83	.47
Leadership skills	3.81	.44
Adult-learning understanding	3.79	.45
Coping skills	3.79	.57
Coaching skills	3.75	.48
Self-knowledge	3.74	.49
Industry awareness	3.70	.67
Visioning skills	3.70	.61
Relationship-building skills	3.70	.64
Competency-identification skills	3.68	.61
Understanding functions of business	3.66	.71
Presentation skills	3.66	.55
Organizational behavior	3.64	.65
Problem-solving skills	3.62	.53
Writing skill	3.58	.69
Cost-benefit-analysis skills	3.58	.53
Preparing clear objectives	3.54	.54
Group-process skills	3.51	.70
Intellectual versatility	3.49	.72
Electronic-systems skills	3.47	.61
Technological awareness and understanding	3.45	.57
Project management skills	3.45	.72
Negotiation skills	3.43	.67
Delegation skill	3.42	.66
Performance understanding	3.42	.60
Observing skills	3.38	.74
Training and development theories and techniques understanding	3.32	.83
Tracking and describing performance behaviors & effects	3.26	.68
Questioning skills	3.21	.60
Consulting skills	3.17	.78
Subject-matter understanding	3.17	.75
Knowledge of interventions	3.15	.74
Data-reduction skills	3.11	.67
Buy-in/advocacy skills	3.06	.93
Career-development theories & techniques	3.04	.71
Records management skills	3.02	.77
Research skills	3.00	.68
Information-search skills	2.94	.77
Understanding OD theories and techniques	2.92	.65
Systems thinking and understanding	2.85	.77
Understanding power networks	2.81	.76
Facilities skills	2.79	.82
Contracting skills	2.64	.88
Model-building skills	2.57	.77

Since this study was based on the study by Dare and Leach (1998), we wanted to compare our results with theirs (See Table 2). Their study dealt with vocational faculty's perceptions of the most relevant competencies, whereas our survey investigated perceptions of HRD graduates in the field: Their top five competencies ranged from 3.74 to 3.51, while our corresponding competencies ranged from 3.58 to 2.94. The biggest difference in means was in "information-search skills" (Dare & Leach mean was 3.51 – Hubschman & Powell mean was 2.94).
Though different audiences ranked the competencies, all three studies showed the largest increase in importance to be "computer competence," which was rated as 3.55 in 1991, 3.61 in 1997, and 3.85 in our study.

Table 2

Comparison of Importance of Top Five Competencies of Dare & Leach (1998) and Hubschman & Powell

Competency	1991 (D&L)	1998 (D&L)	1999 (H&P)
Writing skill	3.69	3.74	3.58
Presentation skill	3.76	3.65	3.66
Computer competence	3.55	3.61	3.85
Objectives preparation skill	3.75	3.53	3.54
Information-search skill	3.40	3.51	2.94

Section II. Roles

Table 3 shows the ranking of the importance of roles. Rankings ranged from a high of 3.60 (for "instructor or facilitator") to a low of 2.62 (for "researcher"). The top five roles (of 15 listed) were "instructor or facilitator" (mean of 3.6), "HRD manager" (mean of 3.57), "needs analyst" (mean of 3.43), "organization change agent" (mean of 3.42), and "change manager" (mean of 3.42).

The bottom five roles, which ranged in means from 2.83 to 2.62, were those of "administrator," "HRD materials developer," "individual career-development advisor," "marketer," and "researcher." We felt that these findings warrant more study. Discussions of these implications are in the Implications section.

Section III: Respondents' Comments

Section III of the Instrument asked respondents to identify any new or additional competencies and roles they perceived as important. Very few responded to these open-ended questions. Of the eleven responses, however, nearly all suggested some combination or integration of traditional HR/HRD competencies and roles.

These comments were reflective of much of the current literature. McLagan (1996, par. 42) noted that "organizations don't distinguish between HR and HRD. Or, at least they shouldn't." In support of respondents who suggested other competencies such as "policy development", "writing business plans," and "teaching corporate heads about HRD," McLagan added that the HRD profession should be engaging in more strategic planning and leveraging, with less focus on training interventions and practices. On the other hand, while the written comments suggested that the respondents of this survey were involved in higher-level networking roles and strategic planning, the majority of the respondents ranked many of the higher cognitive level competencies such as systems thinking, model-building, and understanding power networks quite low. In fact, they were ranked at the bottom of the list (See Table 1). As one possible interpretation of this contradiction, we suggest that those respondents who hold HR/HRD positions which involved executive-level planning and networking were more likely to offer comments on Section III, whereas the overwhelming majority of the respondents held much more traditional HR and/or HRD positions.

Table 3

Importance of Roles to HRD Practitioners

Role	Importance of role	
	Mean	Standard Deviation
Instructor or Facilitator	3.60	.74
HRD Manager	3.57	.80
Needs Analyst	3.43	.84
Organization Change Agent	3.42	.72
Change Manager	3.28	.72
Evaluator	3.25	.76
Program Director	3.19	.79
Evaluator	3.09	.99
Intervention Specialist	3.04	.99
Analyst	3.02	.91
Administrator	2.83	.87
HRD Materials Developer	2.74	.88
Individual Career-development Advisor	2.72	.93
Marketer	2.68	.83
Researcher	2.62	.84

Table 4

Additional/Other Competencies -- Respondents' Comments

Knowledge of:
More HR -- benefits, etc.
Legalities within HRD/HRM: Issues around diversity, etc.
Governmental regulations and how they apply in the workplace
Recruitment and selection
Benefits and Compensation -- especially with veterans and their families
Writing business plans
Policy development...e.g. benefits, conflict resolution
Integrity and ethics issues
Community leadership...i.e. liaison with volunteer programs
CBT Training design
Managing/teaching corporate Vice-Presidents about HRD
Communications skills for managing continuous change and re-organization

Table 5

Additional/Other Roles -- Respondents' Comments

HR Auditor
HRM Program Analyst
De-Stress Agent
Learning Specialist
Media Specialist
Training Coordinator

As with the competencies, respondents identified new or additional roles that appeared to blur or combine traditional HR/HRD roles. The first four listed in Table 4 suggest roles that might include training and developmental tasks but also seem to integrate more traditional HR responsibilities with those of finance and budgeting. The role of "de-stress agent" highlights the degree of stress and tension experienced by many HR/HRD practitioners. It also suggests that some may be expected to "fix" this problem. Apparently, the traditional HRD role of change agent, regardless of what the role or competency is entitled, is still an important one for many of our respondents.

One of the trends consistently reported in the literature is that of consultant. As cited in the Review of Literature section, many writers have pointed to the need for 21st century practitioners to acquire or update their consulting skills. However, the role of consultant, as well as competencies such as contracting, understanding OD, records management, buy-in advocacy, research, and consulting skills, was not perceived as important to the majority of these respondents. In addition, the roles of researcher, marketer, and career development advisor (a role the literature suggests is often outsourced to consulting firms) were ranked low. Apparently, those who chose to participate in this study did not hold internal or external consulting positions, nor did they perform consulting skills in their daily worklives. However, since these respondents lived and worked in a relatively small geographical area, and reflected a very small proportion of the national HR/HRD population, it was impossible to determine whether our findings suggested a real gap between a reported trend and the actual worklife of many practitioners. Additional roles suggested by respondents such as "learning specialist," "media specialist," and "training coordinator" were more accurately supported by the current literature. McLagan (1996, par. 59) noted that the "instructor/facilitator" role is increasingly difficult to assume. "In it, we present information, lead structured learning experiences and facilitate group discussion and group processes sometimes on computers and other virtual environments." Such an expanded description of the traditional HRD role appears to explain the "new" roles expressed by our respondents.

Implications and Recommendations

The findings of this study generally support the Dare and Leach (1998) study. Our respondents indicated that nearly all of the competencies and roles identified in the 1989 McLagan study were important. Of special interest to us were the few competencies and roles not ranked as important. In addition to those competencies and roles that reflect the consulting practice, many were couched in abstract or theoretical language such as model building and systems thinking. Clearly, our respondents live in the real world. We cannot hypothesize that these specific practitioners do not actually use the knowledge and skills implicit in this concepts or models; however, it appears that they do not have regular conversations that address these terms. In other words, they may engage in systems thinking and model building; however, they don't label their tasks as such. Our respondents seem to be a fairly concrete, action-oriented group of doers.

We concur with Dare and Leach (1998) who recommended that university programs continuously assess the appropriateness of academic preparation. However, in addition to the educational personnel who should be part of the creative process of curriculum building and revision, we strongly recommend that HRD practitioners, especially those who are graduates of HRD university programs, be an active part of this curriculum process. Our findings indicate that, although many of the competencies and roles identified by McLagan were a viable part of the HRD professional's work lives, there may be areas of their jobs that were not being addressed, either by the traditional model or by some of the newer ones. More recently defined roles such as HPI evaluator and change manager appear to be accepted by our respondents as an important part of today's HR/HRD profession. However, they ranked other roles and competencies, which were and continue to be thought of by experts as highly important, quite low. For example, do most practitioners actually perform research activities? Or is research delegated to the marketing department or the finance office? Do HR/HRD practitioners engage in career development activities anymore? Is all of this very valuable service outsourced? Or do HR/HRD practitioners assist employees in planning their careers under the guise of another role? Finally, who coordinates the scheduling of formal training activities? Who handles facility-planning? According to our respondents, this is not an HR/HRD activity any more. Is it now a clerical responsibility? And if so, what does this imply about the amount of importance placed on formal training by organization executives? Does this mean that more emphasis is placed on informal learning, as the learning organization research suggests? Or, instead, does this mean that little emphasis is placed on learning at all?

Other questions we have relate to the roles our respondents ranked as of low or no importance, which were administrator, media specialist, materials developer, career-development advisors, marketer, and researcher. For example, have administrative assignments been taken away from the HRD professional, or are there other variables which may have affected these results? Since the HRD materials developer role was ranked so low, can we imply that media specialists and instructional designers are assuming this role? Since HRD professionals do not seem to be working as individual career-development advisors, who is now assuming this role? Has it disappeared as a result of downsizing? If the HRD professional does not consider himself or herself a marketer or researcher, who is assuming these roles?

The level of ambiguity reflected here strongly points to the need for HR/HRD practitioners, representing a wide variety of geographical areas and organization types to be a part of any new competency models that are developed.

Future studies should focus on the following areas:

1. A close examination and review of all of the articles and empirical and theoretical studies which have emerged during the past few years, searching for, in particular, overlapping themes and contradictions.
2. A new model that would specifically determine the extent to which Human Resource and Human Resource Development overlap and are distinct from each other, as it is reflected in current practice. A model similar to McLagan's (1989) Human Resource Wheel, would provide a significant contribution to the field

Limitations of the Study

Because of the small sample size, and the fact that the respondents were all from the same southeastern state, results of this study were not generalizable to a larger or different population.

1. The instrument being used in this pilot study was developed by the researchers, and was previously untested. The researchers view this study as a preliminary attempt to establish validity and reliability.

2. Demographics should be included in the next version of the instrument. Specifically, the researchers need to know job titles, tasks, and responsibilities of the respondents.

Contribution to the Field

We feel that the findings, implications, and recommendations of this study should provide some insight into the extent to which published competencies and roles in the HRD field reflect current practice. The ambiguity reflected in these findings suggests that there may be some confusion in language and terminology being used to identify job titles and skills. Perhaps future competency models should emphasize the extent to which there are shared meanings among HRD professionals.

Ethical Aspects of Human Resource Development

Jean Woodall
Kingston University, UK

Danielle Douglas
Phoenix Human Resources Consultants, UK

Several issues of ethical concern exist within the general field of organizational HRD policy and practice, especially around value and culture change. Ethical frameworks that include virtue ethics and ethics of care are relevant to an analysis of HRD professional practice, and in particular, relations with commercial clients, choice of intervention, and management of individual participant psychological safety. Exploratory research was conducted with a small sample of UK providers of HRD interventions focusing upon value and behavior change.

Keywords: Ethics, HRD, Value Change

Human Resource Development (HRD) is the area of organizational human resource policy and practice that is least likely to receive ethical scrutiny. Recruitment, selection and assessment, performance and reward management, and employee relations procedure are more readily held to account against ethical principles (Winstanley and Woodall, forthcoming 1999). Learning, training and development interventions are invariably presented as intrinsically good activities, and so it is often assumed that 'learning' is a virtuous activity, and that organizations pursuing interventions designed to enhance learning must be well-intentioned towards their employees. Indeed, the dominant theories that inform most organizational training and development practice, such as humanistic adult learning theory (Rogers, 1969; Knowles, 1989), cognitive learning styles (Kolb and Fry, 1975), and field theory (Lewin, 1952) all adopted a positive ethical position towards adult learning, embodied in strong respect for individual learner rights to autonomy, dignity, self-esteem and privacy, underpinned by the upholding of high standards of professional integrity on the part of trainers and facilitators (Woodall and Winstanley, 1998) . There is an undeniably strong respect for ethical humanism implicit in the learning process

However, there are several issues of ethical concern within the general field of organizational HRD policy and practice, especially around value and culture change. The tradition of ethical humanism can be undermined by developmental interventions designed to change culture and personal values (McKendall, 1993; Woodall, 1996), and the current strategically focused agenda of HRD activity can run into a number of ethical risks. There are the dangers of manipulating individuals into acceptance of the need for commitment by displaying certain behavioral competencies and into espousing certain values at the same time as they are forced into acceptance of increased uncertainty and insecurity in the employment relationship.

This is not say that ethical reflection has not or does not take place among HRD professionals, but rather that this is spasmodic and half-hearted in nature, rather than constant and intentional. There was some discussion in the USA in the early 1980s about ethical standards for the organization development profession (White and Whooten, 1983; Walter 1984) as many practitioners were concerned at a tendency to disregard freedom, privacy, and self-esteem in the process of focusing upon task accomplishment and organizational objectives. Minimum ethical standards were proposed, including:

- interventions must be selected that have a high probability of being helpful in a particular situation;
- the consultant should not use interventions that exceed his or her expertise;
- the 'client system' should be kept as informed as is practicable about the nature of the process;
- the consultant must not be working on any personal, hidden agendas that might obtrude into high quality service for the client;
- commitments to confidentiality must be kept;
- individuals must not be coerced into divulging information about themselves or others (French and Bell, 1990:219-233)

The Research Problem and Ethical Frameworks for HRD

More recently there has been some recognition within the AHRD of the need for attention to professional ethics (Marsick, 1997) but this reflects some uncertainty about how to proceed. Do the ethical issues rest entirely in matters of intervention process, or do they also lie in the selected intervention techniques themselves? Above all, how ethically aware are HRD practitioners? This paper explores these issues within the context of a selection of UK practitioners of HRD interventions used to promote value and behavior change.

It is difficult to display ethical literacy and avoid philosophical obscurity. However, we should remind ourselves of what ethics is about. It is the study of moral awareness, judgment, character and conduct in order to clarify the moral perspective in policies and practices. It serves '..to help disprove some suggestions and throw up some confusions' (Raphael, 1994). It is not about arriving at absolute final standards of what is right and wrong. In practice, consideration of ethics might lead us to adopt an ethical framework that informs our personal, organizational, and professional standards of conduct. However, in doing so we should be aware of the strengths and limitations of the ethical framework we adopt.

In an area of professional policy and practice like HRD, the ethical principles that are most commonly adopted are either an attempt to uphold and balance individual rights against those of organizations (ultimately to be derived from the so-called 'Kantian' or deontological perspective - see Table I) or else an attempt to justify the effect of policies and practices upon individuals in terms of the consequences for the wider organization (the 'Utilitarian' or teleological/consequentialist position). However, there are in fact a range of other ethical frameworks as outlined in Table I below.

A quick consideration of the above would indicate that virtue ethics (Solomon, 1993; Collier, 1995) and the ethics of care (Gilligan, 1982; Carse 1996) also provide relevant ethical frameworks for considering HRD policy and practice. Virtue ethics suggests that HRD professionals are obliged to 'lead a good or exemplary life' in their work, and to this end implies that professionals should identify, publicize and constantly uphold the key virtues for HRD, and that adherence to these virtues is not contingent upon organizational context and circumstances. These virtues might include integrity, transparency, and respect for persons, but there are possibly many others. So integrity would involve being explicit about the purpose of a particular development program - including any hidden agenda; transparency would involve being clear about the 'what-how-and-why' of an intervention; and respect for persons would involve being mindful of confidentiality in relation to program participants, and the boundaries between the public and private, between the cognitive and the emotional, and the need for 'permission' to be obtained without duress, if these boundaries are to be crossed.

By contrast, the ethics of care take us away from impartiality and formal abstraction in our ethical reasoning. The care orientation:

> rejects impartiality as an essential mark of the moral, understands moral judgments as situation-attuned perceptions to others' needs and to the dynamics of particular relationships, construes moral reasoning to involve empathy and concern, and emphasizes norms of responsiveness and responsibility in our relationships with others (Carse, 1996).

In contrast to the Kantian and consequentialist approaches to ethics which suggest that moral prescriptions be justified from an impartial standpoint, the ethics of care suggest that sound moral judgment may be dependent upon being attuned to specific individual needs, and the idiosyncrasy of circumstances, and that morally relevant features of particular situations can sometimes be obscured through an overzealous reliance on impartial prescriptions. However, unlike virtue ethics, the ethics of care finds upholding principles to be of limited use in informing and guiding a caring moral response. So, for example, ensuring that all employees experienced the same (possibly personally intrusive) team building program is not an ethical justification if one or more individuals find this to be a distressing experience. In this model, it would be ethical to withdraw such individuals from the program to show empathy and compassion for their distress, and to treat this as a consideration of equal or even more significant weight than overall outcomes, in the evaluation of the program. Thus the extent to which HRD professionals overtly promote and exemplify virtues in their relations with commercial clients, and the extent to which they also display an awareness and management issues around individual participant psychological safety, are also important considerations for ethical HRD.

Table I

A Summary of Ethical Frameworks

Theoretical Base	Type	Perspective	Brief Description
Kantian Theory	a) Universality and Reversibility	Rule based	One must abide by the categorical imperative such that what is right for one person is right for everyone, and do unto others as you would be done by.
	b) Respect for persons	Rule based	Second formulation of the categorical imperative: people should be treated as ends in themselves, never as means to ends.
Utilitarian Theory	a) Act Utilitarianism	Act based	Assess the act that will be for the greater good (or utility) as being ethical - the ends of the act justify the means. The aim is to achieve the greatest good for the greatest number
	b) Rule Utilitarianism	Act/rule based	Focus on the utility of a rule rather than the act: rules are fashioned on utility, and conduct on rules. Assess the tendency for an act to improve happiness or utility if acts of this type are generally done rather than not done.
Social Contract Theory		Contract based	Societal or contractual agreements must be abided by to ensure justice and the rights of individuals prevail
Discourse Ethics		Communication based	Assess the process by which decisions are arrived at. An ethical discourse is open, honest, suspends power differentials and includes all relevant points of view
Virtue Ethics		Character based	Assess a person's character such that a good, virtuous person exhibits virtues such as honesty, kindness, and generosity. Intentions are as important as actions.
Ethics of Care		Situationally attuned	Assess the situation in a manner that shows empathy and responsiveness to all aspects of individual's circumstances

Adapted from: L. Spence (forthcoming, 1999) What ethics in the employment interview? in D. Winstanley and J. Woodall (eds.) *Ethical Issues in Contemporary Human Resource Management.* Basingstoke: Macmillan.

Thus it should be apparent that HRD professionals have many ethical frameworks at their disposal which can all lead to a different interpretation of what is moral HRD practice. This presents a dilemma: either a moral relativism of 'anything goes', or else drawing up codes of professional practice, or at the very least raising professional debate and awareness. It is doubtful whether an open admission of moral relativism would be professionally acceptable, and as Marsick (1997) has pointed out, the familiar recourse to codes of professional conduct is of dubious worth, as codes are best when dealing with normal practice and can come unstuck when practitioners face a dilemma. Recent research on the use of a professional code of practice for psychological testing

within the UK revealed how codes of practice confine themselves to prescriptive statements, avoiding guidance on how the balance between competing claims might be achieved, and are not backed up with monitoring of compliance (Baker and Cooper, forthcoming, 1999). In this case there was a fair degree of correspondence between test users' espoused values about candidate rights, and their reported good practice. However, it was also apparent that in a number of important areas there was a contradiction between the reported practice of test users and their declared values about testing and individual rights. The main underlying reasons for this are pragmatics, self interests and costs. So, codes of practice can end up as a life raft to which organizations and professionals may cling without necessarily carrying out any ethical scrutiny. May be a better starting point is to promote the ethical awareness of HRD practitioners? This involves starting by exploring their awareness of the ethical issues surrounding not only the style in which an intervention is delivered but also the substance of the intervention itself.

Methodology

Previous research into the ethical awareness of managers (Snell, 1993; Maclagan, 1998) draws upon either models of ethical development (Kohlberg, 1969) or discourse, but as these are ethical frameworks which rely upon impartial and formalistic abstractions, and do not address the issues emerging from virtue ethics and the ethics of care, they have been rejected here. In addition, the inevitable sensitivity surrounding any investigation into ethical awareness has to be taken into account when considering valid and reliable methods of data collection. A questionnaire survey needs careful construction to include items that are valid indicators, and careful administration to ensure that it is appropriately completed. Thus the resulting research design for this project, was exploratory and interpretive, relying on documentary evidence and semi-structured interviews with three HRD professionals in each of three areas of specialist HRD practice within the UK. These were outdoor management development (OMD), Neuro Linguistic Programming (NLP) and Gestalt in organisations (GiO). These were selected because they are presented as useful to organizations undergoing significant change, and in particular, they assist with individual attitude and behavior change. More specifically, OMD has aroused considerable controversy in the UK around general health and safety and the placing of individuals in unfamiliar and stressful situations; NLP has acquired a reputation for rapidly achieving results with influencing skills, but again with some controversy surrounding methods; and GiO has a reputation for achieving effective value change and practitioner integrity, despite not being extensively use within the UK.

The sample of respondents was drawn from exhibitors at the March 1998 HRD Week (the major national annual exhibition and conference in the UK sponsored by the Institute of Personnel and Development). Both researchers attended this exhibition and made initial contact with several exhibitors providing OMD and NLP, and collected their promotional literature. In addition, one of the researchers was a practitioner of GiO, and made contact with two additional providers. These initial contacts were followed up by letters requesting interviews and outlining the main research questions. In view of the sensitivity involved in revealing an interest in ethical awareness, the researchers introduced the principal research question as concerned with the values underlying different approaches to personal development, and the approach adopted by the respondents. The identitiy of the researchers and their interests in ethical HRD were also revealed.These introductory letters were followed up by telephone to request an interview. The interview schedule contained eleven questions around the following themes:

- the ethical basis of forming and maintaining contractual relations with commercial client;
- the espoused values of the respondents
- the range of psychological change tools used
- awareness and management of issues around psychological safety and professional integrity

All respondents practicing OMD and GiO interventions were very enthusiastic about being interviewed on this topic. The three OMD respondents were all not-for-profit organizations who were members of the Development Training Advisory Group (DTAG), a trade association for OMD with a code of conduct and statement of principles. The GiO respondents included the two major providers of training in the UK, and a small consultancy in which one of the authors of this article was a partner. It proved much more difficult to secure respondents in NLP. Despite contacting several providers at HRD Week, and through the membership list of the UK Association for NLP, only two agreed to a face-to-face interview. They were both sole practitioners, but with very different backgrounds (humanistic psychology and information management) and different clientele (in the first case working with individuals experiencing personal and work-relationship difficulties, and in the other, delivering open programs in NLP training plus executive coaching). Some of the other NLP providers who were approached expressed lack of

interest and others voiced suspicions about the researchers' motivation. It is possible that contextual issues could explain the differing levels of enthusiasm. In the case of OMD, all three respondents admitted that they perceived the interviews as offering an opportunity to redress what they perceived as sensationalized media misrepresentation of the 'danger' and 'pressure' on individual OMD program participants. The GiO respondents saw this as an opportunity to publicize an intervention that is not well-known among HRD professionals. Finally, litigation over the proposed trademarking of NLP by its US founders was in progress in the UK at the time when interviews were taking place. This may quite understandably explain the reluctance to participate. None of the interviews were taped, but notes taken during the interview were written up later and scrutinized by both researchers to identify the key themes emerging around each of the interview questions.

Results

Ethics and contractual relations with commercial clients

All three OMD providers were concerned about client probity and openness, and although they admitted that they seldom turned down work with a client, their process of contracting would screen out undesirable clients, or would bring to the surface unethical intentions. In all three cases, learning contracts based upon strong diagnosis and regular monitoring and evaluation provided the opportunity to identify problems with the client when they arose. The positions of the two NLP practitioners were very different. One was very aware of the issues about client probity and openness, and was explicit in their refusal to collude with any hidden agendas. The other was bemused with questioning around this issue. The notion that there were clients with whom they could not work, or that there could be problems was reframed as a construct of the interviewer's mental processing!

All the GiO respondents were very firm about their conditions of working with clients. They would only work with commercial clients with whom an open, honest relationship was possible. Hidden agendas were unacceptable, and the iterative manner of arriving at a contract with clients would work to bring these issues to the surface, and if necessary could result in the provider withdrawing from the contract. Commercial clients who could not accept this way of working would not be acceptable.

Espoused values

Although only one had an explicit values statement, all three OMD providers referred to the statement of principles issued by their trade association, and in particular:

> (upholding)...political and religious tolerance, mutual respect, a belief in the dignity and importance of every person irrespective of status, age, sex, origin or preconceived contribution to society; a belief in every individual's capability to learn and to go on learning; respect and care for the environment (DTAG, 1991).

This was echoed in the interviews, with phrases such as 'respect for the uniqueness, dignity and potential of each individual', an aim to establish 'mutual trust...(involving...both sides being open, honest, truthful and reliable'; the provider's acceptance of 'full responsibility for physical and emotional safety', and 'professionalism in terms of skills, experience and knowledge.

One NLP practitioner provided literature with clear values statements, and conceded that their prior training in humanistic psychology, and their membership of the main professional body for counseling, required adherence to a professional code of practice. This respondent was also a member of the UK Association for NLP Psychology and Counseling (a primate limited company, rather than not for profit organization) whose members subscribed to a code of professional ethics that was very similar to those adopted for psychotherapy and counseling. In contrast, the other NLP practitioner was a member of the Association of NLP which has not provided a statement of principles or code of professional practice, and this provider did not have a statement of values. When pressed about their values, the hesitant answer was 'respect for individuals...love..and, oh....fun!'

GiO practitioners are all required to be professionally trained in Gestalt therapy and so are well aware of the codes of professional ethics of their professional body (the Gestalt Association UK), and so did not see the need for any additional written codes of practice or value statements. They were very explicit and eloquent about their values. These included: integrity, self-awareness, honesty, compassion, humanity, choice, responsibility and spirituality. Ethical values were '..the invisible glue that binds like-minded people together'.

Range of psychological change tools used

OMD programs usually use a combination of outdoor instruction and indoor facilitation and guided reflection. All instructors and facilitators were appropriately professionally trained (in one provider occupational psychologists were employed) and professional development activities were provided. All instructors were trained in basic learning styles, group dynamics and management of the 'comfort-stress-challenge triangle'. 'Indoor' facilitators had often taken short courses in other interventions such as Transactional Analysis and even NLP which was generally found to be interesting, although not consciously practiced.

Although one NLP practitioner conceded that they relied on their extensive repertoire of humanistic psychology tools as well as NLP, the other cited a more restricted and eclectic range of interventions including....

Psychological change is at the core of gestalt, but there are no explicit 'tools' in an instrumental sense. It is based upon a paradoxical theory of change, namely that individuals cannot be other than it is in their nature to be, and that attempts to change them otherwise are doomed to failure. So, as attempts to get behavioral and attitude change by just working with individuals at a cognitive level, are perceived as doomed to failure. Hence GiO practitioners assist individuals with the development of their self-support mechanisms in a manner that helps them acknowledge the existence and role of others (often those who hold very different values) and to seek their support. This requires establishing dialogue and supporting self esteem in oneself and others. So the Gestalt approach is not a set of techniques and formulae, so much as an orientation towards experience that is dynamic and flexible.

Awareness and management of issues around psychological safety and professional integrity

There was an explicit commitment to the psychological safety of program participants in the OMD trade association guidelines on health and safety with respect to the identification, handling, and prevention of mental and emotional disturbance at all stages of trainee selection, and course design, preparation and delivery. There was also an acknowledgment that 'evangelical', aggressive, confrontational high energizing leadership styles in trainers were unacceptable and likely to cause injury. All three providers of OMD had a very clear view of what psychological safety involved: openness and transparency in dealing with program participants; maintaining confidentiality about individual participant progress; and ensuring that peer pressure on individuals to go beyond their 'comfort zones' is directly confronted; while endeavoring to maintain a balance between challenge, support and respect for individuals.

Again there were marked differences in this respect between the two NLP respondents. A very conscious concern with boundaries between professional and individual client, an awareness of the limits of their professional expertise, and an acknowledgment of the presence of transference-counter-transference processes in client relations could be contrasted in one case with an instrumental naiveté around values, emotions, and relationships with clients: 'NLP is a means to an end - ultimately it is about what works.

GiO practitioners take psychological safety very seriously, and this is built in from the start, through managing the boundary between organizational and historic family issues, through awareness of and sensitivity to the needs and fears of others, and through flexibility in adjusting material to respond to personal and organizational issues. They aim to avoid pursuing their interventions beyond individual participant capacity to tolerate anxiety, and if necessary, will take time out from different parts of the program to support vulnerable people.

Discussion, conclusion, and future implications for HRD

As the research reported in this paper has adopted an exploratory and interpretative research design, the aim was not to make generalisable statements well rooted in claims to validity and reliability. Rather, it sought to explore the ethical dimension of HRD interventions; the ethical awareness of HRD practitioners specializing in work on value and behavior change; and the extent to which this was embedded in approaches to client contracting and the management of individual participant psychological safety. There are a number of interesting points for further professional discussion and research.

First, while most practitioners of OMD and GiO were eager to discuss issues of values (ethics), there was a marked diffidence on the part of NLP practitioners. This discrepancy is further reflected in the degree to which respondents were ethically literate and comfortable with a discussion of ethical values. Difficulties of access to respondents indicate that this issue should receive further exploration.

Second, the popularity of techniques with commercial clients bears no relation to the ethical practice of an intervention. So, for example, OMD has a poor ethical image in the UK, but can in fact be conducted in a very self-

consciously ethical manner, and little known methods such as GiO can offer a very high degree of ethical sophistication on the part of practitioners. There is a potential policy implication for the HRD profession, over whether it should promote interventions which are conducted in a self-consciously ethical manner, and caution against those HRD interventions of dubious ethical quality.

Thirdly, while codes of practice can provide a useful means of communicating ethical standards of intervention (as in the case of OMD) to both HRD professionals and their commercial clients, this is not always necessary, if practitioners of an intervention have undergone accredited training in humanistic psychology or personal counseling which has built in processes for dealing with ethical issues around contracting with commercial clients and protecting individual psychological safety. A mechanical adherence to 'good practice' is not enough.

Finally, this paper suggests the need to develop an ethical framework for HRD that goes beyond a list of individual program participant rights, or the ethical justification of an intervention in terms of its business benefits. Virtue ethics and the ethics of care are also relevant and should be incorporated in further research into the place of ethics within HRD.

Emotion Management and Organizational Functions: A Study of Action in a Not-For-Profit Organization

Jamie Callahan Fabian
Virginia Polytechnic Institute and State University

This case study of a not-for-profit organization uses Hochschild's (1983) emotion systems theory and Parsons' (1951) social systems theory to look at the purposes for which members of an organization managed their experience and/or expression of emotion (i.e., performed emotion work). The study found that emotion work actions were attributed to all four system functions of Parsons' (1951) theory. The dominant form of emotion work was anger suppression; the majority of emotion work actions were associated with the organizational culture. Because much of the emotion work was performed by individuals for organizational purposes, it may be possible to use emotion work actions by individuals to take a "distributed view" (Glynn, 1996) of organizational level phenomena.

Keywords: Nonprofit Organizations, Emotion Work, Social Systems

Emotion has been a component of many social science theories since the 19th century. In the organizational context, the study of emotion has focused on such elements as job satisfaction and employee stress. However, a growing interest has surfaced regarding a relatively new sub-field of sociology developed by Hochschild (1979, 1983)—the sociology of emotion (e.g., Ashforth & Humphrey, 1995; Fineman, 1993; Rafaeli & Sutton, 1987; Wharton & Erickson, 1993). The sociology of emotion, also known as emotion systems theory, is more concerned with the macro-construction of emotion and the emotional interchange between organization and employee than with specific attributes or outcomes of emotion at the individual level. A key component of the theory focuses on the conscious management of the experience and/or expression of emotion, known as emotion work.

Neither field researchers nor theoreticians have included in-depth explorations of the links between emotion work and the organization. The focus in both field research and theory extension is at the micro-sociology level without generally considering the macro-level. The macro-theory level may provide a lens to view emotion work as it relates to the organizational context. This study explores the links between emotion work and an existing macro-theory encompassing both the individual and collective levels of a social system. Specifically, it demonstrates that Parsons' General Theory of Action (Parsons, 1951) may be used as a meta-framework for a more rigorous approach to viewing emotion work in organizational contexts.

Problem Statement

Studies on emotion work have successfully sought to verify the existence of the phenomenon in a variety of organizational settings (e.g., Hochschild, 1983; Pogrebin & Poole, 1991; Wharton, 1993). These studies were conducted in organizations known for requiring a great deal of control of emotional states by employees (e.g., Hochschild, 1983; Pogrebin & Poole, 1991; Rafaeli & Sutton, 1987, 1989). Interestingly, these employees, such as airline attendants, bill collectors, and police officers, are all required to interface with customers to a large extent. Emotion work has been found to exist in all such occupations. Ashforth and Humphrey (1995) call for the study of emotion work in more typical organizations. Because the research site for this study is a not-for-profit organization, it is distinct from other organizations in which emotion work was studied. Further, the daily staff operations constitute a more "typical" organization. Including both paid and unpaid organizational members, this study captures emotion work in a fundamentally different population than previously studied.

Early studies in the cost of role conflict, which may include emotional roles, revealed an increase in job tension and a decrease in both job satisfaction and confidence in the organization (Cox, 1978). More current physiological studies on emotion suppression indicate that emotion work may have negative physiological consequences—such as impaired immune system functioning and artherosclerosis—which could influence organizational level phenomena (Levenson, 1994). Unfortunately, no attempt has been made to empirically assess the emotion work engaged in by employees as it relates to any organizational level phenomena. Further, no model exists to enable such research. This study links emotion systems theory to a theory of action that will facilitate the study of the relationship between emotion work and organizational phenomena. Such studies may help practitioners

Copyright © 1999 Jamie Callahan Fabian

improve individual and organizational performance by identifying and addressing organizational issues around which emotional suppression is high.

Glynn (1996) points out that "extending a microlevel construct to the macrolevel organization invites opportunities for ambiguity and threats of anthropomorphism" (p. 1087). However, if the goals of emotion work are oriented to both the individual and the organization, it is possible that emotion work is both a micro- and a meso-phenomenon. Individual emotion work may hold the seeds of the collective that can form a bridge between the individual and the collective. It may be a construct which enables a "distributed" (Glynn, 1996) view of the organization. In other words, organizational goals are embedded in the organizational members such that a study of individuals can yield patterns of the collective. This study offers a way to use an individual level phenomenon in order to begin to understand organizational level phenomena.

In summary, research to date has not attempted to "trac[e] a set of links" (Fineman, 1993, p. xii) between emotion work and any type of organization, whether emotion-laden or more "mundane." Nor has any empirical research been conducted to build or extend theory to accomplish such an agenda. This study extends theory in order to trace the links between emotion work and organizational phenomena in future studies by establishing a connection between the emotion work construct and the individual level of Parsons' (1951) analytical systems model. Hochschild (1979, 1983) argued that emotion work is generally conducted for organizational purposes at the behest of organizational management. However, it is also possible that emotion work is conducted for individual purposes, especially in those organizations that do not have a high customer interface. Further, it is possible that emotion work may be conducted for organizational purposes out of a personal sense of commitment to the organization rather than at the behest of organizational management. Thus, the research question that guided this study was, "*Do individuals conduct emotion work for individual or organizational goals within an organization?*"

Overview of Conceptual Framework

Talcott Parsons' model of four "functional imperatives" was used as the organizing framework for the goals of emotion work in this study. These four functional imperatives are associated with the goals of action taken by a system (Wallace & Wolf, 1995). They are called adaptation, goal attainment, integration, and latent pattern maintenance. Although most people associate Parsonian theory strictly with groups or larger levels of systems, Parsons (1961) argued that individuals could be considered systems that encompassed the four functions. Therefore, Parsons' classification system may be useful in understanding the goals of action taken by an individual within a social system. Figure 1 is a representation of the four system characteristics.

Adaptation	Goal
Latent Pattern Maintenance	Integration

Figure 1: Parsons' four system functions

Briefly, according to Parsons (1951, 1961), the adaptation function obtains resources from the external environment for use by the system. The goal attainment function is concerned with mobilizing those resources to meet the larger goals of the total system. The integration function is concerned with the ways to bring together the various units and resources of the system in order to create a collective identity. Finally, the latent pattern maintenance function serves to maintain the stability of institutionalized beliefs and patterns of interaction within the system. Again, these functions relate to the goals of actions taken by a social system.

Hochschild called her contribution "emotion systems theory" because it is comprised of "a system composed of individual acts of 'emotion work', social 'feeling rules', and a great variety of exchanges between people in private and public life" (1983, p. ix-x). Many consider her to be the founder of a relatively new sub-field within sociology known as the "sociology of emotion" (Wallace & Wolf, 1995). As such, the phrase "sociology of

emotion" has often replaced Hochschild's own term of "emotion systems theory". The theory has two primary components—emotion work and feeling rules.

Emotion work is the active attempt to change, in either quality or degree, an emotion held by an individual (Hochschild, 1983). There are two general types of emotion work (Hochschild, 1979). The first is "evocation." When an individual performs the evocation type of emotion work, that individual is trying to draw forth an emotion that is not present. The other type of emotion work is called "suppression." It is just the opposite of evocation. When an individual is performing the suppression type of emotion work, that individual is trying to eliminate or, at the very least, subdue an emotion that is present.

The second major component of Hochschild's work is that of "feeling rules" (Hochschild, 1979, 1983). Feeling rules are the "socially shared, albeit often latent (not thought about unless probed at)" (Hochschild, 1979, p. 563) guidelines that govern how we want to try to feel. They guide our expression of emotion and they guide our attempt to internalize the acceptable emotion (as defined by the situational rule). Feeling rules represent what an individual "should" feel in a given situation. These rules can govern the extent of the appropriate feeling—how much emotion should be displayed/felt; they can govern the direction of the emotion—whether the individual should feel happy or sad; and they can govern the duration of the emotion—how long an individual should maintain a particular emotion. As such, they are "guidelines for the assessment of fits and misfits between feeling and situation" (Hochschild, 1979, p. 566).

Emotion work theoretically constitutes a critical element found in the Parsonian General Theory of Action. Parsons argued that four types of action were possible—expressive, intellectual, moral, and instrumental (Ritzer, 1992). Expressive action is primarily affective; intellectual action is primarily cognitive; moral action is primarily evaluative; and instrumental action is a complex act in which affects are cognitively manipulated in order to achieve goals. Hochschild (1979; 1983) looks at how society forces an individual to cognitively shape and control feelings in order to fit within that society, in order to achieve goals within that society. Thus, emotion work can be considered a type of instrumental action.

The four functions described earlier (adaptation, goal attainment, integration, and latent pattern maintenance) represent the goals of instrumental action at the individual and collective levels of a system. Because instrumental action is goal oriented, when conducted by individuals it should manifest itself in individual goals associated with the four system functions. It is possible, however, that emotion work also constitutes a meso-phenomenon. In other words, emotion work conducted by an individual may be characterized by both individual *and* organizational goals. Because Parsons' model theoretically captures both individual and collective levels of analysis, it has the potential of capturing meaningful data across multiple levels of analysis. If this connection between Parsons and Hochschild can be demonstrated, researchers may be able to use Parsons' model to look at the goals of the individual level phenomenon of emotion work and make inferences about the connection between certain types of individual and collective level goals.

Methodology

This primarily qualitative study was based on a naturalistic design (Lincoln & Guba, 1985). The qualitative element was supported by a quantitative survey element as a triangulation device. A not-for-profit organization established in 1946 and associated with aerospace and national defense agreed to be the research site for this study. The membership of over 160,000 people in this organization is primarily composed of Air Force active duty members, Air Force Reserve component members, veterans and retirees; however, membership is also drawn from civil service personnel, cadets, and civilian individuals who have never experienced military service, many of whom are affiliated with aerospace industry. The sample from this study was drawn from the professional staff, the Board of Directors, and the senior leadership of the states.

Four methods of data collection were used (individual interviews, observations, surveys, and document analysis) to provide a measure of validity through data-collection method triangulation (Patton, 1990; Yin, 1994). Documents reviewed included letters and e-mails from organizational members, videotapes, field books, and organizational publications. The Dealing with Feelings survey (Sashkin & Jones, 1987) served as a data-collection method triangulation element and was administered to 242 members of the professional staff, the Board of Directors, and the leadership of the states. The 25 (9 women, 16 men) individuals interviewed for the study were selected from those organizational members who returned the survey. This ensured that a triangulation point was available for all interview participants. Participant observations were conducted among the volunteers at a state

meeting, a Board of Directors meeting, a convention exhibit, and several luncheons, dinners, and cocktail parties. Traditional observations were conducted of the staff members at the National Headquarters.

Over 800 pages of transcribed interviews and correspondence were analyzed using NUD*IST software. The four functions of systems, as defined by Parsons (1951), were used as the primary codes. Open coding (Strauss, 1987) was used within the larger system codes for greater refinement of the data. Emotion work and the specific emotions associated with the emotion work performed were also part of the primary coding set. Data identified as "emotion work" was automatically included in the study. Each reference to emotion work was assessed to determine if it could be connected to one of the Parsonian functions. As will be discussed later, all references to emotion work actions were easily connected to the functions of Parsons' theory of action.

"Disinterested" colleagues performed coding and data interpretation verification. Three colleagues familiar with the Parsonian framework (1951) coded an excerpt of the data set, resulting in an agreement rate of 89% between the researcher and at least one colleague on the Parsonian component of the analyzed excerpt. When the emotion work codes were added, the agreement rate dropped to 68%. However, this is not surprising. First, the outside coders were more familiar with Parsons than they were with Hochschild. As they focused on classifying actions according to the Parsonian framework, it appeared that they often forgot to add what emotion was associated with the action. Further, the outside coders had only words on a page to guide their perceptions. As the interviewer, I had the benefit of recalling gestures and facial expressions, as well as listening to the taped interviews and hearing vocal inflections. Using an anthropological approach, however, I made the final decision in a qualitative sense regarding which codes to apply to the transcripts after considering comments from outside coders.

In addition, seven scholars with a basic understanding of the theoretical framework, yet unfamiliar with the research site, reviewed the findings and interpretations for consistency. Two staff and two volunteer members of the organization also reviewed the final document for accuracy of interpretation. Finally, ANOVAs were conducted using the overall Dealing with Feelings survey score and the score from an "emotion work" subscale to ensure the survey responses of the interviewed sample were not significantly different from the larger surveyed sample.

Results and Conclusions

The ANOVAs indicated that the interview sample was not significantly different from the larger surveyed sample on either their overall score regarding how they dealt with feelings ($p < .09$) or their subscale score regarding the extent to which they suppressed their emotions ($p < .23$). This gave added credibility to the findings that emerged from the interviews. In general, those individuals who claimed in the interviews that they tended to express their feelings also tended to have emotion work subscale scores that supported this claim. Interestingly, however, these same individuals also tended to have a higher number of emotion work actions identified in their interview transcripts.

There are several possible reasons for this finding. First, the longer interviews contained more incidents of emotion work. In addition, many of the *expressed* emotions described in the interviews may have appeared as emotion work in other contexts. For example, one volunteer thoroughly described her feelings about gender discrimination in the organization and, in her closing comments, made an off-hand remark that she would never let anyone else know how she felt about that subject. Also, the self-report nature of the study may have influenced the responses. Several respondents who claimed to be expressive indicated that performing emotion work was not genuine and, therefore, socially undesirable. One volunteer remarked, "I wouldn't [evoke an emotion], because it would be untrue." Finally, it is also conceivable that those individuals who report themselves to be more expressive are more aware of their feelings and, thus, are able to recall more experiences of emotion work.

The findings and interpretations are presented as they were analyzed, culminating in an assessment specifically related to the research question itself. First, emotion work actions were identified and sorted according to demographic characteristics that emerged as particularly relevant among the respondents. Next, thematic interpretations of the emotion work actions are presented as they were associated with each of the four functions of social systems. Once emotion work actions were identified, categorized, and interpreted, it was possible to assess the underlying purposes for which these actions were taken. Thus, the first analyses formed the foundation on which an assessment of the *purposes* of the emotion work could be conducted.

Out of the 605 participant references to emotion, 174 were emotion work actions. The vast majority of emotion work conducted was suppression of negative affect, especially anger. Evoking positive affect was also mentioned, most frequently by female staff members in the performance of goals associated with adaptation. A new form of emotion work, "veiling", appeared in this study as the simultaneous performance of suppression and evocation. Some of these emotion work actions had become so natural they had become "habits of mind" (Dewey, 1916/1944). When the sample was differentiated by gender and by organizational position (staff vs. volunteer),

women and staff members tended to perform more emotion work. This was particularly true for the female volunteers, who tended to perform the most emotion work. Women comprised only 8% of the senior volunteer leadership of this organization. Among the staff, women tended to be clustered at the mid- and staff level positions that Hochschild (1983) identified as particularly oriented to the performance of emotion work.

The central finding of the study was that the organization was facing an identity crisis due to both the changing nature of society and technology, and the increasing age of its membership. The modal age group in this organization was over 70. At a state meeting, one member commented that, "In a couple of years we'll be holding our meetings in a nursing home." Many of these older individuals who fought so hard to create a separate "air force" seemed to struggle with the concept that the organizational mission now included both "air" and "space." Others struggled with what constituted the mission of the organization since air and/or space forces could be found in all service branches of the United States military. Were they to support the United States Air Force? Or did they support aerospace power regardless of the service branch? Issues such as these formed the core of the identity crisis in the organization. The findings from the four themes associated with the system functions could all be interpreted as manifestations of this identity crisis.

Emotion work actions were associated with each of the four system functions of Parsonian theory (1951), demonstrating that the framework could be used to categorize and interpret emotion work. The vast majority of emotion work actions conducted in this organization were focused on internal organizational goals as opposed to the "customer orientation" goals that served as the focal point in other studies. This highlights that earlier emotion work studies did not capture what may be the richest source of emotion work in organizations—the daily interactions between organizational members. Latent pattern maintenance, or culture, received the most emotion work action references. The majority of staff emotion work actions were clustered in the integration function and associated with communication issues. The majority of volunteer emotion work actions were clustered in the latent pattern maintenance function and associated with discrimination and diversity issues.

The adaptation theme was associated primarily with the staff perception that they functioned as the economic "invisible hand" that guided the organization. As such, they needed to hide their true feelings from their customers, the volunteers. One senior staff member commented, "as a staff person, and with my work ethic, it was ... go out there and promote it, the [organization]." One mid-level manager on the staff discussed her growing frustration with the frequent interface with volunteers, for whom she always had to put on a "fake" smile, and the toll it took on her personal life. Nevertheless, she always attempted to shield her true feelings from the volunteer, her customer.

The goal attainment theme was associated mostly with the volunteer perception that emotions constituted a "monster" that needed to be "controlled" in order to accomplish the mission. Interestingly, this theme, in particular, highlighted the difficulty experienced by active duty and veteran Air Force members in differentiating their organizational experiences from their active duty Air Force experiences. They frequently discussed actions associated with the Air Force when asked to discuss organizational actions. For example, there was a common perception among these individuals that those in the profession of arms cannot allow themselves to share their true feelings about the events of combat (or other situations for that matter) or they will not be able to perform their mission. The most poignant discussions of emotion management were from a retired senior officer whose father had survived the Bataan Death March during World War II and who had himself been shot down during a combat mission in Vietnam. He remarked that emotions are something "that you need to combat internally, within yourself. If you're not afraid, you don't understand what's going on. It's just whether you can conquer the monster or not."

The integration theme was associated with "turf wars" which occurred among staff and volunteers. These turf wars most frequently concerned "biting [one's] tongue" on issues related to the control of information flow within the organization. Although the senior staff perceive that teamwork identifies the nature of the organization, the junior and mid-level staff have a different perception. They believe that teamwork only appears when the organization is sponsoring a major event, such as the national convention. During these times, the organization operates in a matrix structure. During daily operations, the organization is a siloed hierarchy in which directorates within the organization implicitly compete with one another.

Finally, the latent pattern maintenance theme was associated with "duty, honor, country" so often connected to the military culture. Symbolic rituals associated with those killed, missing in action, or prisoners of war generated a wide variety of emotion management. Several active duty and veteran Air Force members discussed how they held back tears during a ceremony performed in honor of prisoners of war (POWs) and those missing in action (MIAs).

The primary issues associated with latent pattern maintenance, however, concerned the suppression of emotion related to gender diversification. The "white, male, preferably pilot" culture associated with the military spurred the suppression of negative affect associated with diversity issues. One female volunteer remarked, "I

certainly feel a sense of being, *certainly*, not on an equal footing with, and never *will* be able to attain an equal footing with, the men who are in this organization... I really feel that there certainly is a bit of discrimination toward women in this organization." Another female volunteer, a military pilot, described a discussion she had with an older male volunteer who believed that only (male) pilots should be leaders in the organization. She apparently refrained from indignantly telling the male volunteer that she has "to take off my skirt to put on my flight suit." Ironically, I found myself performing emotion work under similar situations in this organization. At one point, I held back anger and disbelief as I listened to an interview participant insist that the scholarship committees should refrain from awarding spousal scholarships to women who were not pursuing careers which would complement their military husbands' careers. He also argued that the women's extracurricular activities were too often spent in professional associations instead of the PTA and church activities that should occupy their time.

Although not specifically included in the design of this study due to the focus on the "action" components of the conceptual framework, feeling rules emerged as an additional theme in the findings. The social dimension proved to be an important guide for individuals as they conducted emotion work. Much of the emotion and the emotion work seemed to be almost "unconscious" in nature, contrary to Hochschild's conception of the phenomenon. Shortly after the surveys had been distributed, one staff member was overheard commenting, "What do emotions have to do with organizations?" Another very senior, retired Air Force officer returned his survey, largely unanswered, with a comment that, "In general, I do not feel." An unsolicited description of this individual by an interview participant, however, revealed that he showed a great deal of warmth and compassion in interpersonal encounters. Thus, either this officer is doing an extraordinary job of evoking unfelt emotion, or, after more than 30 years of military service and many combat experiences, he has internalized the emotion work to such an extent that he does not recognize the emotions he is actually feeling and how he is working with them.

The preceding analyses about emotion work and the functions associated with the emotion work actions formed the foundation to analyze the specific research question guiding this study, for what purposes did individuals conduct emotion work in this organization. The purposes for which individuals conducted emotion work were substantially different between staff and volunteer members. Staff members were much more likely to perform emotion work for individual purposes than volunteers were. When staff members *did* perform emotion work for organizational purposes, it was most frequently in association with the adaptation function in the form of organizationally mandated customer service. The volunteers, however, conducted very few actions for strictly individual purposes. The vast majority of their actions were conducted for organizational purposes. This distinction between volunteers and staff members highlights the two prominent subcultures that appeared in this organization. The staff members were more often driven by the economic bottom-line of the organization than the volunteers were and tended to "look out for themselves." The emotion work conducted by the volunteers tended to be driven by a value-commitment to the organization. Because both staff members and volunteers performed emotion work for organizational purposes, there is support for the argument that emotion work may be considered a meso-phenomenon that bridges the gap between individual and organization.

Contributions to Practice

The outcome of this study is an extension of theory that provides practitioners and researchers with a model to view emotion work in organizations and to understand how that emotion work is associated with organizational action. Neurobiological work spanning more than a hundred years has revealed that emotion is a pre-requisite to communicate meaning to others, to make decisions, and to take action on those decisions (Damasio, 1994). This study found that members try to hide their negative feelings about issues and actions associated with the organization. Because much of the emotion work is internal and at least some of that emotion work is unconscious, it raises the possibility that decision-making authorities in the organization are overlooking it. For example, one volunteer commented that he had offered his support for a policy change in the organization, but he personally didn't like the change and didn't believe it would succeed. Such masking of true feelings may have negative consequences for organizational effectiveness (Gilley & Coffern, 1994). This study suggests that the roots of failed organizational action may be found by uncovering emotion work actions associated with early decision-making processes. While these emotion work actions may not have a direct and immediately visible impact on the organization, there are certainly some indirect and perhaps long-term outcomes from such actions for the organization. This study identifies emotion work action as an area that could enable HRD practitioners to help surface and resolve masked issues before the organization suffers harm.

The theoretical connections observed in the application of Parsonian theory to classify emotion work actions offer a concrete means to provide feedback to the organization on issues that are salient to individuals in the

organization. This study demonstrated that Parsons' (1951) model of social systems can be extended to more rigorously view the phenomenon of emotion work. As the importance of emotion constructs continues to gain attention among practitioners and scholars, this extension of theory offers a useful mechanism to study one such construct—emotion work. Although this study should not be generalized without caution, it is possible that the finding of emotion work as a meso-phenomenon may apply to other settings. If so, emotion work as classified and interpreted using Parsonian theory (1951) may enable a more detailed study of phenomena of interest to many HRD practitioners, such as organizational learning and organizational culture. By focusing on the issues around which emotion work is acting as a potential barrier to learning and culture change, HRD practitioners may be able to facilitate positive change in the organization.

In particular, if emotion work can be considered a meso-phenomenon that offers a distributed view of the organization (Glynn, 1996), it may offer a methodological alternative to studying organizational learning. Many studies of organizational learning have focused on identifying factors associated with organizational learning and then asking questions targeted to those specific factors (e.g., Croswell, 1996; Watkins, Yang, & Marsick, 1997). This is especially true for the qualitative studies that incorporated the four systems functions of Parsonian-based, Schwandt (1994) Organizational Learning Model (e.g., Croswell, 1996; Hinds, 1995). When using this approach, it is possible that researchers are more likely to find what they wanted to find because the study was *designed* to provide the theoretical support they were looking for. However, by identifying a type of instrumental *action* associated with the four functions of the model that can be accessed in a population without reference to the four functions themselves, researchers and practitioners may argue that the findings hold even greater credibility for applicability in an organization.

By tracing the types and purposes of emotion work by basic demographic characteristics across systems functions, it was possible to identify two distinct subcultures in the organization. The subcultures had distinct issues and events that generated their emotion work actions. While staff members tended to focus on communication issues, volunteers tended to focus on discrimination issues. This gives the opportunity to not only provide feedback on how the organization might improve perceived problem areas but also reconcile the two subcultures. It is very possible that other, similar distinctions would occur in other organizational contexts. This would enable the HRD practitioner to provide more detailed feedback to an organization that is directly related to critical systems functions of that organization. Practitioners in voluntary sector organizations should be especially aware that volunteers and professional staff members are likely to have fundamentally different purposes behind their actions in the organization. Such a difference in perspective requires tailored approaches for each subculture on issues such as organizational change, reward systems, and recruitment.

Practical applications may also be derived from the findings associated with gender differences in the performance of emotion work. This study supported Hochschild's (1983) premise by finding that women conducted more emotion work than the men did. Gallois (1993) suggests that the higher the power differential between two groups, the more aware individuals from the less powerful group must be regarding emotional contexts of interactions. She specifically refers to power differentials between men and women. It may be possible to discern the extent to which actual power differentials between genders exist in a given organization by focusing on the differences in frequency, context, and type of emotion work performed. This would enable an HRD practitioner to provide interventions to reduce the power differentials in critical areas associated with organizational performance. Among other benefits to the organization, this would increase the involvement of otherwise qualified individuals. Again, generalization of these findings should be taken with caution; nevertheless, HRD practitioners should be aware that female organizational members may be conducting a great deal of emotion work relative to their male counterparts.

This study found that emotion work definitely played a role in the actions taken by the members of this not-for-profit organization. A model that can be used to view emotion work in organizations may be useful to both scholars and practitioners. From Parsons' (1951) analytical model, scholars can create formal propositions (Turner, 1991) to account for an important, but relatively little studied, aspect of organizational life. Practitioners can use this knowledge to increase individual performance within the organization and, hopefully, to increase a variety of overall organizational capacities. Both scholars and practitioners alike can use this information to develop mechanisms to help organizations face the inherent existence of emotions in organizational processes and "manage" (Fineman, 1993) that existence in accordance with individual and organizational needs.

Communities in the Workplace

Darlene Russ-Eft

AchieveGlobal, Inc.

This study focused on developing an empirical definition of "community in the workplace." A total of 401 usable critical incidents were gathered from 119 employees in 22 different organizations in the U.S. and Canada. These factors emerged: team work and participation, mutual respect and responsiveness, investment in professional growth, concern for improvements and performance, recognition of effort, and investment of personal time and interest. They were compared with frameworks developed by Gardner (1990) and Goffee and Jones (1996). Implications for future HRD practice and research were provided.

Keywords: Organization Culture, Workplace Community, Critical Incident Method

Interest in the impact of the community on individual and group behavior has existed for some time. The earliest work on "community" focused on the community in which people live. Various approaches were used to define "community." One approach (e.g., Hoyt 1939; Park, 1915, Park & Burgess, 1925) focused on the relationship between spatial and physical features in the city and certain social characteristics, such as crime rates. This work led to various zonal hypotheses concerning communities. A second approach, called "social area analysis," focused on the social characteristics of an area (e.g., Shevky and Williams, 1949). Another approach concentrated on the personal interactions among residents (e.g., Greer, 1956). Yet another approach used the services provided within an area to define the community (e.g., Warren, 1975). Finally, Russ-Eft (1979) gathered individuals' perspectives to define the neighborhood in order to create an approach to measuring neighborhood quality of life.

More recently, Rossi (1994) introduced the notion of communities within schools and the impact of the "community" on students at risk. Specifically, Rossi and Stringfield (1995) undertook to identify "conditions that must be met in transporting isolated successes to the entire population of schools serving at-risk students." One of those two conditions was labeled "community in schools." They defined "community" as "the deep-structure fabric of interpersonal relations ... this fabric permits a shared frame of reference and supports mutual expectations."

Moving from neighborhoods (as communities) to schools (as communities), we might also consider the workplace as a community. John W. Gardner (1990), for example, recognized the importance of community for leadership. He claimed that a leader can raise employee morale and improve productivity by encouraging a sense of community. Similarly, Brown and Duguid (1991, p. 40) suggested the importance of evolving communities of practice as "significant sites of innovating."

In the wake of actions leading to disintegration, such as mergers, de-layering, and downsizing, the management and research literature abounds with discussions of corporate culture. For example, Marks and Mirvis (1998) and Mottola, Gaertner, Bachman, and Dovidio (1997) examined how corporate cultures led to success or failure in mergers. Michaels (1998) described why many valuable employees resigned from BBN Corporation, a technology company at the forefront of Internet development, after being purchased by GTE. "They weren't in fear of losing their jobs. They were just worried about what this new culture was going to be like."

Goffee and Jones (1996) claimed that such corporate culture can be described as "community." "Culture, in a word, is community. It is an outcome of how people relate to one another. Communities exist at work just as they do outside the commercial arena. Like families, villages, schools, and clubs, businesses rest on patterns of social interaction that sustain them over time or are their undoing" (p. 134).

Goffee and Jones (1996) suggested that sociology provides an identification of critical features for community, namely sociability and solidarity. Sociability refers to the friendliness of the community members, while solidarity consists of a community's ability to focus on shared objectives. Using these two factors, they conveniently derived a two-by-two matrix showing four types of community: networked, mercenary, fragmented, and communal. The empirical data providing support for these four types consisted of descriptions of four organizations fitting each type.

Although case study research can yield important information (Mulder, in press; Russ-Eft, in press; Yin, 1984/1989, 1993, 1994), the selective presentation of cases, as appeared in Goffee and Jones (1996), provides little in-depth understanding. First, one wonders whether the two selected factors are the only ones critical for

Copyright © 1999 Darlene Russ-Eft

reader is left with questions as to whether one can describe the variety of organizations using such a simple taxonomy.

Another approach to describing "community" in the workplace involved the development of a theoretical framework. Gardner (1991) identified ten characteristics or ingredients posited to lead to healthy communities. These were (1) wholeness incorporating diversity, (2) a reasonable base of shared values, (3) caring, trust, and teamwork, (4) effective internal communication, (5) participation, (6) affiliation, (7) links beyond the community, (8) development of young people, (9) a forward view, and (10) institutional arrangement for community maintenance.

The purpose of the present study was to identify the critical components of community within the organizational environment based on actual human experiences rather than opinions and attitudes of the researchers or theorists. The research questions were: (1) What are the dimensions of community in the workplace? and (2) To what extent are these similar to or different from those described by theorists?

Methods

Subjects

A total of 119 employees participated in the study. They were from 22 different organizations (gathered from 100 contacted organizations) located throughout the U.S. and Canada. The types of organizations included business services, manufacturing, publishing, high tech, defense, utilities, wholesale/retail, and education. A critical incident study attempts to obtain a sample of the full range of experience. Thus, it is not necessary to secure a representative sample of employees; instead, it is important to obtain a sampling of employees from diverse organizations and with diverse experiences.

Instruments

A critical incident questionnaire was constructed, reviewed internally, and pilot-tested with five human resource directors. The instructions included the following:

> In some workplaces, people genuinely like and work well with one another, and management policies, to a greater or lesser extent, support teamwork and the development of trust. We want to learn about the types of conditions, events, or behaviors that may foster **community** among co-workers.
>
> Please think of an incident at work involving your **co-workers** that **positively** affected your sense of community or theirs. Please describe the incident in as much detail as possible, focusing in particular upon the actions of the people involved.

Other critical incident questions asked about negative situations and about positive and negative situations involving management. In addition, demographic questions were included.

Procedures

A research staff member contacted representatives of various organizations. The person described the purpose of the study and the survey form and then requested the cooperation of the representative in administering the form to a group of employees. In most cases, the representative agreed to obtain responses from five to ten employees, but in some cases, they agreed to survey only two or three employees. Survey forms and instructions were then sent to the participating representatives. The staff member followed up with the representatives by phone and fax until the completed forms were received.

Analysis

The responses to each question were separated, along with information identifying the characteristics of the participant who made the response. Each incident identified as "critical" by the participant, or judged by the analyst as so intended, was considered as a separate incident. If a response included more than one incident, duplicates of

the entire response were made. Such a procedure allowed the analyst to physically separate the different incidents for classification purposes, while still being able to identify the entire response.

A total of 401 usable critical incidents were obtained from the sample. The only responses not used in the analysis were those that were clearly not an incident or were uninterpretable. The analysis of the incidents followed the guidelines set forth by Flanagan (1954, 1974) and are listed in Russ-Eft (1979; 1995).

Results

Demographic Results

The respondents represented a variety of different backgrounds and workplace experiences. The sample included exempt and non-exempt workers, approximately equal numbers of men and women, and all major classifications of age, education, years with the organization, and ethnicity. It should be noted that these demographic characteristics (i.e., education, age, gender, ethnicity) were identified as major contributors to the workplace experience.

Results from Critical Incident Analysis. Based on the analysis, six major factors emerged. These appear in Figure 1 along with a brief description.

Team work and participation	People feel that they are working as a team, participating fully in decisions and efforts to get the job done.
Mutual respect and responsiveness	Individuals respect each others' skills and interests and respond to perceived needs.
Investment in professional growth	People invest time and money in formal and informal training.
Concern for improvements and performance	Managers improve the work place or work procedures; co-workers do their work well.
Recognition of effort	People recognize others' efforts, and they appreciate rewards for good performance.
Investment of personal time and interest	People give personal time and attention to individuals who need or merit it.

Figure 1. Listing and description of factors identified through the critical incident analysis.

Under each factor listed in the following paragraphs, we summarized the incidents related to managers' behavior and those related to co-workers' behavior. In addition, we provide some positive and negative incidents as examples.

1. Team work and participation. Managers build teams and encourage the participation of workers in setting vision and goals, making decisions, planning, solving problems, improving productivity, and rewarding effort. They introduce formal programs and consultants to increase workers' management of their own tasks. They trust the judgment and recommendations of teams, delegate responsibility to them, and keep them informed of what they need to know to do their job right. On an individual level, managers support ideas and initiatives, select workers to participate in special projects and reinforce decisions they have delegated. In negative situations, work is "micro-managed," indicating a lack of trust in workers, people are not kept informed, and workers feel they are left out of events leading to changes, large and small, that affect their work.

"I was assigned a project by my supervisor ... I gave him my opinion and he said, 'It sounds great. Go ahead and do it.' He was available for questions ...and told me twice I did a great job."

Co-workers cooperate with each other to get the job done well within their own teams or on cross-functional teams and special projects. Individuals pitch in to handle an overload, compensate for absent co-workers, do extra tasks, or handle crises and urgent situations. They assist co-workers, with or without being asked, and help them improve technical skills. When needed they cooperate to redivide the labor and redelegate tasks. In negative

situations, not all team members pitch in, some feel excluded, or conflict arises over responsibilities. People don't offer or refuse to ask for help from co-workers, and as the workload becomes overwhelming, stress increases.

[Negative] "One of our team members feeling work overload does not communicate to management how she feels, creating stress not only for her but upsets fellow team members."

2. Mutual respect and responsiveness. Managers are responsive to their teams, make themselves available, encourage expression of opinion and need, listen actively, and take action to resolve problems brought to their attention. They also respect individuals, treat poor performance with assistance, not reprimand, counsel those under stress, and defend those who are mistreated. Managers pitch in when their groups or individuals need extra hands. In negative situations, managers ignore poor performance, fail to support individuals who are mistreated, and ignore people's opinions. They behave unprofessionally, are temperamental, rude, and moody. They make unreasonable demands and sometimes put their own interests ahead of the team's and the company's interests.

[Negative] "The manager held a mass meeting to communicate items of great importance to all who work here. The meeting was held in an area that requires earplugs when we work in or pass through it. Questions were not fully answered. The key items were not well covered and the manager appeared evasive on some issues."

Co-workers express mutual respect for each others' skills and trust in their intentions and abilities. They solve interpersonal problems, including those involving cultural and racial bias. They feel that they are well informed of what is happening in the workplace. In negative situations, co-workers treat others with disrespect, sometimes building cultural or racial barriers. They take their complaints to the boss rather than to the co-worker concerned. They display animosity, are unable to solve interpersonal disagreements, and mistrust each other in times of external threats to the group. They feel misunderstood and ill informed.

"We hold round table meetings on a regular basis. ...These round tables are designed to be positive where recognition and praise is given from one co-worker to others."

3. Investment in professional growth. Managers demonstrate that they value workers by sending them to off-site training sessions, encouraging on-site training, and supporting individual pursuits of continuing education. They provide cross training of team members. In negative situations, managers refuse to invest more, laying workers off, cutting salaries, or denying them the training and/or moral support they need to continue.

"The manager continues to support human resources development even in tough economic times. This encourages me. Funding training programs gives the message that the company is dedicated to survival (long-term) and has confidence in its present employees."

Co-workers appreciate training in technical and interpersonal skills, and they enjoy becoming acquainted through training events with people outside their immediate work areas.

"Recently we all met in Chicago to receive training on the new benefits plan. We all brought our fears, anxieties, apprehensions, and enthusiasms to the training."

4. Concern for improvements and performance. Managers pay attention to improving work conditions and the work environment. They introduce initiatives to improve the quality of products or services. In negative situations, managers slight quality or safety measures, do not put resources into making working conditions more tolerable, and do not provide adequate technical or administrative support.

[Negative] "We were having a major piece of equipment moved from one plant to another. Our maintenance men were wanting to do things right, which included cleaning and doing preventive maintenance on it during the move. The manager did not heed this and gave them such a short time frame to move it that the extras could not be done."

Co-workers take pride in high-quality work and positive results from their efforts. They often exceed their own expectations or those of others, and are pleased about doing so. They help to maintain good working conditions. In negative situations, workers are ashamed of or discouraged by low quality that is tolerated.

"We recently had a piece of equipment that broke down. This equipment has failed in the past and the maintenance repair time was two to three days. The equipment was repaired this time in one day. It was good coordination and an all out effort by the maintenance department to get the job done."

5. Recognition of effort. Managers recognize and reward good performance, sometimes with salary increases, sometimes with special events, and other times more informally, by praising groups and individuals in private or in public. They are fair and impartial in their recognition. In negative situations, efforts go unrecognized, or they create bad feelings when they are perceived as unfair or partial to certain individuals or groups, including cultural or racial groups. Managers also offend by talking negatively about some people in front of others.

"One day I did a good job—high production quantity and quality. My supervisor came and said 'thank you.'"

Co-workers give useful feedback on performance to each other and feel that their peers—as well as management—recognize their effort. They take pleasure in both giving and getting useful feedback. They are also proud to feel part of their team when they encounter outsiders at some event, even when "recognition" is not formally part of the event. In negative situations, credit or blame is misplaced, and some workers feel excluded from recognition they deserve. Sometimes they think the feedback they receive is malicious or harmful.

[Negative]"Why am I a team member at 1:00 in the morning when we are putting together reports and presentations, but not when recognition is received?"

6. Investment of personal time and interest. Managers sponsor company events and invite workers to social events. They give personal support in times of crisis, allowing more flexibility and privileges and helping as they can. In negative situations, managers completely ignore the personal lives of their workers.

"I had a close friend become terminally ill. I was encouraged by my boss to leave early on occasion and to take a weekend for myself."

Co-workers share positive experiences outside of work, such as preparing for company events or having lunch on special occasions. They enjoy getting better acquainted with co-workers, sharing more of themselves, including feelings. They appreciate company-sponsored social events and community-service activities. Like managers, they show concern for each others' welfare and need in time of crisis. Some make personal sacrifices for co-workers in urgent situations, including taking salary cuts.

"I had a birthday three months after I began work and everyone had a party for me. They usually have parties for 'landmark' birthdays, but this event did help me feel like I fit in."

Comparison of Critical Incident Results with Previous Conceptualizations

We compared data collected on instances of community in the workplace with Gardner's (1991) description of community and the Goffee and Jones (1996) dimensions. First, the factors appearing in the data and in these previous discussions of community will be highlighted. Next, the factors described by these earlier theorists that fail to appear in the critical incidents will be discussed. Finally, we will present the factors appearing in the data but *are* not mentioned by these other theorists.

1. Factors Found in Common

Teamwork and participation. One of Gardner's dimensions, that of caring, trust, and teamwork, appears in the Goffee and Jones' article as sociability. It includes an atmosphere of cooperation and connectedness; a sense of belonging and identity; a spirit of mutual responsibility; and an awareness by members that they need one another.

Some of our data in the theme of Participation and Teamwork correspond to this category. These instances deal with workers' sense of meaningful participation in work activities. They pitch in to get the job done, give and receive help, and take pride in being placed on special projects.

Gardner describes a category called "participation," which corresponds generally – though not precisely – with our data. Gardner describes an array of democratic processes (two-way flow of influence and communication; dispersed network of leaders at every level; voting, attending meetings; consensus building, coalitions, collaboration, compromise). The critical incidents are those in which workers participated in setting visions, goals, and plans; solving problems, and improving productivity. Both sources specifically mention community problem solving.

Under "participation," Gardner discusses the importance of effective leadership. The critical incidents in this study include instances of leadership only indirectly, as comments on managers who set a climate for respect, trust, and teamwork. Gardner's concern for participation reflects the choice that individuals in a community have of a level of participation; some choose to be active leaders; some to participate at less prominent levels, and some not at all. In organizations, by contrast, everyone is required to participate to some extent to earn a salary, and the significance of their participation, in some respects, corresponds with their position in the organization hierarchy.

Mutual respect and responsiveness. These data include instances of respect by managers and workers for the views and skills of others. Managers listen to workers and take action based on what they hear. Cultural barriers are bridged, and interpersonal problems are solved. Such features appear consistent with Gardner's notions of "caring, trust, and teamwork," as well as Goffee and Jones' descriptions of "sociability."

Furthermore, Gardner's category, "effective internal communication", included civility, common language, active and continuous communication between units, common meeting ground, and listening. Several of these, namely civility, listening, and active communication between units, appeared in the critical incidents with the factor Mutual Respect and Responsiveness. The incidents cited in the data are typically negative: co-workers or managers whose behavior toward others is *not* civil, and managers who do *not* listen to workers. Others, however, cited the positive instances of community through the regularity of communications, meetings in which information is shared, useful feedback is given, and managers listen.

Recognition of effort. Recognition of effort was another of the factors emerging in the critical incident data. Similarly, in the Goffee and Jones' article, recognition might be seen as an important component of the dimension labeled "solidarity." In Gardner's description, this factor appears within the category "affirmation" and receives passing mention under the categories of (1) "caring, trust, and teamwork" and (2) "participation." Respondents to the critical incident data collection cited tangible rewards, such as salary raises, recognition events, and being selected for special projects as instances of recognition. They also cited expressions in public and in private of praise and thanks for their effort.

Gardner also writes of recognition and thanks for hard work. He describes a way in which communities recognize individuals that seems to capture the spirit of some of the critical incidents: "The healthy community has many ways of saying to the individual, "You belong, you have a role to play, and the drama has meaning." It is this more than anything else that accounts for the sense of identity so characteristic of community members (p.21).

Investment of personal time and interest. All these schemes recognize the contribution of personal time to a sense of community. A major distinction between Gardner as contrasted with our data and Goffee and Jones rests on the distinction that workers in an organization expect to be paid for their labor, while those who work for the community outside of work are usually asked to volunteer. Yet even paid workers sometimes "participate" in the organization (in Gardner's words) and offer their own time. They "volunteer" to help out with social functions and to help co-workers or subordinates in times of crisis. Managers offer personal invitations or take personal time to support workers. Goffee and Jones recognize the importance of such investment in the dimension labeled "solidarity."

2. Factors Not Appearing in the Data

Gardner described eight general attributes that are barely mentioned in the critical incidents gathered from the workplace. We will discuss these in turn.

Wholeness incorporating diversity. For Gardner, this expresses the main function of a community, that of governing conflicting demands and fostering cooperation. The organization's role, in contrast, is to provide goods and services economically. Toward this end, the organization can insist on cooperation and unanimity of goal – at a certain level – and be less tolerant of diverse demands. The respondents did not comment on coherence, pluralism, or fragmentation, except in instances of bridging cultural barriers. Also, they usually focused on their immediate work group, within which goals are common and interactions regulated.

Shared values. Gardner claims that a sense of social purpose is "the most important ingredient" of community, and Goffee and Jones view it as critical to their definition of "solidarity." Nevertheless, the respondents in this study did not say much about this dimension of the workplace. The exception might be criticisms of co-workers whose disregard for procedures for quality and safety evidence conflicting values.

Forward looking. Gardner views this dimension as vital to a community, while Goffee and Jones fail to mention this aspect of organizations. Certainly, goals are fundamental to organizations, and planning for the future is taken for granted. Perhaps as a result, the critical incident respondents do not mention forward planning, except in terms of being included in activities that engage them as individual participants.

Links beyond the community. Although discussed by Gardner, the critical incident respondents make only tangential reference to this dimension. They discuss clients or customers when referring to their own performance. Occasionally they mention conflict or cooperation between units, such as divisions. Further probing would be needed to determine whether the respondents consider the other units as being within their own community. In any case, this aspect of Gardner's formulation of community receives no attention in the Goffee and Jones' work.

Institutional arrangements for maintenance. This constitutes Gardner's category for matters of governance. The critical incident respondents did not specifically mention governance, which in organizations would probably be synonymous with "management." The exception would be those incidents already identified in reference to participation in decision-making. Again, Goffee and Jones fail to discuss a similar dimension.

3. Factors Appearing in the Data but Not in the Previous Work

Investment in professional growth. Such investment appears both in the critical incident data and in Gardner's conceptualization as an indicator of community in the workplace, but the two differ somewhat in their formulation. Gardner specifies a sound educational system that includes preparation for effective leadership and participation. He also mentions informal training – learning from community members, some who may serve as mentors, and from participation in community activities. He sees formal and informal education primarily as an investment the community is required to make in its children and youth.

He does mention training as a means of support. Both his labeling of this factor as "development of young people" and his conceptualization seem to limit the emphasis of such development to children and young people at home and at school, without recognizing the extensive development activities and opportunities in the workplace. In the critical incident study, however, respondents refer to the training they receive, either on-site or off-site, not only as an investment in individuals but also as a means of improving their effectiveness and rewarding their efforts.

In contrast to the critical incident results, Goffee and Jones (1996) fail to identify development activities of any kind as part of corporate culture. Thus, both Gardner and Goffee and Jones appear to neglect the importance of human resource development in the creation of community in the workplace.

Concern for improvements and performance. This factor encompasses such areas as improvements in the workplace and work procedures and doing the job well. It relates to the quality of work, which, is certainly a concern of organizations offering products and services. One aspect of the Goffee and Jones formulation of "solidarity" involves this concern for performance and a "low tolerance of poor performance" (p.136). This aspect does not, however, appear in Gardner's formulation. This raises the question of whether the quality of schools, libraries, and other community services might or might not affect one's sense of community.

Discussion

The current study identified six factors critical to community in the workplace – at least as such community is experienced by those in organizations. The results more or less agree with previous theoretical formulations of community, as discussed by Gardner (1991) and Goffee and Jones (1996). Indeed, in terms of the Goffee and Jones formulation, the present study provides further definition of the two dimensions, sociability and solidarity.

Areas of disagreement, particularly with Gardner's description, seem to revolve around the context for "community." Gardner deals with community in the geographical or political sense of neighborhood, town, or city. As a result, certain dimensions, such as "institutional arrangements for community maintenance," seem less critical when dealing with community in the workplace.

The results of the present study indicate the viability of the concept of community in the workplace. It is a concept that exists not only in theoretical formulations, but also in experiences of people within organizations. The critical incident method provides the link needed to identify community characteristics most relevant to people within organizations. By drawing upon workplace experiences, it provides the framework for addressing the needs of the workplace community through specific policies and programs.

The study also reveals the complexity of the concept of the community in the workplace. It is composed of factors covering a broad range of concerns. Although 401 incidents were collected, some of the categories are not as well described as others. Flanagan and Russ-Eft (1975) encountered a similar situation in defining personal quality of life, as did Russ-Eft (1979) in defining neighborhood quality of life.

Contribution to Human Resource Development

These results can be used as a framework for measuring and monitoring the status of the workplace community. Under each category, available indicators of current status can be identified (e.g., production measures as an indicator of Concern for Improvement and Performance) or new indicators can be developed (e.g., employee survey on teams as an indicator of Teamwork and Participation). Such indicators can be objective or subjective. Indeed, using both types of measures and determining the relationship between them can help to ensure valid measures.

In addition to measuring and monitoring, the results of this study provide a framework for determining the impact of HRD interventions. They reveal a broad range of potential impact areas. Presumably a well-designed intervention would have impacts in many or most of these areas. Planning, development, and evaluation of such HRD interventions should, therefore, focus on these diverse factors.

Finally, given that the emergence of the factor "investment in professional growth" in these data, practitioners should explore opportunities for using HRD interventions to affect community in the workplace. Certainly new employee orientation provides one opportunity to instill a sense of community to new members of that workplace. Another would involve identification and support for communities of practice for enhancing development and innovation, as discussed by Brown and Duguid (1991).

Limitations of the Present Study and Areas for Future Research

Given the need for a well-defined set of dimensions defining community in the workplace, this research represents a first step. It provides an initial framework, but the data needs expansion. To obtain increased confidence in the stability of the framework, the data collection must include additional types of organizations, such as educational institutions and government agencies. The data set must represent the full range of organizational types.

In addition to representing only certain types of organizations, the data relies heavily on U.S. and Canadian-based organizations. A next step would be to extend this data collection to other countries, allowing for a comparison with the present results. Since today's organizations are rapidly moving to becoming global organizations, this research must examine workplace communities in other parts of the world.

Show Me the Money: Moderators of Satisfaction for University Administrators

Janine Waclawski
W. Warner Burke Associates Inc.

Allan H. Church
W. Warner Burke Associates Inc.

This study presents an analysis of organizational survey data collected from 870 members of the non-academic or administrative staff in a large university setting. Results indicated significant differences between respondents who had prior experience in academia versus those with industry or corporate experience in terms of levels of job satisfaction. Specifically, those workers with prior experience academia were significantly more satisfied with their current jobs than their counterparts. Additional findings and implications are discussed.

Keywords: Employee Satisfaction, Organizational Surveys, University Employees, Academic Setting

Given the significant impact that employee attitudes and perceptions can have on individual and organizational performance, the study of predictors and correlates of job satisfaction represents a key area for applied organizational research. In fact, over the past 40 years considerable research has been done to investigate the predictors, correlates and/or outcomes of job satisfaction (i.e., what predicts job satisfaction and what does job satisfaction, in turn, predict). While research indicates that individuals who like their work are likely to have lower absenteeism and turnover rates (Organ & Bateman, 1986), and perhaps even live longer (Palmore, 1969), research has also shown that the majority of American workers are less than completely satisfied with their present jobs (e.g., Church, 1995; Lawler, 1990; Quarstein, McAfee, & Glassman, 1992; Sullivan & Bhagat, 1992). Even individuals who have what might classify as excellent positions--e.g., jobs that are intrinsically motivating and rewarding—often report low levels of job satisfaction. Although it is unclear if the precursors of such perceptions are due to primarily internal (e.g. attitudes regarding senior leadership, organizational culture, job-person fit, reward systems) or external factors (e.g., economic trends, increased competition for jobs, aggressive downsizing industry practice), this trend has serious implications nonetheless for the day-to-day functioning and management of contemporary organizations. Managerial behavior and resulting employee levels of job satisfaction and organizational commitment, for example, have been linked through research to a variety of outcomes such as reductions in performance, product quality, and customer responsiveness, as well as increases in turnover (e.g., Buchko, 1992; Cohen, 1993; Golembiewski & Sun, 1990; Steers & Mowday, 1987; Waclawski, 1996). Clearly, given the impact that such negative attitudes can have on an organization, it is in the best interest of key policy and decision makers (e.g. organizational leaders, senior managers, and HRD and OD professionals) to have an accurate and more complete understanding of the relationships among their employees' perceptions and attitudes. To date, however, most of the research conducted on job satisfaction has been focused on and collected in private organizations (e.g., industry and corporations), while the realm of academia has remained largely unexplored. Additionally, academic institutions are particularly interesting in the context of understanding job satisfaction because of their unique cultural and structural characteristics (e.g., a highly professional and educationally focused organizational system). To this end, the purpose of the following study is to contribute to the field of HRD and OD by focusing on the correlates of and relationships regarding job satisfaction in a primarily academic setting.

Correlates of Satisfaction

Although almost all organizational systems suffer from the typical concern of "how to motivate their employees", the situation is particularly acute in university settings for the "regular" individual--i.e., someone who functions in a non-academic or administrative position. Besides having to work in a somewhat unusual hierarchical structure, the educationally biased culture found in academic institutions can be disconcerting for anyone with experience in a typical corporate setting. One of the results of such an environment is that administrative employees

Copyright © 1999 Janine Waclawski & Allan H. Church

often feel like "second-class" citizens because of their educational backgrounds and/or position status as compared to the more well respected faculty population. This is unfortunate because these are the people that make the organization's operational systems function. Moreover, given the tendency to provide staff salaries below industry standards in universities, it is no surprise that these types of institutions experience a variety of employee conflicts, many of which can and do have an impact on their individual performance. However, salary alone does not predict job satisfaction. In a study conducted by The National Center for Productivity and Quality of Working Life (1978), for example, job satisfaction levels of private versus public (in this case government) firms showed that employees working in private firms were, on average, more satisfied than their public counterparts (74% vs. 64%, respectively). However, there were no significant differences between these two groups with respect to levels of satisfaction with pay or benefits. Other correlates with job satisfaction in other research studies have included age--i.e., employees under 30 were less satisfied than those over 30 (Sheppard & Herrick, 1972)--individual attitudes towards work (Herzberg, Mausner, Peterson, & Chapwell, 1955; Staw & Ross, 1985), and job level--i.e., professional and managerial workers report the highest levels of job satisfaction (Herzberg et al., 1955). Thus, based on these studies, one might expect there to be significant differences in satisfaction levels and their correlates in managerial and other types of non-managerial populations.

Beyond the differences already noted, however, one could easily argue that any organization whose work force is primarily focused on serving the needs of others (e.g., faculty, students, parents, etc.), will likely suffer considerable hiring, training, and development costs if negative attitudes are pervasive among their administrative employees. Clearly, one outcome of such a situation is greater turnover, which cannot be good for ensuring smooth operation. Thus, in the university setting, the management of employee perceptions through changes to corporate culture, reward systems, work group climate, and managerial behaviors is a critical issue for systemic organization development and improvement efforts (Burke, 1994; Schneider & Bowen, 1993; Sheridan, 1992; Wilkens & Ouchi, 1983).

Given the prevalence of universities, the importance of these issues, and the death of research in this area, the purpose of the following paper is to contribute to the literature by providing a detailed assessment of the key predictors and moderators of employee satisfaction among the administrative or non-academic employees in a university setting based on data collected during a recent organizational survey effort. In this study employee or job satisfaction will be defined as "the constellation of a person's attitudes toward or about the job" (Organ and Bateman, 1986, p.337). More specifically, employee satisfaction is considered to be a function of an individual's satisfaction with different aspects of his or her job such as supervision, pay and the work itself (Organ and Bateman, 1986). It is hoped that the results of this study will prove applicable to other university settings as well as other public institutions and/or service based staff positions in related types of organizational settings.

Method

A paper and pencil mail survey was administered to the officers of administration of a large Ivy League University located in the northeastern United States to assess existing levels of job satisfaction. These survey questionnaires were administered to all university officers of administration during a three-month period between July and September 1997. In total, 870 of the initial 2400 surveys distributed were returned for analysis yielding a response rate of approximately 36%. Although this is lower rate of return than what many practitioners prefer (Church & Waclawski, 1998), it is not an uncommon percentage, and is still within acceptable ranges for analysis purposes.

In terms of demographics, the officers of administration who responded to the survey were predominantly Caucasian (72%), female (62%), and normally distributed in terms of age. The majority of respondents indicating having worked at the university either between 1-5 years (34%), or over 11 years (35%). For the most part, these data corresponded well to the population distributions on these same variables provided by the organization suggesting that the present data were in fact representative of the larger population.

The survey content was initially constructed and then refined based on input from various officers of administration within the university at different levels. This process occurred through: (1) numerous meetings and interviews with senior human resources staff; (2) a series of focus groups comprised of representatives from different departments and levels; and (3) an iterative pilot testing procedure. In total, item instrument development process took several months. The final measure was comprised of 107 items which, although lengthy, was still within acceptable limits for this type of assessment effort (Church & Waclawski, 1998). In general, the reliability coefficient was quite high--computed at .96 overall--for the instrument suggesting the iterative process had indeed results in a stable measure.

Results & Discussion

Survey responses were examined using a variety of statistical approaches with two specific goals in mind: (1) to identify major relationships among employee perceptions of working conditions and organizational factors (e.g., culture, senior management, reward and benefit systems, structure) on satisfaction; and (2) to explore potential moderating variables for these relationships and/or differences various in organizational sub-groups.

Prior Work Experience

Of particular interest and importance in the data was the impact of prior work experience of the administrative staff (self-identified as being from either academia or industry) on the types of issues and concerns raised, as well as the differential impact of their perceptions on employee satisfaction. Based on a series of oneway ANOVAs (controlled for Type I error), significant and meaningful perceptual differences existed between these two groups such that administrative employees with primarily academic backgrounds were far more *positive* about the university than were their counterparts who had crossed over from industry settings. Major areas of contention exhibiting these effects included the perceived adequacy of the compensation offered, the degree of cooperation and support received from peers, the degree to which people were treated fairly and equitably, overall levels of job satisfaction, and feelings of trust and respect in the workgroup. The only areas in which this trend was reversed concerned employee ratings of specific benefits that are traditionally less favorable in organizational settings (e.g., regarding tuition exemption, the amount of vacation; the quality and coverage provided by medical insurance, availability of training). In short, aside from some of the benefit options, staff members with industry experience found the climate and working conditions of their academic experience to be somewhat lacking by comparison.

Given these trends, some additional predictive modeling was done in an attempt to understand the drivers these perceptual differences. Figures 1 and 2 provide an overview of these regression results (see following page). Despite the clear presence of multicolinearity issues inherent in this type of a one-shot survey process (Church, 1995), the difference in the two regression models does suggest clear distinctions in how employees familiar with academic settings feel about their work as compared with people transplanted from more corporate or industry related backgrounds.

Gender Effects

Next, the data were examined more carefully for differences in ratings effects by gender. An interesting finding emerged in the data based on the results of an overall ANOVA model of summary scores for all survey items. Specifically, men reported significantly higher ratings of the university overall, across the entire 107 item instrument, than did women ($M = 3.09$ vs. $M = 3.00$) $F = 3.73$, $p < .05$. Next, a series of follow-up ANOVAs were conducted to examine differences at the item level. These analyses revealed that men gave significantly more favorable ratings to the university on 27 out of 107 items (or approximately 25% of the survey) than did women staff members (see Table 1). In general, men were more satisfied with the treatment that they received at the university, and the pay, benefits and incentives given by the university. Moreover, men reported a greater sense of pride in working for the university than did women and higher levels of satisfaction with their jobs.

Based on these results, it would appear that, in general, male staff members had a better "on the job experience" than did their female counterparts in this university setting. Perhaps this is pattern is indicative of the stereotypically male dominated academic culture. On a related note and in support of this hypothesis, survey participants did have the opportunity to respond to several open ended items on the survey wherein they indicated as much. One of the more frequent remarks from women respondents, for example, was that the university was plagued by "cronyism" and that the "good old boys" mentality was pervasive, thus creating a less than optimum environment for women at the university. This factor alone may help explain some of the difference in satisfaction levels between male and female respondents, and suggests that future change efforts in universities may need to be directed at this gender gap first before moving on to other agenda.

Tenure Effects

In addition to gender, the relationship between job tenure and ratings of the university as a place to work were also examined. While no significant effects were found at the overall level (i.e., across all survey items by tenure), some interesting differences did emerge at the individual item level (see Table 2 for details). For example,

it was evident that newer employees were significantly more positive about their managers' ability to inspire and motivate employees, the presence of career development opportunities, the amount of coaching and mentoring available, and the balance between work and personal life. Although less positive in general, middle tenured employees (i.e., with 6-10 years experience), were more optimistic in their assessments regarding some healthcare benefits and the quality of workspace conditions at the university. Given their position on the cusp of making a long-term commitment, however, this increased level of criticism is not surprising. Finally, more senior employees (i.e., those with 11 years tenure with the university or more), gave significantly higher ratings to items associated with most of the personnel related benefits offered by the university, such as the quality of life insurance, savings plans, medical coverage, spending budgets, and sick leave. This group was also more positive about the conditions in their workspace, as well as having more pride and being significantly more satisfied overall.

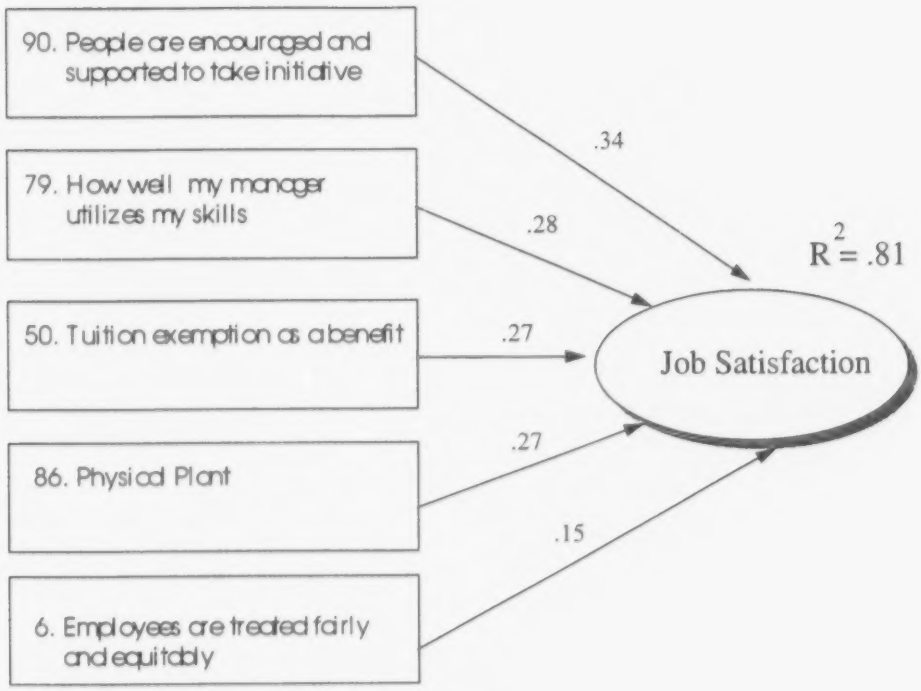
Job Satisfaction

NB: numbers adjacent to arrows are beta weights.

Figure 1. Predictive model: satisfaction for academic workers.



NB: numbers adjacent to arrows are beta weights.

Figure 2. Predictive model: satisfaction for industry workers.

Although one might point to a myriad of factors, these findings are most likely indicative of a combination of (a) those things that are valued by each of the three groups and (b) what is offered by the organization at various levels. More specifically, newer (and probably younger) employees would arguable be most interested in career development and advancement opportunities. Thus, this is both the area they tend to focus on and, in a university setting fraught with would be mentors, is most likely to occur representing a good match. Middle level employees, on the other hand, are likely to be in that in between job stage, where commitment decisions are to be made and the quality of all things including benefits and worklife balance are being considered. Employees with 11 years tenure or more, however, are likely to have already made that commitment to the university and are therefore likely to be more positive regarding the quality of the benefits offered (since this was probably a factor in their decision in the first place) as well as their overall satisfaction.

In sum, based on these results it is apparent that differences do exist in the predictors and correlates of employee satisfaction among non-academic employees in university settings. For the most part, issues of compensation levels, overly bureaucracy structures and policies, and a lack of unity across departments were key. Moreover, there appeared to be clear differences in perceptions with respect to prior work experience, gender, and levels of tenure that should be considered when OD and HRD practitioners are involved in making policy related performance management and personnel decisions.

Table 1

Significant Univariate ANOVA Item Results by Gender

Survey Item	Female (n = 534)	Male (n = 323)	F
2. University Admin. Promotes a sense of unity and shared values	2.18	2.40	8.14
5. I have confidence in the University Admin.	2.61	2.86	10.21
6. employees are treated fairly and equitably	2.74	3.00	9.66
9. managers provide performance evaluations on a regular basis	2.36	2.67	10.62
12. managers respond appropriately to poor performance	2.90	3.11	5.36
16. managers make best use of people's skills and abilities	2.98	3.25	8.21
19. managers work w/ employees to establish performance objectives	2.93	3.17	6.25
21. managers encourage open, two-way communication	3.32	3.55	5.91
22. managers allocate limited resources effectively	3.13	3.42	10.21
23. managers provide employees with info. to carry out their jobs	3.17	3.42	7.82
25. managers reward and recognize good performance	3.04	3.25	4.28
26. employees are given incentives to improve their performance	1.98	2.23	8.50
28. University offers rewards necessary to retain the best people	1.98	2.17	7.02
32. pay and benefits compare to union members on campus	2.87	3.15	5.13
33. pay and benefits compare to support staff	3.02	3.38	9.91
34. pay and benefits compare to similar positions on campus	2.40	2.67	6.60
44. promotions are based on a fair and objective assessment of skills	2.48	2.77	9.99
46. satisfaction with benefits compared with other organizations	3.49	3.23	10.05
48. satisfaction with medical benefits compared with other orgs.	3.22	3.08	5.66
54. satisfaction with savings/investment plans compared with others	3.39	3.25	4.07
56. satisfaction with sick leave compared with other organizations	3.82	3.67	5.08
78. knowledge and experience appropriately fit the job I currently hold	4.12	4.32	7.23
82. ventilation in workspace meets expectations	2.51	2.70	4.12
83. air quality in workspace meets expectations	2.43	2.71	10.46
89. employee morale at the University	2.31	2.47	4.74
91. satisfaction with my job	3.25	3.41	4.00
93. pride in working for the University	3.65	3.91	10.83

N.B. All *F*s are significant at $p < .01$.

Limitations & Suggestions for Future Research

In general, there are several limitations to this research that hinder the generalizability of the results presented. First, only one organization was studied. Future research should focus on replicating the differences exhibited here across a variety of universities and other academic organizations.

Another limitation of this research is the specific nature and size of the sample studied. Although the entire population of the officers of administration were used for this research, differences in other groups that were not studied might serve to either enhance or refute patterns observed. Future research should be directed at looking at a broader array of demographic characteristics (i.e., attitudes towards work, job level, supervisory experience, etc.) that may be correlated with and/or predictive of job satisfaction.

Finally, the present research is only correlational in nature; therefore we cannot with any certainty assess the predictive nature of the relationships involved. Future research should attempt to incorporate additional external measures of satisfaction taken before the assessment of current levels of job satisfaction. This would provide a more empirical baseline measure of job satisfaction against which to measure current and future levels of employee perceptions.

Table 2

Significant Univariate ANOVA Item Results by Tenure

Survey Item	< 5 Yrs (n = 341)	6-10 Yrs (n = 178)	11> Yrs (n = 291)	F
2. University Admin. promotes a sense of unity and shared values	2.39	2.12	2.21	4.16
6. employees are treated fairly and equitably	3.01	2.72	2.70	7.07

Questioning the Viability of a Women's Network as a Management Development Activity

Linda M. Hite
Kimberly S. McDonald
Indiana University-Purdue University Fort Wayne

The focus of this study was the continued viability of a women's network within an organizational system. Once an active part of the company culture, it apparently had ceased to meet. We chose this example to research the current role of women's networks, their contributions and limitations, and the alternative mechanisms that may be replacing them. Quantitative and qualitative data were used to draw conclusions for this network and to pose implications for HRD.

Keywords: Women's Networks, Informal Learning

In the past decade numerous studies have been conducted examining women's progress in organizations. Many of these studies have emphasized developmental opportunities that promote women's learning and advancement within the corporate framework (Bierema, 1996; Gordon & Whelan, 1998; Ohlott, Ruderman, & McCauley, 1994; Ragins, Townsend, & Mattis, 1998; Tharenou, Latimer, & Conroy, 1994; Wentling, 1996). This body of literature suggests that women should seek challenging and important assignments and gain access to line positions, engage in mentoring relationships and training opportunities, and develop a clear career strategy. Frequently mentioned in these studies is the importance of women networking with others as a means of learning and advancing within the organization. For example, Bierema (1996) found that the women in her study ". . .took advantage of relationships— particularly mentoring, peer support, and networking relationships — to help them develop and function in their organization's culture" (p. 157). Further, Bierema reported that executive women ". . .used networking for understanding informal power structures, strategizing, providing and giving feedback, and sharing support" (p.158).

Some organizations, recognizing the importance of networking as a development tool, have implemented network groups exclusively for women or for minorities. The literature reinforces the need for these types of groups. For example, Lewis & Fagenson (1995) suggested support networks as an alternative to single-sex training in a critique of management development strategies for women. Gordon & Whelan (1998) recommended that organizations provide support groups to help women as they approach midlife and later career issues. Rosener (1995) advocated the use of networks and councils as a strategy "to address the underutilization of women . . ." (p. 159).

Problem Statement and Theoretical Framework

According to Friedman (1996) there are four major distinguishing characteristics of networks. These characteristics include: a social identity, such as gender or ethnicity; an intra-organizational entity; being "self-controlled and self-organized," and being recognized publicly (p. 323). Friedman (1996) found that network groups were perceived most effective at achieving the following objectives: getting social support, providing support for younger employees, and getting informal business and career advice (pp. 339-340). Network groups were perceived to be much less effective in fighting discrimination and influencing company policies. Friedman concluded that "there is clearly a role for advocacy on the part of network groups, . . . but the unique strength of network groups is their ability to reshape social networks and communicate with management, rather than serve as a policy-making or policy-influencing body" (p. 341). Networks often serve to reduce the feelings of marginality and isolation felt by individuals not considered part of the majority. Mehra, Kilduff, & Brass (1998), in a study of social networks, found that women and racial minorities tend to make identity and friendship choices within their group (women to women, African-Americans to African Americans, etc.) when they are "relatively rare" in the social context. They conclude that: "To achieve integration in organizations, it may be necessary to first recognize heightened pressures for within-group solidarity among under represented group members" (p. 450).

However, there is some evidence that homophily, the degree to which individuals interact with those similar to them (Ibarra, 1993), may limit one's access to those in power. Brass (1985) found women in integrated workgroups had more access to the dominant coalition and more influence, than women in all-female groups. These

Copyright © 1999 Linda M. Hite and Kimberly S. McDonald

findings led him to conclude that "encouraging women to form networks with other women in the same organization may be unnecessary or, at worst, nonproductive" (p. 340).

The research on networks informs us of the configuration and patterns of networks and the utility of career networks (Ibarra, 1995; Mehra, et al., 1998), but more information is needed regarding the learning that occurs as a result of networks and the evolution of these networks. For example, does this type of network cease to be needed when a significant number of females or minorities reach a certain level in the organization? Will these networks continue to fulfill an important function as organizations change?

Research Questions

This study explored the continuing viability of a structured women's network in an organization nationally recognized for its concern for female employees. One goal was to determine what role, if any, does this type of network still have in promoting continuing career progress for women in organizations. Another was to discover what other mechanisms hold promise as informal learning opportunities for women, if the network structure is not longer viable. Questions explored in this study included the following:

* Why do some women choose to participate in such networks? Why do some choose not to participate?
* What kinds of learning takes place in a structured network for women?
* Has the women's network structure outlived its usefulness as a social support system?
* Are structured women's networks still viable in prompting women's career progression?
* What initiatives (mechanisms), if any, are taking the place of structured women's networks?

Research Methodology and Background

A large, international service industry corporation that frequently has been listed as one of the best 100 companies by Working Mother magazine was the site of this study. We had some history with this organization. In the past, we had conducted focus groups to evaluate their Women at Work program and met periodically with the Women Executives (WE) group. The latter was the focus of this study. Once an active part of the organizational culture, the network seemingly had ceased to meet as a formal entity. The apparent unplanned demise of this structure prompted our questions about the role of women's networks in this organization as well as in others.

Every women above a certain position level in the organization is considered to be a member of the Women Executives group. Historically, as with most organizations, some women have chosen to take leadership roles in the network, while others have ranged in their commitment from those who attended meetings consistently to those who chose not to participate. Our research was designed to reach all of these women, to obtain the richest span of data possible.

This was a quantitative study employing survey methodology. The survey method was chosen for several reasons. First, the use of a Likert scale survey format to determine interest in participation and reasons for non-participation has roots in the work of Scanlan & Darkenwald (1984) and Darkenwald & Valentine (1985) examining deterrents to participation in adult and continuing education. Second, the survey permitted reaching all of the 135 members of the network in a timely way that allowed them to respond anonymously. Survey responses were mailed directly to us as researchers acting independently of the corporation, to encourage participants to be open with their answers and to state their concerns more freely than they might with an internal inquiry. Of a total of 135 surveys mailed, 68 usable responses were received, yielding a return rate of 57%.

The 38 item Likert scale survey was created by the researchers. Two leaders of the network were consulted extensively during the development process to ensure that the survey was comprehensive in scope and accurate in its use of industry terms. There are four major sections of the survey: reasons for choosing to be active in the network (i.e., "I wanted to learn more about the corporate culture), reasons for choosing to be inactive (i.e., "I don't believe in initiatives designed to segregate men and women"), their perceptions of the current need (or lack of it) for the network (i.e., "This group can contribute to the corporation's success" and "The current corporate climate is sufficiently inclusive of women"), and means other than the network that respondents use to build alliances and to create learning opportunities within the organization (open-ended questions at the end of the survey).

Results and Conclusions

Quantitative Results

In gathering information, it was important to establish how active each respondent had been in the network, recognizing that participation choice might be indicative of interest in the potential continuation or demise of the group. Frequency analysis revealed the following percentages of self described activity level: 45% "somewhat active," 34% "not active," 12% "active," and 9% "very active." Written comments explained that several of those listed as "not active" were women who have become eligible for membership during the time the network has been in hiatus and who expressed interest in participating if the group continues.

The descriptive statistical analysis summarized several interesting points about the respondents. Most of the women in the study had been employed by the company for over six years, with 22% noting an employment record of over 20 years. However, as with many organizations, entry into officer ranks has been less forthcoming, with 55% indicating they have been officers for less than six years. An item set regarding professional identity showed that the respondents identified highly with their roles within the corporation as a whole, their business divisions and their departments. They identified least with the roles of "executive" and "woman executive."

Descriptive and correlation analyses yielded few surprises regarding reasons to participate or not to participate in the network, and rationale for continuing or disbanding the group. Each segment will be highlighted briefly in this discussion.

Those who had been active at some level were asked to complete a segment focusing on potential reasons for participating in the group (see Table 1). The item "It was an effective way to make contact with other women in the organization" yielded the highest level of agreement. It was followed by "I wanted to support the advancement of women in the organization" and "I enjoyed the social interaction." The item receiving the least endorsement was "I thought it would advance my career." This group of responses appears to reflect interest in building relationships with other women over a goal of individual professional gain.

Inactive members responded to an item set that reflected typical deterrents to participation in management development activities. The item that showed the highest level of agreement was "I didn't have enough time." The one that showed the least endorsement was "I thought it would be a waste of my time." While both refer to time as a factor, the former clearly is based on priorities, which suggests the network just did not fit in; while the latter is a judgment against the value of the group. Although the result is the same (non-participation), the rationales are quite different; suggesting that even non-participants might see some value in the network.

For the segment regarding reasons the network still is needed, "The glass ceiling continues to exist..." yielded the most affirmation. While the most agreement among reasons the network is no longer viable was "Priorities within the company have changed." Interestingly enough, these juxtaposed statements may be describing similar phenomenon, for example a company that once focused on improving the internal environment for its female employees may now be faced with the need to turn attention more fully on outside competition, and in the process may fall back on traditional hierarchical processes and value systems.

Predictably, items stressing the perception of value in the network, such as "I enjoyed the social interaction" and "Women desire to network with other women" were intercorrelated ($r=.564$, $p=.01$). Another example was the intercorrelation of activity level with social interaction ($r=.416$, $p=.01$) and activity level with the item "There is no other group for women to talk about business, professional and social issues." ($R=.330$, $p=.01$). Similarly, items reflecting on the perceived ineffectiveness of the group such as "I thought it would be a waste of my time" and "Women should move beyond segregated networking/ management development opportunities" were intercorrelated as well ($r=.614$, $p=01$).

Three open-ended questions at the end of the survey asked respondents to indicate if other activities had replaced the network in providing social support or professional development and what the focus of the network should be if it continues. There was a section for general comments as well. Forty-two respondents answered at least one of the open-ended questions. The content from the open-ended items were analyzed separately by each researcher and then analyzed together to determine if common themes existed.

Very few common themes were found, however respondents most frequently reported that work for nonprofits outside of the organization and the development of their own personal network had replaced the executive women's network in providing social support and meeting their professional development needs. Time pressures were reported by some respondents as being a major issue when pursuing any activities to meet their needs. One respondent wrote: "Work has become so intense it is hard to make time for anything. . . "

Table 1: Means and Standard Deviations

Item	N	Mean	SD	
I participated because:				
Effective way to make contact with women in the organization.		44	4.55	.6271
Enjoyed the social interaction.	45	4.02	.8391	
Wanted to learn more about management.	45	3.18	1.029	
Wanted to learn more about the insurance/finance business.	43	3.05	1.112	
Wanted to mentor other women.	43	3.19	.9065	
Wanted to find a mentor.	43	3.02	1.080	
Wanted to learn more about the corporate culture.	45	4.00	.8790	
My colleagues participated in the group.	44	3.36	.9667	
Wanted a professional support network.	45	3.73	.8634	
Thought it would help me advance in my career.	44	3.02	.9997	
Wanted to support the advancement of women in the organization.	45	4.18	.8605	
I chose not to participate because:				
Thought it would be a wasted of my time.	23	1.91	.9002	
Don't believe in initiatives designed to segregate men and women.	23	2.96	1.147	
Didn't have enough time.	24	3.50	1.063	
Had enough networking opportunities already.	23	2.48	1.039	
Location of the meetings was not convenient.	23	2.78	.9023	
Concerned how my colleagues would perceive my participation.	23	1.96	.8245	
Enough management development opportunities.	23	2.39	.8388	
Saw no need for the group.	23	2.22	1.166	
The group still is needed because:				
Women do not receive as many development opportunities as men.	65	3.66	.8888	
Women desire to network with other women.	65	3.88	.8928	
The glass ceiling continues to exist.	64	4.16	.8585	
Members learn from the programs.	64	3.67	.8918	
Is no other group for women to talk about business, professional, social issues.	64	3.66	1.057	
The network is no longer needed or viable because:				
No one has time to attend programs and functions.	51	2.96	1.216	
Women have reached parity with men.	53	1.74	.7112	
Women should move beyond segregated networking opportunities.	51	3.02	1.157	
Other management development opportunities have replaced the need.	53	2.32	.9359

Priorities within the company have changed.	47	3.45	1.100	
There is a lack of interest.	51	3.08	1.055	

1=Strongly Disagree, 5=Strongly Agree

Qualitative Data

When asked what the focus and format of the network should be if it continues, the largest portion of individuals indicated the group needs to focus on providing networking opportunities and developing its' members through substantive programs. Some indicated that the network needs to change. One woman suggested the group needed to be "reinvented." Another suggested that the group be combined with other minority groups or opened to other women managers. The exclusive nature of the group bothered a few respondents. One woman wrote:

> We should be expanded to include all women in management, not officer level only. I believe affinity groups should practice inclusivity versus exclusivity as much as possible, without losing site of its mission (sic).

A few also indicated it was time to disband the group, either due to lack of support or because the group was no longer needed or effective. One respondent suggested: "I think the WE group represents a group who served a valuable purpose at one time but perhaps it is not needed now."

However some women adamantly felt the group is needed now more than ever. Most of these individuals indicated that the current corporate climate was making it difficult for women within the organization. One responded:

> I think WE is sorely needed — particularly at this juncture when executive women are losing jobs or experiencing reduced responsibilities. Women officers need to join forces and have a voice in responding to the negative changes many of us are experiencing.

Data Summary

Taken in full, the responses reveal a key philosophical difference in how the organization and the network are perceived. On one side are those who believe strongly that the network serves a professional and social purpose. While respondents in this segment seem drawn to the network primarily for its social interaction, they cite inequities in women's opportunities as a reason it continues to be needed. The opposition holds the perception that women need to stop being segregated from the rest of the organization and recognize that priorities have changed for the company as well as for them as individuals, and therefore, a women's network is no longer a viable entity.

The gap between these two groups is unlikely to diminish because members on each side have surveyed the same situation and interpreted it very differently. Even if they could reconcile their diverse perceptions into a compromise, it would be unlikely to meet the needs of either constituent group adequately. The moment of women's solidarity on this issue appears to have passed. Even if the network is revived by those interested in its continuation, it could not claim to represent the views of "women executives," the way some corporate caucus and advisory group do. It is unrealistic and naive to believe that any one group could ever speak unequivocally for all of its constituents; however, to be an effective advocate, members need to agree on some basic tenets as a foundation. The responses to this survey indicate that on the topic of an executive level network for women, this group of female executives themselves cannot come to agreement. This case prompts speculation about whether other organizations are facing similar circumstances. Now that women are in management positions, have women's networks lost the momentum and the singular focus that gave them strength, or do they simply need to reassess their functions within organizations? What new goals are being set for the advancement of women, and how can they best be met? These questions remain open for future research on internal single sex network systems.

Implications

Structured networks ostensibly were developed to provide access to social support, professional development advice, acculturation information, and people holding power in the organization, because these resources were not readily available to women. Friedman (1996) has suggested that social support is a primary rationale for network membership, and many respondents in this study appeared to agree. They readily voiced their appreciation of the social contact provided by the network, but they were much less likely to note career advancement as a benefit. What the data did not reveal is if the dismissal of the latter accurately reflects the situation, or if the women subjects were less comfortable acknowledging their interest in furthering their careers through their relationships.

Research suggests that formalized career development initiatives are being supplemented by a variety of individual professional growth opportunities dubbed "informal learning." Networks can offer opportunities for these less formal learning opportunities, but at the same time, structured networks (with meeting times and membership lists) may be less viable in the current climate than they were only a few years ago. Organizational and individual priorities likely have changed over time and support for traditional networks may have decreased as a result. Additionally, some may argue that structured networks segregate female employees within the company, and as a consequence, perpetuate the status quo of women as separate and unequal partners in the organizational enterprise. The respondents in this study expressed these concerns, and they present a dilemma for human resource development professionals in this company and in others. No clear mandate came out of this research. Admittedly, the data set was small. The structure of the survey was such that not all respondents answered all segments, so the number of responses for some items was much smaller than the total return. Within those responses were clear contradictions about the perceived value and purpose of the women's network. The decision to revive, revise, or

remove this network will not be easy, because those who will be most affected by that decision are not in agreement themselves about the outcome they want. Some expressed interest in a forum for substantive programs to serve as learning experiences, but others' preferences were for an emphasis on social interaction. Some want the group opened to all women managers, but others would choose to have male and female executives together. While women still face a glass ceiling and inequities within the company, the liabilities of segregating female managers and executives from the mainstream and not focusing on the changing organizational climate remain as concerns, for this company as well as for others.

To abandon women's networks could be a regressive move, putting women once again in the position of trying to gain access from an inequitable position, and leaving them on the periphery of the organizational culture. Structured networks may not be the viable and valuable entities they were in the past, but should they be dissolved? If they are, what mechanism will replace them to offer social support and professional equity opportunities for women in corporate cultures? This project posed these questions, and while the results of the study offer some insights into the issues, they serve mainly to illustrate the complexity of this situation. While this research focuses on one company, the results have ramifications for other organizations as well. Women still are under represented in senior management. This is a human resource development concern. Perhaps it is time to reconsider past initiatives and determine what strategies have more potential for change as we approach the new millennium.

The Changing Role of Training Consultants in Organizing Work-related Learning

Rob F. Poell
University of Nijmegen, The Netherlands

Geoff E. Chivers
University of Sheffield, United Kingdom

This study draws on interviews with training consultants in 19 different organizations to describe how their role is changing under the influence of a supposed tendency towards self-directed employee learning at the workplace. From a learning-network perspective, this tendency can be regarded as a move towards liberalization. Qualitative data analysis shows that no general claims can be made as to this tendency or the role changes associated with it. If any, it would be an increased focus on HRD standardization, which runs contrary to more liberalized learning arrangements, for the prevalence of which only partial evidence was found.

Keywords: Work-Related Learning, HRD Consultants, Organizational Change

Employees and managers in work organizations are increasingly expected to take on responsibility for individual and team learning (Poell, 1998). What is the impact of this tendency on the role of the training consultant? A significant amount of research has been conducted into job profiles of HRD professionals (McLagan, 1989; Van Ginkel, Mulder & Nijhof, 1994), but not as yet from the perspective of a tendency towards self-directed employee learning. Generally speaking, it is assumed that the traditional emphasis in the role of training consultants on delivery of pre-designed courses is being replaced or supplemented by a stronger focus on the development of multiple learning arrangements. Is this actually happening, and if so, what does this new role of training consultants look like in practice?

Theoretical Framework

In this study training consultants are viewed as strategic actors in a learning network who interact with managers and employees to organize learning programs by negotiation, collaboration, and participation processes (Van der Krogt, 1998). From this perspective, a learning network can have structural arrangements associated with a liberal, vertical, horizontal, and external type. In a *liberal* learning network, individual employees create their own sets of learning activities. The profile of this learning network can be labeled as unstructured and individually oriented, since there is little structure above the individual level. A *vertical* learning network is characterized by linear planning of learning activities. The management develops learning policies, which are translated into pre-designed learning programs by training consultants and delivered to the employees. In a *horizontal* learning network, programs develop incrementally while they are being executed. There are no pre-designed learning policies. These develop by learning from experience as the programs progress. Training consultants are process counselors in this type of learning network. An *external* learning network is coordinated from outside the organization by the professional associations of the employees. Learning programs introduce work innovations to the learners, who adapt their work themselves accordingly.

The tendency towards self-directed learning of employees can now be understood as a move from a vertical to a liberal type of learning network. The role of a training consultant changes accordingly, from designing and delivering training programs to facilitating multiple learning arrangements for individual and team learners. If full emphasis is placed on facilitating team learning instead of individual learning, the consultant's role is congruent with a horizontal learning network. And if a training consultant helps individual professionals adapt their work to innovations introduced by their professional associations, they are operating within an external network. Other strategic actors (e.g., employees and managers) are expected to influence the way in which the learning network is organized as much as training consultants do. A learning network is viewed as an arena where constant processes of negotiation and collaboration among the participants shape and change the way actual learning arrangements are

Copyright © 1999 Rob F. Poell and Geoff E. Chivers

organized. This actor-strategic perspective and the four different learning-network types (Van der Krogt, 1998) will be used to interpret the changes occurring in the roles of trainingconsultants.

Research Questions

This exploratory study aims to describe what changes are actually taking place in the roles of training consultants in organizing work-related learning. The following research questions are investigated to shed light on this matter:

1. What changes are occurring in the way work-related learning is organized?
2. What roles do training consultants play in 'new' ways of organizing learning, in relationship to the roles of other strategic actors?
3. What problems and barriers do training consultants perceive in 'new' ways of organizing learning?

Methodology

Procedure

In May 1998, 293 questionnaires were sent out to all UK based alumni (from 1991 onwards) of the University of Sheffield Master's Degrees in Training and Development, Continuing Education, Information Technology Management, and Networked Collaborative Learning (all delivered by distance learning). After six weeks, 103 had been completed and returned (= 35 per cent). The questionnaire asked alumni for global information about their willingness to participate in the research project, about the job they held, about organizational characteristics, and about their involvement in technological innovations. Fourteen (= 14 per cent) of the respondents indicated they were not interested in participating in the research project, for various reasons, such as retirement, career change, unemployment, and so forth.

An effort was made to single out the alumni with a responsibility for organizing other people's learning within the organization, including trainers, consultants, educators, HRD managers, line managers, and mentors. There were found to be 74 alumni fitting this criterion. Twenty-two of them were approached at random across the United Kingdom, cutting across smaller and larger organizations and across internal and external training consultants. Alumni were included in the final sample if they were willing to engage in an interview and if they had been recently involved in innovation processes. Face-to-face interviews were held with the 19 participants who met both these criteria in June and July of 1998. Interviews lasted approximately ninety minutes each and focused on the participants' changing role in connection with the move toward self-directed employee learning. A topic list was used containing open questions about the following elements:

- Organizational mission, structure, culture, clients.
- Participant's job, typical work activities.
- Current role as a training consultant, tasks and responsibilities, strategies in organizing learning.
- Role changes in recent years, future role.
- Problems experienced in work, barriers to organizing learning, possible solutions.
- Relationship with management and employees, their role in organizing learning, attuning different strategies and values.
- Role in a recent, typical project that involved employee learning or development.
- Status of the training department in the organization, and status of the participant as a 'learning facilitator'.

Data Analysis

Two to three page interview summaries were made by the interviewer and offered to participants for correction and legitimization. Seventeen summaries (= 89 per cent) were returned to the interviewer containing additional information. Analysis was performed using seventeen corrected and two initial interview summaries. A computer program for qualitative data analysis, called Kwalitan (Peters & Wester, 1990), was used to score 144

interview scenes. Each interview scene was scored using an average of two to three labels, resulting in 345 labels all together. In this process, a total of 126 different labels were used, which were then brought under 28 label headings. Finally, three groups of two meta-label headings each were used to categorize the data in accordance with the three research questions: 'Organizational Changes' and 'Tendencies in HRD' referred to the first research question, 'Learning Activities' and 'HRD Roles' to the second research question, and 'Problems and Barriers' and 'HRD Strategies' to the third research question. Counts were made to list how many out of 19 interviews with participants featured scenes filed under the various label headings. These frequencies are reported in the next section.

Results

General Characteristics of the Sample

Four participants are women, fifteen are men. Participants' ages range from 30 to 65, most of them are in their forties or early fifties. Seven participants work self-employed, while twelve are employed in a company. Organizations involved are in electronics (#), a church diocese (#), a trade union (#), a private hospital (#), health care, aviation, mobile phones, insurance, atomic energy, a fire brigade, banking, and chemicals. The four out of twelve organizations marked # are small or medium-sized companies. Five out of seven self-employed consultants work mainly for small and medium-sized companies, including schools, colleges, health authorities, local government agencies, manufacturing firms, and professional organizations. All but two participants have obtained an MEd in Training and Development from the University of Sheffield between 1992 and 1997, most of them in 1995 or 1996. One participant holds an MEd in Continuing Education. One participant holds an MEd in Networked Collaborative Learning.

The companies involved are very different organizations, if only in size. In Mintzberg's (1979) terms, their structures range from machine bureaucracies (insurance, banking, atomic energy, fire brigade), to professional bureaucracies (private hospital, health care), to adhocracies (aviation, chemicals, electronics, mobile phones), to simple structures (church diocese, trade union). Most organizations are evidently in a process of organizational change, which may be as a result of growth (electronics, mobile phones), down-sizing (atomic energy, chemicals), new markets or products (aviation), new policies (church diocese), new laws (fire brigade, private hospital, health care), cost reduction (insurance, banking), changes in funding (trade union), and so forth.

Organizational Changes

Participants report changes in the training budget (n = 8) as a result of down-sizing or government cuts, which leads some organizations to question the added value of the training department. Some organizations are changing their work structures (n = 3) via experiments with self-managed work, lean manufacturing or business process re-engineering. Other companies are changing their organizational structures (n = 2) to a functional organization or a matrix organization. These results are summarized in Table 1.

Table 1
Organizational Changes

Changes	n
Budget changes	8
Changes in work structures	3
Changes in organizational structures	2

Tendencies in HRD

No less than 17 out of 19 participants perceive a tendency towards standardization within the HRD function of organizations. Their training programs are increasingly based on competence or performance standards, mirroring a stronger emphasis on accreditation. Within the UK context, the system of national vocational qualifications

(NVQs) and government programs such as Investors in People reflect this tendency towards standardized HRD programs.

Twelve participants report that the responsibility for training increasingly rests outside the training department. Indications for this tendency are the fact that managers are expected to act as a coach to their employees. The use of train-the-trainer and so-called cascading programs points in the same direction. The work of trainers has become organizing and co-ordinating rather than delivering training. Training delivery increasingly means hiring free-lance trainers. Interestingly, five participants report that their organization has witnessed a decentralization of the training department, while three suggest it is rather a process of centralization that is characteristic of HRD within their organization.

Twelve participants stress the view that training has becoming more strategically aligned to the organization's mission, which has made the training department more credible. Training should support the business, and there should be no more laissez-faire training as there was before.

Several developments point to a tendency towards liberalization within the HRD function (n = 10), meaning that individual employees are increasingly made responsible for organizing their own learning. Participants emphasize the importance of self-directed learning, the possibilities of distance learning and learning resources centers. Modularization of training is happening and employees are enabled to plan time for learning individually and to create their own learning route.

Learning and development are considered to be more important than training nowadays (n = 9). Buzzwords in this respect are learning on the job, integrating work and learning, continuing professional development, continuous employee development, informal learning, and reflective practice. The view that training courses are not the solution to every problem is widely held by these participants.

Five participants hold counteracting viewpoints. They either disapprove of government promoted 'Investors in People' or 'National Vocational Qualification (NVQ)' type programs, or they do not believe that the training department now has more credibility than before, or they do not see any tendency at all towards self-directed learning in the organizations they work with. These results appear in Table 2.

Learning Activities

Group learning is a powerful learning activity in 11 participants' organizations. This encompasses various group learning activities, group experiments, active development sessions, learning support groups, and case-based collaborative learning, amongst others.

Nine participants report the deliberate use of existing possibilities for work-focused learning activities. Recognizing and using available learning resources and opportunities are one side of the coin, while problem solving at work forms the other side. The use of new media in HRD programs is still on the rise (n=7). Intranet, computer-based training, multimedia, email, and the Internet are all used to support other learning activities.

Six participants focus attention on learning from others as an important learning activity, including the use of mentoring, systematic induction, and supervisory coaching. Only three participants point to the possibility of changing (e.g., diversifying) the work to fit with employee competencies rather than the other way around. These results are described in Table 3.

Table 3
Learning Activities

Learning activities	n
Group learning	11
Use existing work-focused learning possibilities	9
Use new media	7
Learning from others	6
Change work	3

HRD Roles

No less than 14 participants report that the promotion of individual development is at the core of their work as a training consultant. Personal development remains an important field of activity, just as individual counseling, development planning, individual learning facilitation, and individual guidance. A second core domain is organizational consultancy (n = 11), encompassing internal consultancy, organizational change, and process counseling. Third, training delivery is still highly characteristic in ten cases.

Organizational analysis is reported by seven participants as an important role. This consists of competency analysis, training needs analysis, job analysis, and monitoring progress during change processes. Six participants mention the recognition of learning by the workforce as part of their role, meaning they try to raise people's awareness of learning that is taking place informally and explicitly identify the new knowledge and skills gained. Six participants have also a responsibility for financial matters (e.g., training budget issues). These results are summarized in Table 4.

Table 4
HRD Roles

HRD roles	n
Individual development	14
Organizational consultancy	11
Training delivery	10
Organizational analysis	7
Recognition of learning	6
Financial matters	6

Problems and Barriers

Two main categories of problems and barriers experienced by the participants emerge from the interviews. First, 10 participants report resistance to change in trainers and, especially, in managers. Managers resent being made responsible for training issues that were formerly dealt with by trainers. Some trainers resist taking on a more facilitative consultant-like role. Second, eight participants experience a lack of recognition for training issues in organizations. They refer to the lack of a training culture and to the fact that despite a thriving training rhetoric not enough money is spent on good training. Sometimes managers are perceived as ignorant about training issues, resulting in a lack of training policy. Both training needs assessment and training evaluation are sometimes considered to be missing from standard operations. These results are described in Table 5.

Table 5
Problems and Barriers

Problems & barriers	n
Resistance	10
Lack of recognition for training issues	8

HRD Strategies

The strategies used by training consultants to deal with the problems and barriers they are facing can be summarized under three headings. First, 13 participants are actively trying to develop the learning climate of organizations. For instance, they attempt to create an empowering climate throughout the company, they encourage learning at all levels and in all places, they develop learning programs incrementally rather than by blueprint, or they try to get employees to recognize the learning opportunities that are available in everyday work situations. Second, 10 participants highlight the importance of negotiating with the various stakeholders involved in HRD processes, especially with managers. An important strategy in this connection is to influence the definition of an assignment or a forthcoming project at an early stage. Participants tend to stress the group's rather than simply their own responsibility for certain learning processes. Sometimes they take to educating the management rather than the operatives perceived to be 'the problem' initially. Third, participants undertake certain activities which will make them more professional consultants (n = 8). They work with associates, they are actively developing their consultancy skills, and they market both themselves as consultants and the products they have developed. These results appear in Table 6.

Table 6
HRD Strategies

HRD strategies	n
Develop learning climate	13
Negotiate with stakeholders	10
Be a professional consultant	8

Conclusions and Limitations

The first research question focused on the changes that are occurring in the way work-related learning is organized. In a context of decreasing budgets, training is found to be increasingly taking place outside a training department. The tendency towards liberalization reflects this observation, in that individual employees and their managers are increasingly held responsible for organizing individual development and team learning. On the other hand, training is also said to have become more strategic and, especially, more standardized. Viewed from the learning-network perspective, this is a counteracting tendency towards a vertical network. Apparently, some organizations are moving in the vertical direction, whereas others are heading for a more liberal learning network. Incidentally, this notion is mirrored in the finding that some organizations are centralizing their training efforts, while others are in a process of decentralization.

The second research question investigated the roles that training consultants play in 'new' ways of organizing learning. Again, the evidence is inconclusive. On the one hand, the prevalence of organizational consultancy and group learning activities points to a more horizontal learning network, whereas the emphasis placed on individual development and training delivery suggests a more liberal-vertical orientation. HRD roles in some organizations are clearly different from those in other organizations.

The third research question was about the problems and barriers that training consultants perceive in 'new' ways of organizing learning. Interestingly, although the strategic contribution of training was strongly emphasized before, the problems of resistance and lack of recognition tell a somewhat different story. Apparently, not all stakeholders have the same viewpoint about the preferred place and function of HRD efforts, which may account for

the fact that no general patterns were discerned in answering the first two research questions. This lack of agreement is probably why the current strategies of training consultants to deal with the problems and barriers they are facing include improvement of the learning climate and frequent negotiation with key stakeholders. These strategies seem well suited to involve stakeholders in HRD processes.

A first conclusion, then, is that few general tendencies across all types of organizations can be discerned from this sample. The strongest visible trend is the one towards standardization, which is pointing to verticalization rather than to more liberal learning arrangements.

A second conclusion is that organizational consultancy is as prevalent a role as training delivery, both of which are over-shadowed, however, by a focus on facilitating individual development. There is a strong awareness among training consultants of the importance of learning and development beyond formal training. In the actual programs that are run, however, informal learning and learning from daily work experiences are relatively under-addressed issues.

A third conclusion is the absolute invisibility of external learning networks, that is, the lack of recognition for employees learning within their professions. Training consultants do not pay enough attention to the fact that employees may wish to develop professional competencies that enable them to work in different organizations.

A fourth conclusion refers to the frequently made claim that training is now more closely linked to the business strategy and more highly regarded within the organization. At least three amendments should be made here:

- Most self-employed trainers and external consultants raise serious doubts about the ability and willingness of organizations to measure such impact at all.
- Internal consultants and HRD managers themselves report serious difficulties in getting line managers to take on responsibility for training issues, which should be part and parcel of a more strategic approach to training.
- Many internal consultants work mainly with senior and top managers. The fact that managers at that level are satisfied with the beneficial initiatives of internal consultants is no guarantee per se that changes are actually taking place at lower management levels or on the shop floor (especially if people are reluctant to take on responsibility for training issues).

So, although HRD is seen as becoming more strategic to the organization, several issues require this observation to be the object of further investigation. First, data were collected from training consultants only. Interviews with managers and employees should be held to check for different interpretations. Second, these conclusions are based on a small, select sample of practitioners with a specific background (having completed a University of Sheffield distance learning MEd) in one specific country (the UK). Interviews should be conducted with training consultants from other universities and in other countries to check for specificity. Third, the analysis so far has focused only on the general changes perceived to be taking place in organizations. Further analysis needs to be conducted to find out if specific changes apply to small and medium-sized enterprises as opposed to larger organizations, and to the role of internal as opposed to external consultants.

Using Study Circles in the Workplace as an Educational Method of Facilitating Readjustment After a Traumatic Life Experience

Barbara Barski-Carrow,
U.S. Department of Health and Human Services

While employees who have undergone a traumatic life experience (TLE) are often referred for counseling and therapy, most organizations do not prepare managers and co-workers for the unique issues posed by TLE employees when they first return to the workplace. The Study Circle, a "democratic" interactive adult learning format, is introduced to make up for this lack by educating managers and co-workers about the various stages in the trauma recovery process and how to facilitate TLE employee's re-entry to the workplace.

Keywords: Workplace, Trauma, Study Circles

Employees who have had a traumatic life experience (TLE) and are returning to the workplace face a difficult road to recovery. The workplace environment as it exists today is not well equipped to handle such individuals. Managers and co-workers lack knowledge of a recovery framework to facilitate and support the survivor-employee's re-entry. The term TLE (traumatic life experience) was coined by the researcher/author after having witnessed and observed people trying to cope and deal with a traumatic event in their lives, especially those individuals returning to the workplace. Such TLE's include a rape, a hold-up, a heart attack, witnessing a murder, the suicide of a loved one, a divorce, and the loss of a career, etc.

Statement of the Problem

Today the workplace manager needs assistance and knowledge in recognizing and understanding the traumatic life experience (TLE) person. Many questions for managers arise such as: What do you do when a traumatized person returns to the workplace and does not want to do his/her work? What do you say to such a person to obtain the status on their work assignments? How do you allow the traumatized person to go through a process of grief and mourning following the trauma?

Three components in the workplace environment that affect individuals who are returning to work after experiencing a trauma are: (1) organizational dilemma, (2) the manager's resistance and (3) survivor's apprehension. In a pilot project related to this study (1993), the author uncovered a wide range of responses on these three components from interviews conducted with managers, survivors and therapists on the subject of employees who re-entered the workplace after having experienced a trauma.

Organizational Dilemma

With the rise in violent incidents in organizations, more knowledge is required in organizations about the recovery process of traumatized employees and how to educate supervisors and managers to work with them. Mantell (1994) has written about how to look for and report warning signs of potential outbursts of employees in the workplace; however, there is little guidance available on how managers should deal with such an employee in general.

Manager's Resistance

Today's managers are already overwhelmed with organizational setbacks dealing with the loss of resources, such as when budgets are slashed, divisions are deleted, responsibilities are added and productivity goals are doubled and tripled. These are the squeaky wheels which get the attention of managers, who must then prioritize their time and staff. In this highly stressful environment, a returning TLE may not get the attention that he/she should receive upon re-entry to the workplace.

Survivor's Apprehension

Copyright © 1999 Barbara Barski-Carrow

Survivors who return to the workplace after having experienced a trauma are not given the attention they require to readapt to their work environment. The author's study (1993) revealed that when survivors returned to the workplace, they received little or no support from the organization, and their managers did not know what to say to them. None were aware of the stages of recovery for a traumatized person to return to normal functioning. They felt they wanted to talk about their trauma, and had difficulty readjusting to the workplace environment.

Theoretical Framework

The research addressed the development of a cost-free short-term adult educational intervention called Study Circles to assist both managers and co-workers in understanding the dynamics of recovery for individuals after a traumatic life experience (TLE). Herman's (1992) three stages of recovery process is used as a model for the Study Circle intervention: (1) Establishing a safety net, (2) telling the trauma story, and (3) reconnecting the individual to the work community. As an educational intervention, the Study Circle is designed to complement any individual or group psychotherapeutic intervention for TLE survivors themselves. The researcher selected the Study Circle method of intervention because it is an adult learning technique that allows managers and employees to come together to share their views on a specific topic (Oliver, 1987). Study Circles promote both group interaction and collective sharing of ideas and information among participants. In a Study Circle, all individual views are considered, and participants have an opportunity to listen, dialogue and disagree (Stubblefield, 1994).

Pre-Study Circle interviews served as an overview of the scope and purpose of the research, and the introduction of themes provided background to better familiarize the potential participants with each theme and its significance in the recovery process. The interview themes, identified through Herman's (1992) three stages of recovery, were (1) establishing a safety net, (2) telling the trauma story and (3) reconnecting the individual back to the work community. These themes served as an introduction to the managers and employees who participated in the Study Circles.

Study Circle participants were selected from referrals. From among these, the researcher chose individuals based upon an employee's and the manager's interest and whether they were willing to "sign on" for the research by making a personal commitment of time and energy. The researcher was able to determine whether participants had a familiarity with this type of problem. Four Study Circle participant categories emerged: (1) senior level managers who did not have a traumatic life experience nor supervised a TLE employee; (2) senior level managers who had a traumatic life experience and had supervised a TLE employee; (3) senior level managers who did not have a traumatic life experience but had supervised a TLE employee; and (4) TLE employees who had made a successful re-entry to their workplace environment.

In the traditional workplace the three most common educational formats are the lecture, the seminar and the workshop. The lecture is best for communicating and clarifying information, procedures, policies, regulations and the like. It is also used by executives to stir and motivate employees. The seminar format is most often used by corporate leadership to explore and formulate new ideas, policies, procedures--to debate and discuss them before implementing them. The workshop used primarily for training people in various skills, is a very practical performance-based educational model.

What is missing in the workplace is an educational process for dealing with topics that need to be learned attitudinally, that is, topics that are aimed at transforming not only knowledge and behavior but also attitudes and emotions. In a topic such as dealing with the re-entry of a TLE employee, it is not enough to present the kinds of knowledge and information given in a lecture, nor is it enough to include a set of behavioral skills that one might learn in a workshop. The "missing" educational format needs also to provide ways to educate attitudes and emotions as well. By its educational design, the Study Circle provides this missing dimension of the traditional learning process in the workplace. The personal sharing in the Study Circle by participants who had experienced a traumatic life event or had managed a returning TLE employee provided the context for the needed attitudinal and emotional learning to take place.

The Study Circle is a distinct form of education which emerged in the United States in 1878 as one element of the Chautauqua Movement which included home-based Study Circles (Stubblefield, 1994). The idea of Study Circles transferred to Sweden during the 19th Century when that country was going through a very bleak period. Today Study Circles are a central part of Swedish life (Schurr, 1988). The Study Circle Resource Center (SCRC) in Pomfret, Connecticut is a clearinghouse of information of Study Circle activities all over the country. The SCRC is dedicated to the revitalization of the "democratic spirit."

Stubblefield (1994) believes, "Study Circles offer a new format for engaging learners in study and discussing public issues." Built on the experience and knowledge of the group members, it expands horizons by ensuring that everyone's views are considered during the discussion (Oliver, 1987). When properly conducted, a Study Circle makes all participants equal and values everyone's contribution. This democratic spirit in the TLE Study Circle reported herein allowed managers and employees to share their experiences and discuss the topic as equals. A rather revolutionary event in most organizations!

Research Questions

The research considered these questions:

1. Can Study Circles be designed and used to engage managers in a discussion of the problems of returning TLEs?
2. Can Study Circles be designed for and used by managers and co-workers to facilitate the TLE re-entry?
3. Does a manager having pervious experience with a TLE in the workplace engage more easily and intensively in a dialogue with a TLE than managers without such experience?
4. What examples of group-participation dynamics are likely to occur during such a Study Circle?
5. How open are managers after a Study Circle to dialogue with a TLE in the workplace?
6. Does the environment and setting of a government agency have relevance for Study Circles in assisting managers to help returning TLEs?

Methodology

The research was qualitative by design. The authenticity of data was verified by the multiple sources of information that were used. These sources included the long interview, case studies, researcher's observations, audiotaped interviews and videography.

The multiple sources of information were verfied by: (a) interviewing the participants prior to the Study Circles Sessions, (the interview information the researcher received and captured on audiotape provided a cross check with other people in the group). (b) The participants in the Study Circle had an opportunity to comment to each other, providing subject feedback verification, and (c) video taping was completed with all three Study Circles Sessions. Not only was the data verified, but the researcher's interpretations were verified by going through a debriefing with advisors which, through this debriefing, defended the data. Alternate interpretations were rejected in the review.

Leedy (1993) writes, "The qualitative research methodology approach is concerned with human beings: interpersonal relationships, personal values, meanings, beliefs, thoughts and feelings. The researcher attempts to attain rich, real and valid data and from a rational standpoint, the approach is inductive."

The long interview was used during the research study. McCracken (1988) writes, "The long interview gives us the opportunity to step into the mind of another person to see and experience the world as they do themselves."

The suggestions of Stake (1995) guided the researcher's audiotaping in the two case studies that were presented in the research: an employee who returned to the workplace after having experienced a trauma and a manager who had never supervised an individual with a trauma. The storytelling approach as described by Stake created both a chronological and biographical development of each case. Also, the findings of Robert K. Yin (1994) guided the researcher in the pilot case study.

The qualitative interviewing approach of Rubin and Rubin (1995) was used in data analysis and in viewing the videography. Analyzing participants words and nonverbal communication during a review of the video tapes assisted the researcher in discovering themes and clarifying perceptions of the participants.

The research clearly showed that Study Circles can and do work successfully as an educational format in a culturally diverse workplace especially a government agency. Two groups of Study Circles (Group A and Group B), with all sessions conducted during the lunch hour, attracted both managers and employees. The lunch hour served as an excellent time for meeting since it did not interrupt the work schedule of the participants.

Each Study Circle program consisted of three sessions where participants, managers and returning TLEs, engaged in open dialogue and discussed questions pertaining to that session's theme. The three themes were: (1)

creating a safety net, (2) *telling the trauma story*, and (3) *reconnecting the employee to the workplace*. Each session provided insights to the participants on the issues and concerns managers may have in welcoming a returning TLE to the workplace. For example, in the "safety net" session conflicting views were acknowledged by managers who wanted to emphasize the need for "productivity and compassion" when the TLE employee returns to the workplace. Managers, primarily responsible for the "bottom line" and getting the work done, felt conflicted if they had to spend a lot of time tending to a TLE--and at the same time not being sensitive to the needs of the returning TLE.

In the second session the discussion focused on how managers should interact with returning TLE's when they wanted to tell their trauma story. All managers agreed that good listening skills were required in order to determine whether or not the returning TLE wanted to talk about his trauma. All managers agreed to "acknowledge" the TLE employee and "treat the person as they wanted to be treated." In the third session, "reconnecting" managers focused on how to explain the recovery process to co-workers and what tone to set in the organization when the TLE returns to the workplace. One manager suggested that the returning TLE be invited to staff meetings and be reassured that his status had not changed because of the trauma.

During all of the Study Circles sessions TLE survivors provided feedback to managers and employees on the expectations they had of managers and the organization. These sessions provided an opportunity to explore uncharted territory in the organization, that of bringing a sensitive topic to the workplace and openly talking about its effect on management and its employees.

Each Study Circle group displayed a different spirit. Group A was homogeneous and shared more feelings and suggested that the organization needed "guidelines to assist managers" in their task. On the other hand, Group B managers remained more abstract and intellectual in their contributions to the group; they did not share their stories or experiences with the group, but more generally encouraged the organization to train its managers to "communicate" better and learn "active listening skills." Although Group B managers were not as open as Group A managers, the employees in both groups were equally open and eager to share their stories with other participants.

Both groups created their own group culture, engaging not only in the sessions's topic but other pertinent issues relative to manager/employee concerns such as acknowledging differences (each TLE will be different), communicating more openly, and recognizing performance issues when the TLE returns to the workplace.

It was concluded that to appropriately welcome a returning TLE employee, managers did not need to have previous experience in dealing with a returning TLE. Their success depended on their individual and career experience, how comfortable they felt in engaging the returning TLE, and their own personal experience with trauma.

The intervention techniques available in today's organizations to returning TLEs are many and varied and their relative applicability and effectiveness will depend on a number of factors,e.g., the traumatic event which was experienced, the level of medical and psychological therapy the TLE employee has had following the traumatic life event and before returning to work, and the help the TLE employee has sought and received outside the workplace from groups, family members, friends and associates.

In addition to psychological counseling and individual psychotherapy for the TLE employee, for example, Corey and Corey (1997) introduced the "Therapy Group." Here individuals meet on an ongoing basis with a counselor to discuss their grief. Yalom (1995) has observed in working with his clients that between the third and sixth month of group therapy individuals often undergo a shift, noting "Their initial goal, relief of suffering, is modified and eventually replaced by new goals, usually interpersonal in nature." Corey and Corey observe "Groups provide a natural laboratory that demonstrate to people that they are not alone and that there is hope for creating a different life. Grief intervention or grief counseling is another short term approach which can be used by a counselor or therapist to smooth a re-entry transition to traumatized employees returning to work. Ward (1995) concludes that "Grief needs time and space to express itself; one needs to give oneself the time, security and permission to grieve."

The educational intervention that the researcher introduced--Study Circles--does not replace importance of the TLE employee seeking one-on-one counseling or group therapy. The Study Circle intervention is designed for the managers and co-workers of the TLE employee. Its educational objective focuses on preparing the managers of an organization to deal effectively with individuals who are returning after a trauma. It does not exclude a manager in their organization from recommending to his/her employee to seek the services of the Employee Assistance Program (EAP) which may in turn recommend that the returning TLE seek personal counseling. In fact, after the Study Circle, a manager may be better prepared to make such a recommendation more selectively and compassionately. In this study the researcher is offering Study Circles as a forum which can assist managers in creating a safe bridge and a caring atmosphere where co-workers along with managers can listen to returning TLE employees and learn to be proactive instead of reactive.

Although in its long history the Study Circle format has been used extensively in community meetings, church groups and home study groups, it has only rarely been tried in workplace settings. These Study Circles

sessions proved that this adult educational process can be effectively applied in business and corporate settings (Osborne & Shevat, 1982).

Results, Conclusions and Limitations

The researcher conducted two groups of Study Circles, Group A and Group B. Both groups were a mix of managers and employees. Group A consisted of managers and employees with no specific professional or interpersonal skill base, they were selected only by availability and referral. Their "chemistry" was excellent; they were the ideal Study Circle. The group got along exceptionally well and freely shared their experiences with each other. Their sessions were filled with light humor, and no one seemed to up-stage another participant. On the other hand, certain Group B managerial participants were selected because of their professional expertise (alternative resolution dispute experts, lawyers, labor-relations, workshop leaders and a human resource manager). Group B as a whole did not generate great "chemistry" with each other. The managers, except for a few, did not share their trauma experiences with the group members. Instead they tended to make professional recommendations.

The researcher believes this occurred because Group A's orientation was toward finding a solution to a problem. Group A was more concerned with getting a result and giving guidance on how a job could be done better. On the other hand, Group B participants were swayed and perhaps awed by the experts in the session, who seemed most concerned about teaching communicating and listening skills, not with solutions. Over and over again, the professional communicators pointed out how the managers needed to be trained and skilled in good communication and active listening skills to support returning TLE employees, but as a representative of their work, they did not "walk their talk."

It would be important in future Study Circles groups for the facilitator to be aware that the types of individuals recruited for the sessions will make a difference in the quality and tone of the Study Circle sessions. For example, if all participants are engineers, because of their technical expertise their views on approaching a returning TLE are likely to be different from individuals who are counselors or group-process oriented.

However, every participant in both groups reported that the educational goals of the Study Circle were accomplished. Thus, despite the lack of group "chemistry," the Study Circle achieved its educational effect.

Administrative Observations

Distributing a list of discussion questions prior to each Study Circle sessions worked successfully. Participants said the handouts got them thinking about the content before the sessions, and gave them ideas, topics and verbiage to engage in a dialogue about a sensitive subject. Group A and B participants repeatedly made reference to the fact that they had reviewed the questions and noted in the sessions that some of the topics would be essential for mangers to focus on when greeting a returning TLE. For example, "good listening skills" was highlighted on one handout and managers and employees had extensive discussion on this topic.

The pre-Study Circle interviews were universally seen as helpful by participants. Numerous benefits about these interviews were mentioned by the participants both on the evaluations and in informal conversations. However, in Group B none of the employees were interviewed beforehand, yet all of them were very involved in the Study Circle, freely sharing their trauma stories, each reported having had a successful educational experience. Thus, it seems that pre-Study Circle interviews are not a critical factor in the learning process. Although the researcher concludes that pre-Study Circle interviews are not necessary to conduct a successful Study Circle, all those who were interviewed stated that the interviews assisted them in getting a broader framework for the topic.

How This Research Contributes to New Knowledge in HRD

This research project contributed significantly to a HRD program by illustrating how the Study Circle as an adult educational format can be transported into the workplace, in this case to assist managers and co-workers in dealing with a returning TLE employee. Through this Study Circle certain human resource problems can be minimized or prevented. Without this education, lack of communication can lead to performance problems on the job. For example, a supervisor who does not know how to approach a returning TLE may give the employee an adverse rating for not performing his functional duties. On the other hand, if the TLE employee is not treated with sensitivity or with compassion, he/she may file a grievance or a discrimination complaint against the manager.

Study Circles provide a model and a method to educate people about sensitive topics, which can be very easily adapted for any type of workplace setting. This "democratic" educational model brought together for the first time both managers and employees who were asked to teach and learn from each other through the Study Circle process about the very sensitive topic of traumatic life experiences.

During the Study Circle sessions participants listened to each person's contribution and offered their own stories and experiences. Some of the participants were willing to risk sharing their personal stories of trauma, which created a very positive learning environment. Because of the personal cohesion and trust that was built up among participants, they learned much, theoretically and practically. In their evaluatory reports, managers and employees said they better understood the process of recovery from trauma and were confidently able to implement some of the strategies and suggestions discussed in the Study Circle sessions. Although in the workplace, there is normally a sense of "difference" between employees and their managers, the interactive dynamics of the Study Circle process proved to be a gentle "equalizer, "enabling a free and respectful exchange among all participants.

Study Circle groups may have tremendous variation in their "group personality," but the Study Circle process, if handled properly, can work successfully within such variation. Even though the researcher was disappointed in the quality of Group B's trust and interaction, it was clear that for a Study Circle to be successful the facilitator does not have to be in control of the participants' relations and behavior. The evaluation forms completed by the participants assured the researcher that both groups had achieved their educational objectives quite successfully.

Whereas the task of helping the successful re-entry of a TLE employee would normally fall to a counselor or therapist, the Study Circle format allowed participants not to assume the work of the therapist, but to support and promote it in ways appropriate to managers and co-workers. This work of support and promotion could not have been produced in a traditional lecture or workshop, but only in a learning format where personal experience and empathy along with the expression of attitude, emotions and values are provided. The Study Circle format puts these experiential and emotional factors at the center of its learning process.

The Study Circle as an educational format can also prove useful with a topic around organizational policies and procedures that have not yet been formulated and institutionalized. Treatment of the returning TLE employee by managers and co-workers is one such focus. Because such treatment requires a major involvement with empathy, attitude and other emotional sensitivity, it is not an appropriate topic for legislation by executives in seminar, none of whom may have had direct experience of returning to the workplace after a traumatic life experience. The Study Circle format invites participants to share their personal views around such topics, and it views this personal experience as important data in helping shape procedures and policies.

In summary, the researcher sees the Study Circle process as an adult learning format that can fill a missing dimension among the educational tools currently used in the organizational workplace.

Learning-activities of Junior Managers: Findings of a Quantitative Pilot-study

Eline S.K. Lankhuijzen
Utrecht University, the Netherlands

In this pilot-study learning-activities of junior managers are addressed. The purpose of the study is to describe how management-tasks are learned and to what extent. Therefore, we developed a categorization of learning-activities. It is assumed that managers generally learn by doing. Additionally, we address the relation between extent of used learning-activities and age. The assumption is that regardless the age, informal learning-activities are used more than formal learning-activities and with the rising of age, less (formal) learning-activities are used.

Keywords: Management Development, Learning Activities

As a consequence of changes in the environment of organizations, functions and tasks of organization-members may change, for example as a consequence of getting a promotion into a management-position. Often it is not clear whether people are still able to function effectively under changed circumstances. Usually, one will try to bridge the gap between the desired competencies and the actual competencies by using learning-activities. Acquiring insight into types and extent of used learning-activities is one of the central assignments for researchers in the field of Human Resource Development (HRD).

In the last decade, the Human Resource Management approach emphasized the critical role of managers. Storey (1996) states that line managers need to be closely involved both as deliverers and drivers of the HR-policies. Furthermore, because of ongoing decentralisation- and flattening-processes, tasks and responsibilities are shifted towards lower levels of management. Earlier, those tasks were done by personnel specialists alone. This includes the responsibility for the development of employees as well as the manager's own development. Consequently, (first-line) managers are at the same time object and subject of Human Resource Development (Thijssen, 1998). Moreover, first-line managers lead independent business-units and are therefore held responsible for the results of their unit. Organizations, then, depend to a large extent on the competencies of their (first-line) managers. Consequently, it is an important issue to gain more insight into the learning of management-tasks. It is especially the group of junior managers that needs attention from the field, because they will normally use many learning-activities to prepare themselves for their new position.

A tendency in the field of HRD is the increasing focus on the workplace as an environment for learning and education. This can be seen as a result of the greater demands placed on productivity in which there is little time for training off-the-job. As a result, work and learning are becoming more and more interdependent. Furthermore, there are some advantages of learning on-the-job: the small transfer-problem, high motivation, early availability of new employees and low(er) costs (De Jong, 1996). In the same line of thought, fits the increasing attention for more informal ways of acquiring job-related competencies. However, the contribution of informal learning-activities of junior managers has not yet been extensively researched.

The objective of this pilot-study was to identify and to describe learning-activities of junior managers and the factors relating to the use of learning-activities. These factors can be individual or contextual; in this paper we describe the relation between age (individual factor) and use of learning-activities. The central research-question addressed here is: How can learning-activities used by junior managers, be characterized with regard to extent and type and how is the use of learning-activities related to age?

Theoretical Framework

Learning-Activities

Work-related learning-activities are various ways in which new qualifications are acquired or already existing knowledge and skills improved, both on-the-job and off-the-job.

Learning-activities vary in extent of formalization; they can be formal, non-formal or informal. Formal learning-activities are generally assumed to be goal-directed, organised and structured and to have educational intentions (Warmerdam, 1993, Marsick & Watkins, 1990). Marsick & Watkins (1990) add that formal learning is institutionally sponsored and classroom-based. Examples of formal learning-activities are courses and seminars.

Copyright © 1999 Eline F. Lankhuijzen

Informal learning is more difficult to define, but in general it is seen as acquiring and developing qualifications in and by executing normal work-tasks, within the normal work-situation. Informal learning usually happens unintended, unorganised and unstructured and is considered a side-effect of executing productive work-tasks (De Vries, 1988). Moreover, the control of informal learning-activities rests in the hands of the learner (Marsick & Watkins, 1990).

It is difficult to draw a precise line between formal and informal learning. Learning-activities that fulfil certain, but not all conditions are therefore called non-formal. Examples are activities like coaching or using job-aids, which are both partially structured.

Researchers in the field acknowledge that although the positive effects of formal training must not be forgotten, this is certainly not the only effective way for personnel development. Informal learning-activities seem to have possible effects on productivity, which are considered to be high, even in comparison with the value added due to formal learning (Van Onna, 1992). Additionally, researchers found that managers value formal training, but mainly learn by doing (Hill, 1992), or as McCall et al (1988) call it: learn from experience. Similarly, Noe & Wilk (1993) concluded that on-the-job experience may be more valuable for skill and competency development than formal courses or seminars. In addition, managers are generally viewed as being 'accommodators'; they prefer to learn from concrete experience and active experimentation (Kolb, 1984). From this point of view we formulated the hypothesis (A) that managers' learning-activities will mainly be informal (learning by doing). Taken together, it seems worth it to take a closer look at the informal learning-activities of junior managers, while at the same time not neglecting the value of formal training.

Warmerdam and Van de Berg (1993) identified 14 learning-activities. Kwakman (1992) carried out a factor-analysis on the same set of activities, which resulted in three factors: discovery learning, coached learning and external learning. On the basis of these findings, we developed our own categorisation of learning-activities in the following four categories:

1. learning by doing: on-the-job, informal;
2. learning with/by co-workers: on-the-job, non-formal;
3. Learning by seeking information: on-the-job, non-formal;
4. Training, workshops, courses, etc.: off-the-job, formal.

From results of reliability-analyses and factor-analyses, it was concluded that this categorisation is justified.

First-Supervisory Experiences

This research focuses on junior managers. Junior managers are managers working in (one of) their first supervisory position and having little experience. Mostly this concerns a first-line management-position in which a manager directly leads the workfloor. Important to note is that the term 'junior' refers to the extent to which a manager has experience in supervisory positions, it does not refer to age. Although age and experience will often be related.

The importance of the first-supervisory experience for further development as a leader, was supported by several studies. Davies & Easterby-Smith (1984), for example, found that confrontation with novelty in a job, e.g. when getting one's first supervisory position, is a common feature of developmental experiences mentioned by managers. In a study done by McCall et al (1988), it was concluded that topmanagers see their first supervisory position as a key-event in their career. Many executives maintained that, it was their first managerial job by which they were introduced to organizational realities. In this period managers are most likely to be open for new experiences and for learning fundamental aspects of the organization's methods. In support of this finding, Finch & Hopkins (1997) found that effective leaders considered new positions that offer new and/or increased responsibilities as most helpful to their development as leaders. Finally, Hill (1992) concluded that the first management position has a remaining influence on the further development in leading positions. Taken together, these investigations indicate that the first managerial position is a relevant starting point for researching managers' learning-behaviour.

The Management-job

A review of literature on management results in a long and varied list of definitions and descriptions of management and corresponding behaviors, activities, tasks, functions and responsibilities. The early descriptions refer to what managers should do (prescription), whereas more recent studies show what managers actually do (description) (Vinkenburg, 1997). For the pilot-study we chose for a description of the management function of the latter kind, developed by Luthans et al. (1984, 1985, 1988, 1995). They distinguish between twelve concrete

managerial activities with behavioral descriptors. These managerial activities, which we will indicate as management-tasks, were grouped into four clusters: (1) Communication (Exchanging routine information, Processing paperwork), (2) Traditional Management (Planning and co-ordinating, Decision making and problem solving, Monitoring and controlling performance), (3) Networking (Interacting with others/outsiders and Socializing, Politicking) and (4) Human Resource Management (Motivating and reinforcing, Disciplining and punishing, Managing conflict, Staffing, Training and developing).

Certain characteristics of management-tasks are likely to relate to the use of learning-activities. In this research we measured the importance and frequency of management-tasks. It is assumed that some tasks are more applicable and important for lower levels of management than others. Our hypothesis (B) is: the more important a management-task is and/or the more a management-task occurs, the more learning-activities will be used with regard to that management-task.

Learning-Activities and Age

One of the questions of the research-project as a whole, is which factors are related to the use of learning-activities in the current job. Since learning-activities are conceived of as depending on individual and contextual factors, we included from both factors some in our research. In this paper we address the relation between age as an aspect of personal characteristics and the use of learning activities.

Several authors stress that when age rises the total extent of use of learning-activities decreases. In other words: the older one gets, the less learning-activities (formal and informal) are used. An explanation that is often given, is that older people are not able and not willing to learn. Onstenk (1995) states that these kinds of explanations are mainly prejudices. The likelihood that learning processes will take place is not only a result of characteristics of the learner/employee, but also depends on the provision of learning opportunities in the workplace. Empirical research shows that often it is the lack of training-opportunities and the low accessibility of training for 'older' people that causes this negative correlation between age and participation in (formal) education. In addition, formal learning-activities are organized for people in the first half of their career. In later stages less attention is paid to formal training. Employees with more experience must find their own way in developing themselves. This mostly comes down to using informal learning-activities. In sum, age can be seen as a moderator-variable.

Although managers in this research cannot be called 'old', there is enough variance in age to study the relation between age and use of learning-activities. Finally, we expect that regardless the age, managers will use more informal than formal learning-activities, since managers are assumed to be pragmatic oriented learners and generally favour learning by doing.

With regard to the relation between age and use of learning-activities we formulated the following two hypotheses:

C. With the rising of age, the total extent of learning-activities used by junior managers decreases;
D. With the rising of age, junior managers participate less in formal learning-activities;

Research Questions and Hypotheses

Three research questions and four hypotheses are addressed:

1. How can learning-activities of junior managers be characterized? (by extent and type)
   Hypothesis A: The more informal a learning-activity is, the more junior managers use it.

2. How can management-tasks of junior managers be characterized by frequency, importance and use of learning-activities?
   Hypothesis B: The more important a management-task is and/or the more frequently a management-task occurs, the more learning-activities junior managers use for these management-tasks.

3. How does age relate to participation in learning-activities by junior managers?
   Hypothesis C: With the rising of age, the total extent of learning-activities used by junior managers decreases;
   Hypothesis D: With the rising of age, junior managers participate in fewer formal learning-activities;

Methodology

Participants

In this pilot-study 70 junior managers participated. Most of them were working in first-line management-jobs as leaders of teams or departments. They have a minimum of 6 months managerial experience, while the average managerial experience is 7 years and 2 months (SD = 5).

The pilot-study was conducted in two organizations: a large government institution and an international chain of fast-food restaurants.

Instruments

Questionnaire. A written questionnaire for the junior manager was developed. Topics were general background information, learning-activities in former job, learning-activities in first year current job (central part), management-tasks, competency and reflection. The respondents needed approximately one hour to fill out the questionnaire. The questionnaire was mainly conducted in groups, in presence of the researcher. Generally the answers were given on a five-points-scale (1 = low, 5 = high). An average score of lower than 2.5 is 'low', a score between 2.5 en 3.5 is 'moderate' and a score higher than 3.5 is 'high'.

Hand-out. In addition to the questionnaire a hand-out was developed with the four categories of learning-activities. The respondents needed this hand-out with examples to help them answering questions concerning their learning-behaviour during the first year in their current job.

Analysis

The main part of the questionnaire was analysed quantitatively, a small part qualitatively. For the quantitative data-analysis the computer program SPSS was used. This paper does not report on the qualitative results.

Results

Research Question 1. How can Learning-activities of Junior Managers be characterized (by extent and type)?

The extent of used learning-activities is given in Table 1. Junior managers score moderately on total extent of used learning-activities (3.02). Furthermore, we can see that the score on 'learning by doing' is high (3.77), while on all the other learning-activities junior managers have moderate scores.

Table 1
The Extent of Use of Different Types of Learning-Activities

Learning-activities	M	SD	F
1. Learning by doing	3.77	.84	27.35**
2. Learning with/by co-workers on-the-job	3.18	.77	
3. Learning by seeking information	2.64	.90	
4. Training, workshops, courses, etc.	2.57	.98	
Total	3.04	1.00	

** p< .01 (two-tailed)

Since we were interested in determining the ranking-order of types of learning-activities used by junior managers, we carried out an analysis of variance (Table 1). The results from this analysis show that the mean-scores of the first three types of learning-activities differ significantly (p<.01), whereas the third and the fourth learning-activity do not differ significantly. This leads us to the conclusion that junior managers learn more by doing than with/by co-workers, and more with/by co-workers than by seeking information and training, workshops, courses, etc. Table 2 shows the ranking-order of used types of learning-activities.

Table 2
Ranking-order of Extent of Types of Learning-activities Used by Junior Managers (1 = most used, 4 = least used)

Ranking	Type of learning-activity	
1	Learning by doing	(Informal)
2	Learning with/by co-workers	(Non-formal)
3	Learning by seeking information	(Non-formal)
3	Training, workshops, courses, etc.	(Formal)

From the data we conclude that informal learning-activities are most used by junior managers. This finding largely supports hypothesis A 'the more informal a learning-activity is, the more junior managers use it'. A slight restriction lies in the fact that there was no significant difference found between the extent of use of the third learning-activity (learning by seeking information) and the fourth learning-activity (training, workshops, courses, etc.). Obviously, the extent of used formal learning-activities does not differ from the extent of certain used non-formal learning-activities.

Research question 2. How can Management-tasks of Junior Managers be characterized by Frequency, Importance and Use of Learning-activities?

Table 3 shows the mean scores on use of type of learning-activity by clusters of management-tasks. The described general pattern of learning-activities (Table 2) is valid for Traditional Management-tasks and Networking-tasks. For tasks in the Communication- and HRM-cluster, the learning-activities 'learning by seeking information' and 'training, etc.' are turned round. Since we already concluded from Table 2 that the positions of these two types of learning-activities are interchangeable, this does not affect the initial conclusions. We conclude that for all clusters of management-tasks most informal learning-activities are used, followed by non-formal and formal learning-activities. Apparently, different management-tasks are learnt in similar ways.

The most right column with mean-scores in Table 3 provides information about the total average extent of used learning-activities for the different clusters of management-tasks. It seems that junior managers use most learning-activities for Traditional Management-tasks and least for Networking-tasks. The analysis of variance shows no significant differences between cluster 1, 2 en 4. Cluster 3 'Networking', however, differs significantly from the others with regard to the extent of used learning-activities. Whereas for the clusters 'Communication', 'Traditional Management' and 'Human Resource Management' is learnt moderately, for the cluster 'networking' junior managers use less learning-activities (the score is exactly at the point of being low: 2.51).

The frequency and importance of management-tasks are presented in Table 4. As can be seen, the total average frequency (3.58) and importance (4.02) is judged to be high. When we take a closer look at the four clusters of management-tasks, we see that tasks in the Communication and Traditional Management cluster have high scores on frequency. Tasks in the HRM- and the Networking-cluster occur moderately. The importance of all clusters is judged to be high, except Networking, which seems to be moderately important. Additionally, managers do not agree largely on the importance of the Networking-cluster (SD = 1.26). This finding may indicate that networking-activities are not especially meant for lower levels of management and are therefore found to be less important.

Table 3
Extent of Used Types of Learning-Activities by Different Clusters of Management-Tasks

	Types of learning-activities										
	Learning by doing		Learning with/by co-workers		Learning by seeking information		Training, workshops, courses, etc.		Total		
	M	SD	M	SD	M	SD	M	SD	M	SD	F
Clusters of management-tasks											
1. Communication	4.03	.98	3.31	.93	2.67	1.05	2.71	1.21	3.18	.64	15.83**
2. Traditional Management	3.87	.99	3.43	1.03	2.93	1.20	2.84	1.37	3.27	.74	
3. Networking	3.29	1.35	2.59	1.18	2.16	1.14	1.91	1.04	2.51	.84	
4. Human Resource Management	3.79	.90	3.30	.91	2.83	1.07	2.89	1.12	3.19	.71	

** p<.01 (two-tailed)

Table 4
Characterization of Clusters of Management-Tasks by Frequency and Importance

	Characterization of management-tasks			
	Frequency		Importance	
Clusters of management-tasks	M	SD	M	SD
1. Communication	3.89	.73	4.06	.73
2. Traditional management	4.07	.76	4.40	.58
3. Networking	3.01	.78	3.36	1.26
4. Human Resource Management	3.37	.61	4.29	.56
Total	3.58	.83	4.02	.92

Table 5 illustrates the ranking-order of management-tasks by frequency and importance. It seems that traditional management-tasks and communication-tasks occur more frequently than HRM- and Networking-tasks. With regard to importance it seems that tasks in the first three clusters are found to be more important than tasks in the networking-cluster. In the last column it is shown that junior managers direct less learning-activities to networking-activities than to the other clusters of management-tasks.

Table 5
Ranking-order of Clusters of Management-Tasks by Importance and Frequency and Extent of Used Learning-Activities (1 = most used, 4 = least used)

Ranking	*Frequency*	*Ranking*	*Importance*	*Ranking*	*Extent of used learning-activities*
1	Traditional Management	1	Traditional Management	1	Traditional Management
1	Communication	1	HRM	1	Communication
3	HRM	1	Communication	1	HRM
3	Networking	4	Networking	4	Networking

Now we know the frequency and importance of management-tasks and which learning-activities are used most. it is interesting to see whether a relation exists between frequency and importance of management-tasks on the one hand, and on the other hand the extent of used learning-activities. For the least occurring and least important cluster of management-tasks 'Networking', junior managers use least learning-activities. This finding seems to point at a relation between frequency and importance and extent of used learning-activities.

To further study the relation between frequency and importance of management-tasks and use of learning-activities, we calculated correlation-coefficients. From Table 6 it appears that frequency and importance of management-tasks are strongly correlated (.722). This can be explained by the high degree of freedom managers generally have. The autonomy in their jobs gives them a free choice to spend their time on tasks that they consider important.

A more interesting finding is that for both importance and frequency of management-tasks indeed a positive correlation exists with the extent of used learning-activities: the more important a management-task is and/or the more a management-task is encountered, the more learning-activities are used. Especially the frequency of management-tasks correlates strongly with extent of used learning-activities (.562). This can be explained by the fact that, in general, managers mention to learn by doing. Prerequisite for learning, then, is for management-tasks to occur. This conclusion is in support of hypothesis B ' the more important a management-task is and/or the more frequently a management-task occurs, the more learning-activities junior managers use with regard to these management-tasks'.

Table 6
Correlation Between Frequency and Importance of Clusters of Management-Tasks and Extent of Used Learning-Activities

Clusters of management-tasks	Importance by frequency	*Importance* by extent of used learning-activities	*Frequency* by extent of used learning-activities
1. Communication	.354**	.318**	.061
2. Traditional Management	.760**	.314**	.507**
3. Networking	.629**	.412**	.247*
4. HRM	.559**	.443**	.595**
Total	.722**	.458**	.562**

** p<.01 (one-tailed); *p<.05 (one-tailed)

Research question 3. How does Age relate to Participation in Learning-activities by Junior Managers?

In order to give an answer to the third research-question, we calculated a bivariate correlation (one-tailed) between age and total extent of used learning-activities. The correlation is -.254* (N = 64, p. 021). Although this score does not show a strong relation, still it is significant. It means that when the age rises, managers use less learning-activities. The third hypothesis 'with the rising of age, the total extent of used learning-activities decreases', hereby is confirmed.

The fourth hypothesis 'with the rising of age, managers use relatively less *formal* learning-activities will be used', was tested by calculating a bivariate correlation (one-tailed) between age and total extent of used *formal* learning-activities. The correlation is: -.059 (N = 67, p = .318). This correlation is not significant. Hypothesis four cannot be confirmed.

From Table 7 we see the results of an independent samples t-test, which we carried out as an extra indication of the difference in use of formal learning-activities for different ages. We divided the total group (20-43 years of age) in two age-groups. The 'younger' group was younger than 30 years (N = 31), the 'older' group was 30 years and older (N = 36). Although the mean-score of the younger group on formal learning-activities is higher than the score of the 'older' group , the result of the t-test shows that this difference is not significant. Again, hypothesis four is not confirmed.

Table 7
T-Test for Two Groups ('Younger' and 'Older') by Total Extent of Used Formal Learning-activities

	Age	N	M	SD	T	df	p
Total extent of used formal learning-activities	>=30 years	36	2.42	1.03	-1.21	65	.232
	< 30 years	31	2.70	.91			

Because we expect the extent of used informal learning-activities to be higher than the extent of used formal learning-activities, the quotient informal/formal has to be larger than 1.00 for both groups. However, the quotient for the older group has to be larger than the quotient of the younger group. To test if these quotients differ for the two groups, we did a t-test (see Table 8). We see that the mean-score on relation informal/formal learning-activities of the older group is higher than for the younger group. However, the difference is not significant. We conclude that the older group does not learn more informally than the younger group. In sum, based on correlation and t-test calculations, hypothesis (D) 'with the rising of age, managers participate less in formal learning-activities 'cannot be confirmed.

Table 8
T-Test for Two Groups ('Younger' and 'Older') by Relation Used Informal/Formal Learning-Activities

	Age	N	M	SD	T	df	p
Informal/formal	> = 30 years	36	1.91	1.04	1.369	65	.176
	< 30 years	31	1.59	.85			

Conclusions and Discussion

The first conclusion we can draw from this study is that junior managers are indeed pragmatic learners. Learning by doing, which is highly informal, is the learning-activity that junior managers use most. The extent of used informal learning-activities significantly exceeds the extent of used non-formal and formal learning-activities. Explanations for this learning-behaviour can be sought in the fact that managers usually have little time for other things than their primary tasks. Moreover, their pragmatic attitude makes that learning while executing their daily work is most efficient. Apparently, it is wise for organizations to create conditions for informal developmental opportunities in the workplace. For example by introducing coaching- and mentoring systems (Davies & Easterby-Smith, 1984).

A second important conclusion is that a correlation exists between importance and frequency of management-tasks on the one hand, and extent of used learning-activities on the other hand. An explanation for this strong relation is the fact that, in general, managers are to a large extent autonomous in their jobs. As a consequence, they have the freedom to direct learning-activities to the management-tasks they value most. For organizations it is important to show their managers the value of management-tasks, since it appears that this is a crucial factor in using learning-activities. Striking is that managers still seem to pay most value to Traditional Management-tasks. Apparently, Traditional Management-tasks are still the core of management, while also nowadays the importance of HRM-tasks is more and more recognized. Moreover, worth mentioning is that the pattern of learning-activities (most informal, least formal) is valid for all the clusters of management-tasks. Obviously, all management-tasks are learnt in similar ways.

Thirdly, we can conclude that the older a manager is, the less learning-activities he will use in total. This most probably relates to the fact that older junior managers have more job-related experience and therefore need to use less learning-activities than their younger colleagues. Furthermore, we expected to find that the older one gets, the less formal learning-activities a junior manager will use. However, this hypothesis was not supported. An explanation for this might be that, although there was enough variance in age, all junior managers were meeting new tasks and therefore all of them had to learn.

The results presented in this study are mainly descriptive. It was a necessary step, first to describe what types of learning-activities are used by junior managers and to what extent. The next step is to examine the effectiveness of (informal) learning-activities; this is the contribution of informal learning-activities to performance in the workplace. Further analyses will be done to uncover the pattern of effective learning-activities for different management-tasks.

Integrating Learning with Working--A Reconception of the Role of Workplace Learning

Richard J. Torraco
University of Nebraska

The nature of work continues to evolve from predictable, deterministic patterns to forms that are more contingent and idiosyncratic. The evolution of work, and of the expertise to perform it, have not been accompanied by innovations in the models used by workplace educators to develop this expertise. For some technical work roles, present models are inadequate for developing the skilled performance these roles require. Using in-depth accounts of actual work activity, this paper examines changes in how work is accomplished. Emergent themes from selected work settings are analyzed against present models of employee development. Using the theories of situated learning and distributed cognition, a reconception of the role of learning interventions is proposed that more fully integrates learning with working.

Keywords: Workplace Learning; Distributed Cognition; Situated Learning

Present models for developing work skills originated in the military and have evolved into the widely used instructional systems design (ISD) model (Gagne, 1962; Campbell, 1984). Efforts to develop and refine models that are responsive to the needs of the high performance workplace have expanded the scope of interventions beyond instruction alone. Present models are more comprehensive and systematic than in the past, yet they reflect a view of developing work expertise that is prescriptive and determinant. While present models are useful for many types of employee development, their potential for developing the type of skilled performance needed in a contingent and dynamic work environment is questionable.

This paper examines how well present models for developing skilled performance meet the challenges posed by certain types of technical work. The paper identifies a key deficiency in the models educators use to develop the skills needed for a particular class of work roles. This deficiency undermines our efforts to promote workplace learning and, if left unaddressed, our credibility as educators and agents of change. It is hoped that the identification of this deficiency will catalyze research to develop new models that are more responsive to the contingent task requirements so prevalent in today's workplace. A framework for integrating learning with working is proposed as a point of departure for this important, new research.

The following sections provide accounts of how work is accomplished in selected work settings. From these work descriptions themes are drawn that pose the greatest challenge to the viability of present models of instruction. Recent enhancements to the ISD model are critiqued against these themes. Finally, a framework for workplace learning is proposed based on this critique that more fully integrates learning with working.

Perspectives on Contemporary Work Practices

This section provides a series of work descriptions that summarize more in-depth studies by researchers who examined the work of six groups: photocopier repair technicians, dairy workers, software support technicians, aircraft carrier personnel, ad hoc work groups, and naval navigators. From these perspectives we gain insight into a particular class of work roles and the demands this work places on the capabilities of those who perform it. They highlight dimensions of skilled performance that warrant further attention from educators and others involved in developing these skills.

These six descriptions of work are not intended to be representative of the various types of work to be found in today's work environments. They are used because they illustrate certain characteristics of how work is accomplished. Thirteen descriptions of work were reviewed to identify features of task performance that challenge the viability of present models of instruction. These studies describe situations at the task level in which workers are confronted with novel or poorly defined problems that cannot be anticipated fully in advance. Thus, this work is difficult to analyze and translate into prescriptive behaviors for task performance. From this pool of studies, six accounts were chosen as the basis for this paper that met the following four criteria. Each account selected provided a description of work at the individual task level that is detailed enough to allow an accurate replication of the work

Copyright © Richard J. Torraco

behavior performed. Each account is an exposition of a single occupational or functional role. This is important to avoid contaminating the analysis with tasks and responsibilities from other occupational or functional roles that, while present in the same system, are not the work roles of interest in this analysis. In addition, the accounts focused on a particular class of work roles that is technical, rather than interpersonal or managerial, in nature. All of the accounts sought to enhance our understanding of how human expertise can be more effectively developed in natural settings where non-human factors also affect outcomes.

An examination of the characteristics of task performance within these six accounts of work lays the groundwork for a reconception of learning interventions for developing the expertise required by this work.

Photocopier repair technicians. Detailed accounts of how photocopier repair technicians resolve the problems encountered in restoring a malfunctioning photo-copier to working order emphasize the crucial contribution of contextual understanding to the development of their skills. Beyond basic technical expertise, technicians need a richer understanding of the social context of how photocopiers are designed and used. Orr (1990) makes the following observation about successful photocopier repair work:

> "[Photocopier repair] is not simply a matter of finding out what is wrong with the machine; there may be nothing wrong with the machine as a thing, in and of itself. The problem may rather lie in the interaction of the machine as it is, the uses its designers anticipated for it, and the uses, methods desired, understood and chosen by the customers. The designers' interpretation of how one would use the machine cannot preclude other interpretations, but the others, because unanticipated, may be unsuccessful. This may appear to be a problem to the customer whose interpretation of how to use the machine fails" (p. 171).

Diagnosis of the malfunction was complicated because the state of the machine was often unclear, a technical problem that is resolved through the social interaction of the technician, customer and machine. Technicians' skills must not only include techniques for machine diagnosis and repair, but a broader understanding of the social context of use in which customers make demands of the machine regardless of designers' intentions. Accurate reconstruction of the machine-user interaction is rarely possible for technicians, though such insight would greatly expedite the repair process. Instead technicians must construct their own representation of the problem as the basis of making repairs. Problems that could not be fully anticipated in advance demanded contingent responses; the use of scripted repair procedures by technicians was insufficient.

Dairy workers. Scribner (1984) studied the work of two groups of dairy plant workers, product assemblers and wholesale delivery drivers. Product assemblers prepared product orders, composed of milk and other dairy products, for shipment to customers based on computer-generated order forms. Wholesale delivery personnel were responsible for delivering orders to customers, including computing the dollar value of the dairy products on invoices. Scribner studied these tasks, assembling product orders and pricing delivery invoices, to compare the work strategies of experienced workers with those new to the tasks. Workers in this environment were presumed to rely on a combination of procedural knowledge from task-specific rules and pragmatic knowledge gleaned from experience. Greater understanding was sought about the different roles these types of knowledge played in the work strategies of experts and novices. Support was sought for the premise that cognitive skills take shape in the course of participation in socially organized practices. Thus, learning in the context of practice would be an essential determinant in the development of skilled performance.

Reflecting the wide range of institutional and retail customers served by the dairy, each dairy order was unique in size and composition, and consequently, order prices varied. Despite the availability of procedures and computer forms for assistance, wholesale delivery personnel adopted their own alternative methods for pricing delivery invoices (for example, effort-saving algorithms and personal crib sheets) that were not used by those new to the task. At the close of each delivery, experts made use of physical aspects of the environment, such as product containers and shipping cases, as cues for computing sub-totals for customer invoices. Their own pragmatic problem solving gave rise to these strategies for preserving mental effort on-the-job. A parallel demonstration of pragmatic thinking to save manual effort was apparent among product assemblers. Economy of effort functioned as a criterion distinguishing skilled from amateur performance. As opposed to relying primarily on procedural knowledge, successful work strategies were goal-directed and varied adaptively with the changing properties of the problems and resources encountered by workers in the task environment. These contextual factors influenced the development of skilled performance and illustrate how workers in a production environment learn and adapt their skills on-the-job.

Software support technicians. Pentland (1997) provided an insightful commentary on an increasingly ubiquitous role in today's computer-mediated work environment—the software support technicians who provide direct customer service through hot lines. A major challenge for these technicians is locating the sources of error underlying customer problems. Sifting through information from customers, technicians had to decide what was and was not relevant to problems. Compounding the challenge, computer problems frequently interrupted key business

operations of customers. Under the pressure of deadlines, customers were anxious to regain their lost computer capabilities. In addition, customers had diverse software and hardware configurations. Thus, both the urgency and complexity of customer problems confronted software support technicians.

Pentland's account reveals the challenge technicians faced in trying to reconcile the ambiguity of most customer problems with their own rational approach to computer work. The customer problems technicians encountered were poorly defined and often conflicted with the belief that software programs do exactly the same thing every time you run them. If a customer encountered a problem since the last time the program was successfully run, something had to have changed. Lacking a definitive diagnosis of the problem, the preferred solution was to tell customers to remove all unfamiliar system features until the software worked again. The overriding principle was that anything that resolved the problem was justified and acceptable, as long as it worked. The precision and logic suggested in theory were replaced by behaviors that were far more contingent and difficult to anticipate in practice.

From the work of photocopier service technicians, dairy workers, and software support technicians we gain insights into how they skillfully accomplish their tasks, aspects of which may have implications for how this expertise is developed. First, in each situation learning through workplace experience was crucial to the development of skilled performance. Without it technicians could not develop a balanced repertoire of solution strategies. Knowledge of diagnostic methods, common user mistakes, and other technical skills were insufficient if not considered within the broader user context. Learning from experience—one's own experience and the shared experiences of other—is a central part of developing skilled performance. Greater sensitivity to the value of contextual learning is indicated for learning interventions for this type of work. Second, successful work strategies in technical work environments are more contingent on environmental factors than the logic and coherence of technology suggests. The problem solving of software technician and dairy workers depended on conditions they encountered in the task environment, forcing them to rely on pragmatic rather than rational solutions.

The work perspectives in the next section focus on collective activity—that is, the work-related efforts of more than one person. Some tasks, such as those required to pilot large ships, develop fundamentally new products, and maintain the flight schedules of aircraft carriers, are necessarily collective efforts that cannot successfully be accomplished by an individual working alone, no matter how skilled the worker. In these instances, the coordinated efforts of several skilled workers are needed for safe, error-free performance.

Aircraft carrier personnel. Weick and Roberts (1993) used flight operations on aircraft carriers to illustrate the effects on performance of the presence or absence of *collective mind* in personnel responsible for launching and recovering naval aircraft. They defined *collective mind* as "a pattern of heedful interrelations of actions in a social system" (1993, p. 357). According to Weick and Roberts, as mindful comprehension among personnel increases, organizational errors decrease. Collective mind is shown to be integral to the successful execution of several key operational tasks requiring the skillful coordination of multiple onboard functions. For example, Weick and Roberts describe the process of taxiing a plane to a parking position on a carrier deck after a successful night landing. Without the benefit of daylight, the pilot relies on the guidance provided by hand signals from the taxi director who is out in front of the plane. Skillful coordination can mean the difference between successfully parking the plane on the cramped carrier deck or taxiing the plane over the side. Each actor, the pilot and taxi director, depends on each other's heedful interactions for the safe execution of the task. Other potentially dangerous tasks are described such as aircraft launch (takeoff), recovery (landing), on-deck refueling, live ordnance loading, and "spotting" (moving) aircraft on deck. Skilled, error-free performance on these tasks requires mindful interaction among personnel, a level of interaction that develops when learning and working are closely integrated.

Ad hoc work groups. Organizations seeking greater responsiveness to rapid changes in the marketplace have increasingly turned to using *ad hoc work groups* to accomplish specific projects. A group developing a fundamentally new product must undertake a complex task under time constraints in non-routine situations (Ancona & Caldwell, 1990). Ad hoc groups consist of members who otherwise would not work together and will likely disband after completing their work. New product development cannot be completed by a single person or work unit, and thus, require the interrelated contributions of group members which are, in turn, informed by needs and constraints external to the group. Ad hoc groups are further challenged by the need to establish norms and guidelines for reporting progress and dividing task responsibilities despite short-term goals. Short time deadlines emphasize efficient learning and task completion, rather than gradual socialization and group development. Yet, despite these constraints, group members must develop a shared sense of how to best distribute the responsibility for new product development. In short, the distributed nature of expertise in ad hoc work groups requires shared accountability for accomplishing a common goal in a short time.

Naval navigators. Hutchins (1990) provided an in-depth account of the expertise required for navigating large ships. Responsibilities are distributed among the members of a navigation team composed of three to six

members depending on the size of the ship. Members of the navigation team who are not located in the pilothouse interact continuously using radios, closed-circuit television, and visual contact. This is especially important for error-free navigation in confined or busy waterways. The career trajectories of naval navigators are such that most members of the team have previously held the positions of one of their junior colleagues. Advancing through progressively difficult navigation jobs allows for the overlapping distribution of expertise among members of the team. The expertise for navigation is not fully captured by any single member's conception of the navigation task. As Hutchins (1990) observes, "[the] sequence of actions to be taken need not be represented any where in the system. If participants know how to coordinate their activities with the technologies and people with which they interact, the global structure of the task performance will emerge from the local interactions of the members" (p. 209). The distributed nature of the expertise required for naval navigation and other group work has implications for workplace learning that are examined next.

Themes from the Workplace

This overview of work practices presents a picture of the sophisticated and demanding nature of this particular class of work roles. Three themes are drawn from these work descriptions about the nature of skilled performance required in these settings. These themes were explicitly identified in the six descriptions of work by the researchers as features of the work settings they examined. The first theme, the contingent versus deterministic nature of work strategies, was a feature of all six work descriptions. Each of these studies was consistent in its emphasis of the need for employees to go beyond scripted procedures to resolve novel and poorly defined work problems. The second theme, the distributed nature of expertise, was a prominent feature of the four accounts that examined the work of groups—photocopier repair technicians, aircraft carrier personnel, ad hoc work groups, and naval navigators.

The third theme, the integration of learning and working, was manifested in different ways in each of the work descriptions. Learning in the context of work for new product development teams was characterized as " 'playing in the sandbox'; members were occupied with exploring new product ideas and determining their feasibility" (Ancona & Caldwell, 1990, p. 179). For aircraft carrier personnel, Weick and Roberts (1993) describe this phenomenon as "teams of people thinking on their feet and doing the 'right thing' in novel situations" (p. 358). Learning could not be distinguished from the work activities of photocopier repair technicians, whose expertise depended on "the interactive construction of an understanding and a basis for action in the context of the problematic situation" (Orr, 1996, p. 12). Similarly, the successful performance of dairy workers relied on "cognitive skills [taking] shape in the course of individual participation in socially organized practices" (Scribner, 1984, p. 37). This theme was also evident in Hutchins' exhortation that any new naval navigation system "incorporates ways for operators to learn their jobs while working" (p. 219) and in Pentland's (1997) conclusion that "the most important insight is that local knowledge is crucial in software support" (p. 127). In each of these situations, skilled performance could not be developed without affording the opportunity for learning in the context of work.

More significantly, these themes were drawn from the work descriptions because they emphasize features of the task environment that are not adequately addressed by present instructional models. The evolution of this work has not been accompanied by innovations in the models educators use for developing this expertise. The following discussion of these themes provides the basis for the critique of present models of instruction.

Contingent versus deterministic work strategies. Rather than the rational and deterministic behaviors suggested by operating procedures and computer logic, successful work strategies are contingent upon multiple factors and expressed through pragmatic behavior. Software support technicians were challenged by problems from customers who were using multiple hardware configurations and software programs, and who each had their own idiosyncratic computer terms and techniques. The technicians' limited problem solving algorithms were inadequate for the variety and unpredictability of these problems. In the case of photocopier repair, the development of the now familiar control panel displays that aid copier users in freeing paper jams and other common problems was the best that engineers could do to reduce the need for service calls. With common, predictable copier problems made transparent enough that customers could resolve them, technicians were left with the breakdowns of ambiguous origins that could not be resolved with schematics and procedural knowledge alone. Scribner's study of dairy workers showed that the need for adaptation to unanticipated situations was not limited to technicians working with computers and electronics. To deal with the unique characteristics of each delivery situation, expert drivers bypassed invoicing procedures and relied instead on pragmatic rules of thumb, makeshift crib sheets, and other shorts cuts afforded by the task environment.

In each of these work settings, employees were confronted with novel or poorly-defined problems that could not be fully anticipated in advance. Successful performance required employees to go beyond scripted procedures to

resolve problems in innovative ways. To understand and respond to these ambiguous situations, they made resourceful use of materials, local conditions, and social circumstances, thus deploying contingent work strategies that reflected the changing properties of the task environment.

The distributed nature of expertise. Skilled performance in many work environments is a function of expertise that is distributed among group members. In the group context learning is a collective activity in which members construct their actions, understand that the system consists of themselves and others, and interrelate their actions within the system (Weick & Roberts, 1993). Rather than limited to a single agent, the *learner* is an aggregate concept representing a corps of individuals engaged in collaborative effort to achieve a common goal.

While present models of instruction feature a comprehensive assessment of the learning characteristics of the individual, they do not adequately address learner characteristics for situations in which the expertise to be learned is distributed. For example, readiness for learning and the need for structure are two learner characteristics not accounted when the skills to be developed are shared. Traditional models of instruction cannot accommodate variability in learner characteristics while, at the same time, developing the desired level of group performance.

The descriptions of group work presented also illustrate the need for greater clarity in the distinction between group dynamics and group performance. The development of group member interrelationships through identifiable stages of intimacy (Tuckman, 1965) is distinct from the development of the level of mindful interaction that yields synergistic performance. It is quite possible for an undeveloped group to become more developed without necessarily achieving the level of mindful interactions that yields high performance. This reflects Weick and Roberts' distinction between the development of group and the development of collective mind. Weick and Roberts (1993) observed that the combinations of "developed group—undeveloped mind" and "undeveloped group—developed mind" are not only possible, but quite prevalent. The dynamics of "developed group—undeveloped mind" are apparent in the experiences of cults (Galanter, 1989), the groupthink phenomenon (Janis, 1982), and the failures of team initiatives (Katzenbach & Smith, 1993). In these instances, comprehension and readiness for mindful interaction declines, regardless of how long the group has been together. Katzenbach and Smith describe the disappointing performance of teams in industrial settings established to accomplish key business goals that "turned from achieving performance gains to improving morale and openness" (1993, p.192). While acknowledging the importance of social and technical integration, the dynamics of mindful interaction that produce high performance are not dependent on formal socialization and group development. High performance is frequently achieved by undeveloped groups (that is, those not passing through stages of group development) (Ancona & Caldwell, 1987; Weick & Roberts, 1993).

The integration of learning and work. The work descriptions show that the distinction between learning and working has significantly eroded in today's workplace. Skilled performance in the work roles described would not have developed if workers did not have the benefit of learning in the context of their work. A more precise definition of *skill* clarifies the importance of integrating learning and work by revealing the contextual nature of skill.

The term *skill* is used to refer to different kinds and levels of human capability. We must first determine whether skill is an attribute of the person, of the task, or of both (Spenner, 1983). Darrah portrayed skills as an attribute of the person such that a skilled worker "can move freely between [workplaces], carrying his or her skills like so much luggage, and transferring those skills effortlessly into new contexts" (1994, p. 67). On the other hand, skill has been grounded in the contexts of its use to the degree that skill ceases to be an attribute of an individual worker, who could not take the skill away, but instead, resides in the interaction of co-workers as skill unfolds in a particular setting (Rogoff & Lave, 1984; Brown & Duguid, 1991).

To further specify the nature of skill, distinctions can be made among the concepts of *skill*, *aptitude*, and *task*. The notion of *task* is conceptually distinct from the performer of the task. A task, arising from particular environmental needs or wants, consists of activities to be performed to achieve desired outcomes. Human *aptitude* is a function of the person that represents individual capacity for a given performance. Individuals are said to possess innate aptitude for spatial reasoning, verbal fluency, and other capabilities. The concept of *skill* adopted here is consistent with the notion that skill is a phenomenon determined by both the performer and the task (Attewell, 1990; Spenner, 1983). Skill is a function of the individual and of the environmental context, that is, the task, within which the skill is demonstrated. *Skill* is not defined exclusively in terms of human capabilities; it retains features of both the performer and the environment in which it is expressed.

Thus, the environment presents constraints and affords opportunities for performance that shape the development of work skills. The influential role of the environment on the development of skilled performance emphasizes the importance of experience and learner control in the learning process. This view is consistent with the theory of situated cognition, in which learner activity and perception precede mental representation (Brown, Collins, & Duguid, 1989). The issue is not the centrality of experience to learning. Experience is crucial to learning (Kolb, 1984; Schon; 1983). Instead workplace educators must give more attention to how the learning intervention

changes when learner control and experience are more prominent. The point is that development to enhance the skilled performance of employees cannot be separated from the context in which the performance is expected to occur.

These three themes—contingent versus deterministic work strategies, the distributed nature of expertise, and the integration of learning and working—present a formidable challenge to the viability of present models for developing skilled performance. In present models, instruction is based on systematic analysis and program development, and then offered as a program that precedes work performance. Yet, the contingent nature of the task environment demands adaptive work strategies that cannot be fully anticipated in instruction based on predetermined analysis and objectives. Moreover, the notion of distributed expertise suggests that collective consciousness is an important element in the development of skilled performance. Yet, present models of instruction address either the job role or group development. Work in a variety of settings demands that workers continuously shift between individual and group expectations to exhibit seamless performance across job boundaries. For work that requires the coordinated efforts of individuals and the group as a whole, we cannot rely on instructional models that address one or the other. Recent enhancements to the ISD model have anticipated some of these concerns. The next section discusses how well these enhancements address the challenges to the ISD model presented by these themes.

Recent Enhancements to the ISD Model

Efforts to develop models that are responsive to the needs of the high performance workplace have expanded the scope of interventions beyond instruction alone (Deterline & Rosenberg, 1992; Rummler & Brache, 1995; Swanson, 1994). Nonetheless, instruction continues to have a powerful hold on the models and methods used by those concerned with improving human performance. The instructional systems design (ISD) model was designed for developing task-related skills and is still the most popular method for job skills and technical training. Since its introduction in the 1960's, revisions and extensions of the ISD model have come from many sources (Andrews & Goodson, 1980; Seels & Glasgow, 1990).

The ISD model recently has been criticized as too prescriptive, linear, time and resource dependent, and insensitive to the context of practice. This critique was catalyzed by Brown, Collins and Duguid's (1989) call for more meaningful "situated" learning experiences. Emphasizing the importance of learner participation in "communities of practice," Brown et al. proposed cognitive apprenticeships as a means for creating learning experiences within the realistic context of practice. Streibel (1991) challenged the field of instructional design to create instructional systems that are more sensitive to Brown's situated learning paradigm. Compared with traditional models Streibel characterized situated learning as more flexible, contextualized, emergent, learner-centered, and interactive. Gustafson (1993) suggested that we need new ISD models. The response to this criticism has weighed heavily toward proposed enhancements to the ISD model, rather than fundamental change in the model.

Richey (1995) discussed the changes anticipated in instructional design based on the influences of general systems theory, cognitive learning theory, constructivism, situated cognition, and chaos theory. Her analysis suggested that enhancements to the ISD model are most likely in the areas of the enhanced roles of analysis and evaluation, greater learner control of instruction, transfer of training, and the continued integration of instruction with technology. Dick (1993) suggested enhancements to the ISD model through clearer definition of the organizational problem(s) to be addressed, refining the use of electronic performance support systems—EPSS (an interactive database, learning tutorials, and expert diagnostic system—all integrated through a desktop user interface), and using the "layers of necessity" approach to instructional design, which advocates using only those design elements necessary for accomplishing a given project (Tessmer & Wedman, 1995). Tessmer and Wedman argued that instructional design models could become more context-sensitive with the use of three techniques—layered analysis, instructional scenarios, and prototyping. Winn (1993) suggested more flexibility in the choice of learning setting and proposed apprenticeships, cooperative programs between schools and employers, and more direct involvement of the community in education. Proposed enhancements to instructional models have been also cast in terms of their compatibility with the constructivist view of learning. Using arguments from constructivism, Lebow (1993) offered a set of principles that integrate the affective and cognitive domains of learning and proposed that critical enabling objectives in instruction.

Are enhancements to the ISD model enough? While these developments are encouraging, they do not address the demand for the skills needed in contingent work environments where expertise is often distributed among group members. Advancements such as EPSS, layered analysis, more effective learning transfer, and other improvements in instructional design foster more context-sensitive learning. However, if subsequent refinements

and computer technology cannot fully integrate learning with working, it may be time to consider fundamental changes to, or even replacement of, the ISD model.

A learning intervention model that is more context-based and amenable to the distributed nature of expertise is needed. At a minimum the development of work skills must arise more naturally out of the conditions and expectations of the performance itself. This requires a fundamental shift from viewing workplace learning as a phenomenon largely driven by educational offerings to a view of learning as a developmental philosophy that permeates organizational life in which learning is enriched through work, and working is enriched through learning. This type of learning does not rely exclusively on educational programs. Programs are episodic events that are time-specific and topic-specific by design. A key question is how much of an experience to develop skilled performance can be meaningfully described in advance? The lessons about how people actually accomplish the work described here suggest that far less can be prescribed in advance than suggested by present models. Comprehensive instruction cannot precede work performance for the development of skills needed in environments that place such a premium on contingent work strategies. The opportunities and constraints afforded in actual work contexts are indispensable for improving this type of skilled performance, for it is the learner who ultimately must translate these experiences into expertise.

Learning models must also be flexible enough to simultaneously accommodate individual and group development. This innovation will not be possible as long as models are based on pre-determined analysis and development and offered as instructional programs. The flexibility for simultaneously fostering individual and group learning can only arise from models in which learning occurs in the context of work. The dynamics of what is expected of the individual and of the group in the workplace cannot be anticipated fully by instructional designers in advance.

Present models are useful for many types of employee development such as new employee orientation, introducing employees to new skills, communication and interpersonal skills training, developing group dynamics, and in other areas. The framework proposed here addresses task-related performance improvement. It may not be appropriate for situations where the focus is on interpersonal relations, cultural change, or in stable work environments where performance expectations and resources change infrequently. The development of skilled performance requires that our best strategies for employee development be flexibly integrated with the dynamics of the workplace. In short, the framework proposed here more fully integrates learning with working.

Learning Transfer in a Social Service Agency: Test of an Expectancy Model of Motivation

Reid A. Bates
Elwood F. Holton III
Louisiana State University

Valence-instrumentality-expectancy (VIE) theory of motivation has been frequently used to study work motivation but has not been applied to motivation to transfer research. In this study, a VIE approach to motivation to transfer is tested using structural equation modeling in a sample of 705 state social service agency personnel. Employees completed the Learning Transfer System Inventory (LTSI). Results indicated that utility predicted motivation to transfer, but rewards did not. Self-efficacy was not a significant predictor of motivation. The VIE model provided a strong fit to the data.

Keywords: Transfer, Expectancy Theory, Motivation

Training alone will do little to increase individual or organizational performance unless what is learned as a result of training is transferred into on-the-job behavior. Including indirect costs, public and private sector organizations in recent years have spent over $200 billion annually on formal workplace training (Bassi, Gallagher, & Schoer, 1996). Of this expenditure, only 10% is projected to pay off in performance improvements resulting from the transfer of learned knowledge, skills, and abilities to the job (Baldwin & Ford, 1988). Although the exact amount of transfer is unknown, learning transfer is the most frequently cited reason why training fails (Broad & Newstrom, 1992). However, knowledge is limited about when, why or how the dynamics of learning transfer work.

A fundamental area in which current transfer research is deficient is in modeling the learning-transfer process. Researchers have recognized the necessity of building comprehensive, integrated models of the learning-transfer process in order to fully understand and reliably identify the causes and effects of training success or failure (Holton, 1996). Researchers examining various models of learning transfer in organizations have produced findings indicating that a variety of individual, process, and environmental variables can significantly affect an individual's ability and motivation to transfer learning to job performance. For example, research by Noe and Schmitt (1986) suggested that trainee reactions to training may either mediate or moderate relationships between intervening variables and training outcomes. Learning has been shown to be related to transfer behavior (Rouiller & Goldstein, 1993) and self-reported increases in productivity (Xiao, 1996). Trainee characteristics including age, self-efficacy, and confidence have also been identified as important factors influencing learning transfer. Other studies have indicated perceived relevance of training is a significant design variable supporting transfer. Studies also point to the importance of work environment factors such as supervisor support, rewards, and opportunity to perform which indicate the important role that individual perceptions of specific organizational elements, often referred to as transfer climate, have in facilitating transfer. In addition, research suggests that an organization's continuous learning culture, or the shared perceptions about a broad, comprehensive set of organizational elements (e.g., values and beliefs) can also play a role in transfer (Tracy, Tannenbaum, & Kavanaugh, 1995). Taken together, research portrays transfer as a complex process and explicitly recognizes the value of useful models.

Unfortunately, only limited research has been done with these models and none have been validated by further research. This may partially explain why 1) our understanding of the transfer of training process is still greatly restricted; 2) theorizing about transfer of training has not produced many generalizable principles; and 3) there is currently no generally accepted theoretical model of learning transfer in organizations. Until more work is done to develop, test, and refine learning transfer models, we will be unable to make significant progress in this important area of research.

The Role of Valence-Instrumentality-Expectancy in Learning Transfer

Motivational factors are among the most efficient predictors of training-related performance, but have generally received little research attention (Latham, 1988). Several authors have noted the need for more research directed at individual and situational factors that influence motivation and have suggested the usefulness of the valence-instrumentality-expectancy (VIE) theory for studying training-related motivation (Baldwin & Ford, 1988). Some

Copyright © 1999, R. A. Bates & E. F. Holton III

research has heeded this call. Noe and Schmitt (1986) examined a number of motivational influences on training effectiveness including the impact of expectancies on motivation to learn. Mathieu, Tannenbaum, and Salas (1992) adopted an instrumentality approach that examined the influence of trainees' perceptions that success in training would lead to better job performance and then to valued outcomes. In general, the VIE approach to training-related motivation is valuable because it facilitates the study of both individual and situational factors and their relationship to expectancy perceptions.

Valence-Instrumentality-Expectancy (VIE) is a "decision theory of human motivation and choice in the work situation" (House, Shapiro, & Wahba, 1974). A core concept of VIE theory is that the psychological interaction of an individual's beliefs about expectancies, instrumentalities, and valences create a motivational force to act in ways that maximize benefit and minimize pain (Vroom, 1964). According to the VIE model, an individual chooses behaviors and level of effort based on three key mental components: 1) the value (valence) he/she perceives to be associated with the outcomes of the behavior; 2) the belief that a certain performance level will lead to other outcomes (instrumentality); and 3) the strength of an individual's belief that attaining a certain outcome is possible (expectancy). These three components represent beliefs held by an individual about effort-reward connections.

Figure1: Expectancy Model of Motivation to Transfer Learning

An expectancy model of factors influencing motivation to transfer, consistent with Lawler's (1971) modification of Vroom's (1964) original theory, is shown in Figure 1. The relationships in the model are similar to those suggested in a training research and evaluation model proposed by Holton (1996). Motivation to transfer is seen as a function of 1) utility, or expectancy beliefs about extent to which learning in training is expected to have useful job application; and 2) rewards, or the extent to which the application of learning on-the-job is perceived to result in some valued outcome for the individual. Learning with high utility value is more likely to be associated with high reward potential, suggesting a dependency relationship between utility and rewards.

Hypothesis 1a: Utility will be positively associated with motivation to transfer.
Hypothesis 1b: Rewards will be positively associated with motivation to transfer.
Hypothesis 1c: Utility will be positively associated with rewards.

Motivation to transfer was also hypothesized to be partially a function of a person's self-efficacy beliefs concerning learning transfer. In general, self-efficacy refers to an individual's belief in his or her ability to mobilize personal resources and courses of action to meet specific situational and task demands (Gist, 1987). This construct is seen as a potential intervening variable between training and performance in addition to being a useful self-construct for predicting performance on specific tasks. Researchers have reported significant positive correlations between level of self-efficacy and task performance, training performance, post-training transfer, and job performance. Research has also demonstrated a self-efficacy - performance relationship for both cognitive (Gist, Bavetta, & Stevens, 1990) and interpersonal skills (Gist, Schoerer, & Rosen, 1989).

Hypothesis 2a: Performance self-efficacy will be positively associated with motivation to transfer.
Hypothesis 2b: Performance self-efficacy will be positively associated with utility.

Method

Subjects Participants in this study were 705 social service caseworkers from geographically dispersed units in a state Office of Family Support. For reasons of confidentiality, neither the identification of the units responding in this study nor the number of participants from specific units was obtained. The participants were part of a larger study to assess the obstacles to training transfer in the Department of Social Services and other state governmental departments.

Analysis Structural equation modeling (SEM) with LISREL 8 (Joreskog & Sorbom, 1993) was used to test the causal relationships between variables. The application of SEM provides a way to 1) model and estimate multiple and interrelated causal relationships, and 2) represent unobserved variables or concepts in these relationships and account for measurement error in the estimation process (Hair, Anderson, Tatham, & Black, 1998). One advantage of LISREL is that it provides tests of relationships between constructs that are not attenuated by measurement error (Loehlin, 1987).

Following a procedure suggested by Anderson and Gerbing (1988) and Hair et al. (1998), data analysis was conducted in two stages. First, the adequacy of the measurement model was examined to evaluate the contribution of each item to the construct (latent variable) being measured. This is equivalent to a confirmatory factor analysis of the measured constructs. Second, the structural model was examined to test the fit of the hypothesized model with the data. For both the measurement and structural models, a wide variety of goodness-of-fit indices are available for assessing model fit. To assess overall model fit, the chi-square statistic (χ^2) and the goodness-of-fit index (GFI) were examined. The root mean square error of approximation (RMSEA), a goodness of fit measure relatively insensitive to sample size, and the root mean square residual (RMR), were examined as complementary measures to the GFI and χ^2. The non-normed fit index (NNFI) represents the incremental fit obtained by comparing any two nested models. The adjusted goodness-of-fit (AGFI) was evaluated because it adjusts the GFI by the degrees of freedom in order to consider the parsimony of the model. To compare the model's fit in relation to the worst and best fit attainable from other nested models, the normed-fit index (NFI) was examined. In general, a good fit of the data is indicated by RMSEA and RMR values that approach zero (with those larger than .08 as unsuitable), and GFI, AGFI, NNFI, and NFI values that approach 1, with values less than .90 indicating the potential for substantial improvement (Medsker, Williams, & Holahan, 1994). Finally, the coefficient of determination (R^2) was examined in relation to the structural model as an indicator of variation accounted for, not of model fit per se.

Measures All measures used in this study were obtained using the Learning Transfer System Inventory (LTSI), formerly called the Learning Transfer Questionnaire (LTQ) (Holton, Bates & Ruona, 1999; Holton, Bates, Ruona, & Leimbach, 1998). The LTSI consists of sixteen scales representing factors affecting the transfer of learning to work performance. Scales represent motivational, ability and environmental elements. The scales have shown good reliability and initial evidence of criterion validity in earlier versions of the instrument (Bates, Holton & Seyler, 1997; Seyler, Holton, Bates, Burnett & Carvalho, 1998). All items use a five point Likert-type scale ranging from "strongly disagree" to "strongly agree." Because it is generally suggested that a minimum of three indicator variables be used for each latent construct (Hair, et al., 1998), seven scales were initially selected as indicators for rewards and utility.

Utility indicators - Three scales served as indicators for utility:

1) Transfer-effort performance expectations (TEPE) – the expectation the effort devoted to transferring learning will lead to changes in job performance.
2) Performance outcome expectations (POE) – the expectation that changes in job performance will lead to outcomes valued by the individual.
3) Content validity – the extent to which individuals judge the content of training to accurately reflect job requirements.

VIE models in current use generally break expectancy connections into two key components: the expectancy that effort will lead to successful performance (transfer effort - performance expectancy) and the expectancy that this performance will produce valued outcomes (performance outcome expectancy) (Lawler, 1971). High TEPE is expected to be positively associated with utility: individuals believe learning is useful because its application will improve their performance. High POE is also expected to be positively associated with utility. Thus, learning is useful because it improves performance and subsequently leads to outcomes that are valued by the individual.

A key aspect of learning transfer relates to the degree the content and design of the learning experience enables individuals to apply their learning. Training content that accurately reflects job requirements, addresses work-related performance problems, or facilitates work-related goals is more likely to be applied than that which does not (Baldwin & Ford, 1988). Valid training content is therefore believed to influence motivation to transfer by virtue of its perceived job-relevant utility.

Reward indicators - Four scales served as indicator measures of the latent construct rewards:

1) Openness to change – the extent to which prevailing group norms are perceived by individuals to resist or discourage the use of knowledge and skills acquired in training.
2) Supervisor support – the extent to which supervisors support and reinforce the use of learning on-the-job.
3) Peer support – the extent to which peers reinforce and support the use of learning on-the-job.
4) Negative personal outcomes – the extent to which individuals believe that applying skills an knowledge learning in training will lead to outcomes that are negative. The negative personal outcomes scale was reverse coded so that that high scores indicated the extent to which individuals believed that applying learning on-the-job would not lead to outcomes perceived as negative. All other scales used in this study were scored so high scores represented high levels of the construct.

Tracy et al. (1995) demonstrated transfer behavior could be influenced by employee beliefs that their organization values the importance of ongoing knowledge acquisition and use. Studies by Baumgartel and associates (Baumgartel & Jeanpierre, 1972; Baumgartel, Reynolds, & Pathan, 1984) showed that perceptions of organizational growth orientation, freedom to set personal goals, non-restrictive rules and procedures, encouragement of risk-taking and approval of innovation and experimentation, and rewards were closely associated with high transfer rates. The present study tests whether peoples' expectancy perceptions can be influenced by their perceptions that their organization values and rewards learning, innovation, and transfer. We expect the more an organization positively rewards learning and its job application, the more individuals will recognize those rewards and be motivated by them.

Although virtually unstudied in HRD research, there is some indication that work group norms may be an important factor in learning transfer. Openness to change refers to the extent to which prevailing group norms are perceived by employees to resist or discourage the use of new learning and skills. An openness to change construct has been found to be significant predictor of supervisor ratings of transfer behavior (Bates, 1997). Research investigating conceptually similar variables has shown that openness to experience (Barrick & Mount, 1991) and participants' belief that the application of new knowledge and skills would disrupt the functioning of current workgroups (Hastings, Scheckley, & Nichols, 1995) are important factors in understanding knowledge acquisition and use. To the extent that people believe their workgroup supports change, they will also believe the effort they expend to make change will pay off in improved performance. Thus, an individual's perceptions of his or her workgroup's openness to change are expected to directly influence reward expectations.

The importance for transfer of support behaviors exhibited by supervisors and peers has been suggested by a number of authors. Bates (1997) found interpersonal support behaviors (e.g., peer support, supervisor opposition to the use of new skills) to be among the most powerful predictors of supervisory ratings of learning transfer. Other research points to the significant influences that supportive supervisor behavior can have on the use of new learning on-the-job (Broad & Newstrom, 1992). Although indications are that supervisor and peer support can play a strong role in learning transfer, more research is needed to establish both their value and precise causal role. Motivationally, these factors are important because they may impact an individual's expectations and beliefs about the value of learning transfer (Farr & Middlebrooks, 1990). Thus, individuals receiving support for learning transfer from peers or supervisors may believe it will result in better job performance. Since supervisors also commonly have some control over extrinsic (e.g., pay, praise) rewards, their support may influence reward expectations. Under

working conditions with relatively high levels of co-worker interaction and interdependence (e.g., self-managing work teams), peers and co-workers may have similar kinds of control.

Motivation to transfer - The motivation to transfer measure was assessed using four items on the LTSI. Unlike the seven initial indicator variables, these items were entered into the measurement model as indicator variables to allow LISREL to calculate the reliability.

Performance self-efficacy - This variable was initially assessed with four items from the LTSI, entered into the measurement model just like motivation to transfer. Procedure Data were collected from a single questionnaire distributed to the different Family Support units by unit Directors. Unit Directors attended a meeting in which the researchers explained the objectives of the questionnaire and provided Directors with guidelines for distributing the questionnaire to their caseworkers. Respondents were instructed to complete the questionnaire within five days and return it via enclosed stamped and addressed envelope to the researchers. The instrument was administered to 905 individuals with 784 questionnaires returned for an 86.6% response rate.

Results

Measurement model A covariance matrix was used for both measurement and structural model tests. The analysis of the measurement model was conducted in two steps. First, confirmatory factor analysis was conducted on all scales in the LTSI with this data. This analysis produced a chi-square value of 2020.52 (df = 783, $p < .001$). Other fits indices included GFI = .85, AGFI = .83, NFI = .84, NNFI = .88, RMSEA = .054, and RMR = .049. These values indicated the fit between the proposed measurement model and the observed data were not strong but deemed adequate to proceed. All items loaded on their a priori determined factor and all the lambda values (similar to factor loadings) were statistically significant.

Next, given an acceptable fit from the confirmatory factor analysis, the number of parameters in the final model was reduced by entering the scale scores for the seven indicator variables instead of entering all the items in the model. This created a new measurement model with the seven indictors for the utility and reward latent variables, plus the eight items as indicators for motivation to transfer and performance self-efficacy. This measurement model was also analyzed, producing a chi-square value of 299.31 (df = 84, $p < .001$).). Other fits indices included GFI = .94, AGFI = .91, NFI = .89, NNFI = .90 RMSEA = .066, and RMR = .038. These values indicate a good fit for the measurement model so analysis of the structural model proceeded.

Table 1 shows the intercorrelations of observed and latent variables and the scale reliabilities on the diagonals. All scales had adequate reliabilities (α = .78 to .90).

Table 1: Correlations Among Observed Variables and Latent Variables

Observed	1	2	3	4	5	6	7	*Latent*	1	2	3	4
1- Content Validity	--							1- Utility	--			
2- Openness Change	.23	--						2- Rewards	.75	--		
3- Peer Support	.34	.27	--					3- Mot Transfer	.76	.50	--	
4- Supervisor Support	.28	.20	.43	--				4- Perf Self-Eff	.38	.29	.27	--
5- POE	.39	.21	.38	.44	--							
6- Neg Pers Outcome	.23	.09	.32	.26	.25	--						
7- TEPE	.43	.14	.36	.29	.42	.16	--					

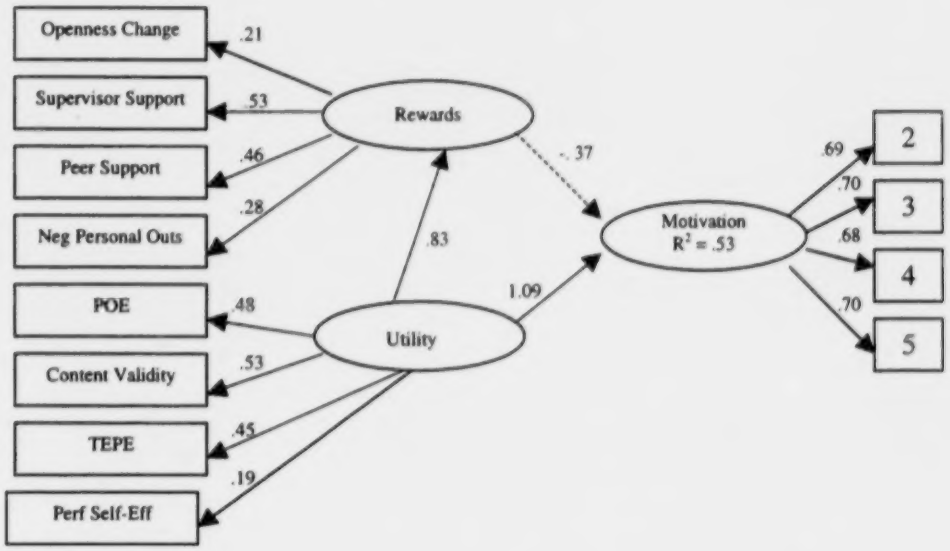
Structural model Five paths were tested in the initial structural model (see Figure 1). The initial structural model produced a chi-square value of 299.31 (df = 84, $p < .001$). The GFI (.94), AGFI (.91), NFI (.89), NNFI (.90), RMSEA (.066), and RMR (.038) indicated acceptable fit. The overall R^2 for the model was .53. However, two of the paths were not significant: Rewards to Motivation to Transfer and Performance self-efficacy to Motivation to

Transfer. Thus, the hypothesized influence of performance self-efficacy on motivation to transfer was not supported.

A revised model was analyzed removing the path from performance self-efficacy and changing it to an indicator of utility using its scale score. The path from rewards to motivation to transfer was left intact as there is strong theoretical rationale for it. In addition, this sample is a public sector organization within which few rewards existed for any type of performance improvement.

The revised structural model, shown in Figure 2, produced a chi-square value of 172.16 ($df = 51$, $p < .001$). The fit indices improved somewhat with a GFI (.95), AGFI (.93), NFI (.91), NNFI (.92), RMSEA (.063), and RMR (.029). All are indicative of strong fit. The overall R^2 for the model was .53. All paths to indicator variables were significant and in appropriate ranges. The path from Rewards to Motivation to Transfer was non-significant (B = -.17).

Figure 2: Structural Model with Path Coefficients



Discussion

Despite the popularity of expectancy theory as a foundation for understanding training-related behavior, constructs representing various elements of the theory have not previously been developed and tested in the context of learning transfer. In this study, utility was a significant predictor of learning transfer motivation. Individuals were more motivated to apply learning on the job when they perceived that transferring learning would be useful in helping them improve their job performance. This finding partially supports an expectancy theory approach to understanding learning transfer motivation and has direct implications for diagnosing a learning transfer situation and changing aspects of the situation to obtain higher levels of effort from trainees. According to expectancy theory as applied in this study, learning must be perceived as job-relevant if individuals are to be motivated to apply it. Training perceived to have little or no utility would also have little motivational value. Thus, by examining individual expectancies, investigators can begin to identify motivational problems and opportunities in training situations. Research suggests a number of techniques for enhancing utility expectations including appropriately framing the purpose of training (Quinones, 1995), demonstrating organizational support for training (McFarlane, Shore, & Wayne, 1993), discussing negative pre-training events (Smith-Jentsch et al., 1996), providing trainees the opportunity to be involved in training design (Clark, Dobbins, & Ladd, 1993), and communicating supervisory expectations of trainee performance in training (Eden & Ravid, 1982).

Rewards were not a significant predictor of motivation to transfer in this study, contrary to what would be expected from expectancy theory. One explanation is that this is a function of the sample which was drawn from a

state social service agency. In the state civil service system, there are few direct rewards for performance so participants may have perceived few rewards for participating in training. In addition, skills and training performance are not usually part of the performance review process, hence supervisors would offer few formal rewards for training transfer.

Contrary to the hypothesized moderating role of self-efficacy, the lack of a significant positive association with motivation suggests the influence of self-efficacy on transfer motivation may be primarily through utility perceptions. Performance self-efficacy was found to be positively associated with utility, indicating that individuals who felt confident in their ability to apply new learning also viewed learning as more useful. Thus, boosting an individual's self-efficacy with regard to their ability to change performance can indirectly enhance the likelihood that learning will be transferred.

These results show that the VIE framework is a useful one for predicting motivation to transfer. However, private sector data are needed to further test the reward-motivation to transfer relationship which was not significant in this public sector sample.

The Relationship Between Learner Utility Reactions and Predictors of Learning Transfer: Implications for Evaluation

Wendy E.A. Ruona

Reid A. Bates
Louisiana State University

Participant reaction measures are increasingly shown to be insufficient and unreliable indicators of training effectiveness. Highly overused in practice, we now see that reaction measures have fostered a narrow view of evaluation and neglected important aspects that influence HRD outcomes of learning, performance, and organizational results. New research on transfer of learning is contributing to enhanced understanding in this area. This study explores the relationship between learner utility reactions and predictors of learning transfer.

Keywords: Reaction Measures, Evaluation, Transfer of Learning

Reaction measures remain one of the most overly-used methods of evaluation in the field of HRD today. A recent benchmarking survey completed by ASTD found that 94% of the organizations surveyed collected participant reaction information, 34% measured learning, 13% evaluated transfer of learning, and 3% measured financial impacts from training (Bassi, Benson, Cheney, 1996). It seems that many organizations persist in believing that participant reactions are valid and reliable indicators by which to audit the effectiveness of training.

These statistics are alarming since recent literature has focused on critiquing Kirkpatrick's (1994) evaluation model which advocates evaluating interventions at four levels: reaction, learning, behavior change, and results (Kaufman & Keller, 1994; Holton, 1996; Phillips, 1995). Even more importantly, research has consistently informed us that there is little correlation between reaction and learning, and even less between reaction and performance (Alliger, Tannebaum, Bennett, Traver & Shotland, 1997; Alliger & Janak, 1989; Dixon, 1990; Noe & Schmitt, 1986; Warr & Bunce, 1995). The consensus among many in HRD is that "evaluation as currently conceptualized, practiced, and researched, is not sufficient for answering many of the questions trainers and others have about the effectiveness of organizations' training and development efforts" (Preskill, p. 53, 1997).

One glaring shortcoming of the current conceptualization of evaluation is that it neglects important aspects that influence HRD outcomes of learning, performance, and organizational results (Holton, 1996). Without this kind of pertinent information, HRD professionals continue to narrowly understand evaluation of training and continue to make costly decisions based on reaction-level information only. The purpose of this research is to expand notions of training criteria and evaluation by exploring the relationship between learner utility reactions and predictors of learning transfer.

Review of Literature

Reaction Measures

Discussion about the insufficiency of reactions measures has been prevalent in the literature since the late 1980's. Noe and Schmitt (1986) determined that trainee satisfaction was not related to learning, and learning was not related to behavior change. Dixon (1990) found no significant relationship between trainee **perceptions** of job relevance, amount learned, enjoyment, or instructor skillfulness and subjects' post-test scores. Warr and Bunce determined that there was no association between reported enjoyment and learning scores (1995). Strong corroboration is found in a recent meta-analytic study conducted by Alliger, et al (1997). An analysis of 34 studies

Copyright © 1999 Wendy E.A. Ruona, Michael Leimbach, and Elwood F. Holton III

yielding 115 correlations found little correlation between reactions of any type and immediate learning and concluded that "reaction measures cannot be used as surrogates of other measures" (p. 353).

Transfer of Learning

Transfer of learning is defined as the degree to which trainees apply knowledge, skills, behaviors, and attitudes learned in training to their jobs. Although there are multiple definitions of transfer of learning, it is generally agreed upon that transfer involves the application, generalizability, and flexibility of new knowledge/skills.

Research during the last 10 years has demonstrated that transfer of learning is complex and involves multiple factors and influences (Noe, 1986; Baldwin & Ford, 1988; Rouiller & Goldstein, 1993; Ford & Weisbein, 1997; Holton, Bates, Ruona & Leimbach, 1997,1998). Three categories of factors that are thought to impact transfer of training include (1) trainee characteristics, including ability, personality, and motivation; (2) training design, including a strong transfer design and relevant content; and (3) work environment, including work processes, support systems, and incentives (Baldwin & Ford, 1988).

These factors are currently being studied as critical components of the transfer system—the network of factors affecting transfer of learning to performance. The Learning Transfer System Inventory (LTSI) has been developed to operationalize the learning transfer system (LTS) and develop a valid and generalizable set of transfer system scales (Holton, Bates & Ruona, 1998a; Holton, Bates, Ruona & Leimbach, 1998b). The instrument's conceptual frame (see Figure 1) is derived from Holton's (1996) proposed evaluation model and includes what are believed to be a comprehensive set of factors that can facilitate or inhibit transfer of learning to workplace performance.

Conference, Austin, TX: Academy of Human Resource Development.

Figure 1. Learning Transfer System Inventory: Conceptual Model

This conceptual framework of factors affecting transfer of learning provides a unique framework by which to further understand participant reactions and how they relate to outcomes of learning, individual performance, and organizational performance.

Research Questions

The purpose of this study is to compare participant utility reaction information to information about other elements of the transfer system. Specifically, two research questions guided the research:

1. How were participant utility reaction ratings associated with ratings on predictors of learning transfer?
2. What percent of the variance in motivation to transfer learning is explained by participants' utility reaction ratings?

Methodology

Instrumentation

Participants were asked to complete The Learning Transfer System Inventory (LTSI) at the end of training programs they attended. This instrument, which has been recently construct-validated (Holton, Bates, Ruona & Leimbach, 1998a), consists of a pool of 69 items designed to measure 16 factors hypothesized in the HRD Research and Evaluation Model (Holton, 1996) shown in Figure 1. In previous research (Holton, et al, 1998b) the LTSI has been shown to reliably measure all 16 factors hypothesized in the LTS model. All factors are measured by at least three individual items. Cronbach alpha reliability coefficients were acceptable for early stage instrument development, ranging from .63 -.91, with all but two greater than .70.

At the same time, participants were also asked to complete a five-item reaction scale designed to measure participants' reactions to the training program. The items on this scale addressed primarily utility reactions. Utility reaction measures "attempt to ascertain the perceived utility value, or usefulness, of training for subsequent job performance" while affective reactions consist of items that explore participant satisfaction or liking of the course (Alliger et al, 1997, p. 344). Alliger's research suggests that utility reactions are more closely associated with transfer than affective reactions and, therefore, we chose five reaction items from a pool of items commonly applied to evaluate corporate training programs. These items were:

- My time was well spent;
- The session objectives were met;
- I would recommend this program to others in my organization;
- I learned something I can apply immediately to my work;
- The course provided me with new ways of thinking about my job.

Data from the utility reaction scale, combined with data measuring participants' perceptions of the transfer system factors, provides additional evidence about the role of reaction information in ascertaining the potential effectiveness of training and development interventions.

Sample

The LTSI was administered to 1,616 people in a wide variety of organizations and training programs. The sample was deliberately chosen to be as heterogeneous as possible (see Table 1). It includes respondents from a variety of industries including: shipping, power, computer/precision manufacturing, insurance, chemical, industrial tool/construction, non-profit, and municipal and state government. The municipal and state government classes were offered by a central training organization, so the classes included representatives from a wide variety of agencies and functions.

A wide range of employees attended various training programs. These included secretaries, manufacturing operators, technicians, engineers, managers, professionals, sales people, and law enforcement personnel. The training programs covered a wide variety of topics including sales, safety, volunteer management, project

management, computer and technical skills, quality science, emergency medicine education, and various classes related to leadership, mid-management, and supervision.

Analysis-*Research Question #1*

Pearson product-moment correlations were used to explore the linear association between the utility reaction scale and each of the sixteen constructs measured by the LTSI.

Analysis-Research Question #2

Examining participant utility reactions within the context of other transfer of learning factors can be tested in a number of ways. In this study, analysis was conducted to determine if participant utility reactions added any predictive power after other transfer of learning factors were taken into consideration. This is an appropriate test in that participant utility reactions are the most general, and therefore, hypothesized as the least useful in diagnosing barriers to transfer. The test was conducted by using a forced entry method. The LTS factors were all entered into the regression equation prior to the entry of participant utility reactions. This allowed us to determine if the participants' utility reactions can add to the multiple-R after other, more specific transfer of learning factors, were already accounted for.

Table 1

Selected Demographics

Organization Type	n	%	Training Type	n	%
For Profit Organization	432	26.7	Technical Skills	544	33.7
Non-profit Organization	192	11.9	Sales/Cust Serv	434	26.9
Public Training Classes (mostly for-profit)	316	19.6	Volunteer Mgt.	192	11.9
Government (State = 175 and local = 501)	676	41.8	Leadership/Mgt.	175	10.8
			Professional Skills	80	5.0
			Supervisory Skills	67	4.1

			Computer	18	1.1
TOTAL	1616	100.0	TOTAL	1616	100.0

Results

Research Question #1: Correlations Between Transfer of Learning and Participant Utility Reaction Table 2 shows the Pearson product-moment correlations between the Participant Utility Reactions and the sixteen LTSI factors. All correlations were significantly different from zero ($p < .001$ for all correlations) and ranged from a high of $r = 0.619$ (Transfer Design) to a low of $r = -0.156$ (Manager Sanctions).

Table 2

Correlations Between Participant Utility Reactions and Transfer of Learning Factors

	Participant Utility Reactions	Sig.
Transfer Design	.619	**
Motivation to Transfer	.554	**
Transfer Effort	.480	**
Perceived Content Validity	.456	**
Performance Self-Efficacy	.358	**
Opportunity to Use Learning	.349	**
Outcomes Expectations	.303	**
Peer Support	.277	**
Feedback	.260	**
Personal Capacity for Transfer	.211	**
Supervisor Manager Support	.211	**
Learner Readiness	.167	**
Personal Outcomes – Positive	.121	**
Personal Outcomes – Negative	- .091	**
Resistance/Openness to Change	- .115	**
Manager Sanctions	- .156	**

** = $p < .001$

The strongest correlations appeared to be with the Motivational and Ability antecedents to the training event. All of the Environmental factors were in the lower half of the correlation set. Among the Ability factors, the strongest correlations were with Transfer Design (r = 0.619), and Content Validity (r = 0.456). Among the Motivational factors the strongest correlations included Motivation to Transfer (r = 0.554), Transfer Effort-Performance Expectations (r = 0.480), and Performance Self-Efficacy (r = 0.358).

Research Question #2: Predicting Motivation to Transfer. A forced entry multiple regression procedure was used in which Participant Utility Reactions were entered last after all the transfer of learning factors. Participant Utility Reactions were forced to enter the predictive equation last, after all of the variability associated with the Transfer of Learning constructs was accounted for. The results of this analysis are presented in Table 2. Results indicate that Participant Utility Reactions had a small, but significant impact on the ability to predict Motivation to Transfer. Entry of Participant Utility Reactions raised the multiple-R from R = .641 (without Participant Utility Reactions) to R = .679 ($F = 87.88$, $p < .001$).

Table 3

Multiple-Regression Results of Transfer Climate Factors Predicting Participant Utility Reactions

	R	Adjusted R^2	F
Transfer of Learning Factors	.641	.405	76.98*
Participant Utility Reactions	.679	.460	87.88*

* = $p < .001$

Addition of Participant Utility Reactions to the regression equation increased the amount of variability accounted for by .038 which was a significant increase in R^2. Table 4 shows the Beta-weights for each factors. Step 1 results show the standardized beta coefficients of the LTSI factors before entry of participant utility reactions. Step 2 results show the Beta coefficients after the entry of participant utility reactions.

Table 4

Factor Betas From Multiple-Regression of Transfer Climate Factors Predicting Motivation to Transfer

	Step 1 Results		Step 2 Results	
	Standardized Beta	t	Standardized Beta	t
Learner Readiness	.010	0.47	.013	0.64
Personal Outcomes – Positive	.224	9.49*	.202	8.91**
Personal Outcomes – Negative	.105	4.82**	.062	2.91**
Peer Support	.099	3.92**	.096	3.97**
Supervisor Manager Support	.046	2.02*	.045	2.09*
Manager Sanctions	.005	0.219	.001	0.03
Perceived Content Validity	.025	4.19**	.069	2.66**
Transfer Design	.148	5.65**	.023	0.85
Opportunity to Use Learning	.008	0.346	.004	0.17
Transfer Effort	.254	10.01**	.209	8.48**
Outcomes Expectations	.113	4.10**	.085	3.21**
Resistance/Openness to Change	.112	4.61**	.082	3.50**
Performance Self-Efficacy	.082	3.51**	.057	2.55*
Feedback	.007	0.29	.009	0.36
Participant Utility Reactions	NA	NA	.306	11.92**
Factors Excluded from equation				
Personal Capacity for Transfer				

** = $p < .01$, * = $p < .05$

Despite being the final factor entered, Participant Utility Reactions had the strongest Beta of all factors entered into the equation (Beta = .306, t = 11.92, $p < .01$). In addition, the entry of participant utility reactions resulted in Transfer Design being eliminated as a significant contributor to the regression analysis. The standardized beta for Transfer Design was reduced from 0.148 ($t = 5.65$, $p < .01$) to 0.023 ($t = .853$, ns). This is not surprising given the strong correlation between Transfer Design and participant utility reactions shown in Table 2 and suggests a great deal of shared variance between participant utility reactions and Transfer Design.

Discussion

Forcing participant utility reactions to be entered last into the regression equation limited the opportunity for them reactions to contribute to the regression analysis. Despite this, Participant Utility Reactions still contributed significantly to predicting Motivation to Transfer. While the increase in the multiple-R was relatively small, it was a significant increase in the predictive power of the model. It should be noted that the large sample size made for a rather robust analysis with sufficient statistical power to detect even small effects. Perhaps if this study were replicated on a smaller sample, participant utility reactions may not contribute significantly to the regression equation.

Despite the limitations, these results raise two critical issues. First, what could Participant Utility Reactions contribute that is not accounted for in the other Transfer of Learning constructs? The results, while not providing direct evidence, hint at a possible answer. The correlational analysis indicates that Participant Reactions are more closely associated with Ability and Motivational constructs (including Secondary influences) than with the Environmental constructs. Ability and Motivation are largely antecedent constructs, representing what the participant and the program bring to the learning process.

In contrast, perceptions of the Environment constructs, while formed earlier, are largely directly experienced after a training program. It may be that Participant Utility Reactions are associated with yet un-conceptualized antecedent constructs associated with transfer of learning or that utility reactions serve some sort of moderating role with HRD outcomes of learning and performance, which has been proposed in earlier transfer of learning literature (Holton, 1996; Noe & Schmitt, 1986). Further research might help clarify this and ultimately strengthen HRD's understanding of evaluation and transfer. However, it should also be noted that the correlation analysis does suggest that there is a great deal of shared variance between Participant Utility Reactions and all of the LTSI factors. It may be that participant utility reactions operate as a kind of summary judgment, particularly for the Ability factors. However this summary judgment would have limited utility in diagnosing problems with learning transfer (Holton et al, 1998).

The second issue raised by this analysis concerns the value of Participant Utility Reactions given the small contribution to the prediction of Motivation to Transfer. Participant Utility Reactions are broad, vague, and therefore, not a very useful measure for identifying and diagnosing the causes of transfer (or lack thereof). Their relatively small contribution to the overall predictive power of transfer motivation suggests that utility reaction measures serve little purpose in the analysis of learning outcomes. While Participant Utility Reactions may appear to be a simple substitute for the general characteristics of Ability and Motivational constructs, their usefulness is limited in predicting whether or not learning will transfer to the work place or in determining facilitators/barriers to transfer.

Finally, this analysis showed the degree to which Participant Utility Reactions contributed to predicting motivation to transfer learning, not actual performance outcomes. Given previous research cited above, we would expect Participant Utility Reactions to have even less of an impact on actual performance. While we can not assess utility reactions' impact on learning in this analysis, these results clearly suggest that they are unlikely to have much, if any, impact on transfer of learning to job application.

This research contributes additional evidence that directly speaks to the validity of utility reaction information, given knowledge of other predictors of learning transfer and HRD outcomes. The evidence provided here helps us to better understand what is involved in the transfer of learning process, thus, helping HRD professionals to steer resources towards those things that can actually improve the effectiveness of an organization's performance improvement efforts. It is hoped that this will further inform HRD professionals in their use of various frameworks for categorizing training criteria as well as provide added theoretical undergirding for the mov ment towards new approaches to training evaluation.

Mixed Methods: The Value of the Qualitative Perspective in Transfer of Training Research

Gary L. May
Millbrook Distribution Services

Qualitative data can often help elaborate the meaning of statistical findings and provide insight on causal factors. This study lends support for a mixed method approach in transfer of training research by demonstrating how a qualitative method, the analysis of data from semistructured interviews using conceptually ordered matrices, can illuminate quantitative data gathered from the same setting.

Keywords: Transfer, Qualitative, Mixed Methods

Mixed method evaluation designs continue to generate debate in the research literature (Greene & Caracelli, 1997). The purists (e.g., Guba & Lincoln, 1989) argue against mixing quantitative and qualitative methods, while others (e.g., Patton, 1988) support a more pragmatic approach, viewing methodological decisions, including the use of mixed designs, to be dependent on the content and needs of the study.

The purpose of this paper is to lend support to the pragmatic view by providing an example of how a qualitative method, the analysis of data from semistructured interviews through conceptually ordered matrices (Miles & Huberman, 1994), can illuminate quantitative data gathered from the same setting in a dissertation study (May, 1998). A brief summary of the research problem and questions appears first. This is followed by a synopsis of the methodology and findings for both the quantitative and qualitative components of the study, with emphasis given to the qualitative process. The paper then provides some examples of insights gained from the qualitative data and concludes with a discussion of the implications for HRD research on transfer of training.

Research Problem and Theoretical Model

The research problem deals with *transfer of training*, defined as the effective and continuing application of newly acquired skills on the job (Broad, 1997; Ford & Weissbein, 1997). Enormous investments in training are believed to be largely wasted because of inadequate transfer, especially in the "soft skills" area of management development such as interpersonal communication and negotiation skills training (Georges, 1996). A widely respected theoretical model for analysis of the transfer problem (Baldwin & Ford, 1988) suggests that transfer is a function of three factors: trainee characteristics, learning retention, and work environment. Learning retention, in turn, is impacted by training design and also influenced by trainee characteristics and the work environment. The transfer equation is considered to be systemic and complex, with many variables affecting the ultimate generalization and maintenance of newly learned skills.

A number of recent studies have begun to isolate important variables in the components of the Baldwin and Ford model (see Ford & Weissbein, 1997). However, examination of the transfer of training literature reveals continued research gaps. Of particular concern is the lack of current research on the training design component *conditions of practice*, especially within the delivery method of behavior modeling training. This is significant because behavior modeling is currently the primary training design for delivery of supervisory interpersonal skills training in business today (Russ-Eft & Zenger, 1995) and the practice component has been called "the crux" of the behavior modeling process (Pescuric & Byham, 1996, p. 29). Yet, as noted by Salas, Cannon-Bowers, and Kozlowski (1997), there is little empirical research on the mechanisms and principles of skill practice in relation to both learning and transfer in a field environment. This is especially true for the more complex interpersonal skills that include significant cognitive components such as active listening and negotiation skills (Stevens & Gist, 1997).

Research Questions and Hypotheses

This study therefore undertook to build a theory-based practice protocol and test its effect on learning and transfer of a complex interpersonal skill taught in a behavior modeling training program in a field setting. Three research questions were addressed: (a) What theoretical framework can guide the development of a practice protocol for

Copyright © 1999 *Gary L. May*

learning a complex interpersonal skill, (b) how can an effective practice protocol be operationalized; that is, what tools and systems are needed to make the protocol effective in the workplace, and (c) given equal practice, what is the effect of the practice design on learning and transfer when compared to traditional behavior modeling practice sessions?

Anderson's (1983; 1995) ACT* theory of cognitive architecture provided the theoretical basis for the practice protocol. Anderson's theory proposes that memory is composed of three major structural components and their interlinking processes: working memory, declarative memory, and production memory. Given the ACT* theory of cognitive structure, skill acquisition is believed to proceed through three stages: (a) a cognitive stage, in which a description of the procedure is learned (declarative knowledge); (b) an associative stage, in which the facts are compiled and integrated with a method for performing the skill (procedural knowledge); and (c) an autonomous stage, in which the skill becomes more fluent and automatic. It is this third stage that is crucial for competent performance (Howell & Cooke, 1989), where component skills become compiled and automated so that conscious process capacity can be devoted to the more demanding aspects of complex tasks. Goldstein (1993) described such automaticity as a "crucial point in instructional theory" (p. 110). According to Anderson, the critical factor that determines both the accessibility of declarative knowledge and the performance of procedural knowledge is the strength of the encoding of this knowledge in memory, which basically reflects the amount and type of practice.

Given this theoretical framework, a literature review, which included both historical behaviorist research on the conditions of practice and recent research on practice in the fields of cognitive and educational psychology, yielded five practice design principles:

1. Develop a criterion checklist that clearly describes the key behaviors that make up each component skill set. Arrange the behaviors on the checklist in order of difficulty within each component (Blank, 1982).
2. Use progressive part-task role-play practice of the component skill sets to develop and compile procedural knowledge. Then integrate the component skills with guided whole task role-play practice (Proctor & Dutta, 1995).
3. In the whole-task practice, practice to mastery (one errorless performance of all criteria) then continue practice to a minimum of 50% overlearning (Driskell, Willis, & Copper, 1992).
4. Use video feedback to provide knowledge of results after each practice round (Ilgen & Moore, 1987; Rothstein, 1980).
5. Use reciprocal teaching techniques to scaffold learners, prompt elaboration for memory retention, and foster use of higher level cognitive strategies (Palincsar & Brown, 1984).

These principles were synthesized into a practice protocol, termed a *mastery practice lab*, and implemented in a field environment to test the following hypotheses: trainees participating in the mastery practice design, when compared to trainees participating in the traditional workshop practice design, will have (a) higher cognitive retention of the listening model, (b) better performance on behavioral demonstrations through role-play, and (c) greater transfer of behavior as measured by perceptions of coworkers.

Quantitative Component: Methods and Results

Method

Participants in the study were 38 first line supervisors and managers at a consumer product manufacturing plant located near Atlanta, Georgia. The training program focused on active listening skills. The study employed a pretest-posttest control group design with participants randomly assigned after a basic introductory workshop on listening skills to one of two conditions: mastery learning lab (test group) and conventional workshop practice (control group). Dependent measures included knowledge retention, behavioral skill demonstration, and far transfer to the workplace. Knowledge retention was measured by a free-recall test. Behavioral skill demonstration was evaluated by rating videotaped role-plays against a criterion checklist. Far transfer was assessed by use of the Listening Practices Feedback Report (LPFR), a multirater 360-degree survey instrument which has been found to be a reliable measure of listening in the workplace (Emmert, Emmert, & Brandt, 1994).

Results

A one-way analysis of covariance (ANCOVA) was conducted on each dependent measure to determine whether the posttraining results for the two groups differed after adjustments were made for pretraining differences. The ANCOVA procedure found a significant difference between groups for the two learning measures, indicating the mastery practice condition made a positive difference in knowledge retention and the ability to demonstrate the key listening behaviors. However, in terms of practical significance, learning in both groups fell short of acceptable levels. In regard to the transfer measure, there was no significant difference between groups and no significant change from pretraining conditions.

Qualitative Component: Methods and Results

Method

At the conclusion of the study, semistructured interviews were conducted with 36 of the 38 participants to obtain qualitative data on the dynamics of the learning and transfer process related to the two training conditions. The interviews were approximately 45 minutes in length and were conducted during a final debriefing that included a review and discussion of the individual's performance data in comparison to group averages. Given the exploratory nature of the study, particular emphasis was placed on understanding the participants' views of the practice experience during training, the nature of their behavior changes, and the factors that may have influenced their efforts to transfer the training to the workplace.

The interview responses to each question were coded and categorized according to underlying concepts. Conceptually ordered displays (Miles & Huberman, 1994) were then constructed for each question to organize themes within a 2 x 3 x 2 matrix: (a) by group (mastery or conventional), (b) by performance on a composite index of the dependent measures (upper quartile, middle range, or lower quartile), and (c) by relevant perspective (e.g., personal or environmental). A concept mentioned by three or more respondents across all groups and performance levels was considered to be a possible conceptual theme and was included in the appropriate matrix block along with the number of respondents contributing to that theme and representative quotations from the interviews. Two examples of the resulting conceptual matrices are shown in Tables 1 and 2.

Results

The posttraining interview data revealed several themes across both groups and across all performance levels, which helped in the interpretation of the quantitative results. These themes were:

1. the issue of poor execution of the role-play practices during the conventional workshop,
2. the shallow depth of learning, with on-the-job application restricted generally to the simpler aspects of the listening model,
3. the abundance of barriers, both personal and environmental, that limited application of the listening skills in the workplace, and
4. the need for on-going reinforcement after the training.

In addition, only the participants in the high performance group mentioned one unique theme: the desire to learn. It is significant that every participant in the high performance group (N = 8) spontaneously mentioned and provided examples of their personal desire to learn, while this trait was never mentioned by any of the participants in the middle range or low quartile performance groups.

Examples of the Value of the Qualitative Perspective

Kraiger, Ford, and Salas (1993) note that there is an important difference between the concepts of training evaluation and training effectiveness. Training evaluation focuses on whether training leads to the desired level of proficiency. Training effectiveness, on the other hand, deals with the broader issues involved in understanding why training did or did not lead to the desired level of proficiency. Qualitative data, when combined with quantitative data, can often help elaborate the meaning of statistical findings and provide insight on causal factors (Swanson,

Watkins, & Marsick, 1997). For example, the results on the far transfer measure in this study were disappointing. There was no significant change in performance on the LPFR listening scores from pretest conditions for either group. While the level of learning and even the management of the survey process itself may have contributed to this result, the qualitative data helped provide valuable and practical insights on why transfer may not have occurred. Two examples will be provided here, drawn from Tables 1 and 2, which lend support to the importance of work environment factors and personal characteristics in the Baldwin and Ford (1988) model.

Work Environment Factors

An examination of the organizational transfer climate literature (May & Reilly, 1997) revealed that the climate factors which support or hinder transfer tend to cluster into two related dimensions: one social or interpersonal in nature and the other reflecting structural factors in the organization. The interviews conducted in this current study did not reveal any significant issues with the social factors such as supervisor or peer interaction in the organization. However, there were problems with the structural factors in the organization that may have hindered transfer.

The structural dimension of transfer climate includes such factors as work flow and job design (Ford, Quinones, Sego, & Sorra, 1992) and situational constraints such as the lack of resources, including information, tools, supplies, and time (Tziner, Haccoun, & Kadish, 1991). In addition, there are cultural factors that communicate the extent to which a company values and emphasizes learning as part of everyday work life (Tracey, Tannenbaum, & Kavanagh, 1995). The interview results from this current study provide additional evidence for the powerful influence of these structural factors in the work environment and how they can create a negative transfer climate (see Table 1). For example, there was a pervasive "time bind" for almost all of the participants, related, in part, to their large number of direct reports (mean = 28) and also to constant work crises stemming from the on-going introduction of new work processes and production equipment. The arrangement of workspace, which required supervisors to share office space, also contributed to a high level of distractions. This simply was not a work climate conducive to application of a counseling type listening model taught in the workshop. It is clear from the posttraining interviews that training alone, even with a robust practice design, is not a sufficient means of improving and maintaining performance. This qualitative data therefore supports the need for a sufficiently valid and reliable measure of transfer climate. Such a measure could be used as a diagnostic tool to identify when an organization is ready for a training intervention and could provide information to guide pretraining interventions aimed at increasing training effectiveness. Holton and his colleagues (Holton, Bates, & Leimbach, 1998) have recently developed a transfer climate instrument, called the Learning Transfer Questionnaire (LTQ) which appears to meet this need.

Trainee Characteristics

A number of individual characteristics have been empirically linked to transfer, including cognitive ability and aptitude (Ford et al., 1992), locus of control (Quinones, Ford, & Teachout, 1995), and self-efficacy (Gist, Stevens, & Bavetta, 1991). One recent study appears to be the first to apply a personality dimension termed *conscientiousness* to the study of transfer. Stewart, Carson, and Cardy (1996) found a significant correlation between conscientiousness and supervisor performance evaluations of self-directed customer service behavior. Conscientiousness includes facets of organizational skills, persistence, need for achievement, and self-discipline (McCrae & Costa, 1989). The posttraining interviews in this current study revealed a similar theme, termed *desire to learn*, that seems related to the construct of conscientiousness (see Table 2). It was significant that all 8 of the top quartile performers talked about an innate desire to learn while no other interviewees mentioned this factor. These performers exhibited this desire by taking steps on their own initiative to improve their learning, such as posting the listening model in their work area, sharing with their subordinates, and periodically reviewing the training material without prompting. Thus, the construct of conscientiousness and other related personality factors may be a significant consideration in the study of transfer. It seems reasonable to expect that personality factors such as conscientiousness and openness to experience might not only be predictive of future job performance but also relate to an individual's motivation to learn, learning strategies, skill acquisition rates, and training transfer (Ford & Weissbein, 1997). Advanced diagnosis of relevant personality variables could lead to tailored practice designs and posttraining support systems customized to individual needs.

Table 1. Example Conceptual Matrix: "Factors that Prevent Effective Listening"

Group by Performance Rank (N)	**Personal** **Theme (# mentioning): "Example quotes"**	**Environmental** **Theme (# mentioning): "Example quotes"**
Upper Quartile Performance		
Mastery (5)	Biases (4): "My personality; I get offended when person is inflexible." "Sometimes don't want to hear other person's priorities." "Have a hard time with people who have 'attitudes'." "Got ticked; didn't listen."	Time Bind (3): "Behind on production; pressed for time." "Pushed for deadlines, start cutting corners, getting short with people." "When in hurry, on way to meeting, hard not to blow off."
Conventional (3)	Biases (1): "More an internal issue – who other person is, what level."	Distraction (2): "Lots of things going on; hard to concentrate and focus." "Distracted – office we're in; people coming in and out; telephones ringing."
Middle Range Performance		
Mastery (10)	Personal Worries (2): "Personal worries prevent me from focusing."	Time Bind (9): "Fast paced environment." "Deadlines." "Too much on plate." "Completely overwhelmed." "Hectic." "Pressing time issue." Work Crisis (2): "Crisis on the production floor." "Confusion, chaos – like when machine goes down." Distraction (1): "Phone calls, people coming in office."
Conventional (10)	Biases (5): "Judgmental of 'whiners'." "Depends on who person is." "Some people just want attention." Personal Worries (1): "Lots of issues outside the job – single parent."	Time Bind (4): "Always juggling bunch of balls." "Reports, meetings, people constantly wanting information." "Time constraints." "43 direct reports; can't even take time to write things down." "Pace!" Work Crisis (1): "Pressure, problems – such as equipment down." Distraction (3): "Interruptions constant." "Phone ringing." "People in and out."
Lower Quartile Performance		
Mastery (2)	Biases (1): "When people are belligerent."	Distraction (2): "Have someone in my office; other people trying to get my attention." "Soon as I walk out to do something, 2 or 3 people approach me."
Conventional (6)	Biases (2): "Tone of voice can turn me off." "No patience with bullshit." Personal Worries (1): "On 3rd shift; wrong for me – people dragging, single parents."	Time Bind (1): "Someone catches me on way out the door to meeting; rushed." Work Crisis (1): "Depends on number of fires trying to put out." Distraction (1): "Tremendous amount of interruptions."

Table 2. Example Conceptual Matrix: "Participants' Final Thoughts"

Group by Performance Rank (N)	**Theme (# mentioning): "Example quotes"**
Upper Quartile Performance	
Mastery (5)	Desire to Learn (5): "Difference for me – real desire to learn; willing to try." "Have desire to improve." "Made mnemonics out of model; posted model in office." "Put model on my filing cabinet by my desk." "Put model on my bulletin board; shared with my people what I'm working on." Need for Reinforcement (1): "Like getting together each month during research project; come back and refresh; makes me review." Workload (1): "What happens to most, go back to work, so much on plate, decisions to be made – forget about training."
Conventional (3)	Desire to Learn (3): "I do a lot of study on my on; feel responsibility to progress; posted model where could see on continuing basis." "What works for me, must go out and do; apply soon afterward." "Want to do it right." Need for Reinforcement (1): "Coming back from time to time – pretraining, workshop, post video, interview – all reinforcement."
Middle Range Performance	
Mastery (10)	Need for Reinforcement (5): "Has to be subsequent follow-up; refreshers to reinforce; otherwise won't retain." "Multiple meetings helpful." "Follow-up – meeting 3-4 times; reinforced vs. 'flavor of the month' type thing." "Follow-ups forced me to review." "Came to workshop, left, went back to office, tossed workbook on pile; would not have throught about it again if we did not have the follow-up appointments." Workload (2): "Don't know how could have crammed more in – listening, team concepts, SOPs, safety, violence in the workplace." "Training competing with so many things."
Conventional (10)	Need for Reinforcement (5): "Must keep in front, on going; refreshers over period of time." "Follow-up is key. Must revisit multiple times." "Follow-up is absolutely necessary." "Tend to put book on shelf if no follow-up / reinforcement." Workload (1): "Lots of direct reports. So much stuff coming at you."
Lower Quartile Performance	
Mastery (2)	Need for Reinforcement (1): "What's helped me in past are reinforcers – cube on the desk as reminder."
Conventional (6)	Need for Reinforcement (2): "How can we tie into reward system? All would put forth more effort. Example: Safety a joke around here until became item on evaluation." "If never bring up again, won't be used. Must have constant reminders, reinforcement, periodic refreshers." Workload (3): "Going through lots of things – overload." "Number of people reporting is important." "So damn busy. No time to do anything well. Making me crazy."

Implications for HRD Research on Transfer of Training

From a theoretical perspective, the HRD profession is still in the early stages of model building in regard to training transfer. We are seeking to conceptualize a transfer system in terms of variables and relationships that will be intellectually manageable and then examine the components with strong research designs until a valid representation of the real system emerges. Such a model can then provide a basis for effective HRD practice and prescriptive interventions. The qualitative examples in this study provide further evidence that transfer is a complex, systemic

issue and quantitative data alone will not give us the insights we need. As noted by Chen (1997), mixed methods can compensate for the inherent weaknesses of quantitative data collection in a work environment, triangulate the evaluative evidence, provide richer and more accurate understandings, and even expand the scope of the study. This study lends support to the pragmatic approach of integrating quantitative and qualitative evaluation paradigms in transfer of training research.

Theories Supporting Transfer of Training

Siriporn Yamnill
Gary N. McLean
University of Minnesota

The purpose of this paper is to review theories and conceptual frameworks necessary to describe three factors affecting transfer of training. This information helps HRD professionals understand why people desire to change their performance after attending a training program; what training design contributes to people's ability to transfer skills successfully, and what kind of organizational environment supports the transfer. This paper also provides HRD implementation strategies to help organizations achieve a high level of transfer.

Keyword: Transfer of Training

Today we believe that competitive success is achieved through people (Pfeffer, 1994). It follows, then, that the skills and performance of people are critical. Many organizations spend a lot of money on training, believing that training will improve employees' performance and, hence, increase the firm's productivity. In 1997, organizations with more than 100 employees are estimated to have spent $58.6 billion in direct costs on formal training. And with the inclusion of indirect costs, informal on-the-job training, and costs incurred by small organizations, total training expenditures could easily reach $200 billion or more annually (Holton, Ruona, & Leimbach, 1998). However, unsettling questions continue to be raised about the return on this investment.

There is strong consensus that acquisition of knowledge, skills, behaviors, and attitudes through training is of little value if the new characteristics are not generalized to the job setting and are not maintained over time (Kozlowski & Salas, 1997). In other words, training is useless if it cannot be translated into performance. According to Swanson (1995), for HRD to become a core business process, performance is the key. Transfer of training is a core issue with respect to linking individual change to the requirements of the organizational system. Therefore, if we believe that training truly makes a difference in organizational and individual performance, we must understand how to support transfer of training in organizations.

A Transfer of Training Model

Traditional approaches to transfer of training tend to consider it as a horizontal linkage that connects training and performance environments. A comprehensive review (Baldwin & Ford, 1988) classified the factors affecting transfer of training into three categories: (1) training inputs, including trainee characteristics, training design, and work environment; (2) training outputs, consisting of learning and retention; and (3) conditions of transfer, which focus on the generalization and maintenance of training. All three sets of training input features are seen as affecting learning and retention, which directly influence generalization and maintenance. However, the purpose of training and development is to improve performance (Swanson, 1995). Learning is of little value to organizations unless it is transferred to performance (Holton, Bates, Seyler, & Carvalho, 1997). Kuchinke (1995) also argued that learning is a means, not a primary organizational outcome. Learning is an internal behavior, whereas performance is usually a more external one. Therefore, training outputs should emphasize performance, not just learning.

Holton (1996) provided a conceptual evaluation model of training focused on individual performance. This model proposes three primary outcomes of training intervention: learning, individual performance, and organizational results. These outcomes are defined, respectively, as achievement of the learning outcome desired in an HRD intervention, change in individual performance as a result of learning being applied on the job, and results at the organizational level as a consequence of change in individual performance. Figure 1 illustrates Holton's transfer of training model that suggests three crucial factors that affect training transfer--motivation to transfer, transfer climate, and transfer design.

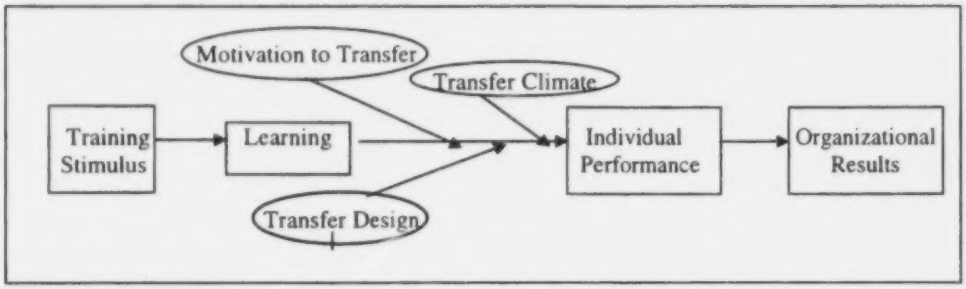
Figure 1. Holton's (1996) Factors Affecting Transfer of Training



Statement of the Problem

Individual performance is at the core of Holton's transfer of training model. Learning is expected to lead to individual performance change only when the three primary influences on transfer behavior are at appropriate levels. This model emphasizes three factors that affect implementation and transfer. However, this model needs theories and a conceptual framework to explain:

- why people desire to change their performance after attending a training program
- what training design contributes to people's ability to transfer skills successfully
- what kind of organizational environment supports people as they apply the knowledge, skills and attitudes gained in a training program to their job.

To enhance transfer of training, the HRD consultant must understand theories of evaluation and performance. Without this, it is difficult to conduct the high-quality research that leads to effective solutions to transfer-of-training problems. Therefore, to access theories and conceptual frameworks necessary to describe the three factors affecting implementation and transfer of training and the HRD implementation strategies to help organizations achieve a high level of transfer, this paper will address theories of motivation of transfer, theories of transfer design, theories of transfer climate, and conclusions and recommendations.

Theories on Motivation of Transfer

Motivation to transfer was hypothesized in Holton's (1996) model to connect learning with individual performance change. Motivation to transfer can be described as trainees' desire to use the knowledge and skills mastered in the training program on the job (Noe & Schmitt, 1986). Behavioral change will likely occur for trainees who learn the material presented in training and desire to apply that new knowledge or skills to work activities. To support the degree of transfer of training desired, it is important to understand why individuals choose to apply their knowledge, skills, and attitudes in their workplace. Several theories of human behavior exist to help us understand and predict behaviors that contribute to performance at work. They include the theories of (1) expectancy (2) equity, and (3) goal setting.

Expectancy Theory

Expectancy theory, presented by Porter and Lawler, describes the relationship between employee satisfaction and performance (cited in Moorhead & Griffin, 1992). Porter-Lawler's model includes abilities, traits, and role perceptions (how well the individual understands his or her job). At the beginning of the motivation cycle, effort is a function of the value of the potential reward for the employee (its valence) and the perceived effort-reward probability (an expectancy). Effort then combines with abilities, traits, and role perceptions to determine performance.

Performance results in two kinds of rewards. Intrinsic rewards are intangible--a feeling of accomplishment, a sense of achievement, and so forth. Extrinsic rewards are tangible outcomes, such as pay or promotion. The individual judges the value of his or her performance to the organization and uses social comparison processes to

form an impression of the equity of the rewards received. If the rewards are regarded as equitable, the employee feels satisfied. In subsequent cycles, satisfaction with rewards is influenced by the value of the anticipated rewards, and actual performance is influenced by perceived future effort-reward probabilities.

Equity Theory

Equity theory is based on the simple premise that people want to be treated fairly (Adams, 1963). Vroom (1964) recognized that individuals seek equity in their jobs; thus, job satisfaction reflects the extent to which rewards received match the rewards the employee believes should be received.

This theory rests on three main assumptions: (1) people develop beliefs about what constitutes a fair and equitable return for the contributions they make to their jobs; (2) people compare their own returns and contributions to those of others; and (3) beliefs about unfair treatment (inequity) create tension that motivates people to reduce that tension (Carrell & Dittrich, 1978). Mechanisms for reducing perceived inequities include: (1) cognitively distorting the inputs or returns/outcomes; (2) acting on the comparison with others to change his/her inputs or outcomes; (3) changing one's own inputs or outcomes; (4) changing the person with whom a comparison is made; and (5) leaving the situation where inequity is felt (Campbell & Pritchard, 1976). Equity theory predicts that individuals will choose a method of inequity reduction that is personally least costly (Adams, 1963). However, predicting which mode will be seen as least costly has proven to be quite difficult.

Goal-Setting Theory

Goal-setting theory suggests two cognitive determinants of behavior: intentions and values. Intentions are viewed as the immediate precursors of human action. The second cognitive process manifests itself in the choice or acceptance of intentions and subsequent commitment to those goals (Locke, 1968). It is the recognition that instructions will affect behavior only if they are consciously accepted that makes goal setting a cognitive theory of motivation. A goal is that level of performance the individual is trying to accomplish; it is the object or aim of behavior. According to Locke (1968), goals direct attention and action. Additionally, they mobilize effort in proportion to perceived requirements of the goal or task (Locke, Shaw, Saari, & Latham, 1981). Therefore, goal setting, like expectancy theory, may explain how and why behavior is facilitated or restrained in the pre-training, training, and post-training processes.

Impact of These Theories on Transfer Motivation

According to these theories, trainees leave training programs with different levels of motivation to utilize their learning on the job. According to Holton (1996), influences on transfer motivation fall into four categories: intervention fulfillment, learning outcomes, job attitudes, and expected utilities. All of these categories can be explained by expectancy theory, equity theory, and goal-setting theory as follows:

Intervention fulfillment. Tannenbaum, Mathieu, Salas, and Cannon-Bowers (1991) conducted a rigorous study and found that training fulfillment played a significant role in understanding training motivation. Training motivation is similar to motivation to transfer because it is a measure of the trainees' perception of the relationship between training success and future job performance (Holton, 1996). This can be explained by goal-setting theory and expectancy theory--if individuals perceive that what they learn is relevant to their goal (what they need to know) or an intervention has met their expectations and fulfilled their need for performance-related learning, they will be more motivated to transfer learning into on-the-job performance.

Learning outcomes. Tannenbaum et al. (1991) also found that performance during training had an independent relationship with post-training motivation. Expectancy theory (Vroom, 1964) suggests that individuals will be more motivated if they believe that their efforts will lead to enhanced performance. More successful learners would be expected to feel better able to perform and, therefore, more motivated to transfer. In contrast, less successful learners would be expected to be less motivated to transfer learning (Holton, 1996).

Job attitudes. Expectancy theory, goal-setting theory, and equity theory would lead us to speculate that people with high commitment and job satisfaction would be more likely to exert effort to transfer. Tannenbaum et al. (1991) also found that participants with more positive job attitudes would be expected to be more motivated to transfer learning to performance.

Expected utilities or payoffs. Clark, Dobbins, and Ladd (1993) found that trainees who perceived training to have more job and career utility were more motivated. These findings are consistent with expectancy theory, which

states that individuals will be more motivated to transfer if they perceive that their effort will lead to rewards that they value (Porter & Lawler, 1968).

Theories for Training Transfer Design

According to Holton (1996), one cause of failure to transfer is that training design rarely provides for transfer of learning. That is, cognitive learning may well occur, but program participants may not have an opportunity to practice the training in a job context or may not be taught how to apply their knowledge on the job. So, the training itself can have a direct influence on transfer of training. Thus, it is important to understand the theories that provide information about the conditions necessary to achieve positive transfer. The two major viewpoints that describe the conditions necessary for transfer are the identical elements and the principle theories.

Identical Elements Theory

The theory of identical elements was proposed by E. L. Thorndike and R. S. Woodworth (1901). According to the identical elements theory, transfer is improved by increasing the degree of correspondence between the training setting stimuli, responses, and conditions and those related factors operative in the performance setting. Holding (1965) summarized this work on transfer by detailing the type of transfer expected based on the similarity of the stimuli and responses.

Holding (1965) explained that, if the task is identical in both training and transfer, trainees are simply practicing the final task during training, and there should be high positive transfer. The second case assumes that the task characteristics--both stimuli and responses--are so different that practice on one task has no relationship to performance on the transfer task. The third case is common to many training programs. The stimuli are somewhat different in the training and transfer settings, but the responses are the same. In this case, the learner can generalize training from one environment to another. The fourth case presents the basic paradigm for negative transfer; if the response to identical stimuli in the two settings is different, negative transfer results.

Principles Theory

The principles theory suggests that training should focus on the general principles necessary to learn a task so that the learner may apply them to solve problems in the transfer environment (Goldstein, 1986). This theory suggests that it is possible to design training environments without too much concern about their similarity to the transfer situation, as long as it is possible to utilize underlying principles.

Near and Far Transfer

According to Laker (1990), there are transfer of training can be near or far. Near transfer is the application of learning to situations similar to those in which initial learning has taken place; far transfer is the application of learning to situations dissimilar to those of the original learning events. Whether one achieves near or far transfer appears to be dependent on which theory of transfer guides the development and presentation of the training program. Research reviewed by Clark and Voogel (1985) suggested that the following recommendations would increase the likelihood of near transfer:

- The more the training content and program reflect the workplace, the more successful the near transfer (Baldwin & Ford, 1988).
- The greater the specificity as to where and how the training is to be applied to the job, the more successful the near transfer (Clark & Voogel, 1985).
- The more overlearning of the task is encouraged, the more successful the near transfer (Noe, 1986).
- The more the procedural nature of the task is emphasized, the more successful the near transfer (Clark & Voogel, 1985).
- The more the application of the training is restricted to only those areas for which the trainee was prepared, the more successful the near transfer (Clark & Voogel, 1985).

Therefore, the identical elements theory influences the acquisition of near transfer. According to Spitzer (1984), near transfer would be the objective of short-term skill development that can be applied immediately to improve performance in one's present position. Near transfer would seem to be most desired when pursuing technical training (Laker, 1990), because technical training usually teaches specific behaviors and procedures applicable to the individual's current job. On the other hand, the theory of transfer through principles emphasizes the importance of creating variety and explaining the "why" that underlies what an individual is being taught. From this perspective, the following factors may hypothetically influence the acquisition of far transfer:

- The better trainees understand the underlying principles, concepts, and assumptions of the skills and behaviors they are learning, the more successful the far transfer (Goldstein, 1986).
- The more trainees practice in different contexts and use novelty in their practice exercises, the more successful the far transfer (Baldwin & Ford, 1988; Goldstein, 1986).
- The more encouragement trainees receive during training to discuss and apply the training in situations of their own choosing, the more successful the far transfer (Noe, 1986).
- The more encouragement trainees receive after training to apply the training to situations other than those for which they were trained, the more successful the far transfer (Goldstein, 1986).

Principles theory is critical to far transfer because knowledge can be abstracted and connected to new problems. If trainees can understand the principles and concepts and if they have a chance to practice exercises and apply situations in training programs to their workplace, they are more likely to apply their newly acquired skills and behaviors when they are faced with new challenges and unfamiliar problems. According to Laker (1990), far transfer might be most attractive for management development or creative problem solving as these types of training are frequently directed toward long-term goals and future positions.

In conclusion, near transfer and far transfer can be viewed as a series of goals or objectives of training and should be reflected in the content and design of training. So, it is critical to identify in advance the situations in which training is to be applied. However, if we accept the hypothesis that training strategies differ in terms of the types that facilitate near transfer versus far transfer, it is important to identify which parts of the training content and design represent specific parts of the training program.

Theories Supporting Transfer Climate

Transfer climate was described by Schneider and Rentsch as a "sense of imperative" (cited in Holton et al., 1997) that arises from a person's perception of his or her work environment. It influences the extent to which that person can use learned skills on the job. Transfer climate is seen as a mediating variable in the relationship between the organizational context and an individual's job attitudes and work behavior (Holton et al., 1998). Thus, when learning occurs in training, the transfer climate may either support or inhibit application of learning on the job. Organizational climate is at least as important as learning in facilitating transfer (Rouiller & Goldstein, 1993). The conceptual framework and theory that help to explain how organizational environment supports transfer of training are presented below.

Transfer Climate Framework

Rouiller and Goldstein (1993) offered a conceptual framework for operationalizing transfer climate; they suggested that transfer climate consists of two types of workplace cues, including eight distinct dimensions.

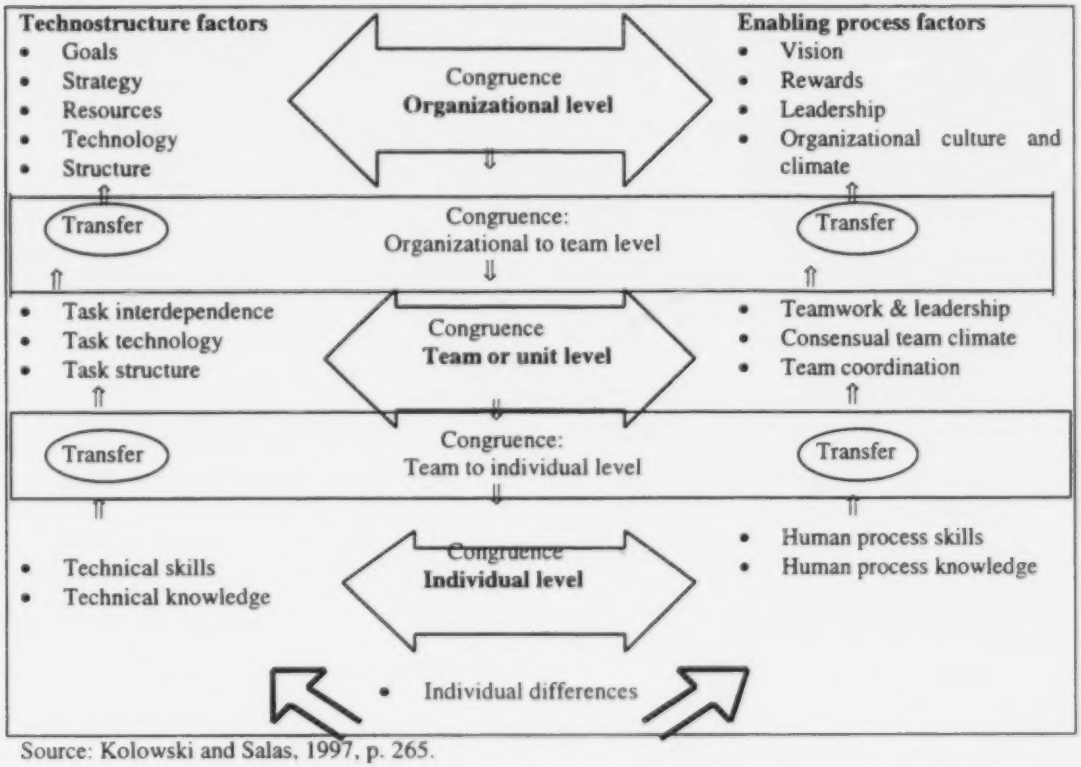
The first set of workplace cues--*situation cues*--remind trainees of opportunities to use what they have learned when they return to work. There are four types of situation cues: goal cues, social cues, task cues, and self-control cues. The second set of workplace cues--*consequence cues*--is the feedback trainees receive after they apply their knowledge, skills, and attitudes gained in the training to their jobs. There are four types of consequences: positive feedback, negative feedback, punishment, and no feedback. Rouiller and Goldstein (1993) used this framework in a study of fast-food restaurant management trainees and demonstrated that the transfer climate added significantly to the explained variance in post-training job performance. They also found that a positive organizational transfer climate appears to be important if transfer of training behavior is to occur.

Organization Theory

According to Kozlowski and Salas (1997), the need for change, the implementation of interventions, and the transfer of trained skills are embedded within the context of work team, sub-units, and organization levels. They propose an organization theory that benefits from the application of concepts drawn from systems-oriented theories. Key concepts that underline the systems framework include: organizations are open to external environmental influences, subsystem events are embedded in the larger systems context or network of relations, and it is impossible to understand complex events in systems by reducing them to their individual elements.

Organization theory enhances the identification of tangible work environment characteristics. Contextual factors exert an influence on individual responses through their perceptions of the organizational environment. This means that important, tangible, and meaningful work environment factors (structure, reward systems, or decision autonomy) are stimuli that underlie perceptions of the context. Under this analysis interpretive perceptions serve as mediating mechanisms to link salient contextual features to individual responses (Kozlowski & Farr, 1988). Three theoretical concepts or themes--levels, content, and congruence--underlie organizational context from the perspective of climate theory and are presented in Figure 2. This framework can be used to identify issues to improve the effectiveness of training implementation and transfer.

Figure 2. A Multilevel Model for Training Implemention and Transfer



Source: Kolowski and Salas, 1997, p. 265.

The dominant feature of the model is the distinction among the levels that comprise the organizational system—individual, team or unit, and organization. Second, the model distinguishes between technostructural and enabling process content which provides a means to identify relevant features that comprise contexts. Third, the framework incorporates congruence as a critical mechanism for conceptualizing configurations or alignments among key variables comprising the organizational system. It addresses the connection of variables within content domains, between content domains, and between levels. Changes in system functioning produced by training interventions are represented by arrows: (a) horizontal arrows illustrate congruence between content areas within levels, (b) central downward arrows signify congruence between higher level embedding characteristics and lower level training

targets, and (c) upward arrows within content areas represent composition processes that link training-induced change at lower levels to higher level change targets.

Training significantly benefits from integration with concepts drawn from organizational theory. According to this theory, trained knowledge, skills, and attitudes at the individual level are embedded in team or unit-level technology, coordination processes, and social system contexts, with broader contextual constraints originating at higher system levels (Kozlowski & Salas, 1997). From this perspective, preparing individuals to accept training-induced change and encouraging them to express their new capabilities in the work environment requires training that is delivered at the appropriate level and is congruent with contextual supports.

Kozlowski and Sale (1997) assert that the transfer processes in this model implicate the pre-training environment as well. If a context does not support or actively discourages the use of new skills prior to the implementation of training, it is unlikely that trainees will be motivated to learn.

Conclusions and Recommendations

All three factors reviewed--motivation to transfer; transfer design; and transfer climate--are significant to support the transfer of training and help HRD professionals to see the causes and effects of transfer of training to enhance the use of appropriate training strategies and lead to higher quality research. In practice, these theories show that systems congruence is essential for transfer. Considerable planning will be required to identify the relevant factors, processes, levels, and linkages implicated by the target training. Establishing the requisite alignments may necessitate simultaneous or phased interventions across several different factors, processes, and systems levels.

HRD professionals should encourage stakeholders of training, such as managers, trainers, and trainees, to work together to ensure that the training investment pays off through full transfer of training by:

- collaborating with key stakeholders in the organization at each step of the process to provide links to strategic goals, reinforce organizational priorities, and support performance-related factors.
- encouraging managers to provide clear performance objectives so that employees know exactly what they are expected to do. Managers should provide the necessary support (resources) for high performance and establish clear rewards for performance. They should provide prompt feedback to let employees know whether their performance meets the established standards.
- assigning high priority to learners as full stakeholders in the design and implementation of training. Groups of learners may be responsible for identifying training objectives; assessing their learning needs; developing action plans; and identifying organization-wide strategies to support full transfer to new contexts.

In addition, based on this review, the following applied research is needed within each organization:

- an examination of systems-wide components that determine whether a training program can yield meaningful change.
- an examination of contextual constraints and barriers that trainees face in applying learning in the workplace.

Finally, the transfer of training model and the review of transfer of training theories can help the HRD professional to understand that many factors affect performance change. Therefore, effective solutions to enhance transfer of training or training effectiveness will require that all of these factors be considered.

The Role of the Survey in the Assessment of an Organization for High Performance Redesign: A Case Study

Teresa K. Moyers
Hollister Incorporated

Oris T. Griffin
James Madison University

Many companies seeking to implement high performance work systems study the interaction and fit of the social and technical systems prior to designing the new organization. This paper looks at how one company utilized a survey instrument to analyze the way the social system currently is designed and operates. The survey was developed, using the Socio-Technical Systems Model, to provide insight into five major areas: Individual Needs, Goal Attainment, Adaptation, Integration, and Long Term Development.

Keywords: High Performance, Communication, Survey for Redesign

The redesign of an organization requires extensive research and analysis of the current operating systems prior to any implementation of change. Hollister Incorporated, with the guidance of their consultants, David W. Miller and Associates, has used the Socio Technical Systems Model to study their organization to identify those areas that are working well and which areas have opportunities for improvement. This paper covers only a small part of the social analysis e.g. the survey, which provided a tremendous amount of information concerning the existing social system, how people communicate, solve problems, make decisions, know and understand goals etc. that was essential to the redesign process. A communication matrix was created that listed the available modes of communication and the key issues and areas that were identified as needing to be communicated to the plant at large (see Table 1). Each method of communication was then rated as either a primary or redundant source of information for each key element. As information was collected, it was analyzed and disseminated per the matrix. The information gathered from the survey was used not only during the redesign phase to develop a better support structure but it was also used to improve the way we communicated the news and information gathered during the entire STS analysis and redesign process.

Literature Review

High performance emerges out of the integration of the social and technical systems: how work is organized, how people are managed, how technology is used, and how all of these are linked to an organization's competitive strategy and culture. Discussions of high performance workplaces often focus on self-managing teams, quality circles, flatter organizational structures, new flexible technologies, innovative compensation schemes, increased training, and continuous improvement. Effectively managing people is an integral part of this process (Gephart, 1995).

Most companies seek to increase productivity and lower costs by improving their processes through innovations in technology but many neglect a very important key asset in their organization: the employees. Employees make an organization a successful high performance organization. Technological advances alone can increase profitability but it is the integration of the technical with the social system that creates the synergistic effect reflected in the performance measures of quality, service and cost.

Socio-Technical systems (STS) analysis provides an alternative approach to redesigning existing organizations. Socio-Technical systems analysis focuses on problems built into the system and recognizes that even though different people in a specific job will deal with these problems differently, the problems will continue to exist until the system is redesigned. Socio-Technical systems redesign is a creative process whose purpose is to improve the quality of working life of the people in the system and increase the productivity of the system. The key is to expand the roles of people and to increase skill level and decision opportunities so as to create better careers in the workplace by pushing variance control and problem management down to the operating level of the organization.

The social system analysis attempts to examine the human systems of the organization to identify what is working well and what needs to be improved. Individuals bring their unique individual needs to the organization, both personal and professional. The social system analysis examines to what extent these needs are met and what is the resultant quality of working life as perceived by organization members. The analysis also looks at how individuals and groups interact with each other and how the organization interacts with the external environment. The process also tries to identify how the organization adapts to the external factors and how it develops its capabilities to be prepared for future challenges (Miller & Assoc., 1997).

Background

Hollister Incorporated is an employee-owned, independent manufacturer of disposable medical products with three manufacturing facilities located in Ballina, Ireland; Kirksville, Missouri; and Stuarts Draft, Virginia. For more than 75 years, Hollister has been serving healthcare professionals and the people they serve. Hollister corporate headquarters are located in Libertyville, Illinois--forty miles north of downtown Chicago. Hollister products and services are available in over ninety countries on five continents.

The Stuarts Draft facility is centrally located in the rural industrial setting of the Shenandoah Valley in Virginia. Four hundred seventy regular full time associates staff three shifts. The shifts are non-rotating, which results in the most senior employees staffing first shift. Seventy-five percent of the population is female with the majority (70%) between the ages of 25 – 40 years old. Only five percent of the population is under 24 years of age; five percent is over 55; the remaining 20% of the population are between 41– 55. The turnover rate is very low within the organization. In 1997, the total turnover rate was 9.5% of which 3.4% was due to terminations for cause or employees quitting. The remaining 6.1% were due to retirements.

Hollister is currently organized very traditionally with a plant manager, five staff managers, twelve supervisors and fourteen leadpeople. However, a redesign project is currently underway that will dramatically alter this structure. The survey data was collected and analyzed to assist in the redesign effort.

Method

There are several ways to describe and measure the effectiveness of a social system. The "As Is" Social Survey, used by the Hollister Design Team, was constructed using resource materials provided by the consulting firm of David W. Miller and Associates (1997) who facilitated and guided the design process. The basic instrument used was a modified version of one adapted from Hackman & Oldham (1975). The survey was designed to provide information about how the plant currently operates. The key areas covered in the survey were the systems for communicating, coordinating, problem solving, decision-making, and training. Questions were also included to cover how well the individual needs of the associates were being met. These questions included topics concerning the culture such as honesty and trust issues, respect and support, feedback and personal growth opportunities as well as how valued people feel within the organization.

The "As Is" Social System Survey was a plantwide survey that had a 92.8% response rate e.g. four hundred thirty six out of four hundred seventy associates completed the survey. Using the GAIL Method (Cherns & Wacker, 1978), questions were asked about goals, adaptation, integration, and long term development. In addition, questions concerning individual needs were included. The demographics of the survey included identifying each department by number and shift (Table 2).

The survey was conducted over a two-week period. Each supervisor was notified of the date and time selected for his/her group and was asked to announce and post the information. Each group was allotted thirty minutes to complete the survey. The times were scheduled directly after each group's break or lunch period and were held in the training rooms in order to emphasize the importance of the data being gathered, to minimize time away from the production floor and to reduce distractions. For all associates on leave of absence, vacation or out sick, a survey was mailed to their homes with a cover letter stating the purpose and importance of their responses. A two-week deadline was placed on gathering the information.

Using Approach, a database computer program, in the operating system of Windows 3.1, a program was created to input all of the information from the surveys. Data were compiled, sorted and graphed to aid in the analysis. All graphs were created using the spreadsheet program, Lotus 1-2-3. The upper and lower control limits were manually chosen to provide a realistic view of the data. Any value above 4.50 (the upper limit) which translates to 87% of the time, was categorized as something working well. Any value below 2.5 (the lower limit) which translates to 37% of the time, was viewed as something that definitely needed attention. Trends, potential problems, and opportunities were then identified from the analysis of the data.

Table 2

Department and Shift Profile

GROUP NAME:	DEPT.	SHIFT 1	SHIFT 2	SHIFT 3
Plant Mgr. Group	810	2	0	0

Raw Bag	885	46	30	2
Total Associates	**436**	**261**	**120**	**55**

Measures

The survey consisted of thirty-three questions covering five areas of interest: (1) Individual Needs (2) Goal Attainment (3) Adaptation (4) Integration (5) Long Term Development (Table 3). The questions concerning individual needs attempt to identify the reasons why people would consider leaving the organization. These include being respected, treated fairly, honestly and consistently, receiving feedback and recognition, feeling valued, and feeling a part of the organization (Miller & Assoc., 1997).

Table 3

Question Structure

Question Type:	Question Numbers
Individual Needs	1 - 15
Goals	16 - 19
Adaptation	20 - 24
Integration	25 - 28
Long Term Development	29 - 33

Goal Attainment was measured by questions 16 – 19 dealing with if and how the organization's goals and performance are communicated. Adaptation questions (20 – 24) were centered on how the employees learn about important changes, both in their work area as well as in the organization as a whole, which is an indicator of the degree of adaptability of the organization to change. Questions 25 – 28 provided insight into the communication system within the plant – how work is coordinated and communicated (integration). The long term development section of the survey looks at the way work is organized and planned and how employees are trained both for their

BEST COPY AVAILABLE

current positions as well as how career development and ongoing training are handled.

Data Analysis/Results

The plant wide survey average (see Figure 1) provides an overall picture of the survey results. There were four questions that rated below the lower limit (21, 26 – 28) all involving the communication system.

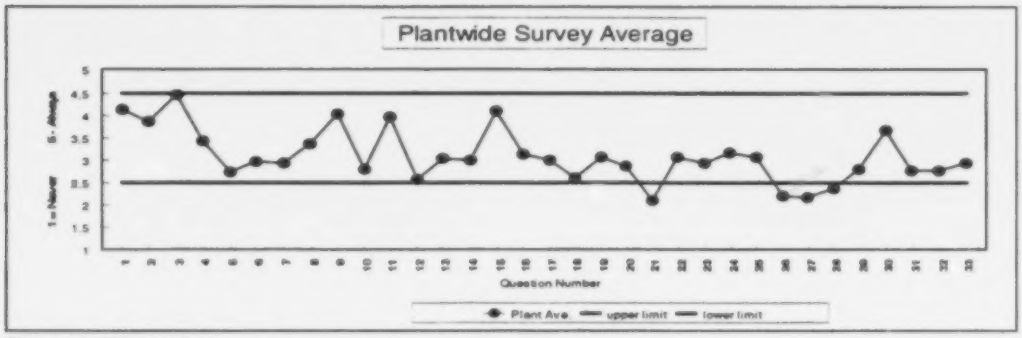

Figure 1. Plantwide survey average.

Associates perceive they do not know what is going on within the plant. A system to link departments and shifts may be needed as well as a process developed and implemented to allow for open and constructive feedback and conflict management. The four highest rated questions (3, 9, 11, and 15) occurred under the Individual Needs section. Associates feel that they are valuable to the company and their jobs are important and that they work in a safe environment. Job security is not a concern; there has been only one small temporary lay-off in the 25-year history of the plant. Personal success may be linked to the company's success due primarily to the lucrative retirement plan that many have taken advantage of after only 20 years of service.

The survey tracked department and shift as well as type of group e.g. exempt, hourly, and salaried non-exempt to see if there were any significant differences among these groups. The exempt and salaried non-exempt groups tracked very closely to each other with both tracking much higher than the hourly group (see Figure 2).

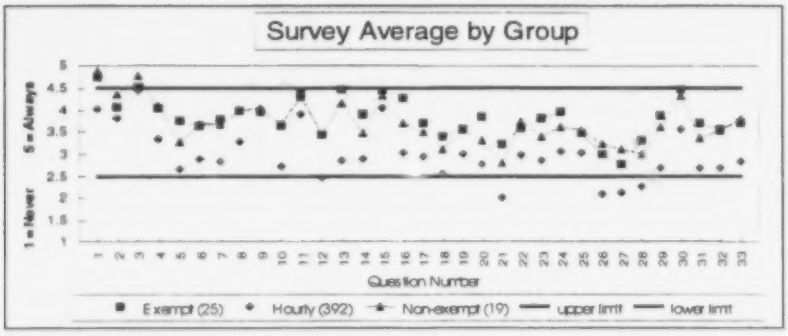

Figure 2. Survey average by group.

This can be explained by the traditional organization of the plant. These groups are comprised of engineers, supervisors, planners, inventory analysts, purchasing agents, and managers. All of the people in these two groups are in constant communication with each other and they attend regular meetings that keep them informed of any problems or new developments throughout the organization. They make most of the decisions that affect the rest of the plant.

The survey average by shift (see Figure 3) can be very misleading. Second shift associates appear to be very informed and satisfied with their jobs and they rated nearly every question higher than either first or third shift. Eighty-five percent of the employees on second shift have less than three years service with the company.

Employees staffing first and third shifts have on average more than eight years of service. Second shift employees are still being integrated into the work environment and are more concerned with learning to do specific tasks and understanding their responsibilities. Staffing on second shift is less than half of that on first shift which provides a greater opportunity for learning more jobs and allows for more flexibility. Nearly all of the new hires are placed on second shift and they accept the job knowing that it may be a very long time before they will have the opportunity to move to first shift. The supervisor on second shift is much less involved in meetings and therefore spends more time on the floor and is more accessible and available to the associates. Second shift associates feel valued and more connected to each other.

The opportunity to move to other areas in the plant is very limited for those associates on first shift who do not wish to relinquish their first shift hours. Therefore, first shift associates feel stuck in their jobs and have fewer opportunities to change jobs even though they do rotate jobs within their given departments. Third shift associates rated every question lower than their counterparts on the other shifts. They really feel segregated and cut off from the rest of the plant. There is no direct supervision on third shift and only one leadperson for the entire shift. Third shift is only one-fifth the size of first shift and one-half the size of second shift. There is no support staff other than quality assurance technicians available to answer questions or concerns.

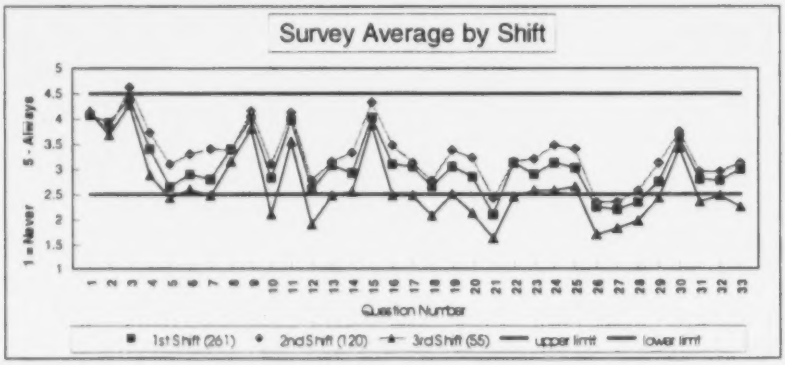

Figure 3. Survey average by shift.

At the time this survey was completed, only one department was implementing self-directed activities, Weigh and Fill. This department is a one-shift, first, operation and overall scored very high in all areas of the survey. They have access to data and the resources necessary to run their day-to-day operations. However, they also are not kept informed of changes and developments in other departments or on other shifts (Figure 4, Questions 21 and 27).

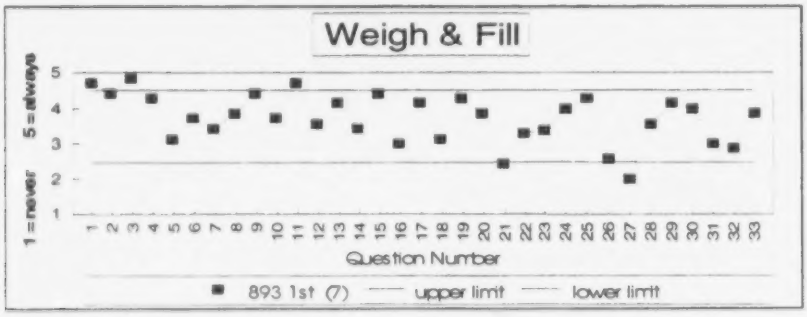

Figure 4. Weigh and fill.

Survey Conclusions

Results from the survey show that, as a company, the entire communication system needs to be greatly improved. Providing information about the plant in general, better feedback and recognition as well as expanding the training program to include interpersonal and team skills are needed. Safety and job security are not considered problem areas as they were rated very highly.

Overall, there were no surprises gathered from the survey data. All of the deficient areas are typical problem areas identified in a traditional organization: communication problems, lack of knowledge about company, plant, and department goals, lack of knowledge concerning other shifts and departments, lack of support on the off shifts, little personal or career development, lack of involvement in the business.

Actions Taken

As the Design Team continued with the gathering of data throughout the STS process, they attempted to incorporate lessons learned. One of the areas they were able to address immediately was communication. The communication matrix (Table 1) was constructed to identify available methods of communication. The Design Team communicated their progress to the plant regularly using as many types of communication methods as practical. The team also involved as many associates as possible throughout the data gathering process. All of the results from this survey were reported to the management and staff where many have initiated changes to improve the various situations.

The "As Is Social Survey" is only one method used by Hollister Incorporated to study the social system, which in turn was part of the Socio-Technical Systems (STS) Analysis. The information from this survey, combined with the other data gathered using the STS approach, will be used to guide and direct the development and implementation of the redesign plan. The redesign plan will attempt to find the best fit of both the social and technical systems to create a high performance organization.

Conclusions

It is easier to implement changes in organizations that are obviously in trouble. Everyone is aware of the need to change for security, stability and their personal success. However, in successful organizations, the need to change is difficult for the vast majority to comprehend. Why fix something that isn't broken? Hollister is a very successful company. There has been a lot of resistance to what they have nicknamed the outcome, HPO (High Performance Organization). Preparing the culture for change is an ongoing process. Designing changes for improving the work environment, increasing efficiency and reducing costs must be systematic and logical and must look at both the technical and social systems in order to produce high performance results.

Because innovation and adaptation require human commitment, we need to understand how the design of organizations influences the willingness of people to help organizations succeed. By studying the current operating systems within the organization, we can identify those areas that are working well and those that need to be improved. The survey provided specific data that will be used in the redesign process. It is obvious that the social system must be integrated with the technical system and both must be aligned with the organization's goals.

Thriving on Change: An Organizational Identity Model

Sheila L. Margolis
Georgia State University

Mergers often contribute to a climate of uncertainty causing members to revise how they view their organization. The purpose of this research was to investigate members' perceptions of organizational identity and understand how the organization can help members during such a change. Findings suggest that the organization's purpose and philosophy constitute organizational identity. Construction of identity is influenced by numerous factors. Suggestions for the HRD professional in facilitating organizational change are provided.

Keywords: Organizational Identity, Organizational Change, Mergers/Acquisitions

Mergers have transformed the landscape of organizations, contributing to an environment of instability (Bastien, Hostager, & Miles, 1996). Even when the merger is an avenue for organizational survival, it has the power to shake up emotions and produce feelings of loss and uncertainty (Mirvis & Marks, 1992; Overmyer Day, 1993; Schweiger, Csiszar, & Napier, 1994). The organization has an identity; it is the essence of the organization, a source of stability and definition for its members, and a basis for action (Albert & Whetten, 1985; Ashforth & Mael, 1996). With a change in collective status (Albert & Whetten, 1985), members are more aware of these organizational images (Ashforth & Mael, 1996) and are more likely to reflect on their organization's distinctive attributes (Dutton, Dukerich, & Harquail, 1994) than in a more stable period.

This study provided a unique opportunity to examine perceptions of organizational identity during a transformation process in an organization that had chosen a merger as its avenue for change. This research focused on what members described as the essence of the organization.

Theoretical Framework

Because mergers have been and are continuing to be a path for organizational growth and survival (Sikora, 1997), the human response to this dramatic change event was of interest. What emerged from a review of the literature on the human issues in mergers (Buono & Bowditch, 1990; McEntire, 1994; Napier, 1989; Schweiger, Csiszar, & Napier, 1993) were the feelings of loss of identity that often cripple people emotionally not only during the change but also long into the future (Cartwright & Cooper, 1996; McEntire & Bentley, 1996; Nahavandi & Malekzadeh, 1993). Although loss of identity appears to be a significant issue, there has been little research with this focus in an actual merger environment (McEntire, 1994). Also, most of the research that touches on this loss is embedded in varying definitions of organizational identity. A separate body of literature on organizational identity has been evolving using the definition by Albert and Whetten (1985) as its base. The merger literature on loss of identity is lacking this consistent foundation. Because aspects of identity appear to contribute to merger problems, this second body of literature on organizational identity was central to this research.

The literature on organizational identity is theoretical (Albert & Whetten, 1985; Ashforth & Mael, 1996; Bouchikhi & Kimberly, 1996; Dutton et al., 1994; Dutton & Penner, 1993; Fiol & Kovoor-Misra, 1997; Hatch & Schultz, 1997), and includes a limited but growing body of research (Dutton & Dukerich, 1991; Elsbach & Kramer, 1996; Foremen, 1995; Gioia & Thomas, 1996; Golden-Biddle & Rao, 1997; Gustafson, 1995; Gustafson & Reger, 1995). Much of this work is based on a noted article by Albert and Whetten (1985) defining the three necessary criteria for organizational identity: central character, distinctiveness, and temporal continuity. "Identity goes to the core of what something *is*, what fundamentally defines that entity" (Ashforth & Mael, 1996, p. 20).

There has been limited research on shared organizational identity (Dutton & Dukerich, 1991; Gustafson, 1995), what Dutton and Penner (1993) have labeled as "the collective version of organizational identity" (p. 104), from an organizational identity theory perspective. A case study by Dutton and Dukerich (1991) revealed six attributes that members used to characterize the Port Authority of New York and New Jersey. All informants described only one of these attributes—a professional organization with a uniquely technical expertise. The remaining five attributes were each suggested by less than half of the informants. Research by Gustafson (1995) also revealed a small number of shared organizational identity attributes; only three organizational identity attributes were shared by a majority of

Copyright © 1999 Sheila L. Margolis

the respondents, although two of these may have been biased upward because they were related to elements used in the instrument. The three attributes were attitude toward customer, quality, and culture/values.

Past research has given limited attention to the classification and structure of organizational identity. Gustafson (1995) offered a preliminary classification of organizational identity attributes for organizations in hypercompetitive environments. He suggested that there are a limited number of intangible identity attributes that address "why and how things are done" (p. 180) and many more specific substantive identity attributes that deal with "what things are done" (p. 180). Based on this classification scheme, not all identity components are central, distinctive, and enduring, which differs from the Albert and Whetten (1985) definition. Gustafson suggested further research in this area.

The construction of organizational identity was also a focus of this research. According to Bouchikhi and Kimberly (1996), organizational identity is typically defined at founding and is a product of the motives, skills, experiences, and personality of the founders and the context of the founding. It is a reflection of the powerholders of the organization (Ashforth & Mael, 1996). The type of people that a company hires is often influenced by the background and experiences of its founders and their values and vision for the organization (Kimberly & Bouchikhi, 1995). Ashforth and Mael (1996) explained, "There are limits to how far identity claims can deviate from perceptions of either external stakeholders or internal members" (p. 40). This study was designed to further investigate the construction of organizational identity using qualitative methods.

Although there are disagreements about the definition of identity (Barney et al., 1998), the enduring nature of identity within a context of change (Gioia & Thomas, 1996), as well as the need to discuss dimensions of identity (Barney et al., 1998), this identity literature builds on a foundation that contributes to the development of theory. This focus for research is in its infancy, and there is a need to further develop and contribute to organizational identity theory development.

Method

The questions that served as the focus for this research were as follows: (1) How do members describe organizational identity? What attributes are core, distinctive, and enduring as defined by Albert & Whetten (1985)? What attributes are shared? (2) What contributes to a member's perception of organizational identity? (3) How can the organization support its members during a merger? These questions lend themselves to investigation through a qualitative approach (Albert, 1998).

Using an inductive and emerging process, this qualitative case study provided an opportunity to examine a bounded system to uncover insiders' perceptions of organizational identity within the context of a merger experience. An in-depth examination of one organization's response to these issues was the focus of this research. This particular case offered a unique setting because the organization was using a merger for the purposes of losing identity in an effort to remove the stigma attached to its name. It was a contemporary event where phenomena and context were interwoven. The results of the data gathering produced a rich description of the complexities of the situation, revealed through many sources, over a six-month period.

Context of the Study

The setting for this research was a company that I shall label as Company A. Company A was a public company in the business of commercial air transportation. This company offered low-fare, passenger air service. Company A was extremely profitable and growing until its accident. This was followed by a massive reduction in service and a furlough of employees. Scheduled service resumed, but losses continued to accumulate. In an effort to regain its profitability, the airline tried to attract customers back to the company. After continuing declines in profits, the company announced a merger. This merger was specifically targeted as the best vehicle for transforming the company's identity that had been damaged as a result of intense and unrelenting negative media exposure since the accident. Two months prior to the official merger, the company enacted a name change that would be consistent with the upcoming merger.

Data collection began after the merger was announced, continued through the time of the identity change, and was completed a couple of months after the merger went into effect, totaling a six-month period. The timing of this research coincided with heightened emotions about issues of identity in this organization. Attitudes and comments of interviewees were reflective of the point in time of the interview.

1. The participant was an employee of Company A.
2. The participant had been employed at Company A prior to the accident. This criterion was chosen predominantly because of the enduring nature of identity. In order for employees to assess whether or not attributes were enduring, they needed to have experience with the company over a period of time. The first 31 employees met this criterion. The remaining five interviewees were selected specifically because they were "new" (six months or less in employment) to determine if there was a significant difference in their perceptions. These employees could be part-time or full-time employees. The decision to expand the sample was made after completing the 31 interviews. As explained by Miles and Huberman (1994), "Samples in qualitative studies are usually not wholly prespecified, but can evolve once fieldwork begins. Initial choices of informants lead you to similar and different ones" (p. 27).
3. The various functional groups in the organization—pilots, in-flight, maintenance, and reservations—were fairly equally represented in the sample: five pilots, six in-flight, five maintenance, and six reservations. A larger number of customer service employees, 14, were interviewed because that category consisted of several subgroups: ticketing, gate, baggage, ramp, transfer, and operations employees. This was an effort to achieve purposeful random sampling (Patton, 1990). Using a process that enabled the selection of members from each functional group, I was able to use a sample of 36, yet increase the credibility of the results.

In addition to these 36 interviews, I talked with numerous employees in informal, non-taped conversations. Notes from these were included as memos.

In my second round of interviews which concentrated on mini-tour questions, I began by interviewing my key informant. Then, after further analysis of all data, I conducted 15 additional interviews. Ten of these interviews were with employees included in the initial round of interviews, two from each functional area. Five of the 15 interviews were with employees who I had not previously interviewed. Thus, for this research, I formally interviewed 42 employees of Company A; ten of those employees were interviewed during both the initial interview period and the later follow-up round of interviews.

Data Collection

The purpose of this research was to understand what employees perceived as being core, distinctive, and enduring about their organization. The interview guide was used for each interview. The guide was modified as new issues emerged. Using a semi-structured interview process, I was able to efficiently use the time allotted, and I had the flexibility to follow leads that emerged in the interview.

A second data source was observations. Observations took place in the natural setting where I was able to experience firsthand life in this organization. Approximately 21 hours were dedicated to observing activities in Company A.

A third data source was documents. Company printed materials consisted of annual reports, press releases, brochures, promotions, advertisements, and flight-related documentation. Numerous documents from the newspapers and magazines were also available.

Opportunities to observe and review physical artifacts were particularly critical in this research. Because this study focused on identity during a merger, it was quite revealing how the company logo was handled before and after the name change. Data from interviews, observations, and artifacts were coded using the NUD*IST software.

Data Analysis

Data collection and data analysis are iterative, tightly interwoven processes. Using the constant comparative method (Glaser & Strauss, 1967) while coding data, it is critical that one also compares data with previous data coded in both the same and different groups. Then, through a complex analytical process of deductive and inductive thinking, the researcher not only relates subcategories to a broader category in a set of relationships but also connects these relationships to data. The process of proposing and verifying patterns against data, produces patterns that are grounded in data.

A later stage of analysis involves identifying the essence of the story revealed through the data and analytically formulating the story line by relating other categories to the core category. This is a complex integration process that relates categories in ways that can produce theory that is grounded in the research data.

Establishing Rigor for the Inquiry

This study was conducted using techniques to support the trustworthiness of the findings. This research allowed prolonged engagement because the data collection was spread over six months, totaling 85 hours in the field.

Triangulation can be carried out through the use of multiple and different sources, methods, investigators, and theories (Denzin, 1970). I triangulated the data using multiple and different sources and methods. This research involved multiple sources because I gathered data from over 42 different employees in several functional groups of the organization. Multiple methods involved my use of interviews, observations, documents, and physical artifacts in the collection of data.

Peer debriefing is an opportunity to probe for biases in the researcher's thinking. A frame interview was conducted prior to interviewing, and throughout the research, I periodically posed questions to peers.

Negative case analysis was used in efforts to rethink themes in response to exceptions that might not fit one's thinking. The importance of dealing with negative evidence was central to establishing credibility. Throughout my data collection and analysis, I consciously identified exceptions and followed up on them to enhance my understanding of the meaning behind the exception and its impact on the themes that I felt were emerging.

Although some state that "the general rule of thumb here is to transcribe only as much as is needed" (Strauss & Corbin, 1990, p. 30), I chose to transcribe the initial 36 interviews to ensure that all interview data were preserved and checked by each interviewee, enhancing credibility through member checks. Member checks were critical opportunities to have those who provided data also sign off on the accuracy of that data. In order to check the accuracy of transcriptions and their consistency with the overall feelings of the person interviewed, I mailed a copy of the transcription of each interview to that interviewee and requested that they sign off on its accuracy or make changes where needed. I waited to analyze the interview data in the NUD*IST software until I received these responses.

Member checks also can involve taking tentative interpretations back to the people from whom they were derived and asking them if the results are reasonable. In two functional areas, I met with a manager or director and reviewed how I was interpreting data. This was an excellent opportunity to get feedback and also to pose follow-up questions for my own clarification. I also met with the key informant after coding most of my data in order to present tentative findings and get his reaction. Finally, during my mini-tour interviews, I asked 15 additional members for feedback on my interpretations.

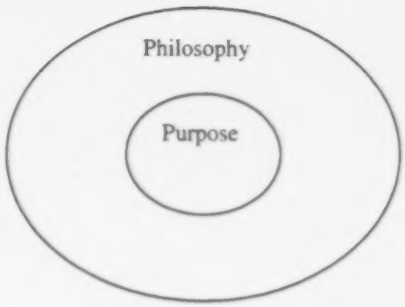
The audit trail is the collection of records of raw data, analysis, and process, as well as any other documentation from the research. A record of such detail allows someone other than the researcher to make a determination if the analysis and interpretation are supported by the data. I maintained an audit trail throughout the study. All interview transcriptions, audiotapes, observation notes, memos, documentation, and coding results were stored in an organized manner. Also, NUD*IST maintained rawfiles and coding results.

Results

How Do Members Describe Organizational Identity? What Attributes Are Shared?

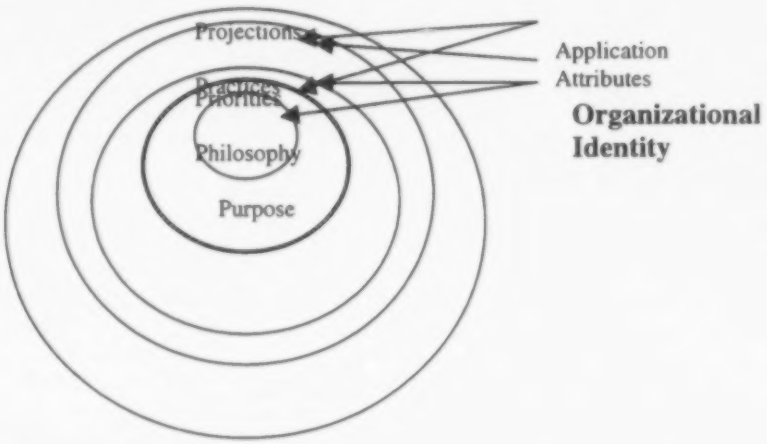
Data revealed that a small number of organizational identity attributes constitute organizational identity. The findings of this research suggest that organizational identity is composed of a purpose and a philosophy. The purpose is the organization's fundamental reason for being in business (not to be defined as making money). An enduring purpose is stated broadly and usually benefits society. The philosophy is the distinctive framework and guiding spirit for how members do that business. This unique philosophy is perceived by members as the special way members do business that sets them apart from others. These two components, shown in Figure 1, are organizational identity as viewed by its members. It is the basis for what members do at work and how they do it. Because this is the core and essence of the organization and the foundation and framework for action, it is the heart and soul of the organization.

Figure 1. Components of Organizational Identity



Surrounding these organizational identity components are priorities, practices, and projections of the organization. These application attributes are what outsiders see and what insiders do naturally if their behavior is inherently aligned with the identity. An organization typically has priorities or standards for action that are more enduring although they are not organizational identity. Priorities are the values that support achieving the organization's purpose and are consistent with its distinctive philosophy. These priorities are a direct application of the purpose and distinctive philosophy to work. Outside of those more enduring attributes are internal and external practices and features that fluctuate with the needs of the organization in its attempts to be competitive as well as projections or images of the organization that are a reflection of the organization to the public. These images, although extremely important to the organization, are also not part of organizational identity. Although these are the aspects of the organization that are most visible to the public, they are typically symbols used by the organization to influence impressions. Together, organizational identity and the application attributes are the organization's attributes. Figure 2 illustrates the structure of organizational attributes.

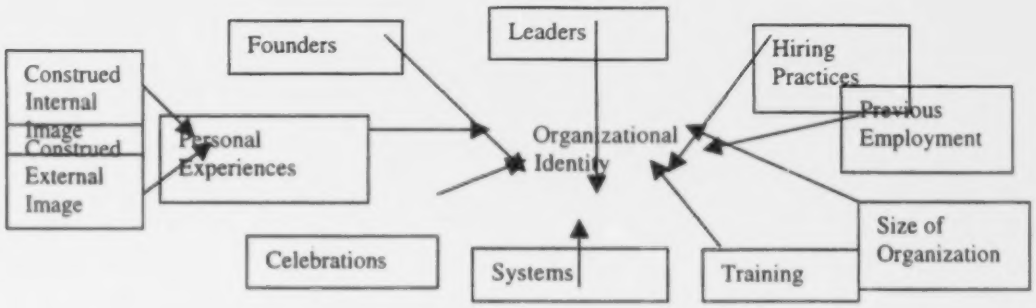
Figure 2. Structure of Organizational Attributes



What Contributes to a Member's Perception of Organizational Identity?

Findings indicate that organizational identity is a product of multiple elements, as illustrated in Figure 3. Based on this research, the following have contributed to the way this organization constructed its organizational identity: founders and leaders, hiring practices, previous employment of organizational members, organizational size, training, systems, celebrations, and personal experiences. Personal experiences are influenced not only by what a member sees and does related to work but also by what a member believes others inside and outside the organization say and think about the organization, their construed internal and external images.

Figure 3. Construction of Organizational Identity



The consistency in how these factors support organizational identity can impact the organization. Fragmented activities that do not contribute to the preservation of organizational identity can be quite damaging to the organization. The factors that helped construct identity are also the vehicles for maintaining or changing that identity.

How Can the Organization Support its Members During a Merger?

In addition to members' concerns about the future of the organization, they have other needs during such a major change. Timely, regular, and congruent communications are critical for relieving uncertainty. Such communications provide information and demonstrate that the employees are important to management and to the success of the organization. Face-to-face meetings with the leadership show that the leader cares about the people and that they can trust that leader with their futures.

Stability during such a change can be achieved by clarifying a member's status of employment as well as the status of the new organization's identity and plans for the future. This gives members an anchor to support them through the change, giving them knowledge of what is constant and direction and insight into their future.

Symbols can be used in both expressive and instrumental roles to represent the new organization and promote identification with it. Such a process may include a ceremony to close one stage in the organization's life and celebrations to welcome the new. The management of such symbols could be consciously planned in order to help members make the emotional change from what they have been a part of to the new entity.

Conclusions and Implications

This research contributes to the development of organizational identity theory in the aspects of structure, content, sharing, and construction of identity. This contribution to theory development can influence knowledge that impacts the organizational development component of HRD practice. It is suggested that future research on the human aspects of mergers be framed within theory and research in organizational identity so that it contributes to theory development and a better understanding of the processes that support such changes in an organization.

This research on organizational identity has several implications for practice, particularly for human resource development (HRD) professionals (see Figure 4).

First, HRD professionals should be integral participants in planning and implementing mergers and other organizational change events. Because the primary focus of management is directed at financial and strategic decisions, those in key decision-making roles are sometimes insensitive to the impact of the change on the people in the organization. And this impact can produce negative outcomes that can influence merger success. There must be someone in a leadership role who listens to and represents the voice of the employees. In addition, for humanitarian reasons, there needs to be an advocate for how this change will impact the people so that appropriate actions can be taken to make transitions and change more livable for the workforce. The HRD professional has the obligation to serve in this role and, as a team member, participate in planning and executing these activities.

During organizational changes, such as a merger, the HRD professional could concentrate efforts on those levers that will contribute to satisfying human needs and enhancing productivity. Based on the findings of this research, this effort involves targeting four distinct areas.

First, the HRD professional can help in monitoring and facilitating communications. This role involves ensuring that timely and accurate communication systems are in place throughout the change process. These communications are necessary during normal times but are critical during times of uncertainty and transition. An array of techniques can be used including face-to-face meetings with leadership, memos, telephone hot lines, and newsletters. The HRD professional must be aware of how well these communications are serving their purpose and monitor information flow so that unnecessary uncertainty does not deter productivity.

Second, the HRD professional can support leadership in defining and translating organizational identity. This involves ensuring that leadership is clear on the organizational identity attributes of the merged organization and then ensuring that members understand that identity and evaluate whether they fit with it. When organization members have clarity about the essence of the organization and if they feel comfortable and connected with it, there is less uncertainty because they have an anchor of stability, even in an environment of change. The HRD professional could work with the leadership to clarify changes and facilitate processes so that those changes can be smoothly adopted in the organization.

Third is the focus on future organizational images. The HRD professional can work with the leadership in determining how to clarify direction for the future of the organization and then clearly communicate that to all employees in a way that sparks enthusiasm among members.

And, fourth is the role of supporting alignment. The HRD professional must work with others to be alert to misalignments, create new alignments, and strengthen current alignments within the organization so that attributes of the organization are congruent with the organizational identity and future image. The levers for constructing organizational identity offer a focus for managing alignment. If those elements that construct identity do not consistently reinforce the organizational identity, then such misalignments must be corrected. These elements are also sources for creating new alignments and strengthening current alignments. Also, these levers should be harmonious with the vision of the organization so that all actions are consistent not only with who they are as an organization but also where they are going.

The HRD professional could also work with members to determine if organizational attributes support organizational identity. Because there is a funnel effect for organizational attributes, the HRD professional could help others to be alert to any misalignments in those attributes.

In times of transition, members need the stability of knowing what is not changing, and they need the challenge of knowing where they are moving. With this basic information, members can better travel through transitions and maintain a sense of balance within the change. With the anchors of information, organizational identity, and future organizational image, each member can contribute to organizational success by aligning their actions to what is important to the organization.

Thus, the HRD professional has a critical role to play in enhancing the capacity of an organization to not only survive change but also thrive on it. As a change agent, the HRD professional must promote communications, guide leadership in defining and translating organizational identity and a vision for the future, and advocate the continuous creation of alignments within the organization to both the identity and the organization's strategic goals. The challenge is to grow and develop an organization in ways that reinforce and adhere to the stabilizing identity core yet simultaneously motivates members to be flexible in all other aspects of the organization. The HRD professional must take on this critical role in facilitating change and thus enhancing the organization's capacity for competitiveness.

Organizational Change and Transformation: A Multifaith Perspective

Dorothy A. Marcic
Susanne M. Fest
Peabody College at Vanderbilt University

The literature related to organizational change reflects a paradigm shift in that for the last decade it has increasingly included a focus on spiritual and religious dimensions. Among the reasons are increased anxiety due to high levels of global macro-change, as well as post-modern thinking seeking to integrate dimensions beyond the purely scientific. As the faith dimension gains new legitimacy, we must seek to understand how different religious beliefs potentially imprint on managerial decision-making.

Keywords: Organizational Change, Multi-Faith, Spirituality

During the last decade we have seen a proliferation of references to spirit in the workplace, (Chappell, 1993; Conger, 1994; Hawley, 1993), spiritually grounded leadership (Lee & Zemke, 1993; Covey,1992; Bolman and Deal, 1995; Daft and Lengel, 1998; McCarthy, 1996; Neal, 1997), values based management (Marcic, 1997; Kueng, 1998; Miller, 1996; Toney, 1998) in the literature related to organizational change. In addition, the manufacturing and sales of Christian-based products has grown to a stunning $4 billion in 1998 in the United States alone (Marketplace, NPR, 1998). Independent watchdog organizations such as Transparency International are dedicated to un-covering, containing and eradicating corruption in the civil society as well as the private sector. In 1993 in Chicago, the Parliament of the World Religions proclaimed the principles of a Global Ethic, which provided the guidelines for principles of a global business ethic. (Kueng, 1993, and 1998).

What are the reasons for this recent paradigm shift, for the inclusion of the spiritual and religious dimensions in the way we debate organizational and business change? Several reasons are commonly suggested:

1. We are currently in the midst of high rates of global macro-change. High rates of change tend to destabilize systems. Anxiety rises in response. This anxiety needs to be managed. One way is to seek guidance in what is familiar and authoritative, subsequently; many turn to scripture and faithstories. " It is common for people to wring their hands and wonder: how can scripture help us?" (Doug Knight, personal communication, 1998).
2. The age of modernity, with its focus on reasoned, scientific thinking ushered in the rise of secular humanism and the rejection of anything that could not be quantified or empirically proven. Post-modern thinking not only follows the swinging of the pendulum in the opposite direction, but also attempts a marriage between scientific and mystical, spiritualistic thinking, acknowledging the dialectic process of thesis, antithesis and synthesis. This marriage has gained much legitimacy from the insights of quantum physics. (Capra, 1975). Wheatley, a management consultant, states: "The mechanistic image of the world is a very deep image, planted at subterranean depths in most of us. But it doesn't help us any longer. Our own search for new ways of understanding has led us to philosophers, scientists, poets, novelists, spiritual teachers, colleagues, audiences and each other. We keep exploring what we can see when we look at life and organizations using different images." (Wheatley, 1996, pg. 1)

As the faith dimension gains new legitimacy, it seems apropos to explore how faith could possibly imprint, consciously or unconsciously, on daily decision-making processes of business leaders as they steer their organizations through an ever-changing world. By including the multi-faith perspective, we are acknowledging both the unity and diversity of the market place in this global village.

Conceptual Framework

Change leaders and consultants are sometimes hampered by an insufficient understanding of how deeply held beliefs and values impact individual reactions to the change process. It is impossible to understand the worlds of art history, literature and politics without understanding the impact of religion on these fields, similarly, this is true for the study of organizational change. In multinational companies, Hindus, Buddhists, Christians, Jews or Baha'is may work together, each operating from their respective frame of religious reference. Failure to incorporate this dimension will hamper many communication and problems-solving collaborative efforts. Once we understand the faith dimension and its impact on leadership and decision-making more fully, efforts at organizational change will become more effective. This will not only affect organizational well being, but also our ability to conduct business across cultural and religious borders.

Marcic (1997) has written extensively on the importance of balancing the five dimensions of work in the pursuit of organizational change. The five dimensions are as follows:

Physical

Concerned with physical life issues, such as buildings, equipment, comfort, safety, and adequate pay. Questions to ask are: Does your company operate mostly in the black? Are you in continuous financial crises? *Do you have the resources to pay your employees decently? Are compensation differentials between top and bottom excessively large? Increasing? Is there a high turnover rate for employees? Are the places of work (factories, offices) clean, comfortable, well kept, and adequately furnished? Is the equipment modern, efficient, and safe?

Intellectual

Includes the collective intelligence of employees plus their continuing drive for further development and learning, as well as abilities to effectively use available resources, to plan productively, and to be on the cutting edge. Questions to ask are: Do your engineers, technicians, or others keep up with cutting-edge technology? Do you spend adequate resources to send people for continuing education or to important professional conferences? Is spending on continuing education as a percentage of sales increasing? Are employees able to get reference materials, books, journals, and magazines that will help them learn more about their work and the environment? Do you reward employees who continue to learn? Are people happy to learn (rather than having to be coerced)? Do other organizations respect the knowledge of your employees? Do you respect the knowledge of your employees? Do employees often lack the necessary competence to complete projects adequately and on time? *

Emotional

Involves the interpersonal work environment, how well people get along with each other and how effectively they can be a team. Research shows that effective teams usually need members to be concerned with the process skills of support, listening, positive feedback, and lack of defensiveness, all of which require members with mature emotional development. Questions to ask: Do there seem to be high levels of job satisfaction? Do people enjoy working with each other? Do employees like one another? Are there a disproportionate number of problems with depression, alcoholism, and frequent, even violent, outbursts? *In meetings, do people behave defensively or with power plays? * Are people afraid to bring up in meetings what they really feel? "Is there frequent concern about " not upsetting the boss"? *

Volitional

The desire or will to change for the better. We may know that some other behavior would be healthier but we may lack the will to change it. One psychiatrist wrote that the hardest thing for his patients was not to change but to decide to change. Once the will was there, change was relatively easy. Questions to ask: Is there a willingness to look at new ways of doing things? Do you rarely hear "It won't work" or "That's impossible to do"? Is there a high level of energy on new projects? Do workers put energy into maintaining the status quo? * Are new programs met with many complaints and much resistance? *

Spiritual

Concerned with moral issues, such as justice and respect, and working toward empathy. Understands each member to be a unique human being, a sacred soul, with dignity. Questions to ask: Is there an acceptance and assumption of integrity among coworkers and bosses? Do people trust on another? Do they trust management? Do employees feel exploited or treated unjustly? * Do customers expect and get a quality product? Is cynicism common among employees? * Do people joyfully help one another?

Is there a lot of backbiting? * Are there political fights? Political intrigues? Political posturing? * Is there an openness of communication that depends on a deep level of trust and commitment? Is there a unity of "theory" and "practice" (i.e., do managers practice what they preach)? Can groups discuss problems and handle conflict in a competent and dignified manner? Is there a "spirit" of service to one another, to clients, to suppliers?

Note: * indicates negative scoring
From: Marcic, D. (1997), p. 40-41

The World Religions

The existence of nine to twelve world religions is commonly suggested. Of those, Islam and Christianity make up half of the world's population. Knowledge of Hinduism is essential to understanding modern Asia and the cultural heritage of its people living in Europe and America. The Bahai Faith is a relatively young, but growing religion, which maintains that there is a basic unity of all religions. Due to space and time constraints, we have chosen to highlight three religions, Hinduism, Baha'i Faith, and Christianity, and to examine their possible impact on organizational change. However, further study for the review of all world religions is indicated.

Hinduism

Hinduism is perhaps the oldest, most complex and diverse of all the world religions. It is the source for three other religions: Jainism, Buddhism and Sikhism (which is a combination of religious features of Islam and Hinduism), but has eventually absorbed distinctive features of those religions into mainstream Hindu thought. (Hopfe, 1998) According to Capra (1991), Hinduism is "... a large and complex socio-religious organism consisting of innumerable sects, cults and philosophical systems and involving various rituals, ceremonies and spiritual disciplines, as well as the worship of countless gods and goddesses. " (p.85) The spiritual sources of Hinduism are numerous and complex. consisting of :

1. The four Vedas, the oldest sacred books; the law of Manu, the moral and ethical law which provides the roots for many social and religious traditions which characterize modern Hinduism, including the varna, or caste system.

   For the Brahmanas, (priests) he created teaching, studying, sacrifice, officiating at sacrifice, giving gifts, and accepting gifts.

   For the Kshatriya, (warriors), he created in short the protection of people, giving gifts, performing sacrifices, studying and nonattachment to sense pleasure.

   For the Vaishya, (traders) he created the protection of cattle, charity, performance of sacrifices, studying, trading, lending on interest, and agriculture.

   The Lord created only one profession for the Shudra (manual workers): service without envy of the above three castes. (The Law of Manu, 1:88-91)

2. The Bhagavad Gita, India's most favorite religious text that is essentially and epic poem. The teachings inherent in the Gita are many, but Hopfe (1998) suggests the following as the main ones:
   - to perform the duty of one's caste
   - to be open to a variety of religious expression, such as asceticism, meditation, devotion to and worship of gods, obedience to caste rules
   - to believe that Vishnu is a god who loves human beings: "For whenever the law of righteousness withers away and lawlessness arises, then do I generate myself on earth." (Bhagavad Gita, IV:7)
   -

The goal of Hinduism is liberation from karma, the Sanskrit word from a root, which means "to do or act", and samsara, which means, "to wander across". According to Hindu belief, "one is bound to life in ignorance and pain, living over and over again through countless generations. Release from life comes when there is true knowledge of the illusion of life. 'By knowing God, man is freed form all bonds.'" (Hopfe, 1998, p.90) This is a long and difficult process, which requires much study: " Arise, awake, go to the sages and learn. The wise say that the path is sharp like the edge of a razor, hard to walk on, and difficult to obtain". (Katha-Upanishad, I.14)

Spiritual and mental development is achieved through the practice of yoga meditation, which focuses of freeing the mind from anger, lust, hatred, and greed. According to the Yoga Sutra, there are eight steps, which involve:

- vow of restraint against harming living creatures and unchastity
- attempting to achieve internal control, calmness, and equanimity
- learning and practicing bodily postures
- breath control
- control of the senses by shutting out the outside world
- extreme concentration on a single object
- seeking to achieve meditation
- seeking to achieve trance, becoming one with Brahman. (Hopfe, 1998, p. 105)

The concept of time is seen as moving endlessly through various cycles. At the beginning of a cycle, there is peace, abundance, and morality. Then the world begins to decay, famine, wars and general immorality become the rule. Finally, the world is destroyed. When one cycle of time is completed, the world dissolves and all souls depart into suspended being. After a period of calm, a new cycle begins and the souls are reborn in new bodies (Hopfe, 1998).

Like all religions, Hindus struggle with adjusting to the age of modernity. In the past, " people were taught to accept their lot in life and not complain, in that the next life might be better. If problems became so severe that one could not endure them, there was always the alternative of life as an ascetic." (Hopfe, 1998, p. 115)

Baha'i Faith

All the prophets of god proclaim the same faith.
Bahaullah

In 1863, the son of one of the most distinguished families in Persia revealed to his followers that he was the messiah and assumed the name of Bahaullah—"the Glory of God". His writings form the basis of the Baha'i doctrines and teachings:

- the oneness of the entire human race
- independent search after truth, unfettered by superstition, tradition, or imitation
- basic unity of all religions
- all forms of prejudice, - religious, racial, class, national, are to be condemned. " Religion should unite all hearts and cause wars and disputes to vanish from the face of the earth; it should give birth to spirituality, and bring light and life to every soul. If religion becomes a cause for dislike, hatred and division, it would be better to be without it... Any religion which is not a cause of love and unity is no religion." (J.E. Esslemont, Baha'llah and the New Era, 1976, p.6)
- harmony must exist between religion and science.
- equality between men and women, "Humanity is like a bird with its two wings—the one is male, the other female. Unless both wings are strong and impelled by some common force, the bird cannot fly heavenwards. According to the spirit of this age, women must advance and fulfill their mission in all departments of life, becoming equal to men. (Ibid., p. 154)
- compulsory education as a necessary condition for world peace and stability.
- universal language
- abolition of extremes of wealth and poverty
- a world tribunal for the adjudication of disputes among nations
- everyone should perform some form of work in the spirit of service: "It is enjoined on every one of you to engage in some occupation—some art, trade, or the like. We have made this—your occupation—identical with the worship of God, the true One. (Bahaullah, Glad Tidings.)
- Justice should be glorified as the ruling principle in human society and religion for the protection of all people and nations.

- the establishment of a permanent and universal peace should be the supreme goal of humankind. (Thirteen principles from Public Information Department, National Baha'i Headquarters, 112 Linden Avenue, Wilmette, IL 60091)

According to Baha'i beliefs, heaven and hell are conditions of the soul, which is eternal and in continuous progress. "When the soul is close to God and God's purposes, that is heaven, when the soul is distant from God, that is hell" (Hopfe, 1998, p. 402) " In creation there is no evil; all is good. Certain qualities and natures innate in some men and apparently blameworthy are not so in reality." (Abdul Baha, 1964, p. 250) One of the most important aspects of Baha'i life is that all of life should be lived in the spirit of prayer, this applies to work, thoughts, actions, relationships.

> Be generous in prosperity, and thankful in adversity. Be worthy of trust of thy neighbor and look upon him with a bright and friendly face. Be a treasure to the poor, and admonisher to the rich, an answerer to the cry of the needy, a preserver of the sanctity of the pledge. Be fair in thy judgment, and guarded in thy speech. Be unjust to no man, and show all meekness to all men. Be as a lamp unto them that walk in darkness, a joy to the sorrowful, a sea for the thirsty, a haven for the distressed, an upholder and defender of the victim of oppression. Let integrity and uprightness distinguish all thine acts. Be a home for the stranger, a balm to the suffering, a tower of strength for the fugitive. Be eyes to the blind, and a guiding light unto the feet of the erring. Be an ornament to the countenance of truth, a crown to the brow of fidelity, a pillar of the temple of righteousness, a breath of life to the body of mankind, an ensign of the hosts of justice, a luminary above the horizon of virtue, a dew to the soil of the human heart, an ark on the ocean of knowledge, a sun in the heaven of bounty, a gem on the diadem of wisdom, a shining light in the firmament of thy generation, a fruit upon the tree of humility." (Bahaullah, 1952, p. 96)

Christianity

Jesus said to him, " I am the way, the truth, and the life; no one comes to the Father, but by me."
John, 14:6

With an estimated number of 1.783.660.000, in 1991, one third of the World's population is identified in some way with Christianity, as the largest religion in the world. (Hopfe, 1998). Christianity grew out of Judaism with the event of Jesus of Nazareth and the belief that he was the savior of humankind. Thus, Christianity incorporates both the story of the Jews, as God's chosen people, in the Old Testament, as well as accounts of Jesus' life and teachings by his disciples in the New Testament. Major elements of the Old Testament are comprised in the ten commandments, which constitute the laws which adherents are held to obey:

1. I am the Lord your God, who has brought you out of the land of Egypt, out of the house of bondage. You shall have no other gods before me.
2. You shall not make any graven image.
3. You shall not take the name of the Lord your God in vain.
4. Remember the sabbath day, keep it holy.
5. Honor your father and your mother.
6. You shall not kill.
7. You shall not commit adultery.
8. You shall not steal.
9. You shall not bear false witness against your neighbor.
10. You shall not covet your neighbor's property.

(Summarized by Hopfe, 1998, p. 265.)

It is often suggested that the God of the Old Testament is one of wrath and judgment, who requires strict adherence to the his laws, while the God of the New Testament is one of love, forgiveness and compassion, as exemplified by the Beatitudes from Jesus' Sermon on the Mount:

> Blessed are the poor in spirit, for theirs is the kingdom of heaven. Blessed are those who mourn, for they shall be comforted. Blessed are the meek, for they shall inherit the earth. Blessed are those who hunger and thurst for righteousness, for they shall be satisfied. Blessed are the merciful, for they shall obtain mercy. Blessed are the pure in heart, for they shall see God. Blessed are the peacemakers, for they shall be called sons of God. Blessed are those who are persecuted for righteousness' sake, for theirs is the kingdom of heaven. Blessed are you when men revile you and persecute you and utter all kinds of evil against you falsely on my account. Rejoice and be glad, for your reward is great in heaven, for so men persecuted and the prophets who were before you. (Summarized in Hopfe, 1998, p. 306)

Currently, the numbers of affiliates are declining in Europe, remaining stable in the United States, but are growing in Africa, Asia, and Latin America. The two most popular and controversial issues in modern Christianity are Liberation Theology, which focuses on issues of social and economic justice for the poor and oppressed on the one hand, and fundamentalism on the other hand, which combats all liberalizing trends in American culture. Fundamentalists believe that the Bible needs to be read and understood literally, that it needs to be defended against modern scientific and philosophical thought. (Hopfe, 1998) However, there are some basic issues, which underlie all Christianity:

- Are humans sinful?
- Can they be redeemed and saved through God's love?
- There is only one life on earth, but is there life after death?

Marcic's Five Dimensions of Work and the Three Religions:

Based on the above examination of religious teaching and principles, the following model emerges:

Physical/Material Dimension

1. Hindu = low, asceticism, inevitability of cycle of birth, death, and rebirth, non-attachment to sense pleasures.
2. Baha'i Faith = high, abolition of extremes of wealth and poverty, " *be generous in prosperity*".
3. Christianity = high for liberation theology with focus on alleviating poverty and increasing social justice; low for traditional theologies with focus on sacrifice, redemption and afterlife.

Intellectual Dimension

1. Hindu = low, eastern focus on mystical aspects, "illusion of life", " one is bound to life in ignorance", learning and studying does not focus on acquisition and creation of new knowledge, but on alignment with universal laws and principles.
2. Baha'i Faith = high, independent search after truth, unfettered by superstition, tradition, or intimidation, freedom from prejudice, creation of harmony between religion and science, compulsory education.
3. Christianity = low, Old Testament stresses obedience and loyalty to law, not critical evaluation and innovation and continual improvement. New Testament stresses humility and service to the poor.

Emotional Dimension

4. Hindu = low, not an issue in sacred texts, except for acceptance of suffering as the basic condition of life, goal is to free oneself from emotions and the restraints they create, rather than an exploration and acceptance of emotions as an integral part of life. This involves freeing the mind from anger, lust, hatred and greed.
5. Baha'i Faith = high, focus on harmony and unity between people, religion should unite all hearts, if it becomes a cause for dislike, hatred or division, it would be better without it. Focus on awareness of self and self-improvement.
6. Christian = low, focus on suppression of negative emotions such as greed, lust, and envy which, in their inevitable occurrence, are either punished of forgiven by God. Attempt to transcend self.

Volitional Dimension

1. Hindu = high, disciplined pursuit of meditative practices.
2. Baha'i Faith = high, focus on justice and equality between people, races and gender.
3. Christianity = high, focus on commitment to laws and virtues.

Spiritual Dimension

1. Hindu = high, permeates every aspect of life.
2. Baha'i Faith = high, work is a form of worship.
3. Christianity = medium, spirituality is confined to private, as opposed to the public domain of work, duality of Western culture.

Discussion

The above model is based on selections of sacred texts of the three religions which have been examined, as well as on interviews with adherents to these religions. While the model serves as a conceptual framework for further, more extensive study, it is in itself, at this stage, untested. It is our hope, however, that it will stimulate processes along all five dimensions, which were previously discussed. Along the physical dimension, we hope that managers will begin to consider this often-neglected area by developing an awareness of the reasons for this neglect. Regarding the intellectual dimension, we hope to encourage discourse about the ideas presented. Concerning the emotional dimension, we would like to acknowledge the potential for controversy, but hope that through increased awareness of self and others, understanding and acceptance of differences, connectedness between faith groups and cultures can be fostered. True to the volitional dimension, we hope that this paper catalyzes interest and the willingness to look at old concepts in new ways. And finally, regarding the spiritual dimension, we hope to have presented compelling arguments for the importance of including this dimension in the study of organizational change. Additionally, we wish to point out that we are well aware of the fact that culture and religion are continuously impacting and shaping each other, and that we are in no way attempting to separate the two. Since this paper constitutes work in progress, we are inviting feedback, criticism, suggestions and additions.

A Nine-Month Follow-up Assessment of a Large Scale Interactive Event Designed to Implement Organizational Change in a State Government Organization

Dominic G. Kamau
Gary N. McLean
University of Minnesota

A follow-up study was conducted on a state government organization that had employed a large scale interactive event (LSIE) to implement organizational change after a merger. Much information about the organization was collected during the LSIE. Some changes resulted from the LSIE, but some of the changes had been planned before the event. Feelings about the LSIE were largely negative except for those in leadership positions. HRD professionals may benefit from this study's recommendations for improving how LSIEs are conducted.

Keywords: OD, Change, Systems

Leaders in all kinds of organizations have to deal with change. Change occurs for many reasons, including technology, globalization of the economy, and changes in demographics (Merriam & Caffarella, 1991; Nutt & Backoff, 1994). State services have to deal with the same economic, political, social, and technological forces (Menefee, 1997). Managers often seek help from organization development (OD) consultants for help in implementing and maintaining change. OD consultants are constantly looking for innovations to cope with change and to implement change efficiently and effectively.

Recently, OD consultants have devised new methods of implementing changes that are aimed at shortening the time it takes to effect change by focusing on the entire system rather than on individuals or groups of individuals. As observed by Bunker and Alban (1992b):

> In organization development (OD) practice we have been impressed and excited by what appears to be a new type of social innovation occurring all around us. We are speaking of several different types of work with whole systems that is (sic.) emerging in a variety of forms. (p. 473)

In this study, whole system means the entire organization, including all departments, the relationships that exist between the departments, and the environment in which it operates. The environment includes (but is not limited to) consumers of its services. One way of implementing change is the use of Large Scale Interactive Events (LSIEs). These events are attended by as many as 1,500 people (Sullivan, 1997), all meeting in one place for a two- to three-day period. In such an event, participation is extended to all possible stakeholders--employees, shareholders, customers, and suppliers.

Background of the Study

Working with the whole system in the implementation of change appears to have begun with the work of Emery and Trist in Britain in the late 1950s and early 1960s (Purser, Cabana, Emery, & Emery, 1997). They referred to their work as Search Conferences. The work of Rensis Likert in the 1950's on survey research and feedback is also supportive of the idea of participative organizations (Rothwell, Sullivan, & McLean, 1995). Before then, OD interventions had targeted individuals or departments, resulting in gradual manifestation of change in organizations. Since the 1970s, the use of LSIEs has grown phenomenally (Bunker & Alban, 1992b). This is evidenced by the increasing number of OD consultants making reports of having used various types of LSIEs.

Purposes of the Study

As with all organizations, state government organizations find themselves having to cope with rapid changes. These changes may result from new regulations, dwindling funding, or political crisis. A state government organization in Minnesota held a three-day LSIE to implement organizational changes after a legislative mandate to merge

Copyright © 1999 Douglas G. Kamau and Gary N. McLean

organizations. A case study was conducted by the researchers during and one month after the LSIE (Kamau & McLean, 1998).
This is a follow-up study with the following purposes:

1. To validate the research findings of the first phase of the case study on the use of a Large Scale Interactive Event to institute change in the state government organization.
2. To document the feelings of the research participants approximately nine months after the LSIE.
3. To document the changes since the LSIE was held.
4. To solicit advice about holding LSIEs, from the perspective of a nine-month interlude.

Need for the Study

There has been a great deal of activity in using LSIEs in the public and private sectors (Nutt & Backoff, 1994; Purser et al., 1997; Sullivan, 1997). Bunker and Alban (1992b) alluded to OD practice being atheoretical today and called for interaction between theory and practice. Research should be conducted to address that imbalance where practice is not supported by theory.

An earlier study by the current researchers (Kamau & McLean, 1998) involved observation of the planning process for the LSIE, observation of the LSIE, and interviews with 22 participants one month after the LSIE. It was found that there was free interaction during the LSIE and high expectations of what could be achieved, but there was a slow pace of implementation of the resulting recommendations. It was also found that there was minimal individual and organizational change immediately after the event. Persons had volunteered to participate in the follow-up activities, but there was little action during the first month after the LSIE. There also existed consultant-client incongruencies over the duties and responsibilities of the consultants regarding the follow-up activities.

There is need for this study to confirm or refute the findings of the earlier study and to identify the feelings of the research participants nine months after the LSIE as a next step in a longitudinal study of the effects of an LSIE.

Significance of the Study

Organizations are systems, yet they are built on individuals--individual chief executive officers, individual managers, individual employees, individual shareholders, and so forth. Thus, it is important to study organizational change as a whole, while also exploring the experiences of individuals experiencing change in that organization. Much of the writing on LSIEs is based on reports of what happens during the event. The earlier Kamau and McLean (1998) study reported on the planning for the event, the feelings of participants about the event, and the changes that followed. This study was intended to validate the earlier findings, but, more important, to identify participant reactions and what happens nine months after the event, as part of a broader longitudinal study about the effects of LSIES.

Research Questions

The central question for this research was: Reflecting back nine months, how did the LSIE influence organizational change? The questions in this phase of the research were:

a. Comment on the summary of the findings of the first phase of the research.
b. What are your feelings now concerning the large group interactive event?
c. What changes have occurred in the organization since the LSIE?
d. How do you feel about those changes?
e. If there were another large group interactive event, what advice would you give to the organizers?
f. What final comments would you like to add?

Constraints of the Study

This case study, as with all case studies, involved participants from one organization experiencing the same LSIE. Their experiences could well be very different from experiences in other LSIEs and in other organizations. Thus, this study focuses specifically on this LSIE and this organization, without any intent to generalize more broadly. Further, as in any use of interviews, the interviewer is necessarily imposed into the study, both in influencing the responses and in analyzing transcripts.

Literature Review

There has been a recent influx of LSIEs aimed at working with a whole organization to institute change. Such interventions use various names: Search Conference, Future Search, Multisearch, Future Search Conference, Conference Model, Simu-Real, Open Space Technology, Appreciative Inquiry, Work Out, Fishbowl, Real Time Strategic Change, Large Scale Interactive Events (Brigham, 1996; Klein, 1992; Purser et al., 1997; Sorensen, Gironda, Head, & Larsen, 1996; Weisbord & Janoff, 1995).

Characteristics of LSIEs

The primary strategy utilized by all of these variations is the involvement of large groups meeting in one place for two or three days. LSIEs are based on the principles of small groups (Dannemiller & Jacobs, 1992; Emery, 1992), though the number of people in the groups could be very large, ranging from as few as forty to over two thousand, all meeting in one place for two to three days. There is, however, no agreement about the minimum or maximum number of participants (Dannemiller & Jacobs, 1992; Gilmore & Barnett, 1992; Purser et al., 1997; Sullivan, 1997). Some OD consultants utilizing this strategy suggest a minimum of 100 and others mention 300. There appears to be no claims as to the maximum number of participants, nor any extant research to support a claim of an optimal number.

A second characteristic is that LSIEs target the whole system as opposed to dealing with a single department or a group of persons (Bunker & Alban, 1992b). Thus, each small group in an LSIE is usually made up of persons from different departments and levels. This is referred to as max-mix in the jargon of LSIEs (Sorensen, 1996).

Third, LSIEs are democratic (Emery, 1992; Sorensen et al., 1996). Each person is given an opportunity to air her or his opinions. However, it is unlikely that the short time of the event will allow for a truly democratic atmosphere.

A fourth characteristic is increased commitment to change (Axelrod, 1992). If a person is a party to a decision, she or he is likely to be more committed to that decision.

Another stated characteristic is that LSIEs have greater speeds of implementing change (Axelrod, 1992). As LSIEs involve all parties affected by the change, commitment is achieved quickly, thereby reducing the time to implement changes.

A sixth characteristic is the development of working relationships that go beyond departments. As persons interact, they develop working relationships that would not have been possible without the LSIE (Bunker & Alban, 1992a).

Finally, LSIEs are interactive in nature (Dannemiller & Jacobs, 1992). Interventions are designed to allow interaction among persons of different departments and levels in an organization.

Other characteristics include consensus, collaboration, and shared ownership of decisions.

Concerns about LSIEs

Purser et al. (1997) have expressed their concerns about the number of participants in LSIEs:

> We suspect that these large group events might be useful for enhancing information sharing across boundaries, but we would be hard pressed to believe that the quality, depth of dialogue, and solidity of joint agreements around long-term purposes could be equivalent to a group of 35-40 participants which is the upper limit in a Search Conference. (p. 48)

While the authors are advocating for search conferences, it is easy to be sympathetic with their position. The large numbers of people and the compressed time for deliberations raise concerns for us as well. Might an LSIE turn out to be like a political rally rather than an effective tool for change?

There is a possibility of planning committees to fail to design an event that will serve the needs of the participants and their organization. Emery (1992), commenting on this possibility, wrote:

> All this is predicated on early and thorough planning and design that again involves understanding of the genotypical design principles. Until this under-standing becomes widespread through cooperative work, management committees will continue to design camels instead of race horses. (p. 532)

Emery was referring to management committees that institute fast changes in organizations using LSIEs.

Another concern related to LSIEs is the possibility of the "illusion of participation" dilemma (DeVogel, Sullivan, McLean, & Rothwell, 1995). An illusion of participation may be created when decisions are not actually made at the event but at another venue by different persons. It is possible that participants will not chart any change but may be used to "rubber stamp" decisions reached by a handful of individuals (say, top management). Bunker and Alban (1992a), for example, observed:

> The large group event is primarily an interactive planning event. When it comes time to make decisions, those with responsibility in the organization must take their decision-making roles again even if that simply means blessing what has already been done. (p. 585)

However, the decision-maker may decline to implement decisions reached in an LSIE.

It is evident from the literature reviewed that there are many OD consultants who employ various types of large scale interactive events in their intervention work. As long as practicing OD consultants continue to develop different intervention strategies, researchers will have to study the interventions (LSIE in this case) to add theory to improve practice. Knowledge about LSIEs will enrich OD theory and practice. Research about LSIEs is needed to confirm their benefits or allay the concerns raised about them.

Research Methodology

This case study is evaluation research utilizing phenomenology. Van Manen (1990) stated that "phenomenology must describe what is given to us in immediate experience without being obstructed by pre-conceptions and theoretical notions" (p. 184). This research was designed to collect accounts of persons who participated in an LSIE. Streb (1984) identified three stages in phenomenological study: making judgments, asserting the judgments made, and thinking about empirical categories. The researchers have described in detail the experiences and reflections of the participants, leadership of the state government organization, and the OD consultants involved in the LSIE (Kamau & McLean, 1998).

Research Design

The research was a case study of one state government organization headquartered in St. Paul, Minnesota. The research involved interviewing 21 of the 22 participants in the earlier study. The other research participant who would have been interviewed had left the organization. These interviews captured the participants' perceptions of and feelings about the event approximately nine months after the LSIE. While an interview guide was developed, the interviews were largely unstructured, with the participants being allowed to make uninterrupted responses.

Instrumentation and Validation

The study was designed from an interpretive perspective. Its validity is built on agreement between the researchers and the participants on the themes emerging from the discussions.

Analysis

Tape-recorded interviews were transcribed and hard copies made. A thematic analysis was made from the interviews and observations of the LSIE. The frequency with which a theme was repeated by the research participants gave the importance attached to the theme by the research participants. The eloquence of how the theme was put by the research participants was also important. Dominant themes were identified, summarized, fed back to participants, and then revised, as needed.

Comments about Earlier Research Findings

The research participants were given a copy of the results of the first study. Then researchers read a summary of the findings to the research participants. Their reactions were recorded as a validation of the earlier research study findings.

Findings

The results of the analyses of the transcripts follow.

Earlier Research Findings

All research participants agreed that the findings in the first study presented a true picture of the situation as it was one month after the event. One research participant said, "You hit it right on the nose." Another research participant said, "I think, in general, I would be inclined to agree with those statements." One participant pointed out that there was a max-mix table during the event that had six occupants, and occasionally it had fewer than six members during the LSIE. Another point concerned the hiring of an officer specifically to deal with the follow-up activities. It was nearly two months before the person could take office. Other than these concerns of omission, the research findings were validated by the research participants.

Changes Since the LSIE

There were some changes nine months after the LSIE. One research participant cautioned that the color of the sky is still blue and not purple even though changes have occurred. The changes that have occurred were the wearing of name tags, a receptionist at the entrance, establishment of intranet pages, "open days" for sections of the state agency (so people in other sections can visit and see what is done there), and a commitment to move into a healthier building before the end of the year. One research participant stated:

> There have been some groups working, and they have actually made some advances to the various needs we expressed down there. I look at some of the small things that have happened as very beneficial. There are not many of those but some.

Another said:

> Well, I have seen some changes. One of the things that comes to my mind is that each section had to have an open house. We had an open house. It was a very good turnout. So I have seen that part of it. Let's see here; name tags, we've got our name tags. They're really trying to implement, but it is a slow process.

Receptionist

In order for the agency to serve its customers better, it was suggested during the LSIE that there should be a receptionist to give directions to customers. This had been implemented by the time of the second round of interviews. One research participant thought that the changes that have occurred, including the receptionist, have been cosmetic.

Name Tags

In order for the agency to serve the customer better, it had been decided that name tags be worn. These have been made. Some employees display them on their chests. Others do not wear them (reasons for not wearing were not sought by the researchers). The introduction of name tags was as a result of the LSIE. The staff in the field office that the researchers visited did not have name tags. The name tags were also referred to as cosmetic by the same respondent quoted above. This is what he said:

> I do not think they made an effort to respond to the things that came out of the meeting. Like I mentioned before, the name tags, things of that nature which are cosmetic on the surface...

Intranet Pages

Before the LSIE, information about the agency was available on the internet. It continues to be available there. However, there is information that needs to be available within the agency only because of the security of the information. Because of the need to inform more people, and at the same time maintain security, the technology department responded with the development of intranet. Different intranet pages (available only to those in the agency) have been developed. The development of intranet was as a result of the information collected during the LSIE.

Commitment to Move

The current facilities for the agency have been condemned as an unhealthy environment. There is now commitment (lease agreement signed) to move into another, healthier building. Some research participants looked forward to moving to the new address. Others expressed concern about increased commute time, the customers that they serve, and office space--cubicles instead of solid walls. One participant said:

> We will be moving from what used to have offices to cubicle type arrangements. I have a feeling that there is going to be a lot of adjustment from a personal level in terms of noise level and proximity with other people. (but added) There are those who say that it might lead to a more open communication and better interaction.

The organization would have moved to a new location with or without the LSIE. However, some research participants think that the LSIE accelerated the movement.

Feelings about the LSIE

Feelings about the large scale interactive event were varied with participants expressing both positive and negative feelings as depicted by one research participant who stated:

> I have mixed feelings. I guess first of all my negative feelings are there was a lot of time that was taken away from the workplace; therefore, it should have produced more than it has. The positive side of it was it was the chance to communicate with co-workers in a different location, and find out different working environments and what they are like.

The participants acknowledged that some changes had occurred as a result of the LSIE but added that some changes would have come anyway. Moving to a new address is one of the most significant changes. It was intimated that it would have happened with or without the LSIE. However, some changes were as a result of the deliberations at the LSIE.

The research participants reported that there was a notable absence of visibility of some key persons in the organization. They believed that more would have been achieved if more of the executive team were more visible along with the one person responsible for planning and implementing the organizational change. They also said that the management layer may have been less committed to the changes. It is this management layer that would not be affected by political changes. Therefore, had these people been spearheading the organizational changes, then more would have been done. This is not to say that changes have not occurred, but they have not been extensive.

Advice about the LSIE

The research participants thought that the LSIE was best suited for delivery of information. It was least suited for strategic planning. The most repeated concern was the length of time it took--three days. Most research participants were concerned that three days were too long for their customers to go without service. One of the agency's field offices had hired temporary staff to offer basic services during the LSIE. One day was suggested for any other LSIEs in the future. One research participant would rather there be no LSIE, and, if there must be, then "let it be for a half a day." Another research participant stated:

> Just don't make it three days in a row. Because three days to absorb all that is being given to you, taught to you, shared with you, was just a lot! So maybe not three days back to back.

Internal Follow-up Survey

The client organization surveyed 187 persons and published its results approximately eight months after the LSIE on matters related to the LSIE and the follow-up activities. On a statement, "Multiple-day agency wide meetings are useful," 31% of the respondents strongly agreed or just agreed compared to 55% who disagreed or strongly disagreed. Strongly disagreed was selected by 29% compared with 5% who strongly agreed. The remaining 14% gave either invalid responses or "don't know" (source excluded as it would reveal the identity of the client organization). One research participant summarized the situation at the client organization like this:

> I am working with people who volunteered. They are pretty optimistic that things can change. But, outside that group, the majority of what I hear has been negative. Things like the event was a waste of time, and why do we do these things?

Conclusions, Implications, and Recommendations

Nine months after the LSIE, the research participants still remembered the event. The LSIE had resulted in an acceleration of some changes. It can be said that the information gathered during the event led to a better understanding of internal and external customers.

The time spent (three days) on the LSIE was considered to be too long, and the research participants would have preferred a shorter period. LSIEs should focus more on gathering and delivering information rather than formulating strategic plans.

A power base that will endure over time in an organization should be identified and targeted for implementation of organizational change. In this case, the management team should have been involved more in the planning and the execution of the LSIE. The management team was considered more permanent than the "genuine, but transient" executive team.

Most of the changes that occurred in this organization would have occurred with or without the LSIE. The changes that occurred as a direct result of the LSIE were considered "cosmetic" by some research participants.

From this study it was found that the value of holding an LSIE lies in the information that is collected. The participants are able to give information more freely in an LSIE. It is important to analyze and use that information properly. It is also possible to use LSIEs to deliver information (such as policy matters) to a wider audience in a participative manner.

OD consultants planning on using LSIEs should spend more time on the implementation phase following the LSIE rather than assuming that change will be achieved during the event. Information collected during an LSIE can be overwhelming to the client organization and help is needed to analyze the information and arrange it in a meaningful and useful form. When internal OD does not exist, an external OD consultant should plan on spending more time to help with follow-up activities. Planning for follow-up activities is as important as the planning for the LSIE itself. OD consultants should anticipate the problems organizations may encounter and coach the leaders accordingly.

Much more research is needed, using a wide variety of LSIEs in a range of organizational types. Another possibility is to research organizations long after the LSIE to document the impact of LSIEs on the operations of an organization. The ongoing research into this organization will provide one set of longitudinal results.

What is it Like to be an Independent HRD Consultant?

Alexander Ardishvili
University of Minnesota

This phenomenological study investigated the experience of being an independent HRD consultant. In-depth interviews were conducted with ten successful HRD consultants. Eight themes emerged and are presented here: freedom, flexibility, and control over one's destiny, time, and income; enjoying one's work; learning and exploring a variety of new things; responsibility; embracing the tenuous nature of things and coping with uncertainty; marketing, partnering, and referrals; working long hours; and focus.

Keywords: Independent Consultant, Contracting, Human Resource Development

Recent trends in the U.S. business environment--re-engineering, outsourcing, elimination of multiple layers within business organizations--all lead to an increasing role for independent consultants and contract employees. Morrow (1993) wrote in his Time Magazine article: "America has entered the age of the contingent or temporary worker, of the consultant and subcontractor, of the just-in-time work force—fluid, flexible, and disposable" (p. 40). According to Pink (quoted in Carlson, 1997), the U.S. is entering a stage of a "Free Agent Nation," with 14 million self-employed, 8.3 million independent contractors, and 2.3 million employed by temporary agencies (p. E3).

The reasons for this change have been analyzed by Rifkin (1996) and Bridges (1994). Building on Zuboff's (1988) groundbreaking analysis of the current automation revolution and the way it changed the employment landscape, they argue that, among other things, the emergence of personal computers and communications technology improved personal productivity of knowledge workers, eliminated the time and space barriers, and made independent practice a reality for millions of people. There are also several other reasons for the increased use of independent contractors. A firm that is facing a turbulent, constantly changing environment (and today most sectors of the U.S. economy fall under this category) may derive substantial benefits from using contract workforce. First, this may reduce employment costs: external workers can be hired without increasing the cost of health insurance and benefits (Casey, 1989). Second, this reduces certain administrative costs, because independent contractors are responsible for planning and managing their own work (Belous, 1989). Third, contract workers can be hired without an expectation of long-term employment and can be let go without tarnishing the firm's image (Belous, 1989). Fourth, use of contractors can offer a firm a way to access highly specialized skills on an as needed basis for only a short period of time (Davis-Blake and Uzzi, 1993). Belous (1989) reported that using independent contractors allowed firms in a number of industries to offer a wide range of products without a large and risky investment in expensive permanent labor.

As for the use of HRD contractors, in recent years HRD has become one of the most outsourced of corporate functions. A 1997 overview of corporate HRD trends (Bassi, Cheney, & Van Buren, 1997) called outsourcing HRD the "growth industry of the nineties" (p. 52). The authors indicated that, though outsourcing all training is rare (3% of firms surveyed by the Manufacturing Alliance in 1996), most companies (83%) were outsourcing at least some training (p. 53). Oberle (1989) pointed out that some organizations have been using contract trainers for years. Consulting firms like Kepner-Tregoe, for example, have employed them to deliver their programs since the early 1960s. However, in the 1980s this trend became much more visible: a survey by the Administrative Management Society revealed that 90% of respondents used temporary employees during the previous year (Oberle, 1989, p. 57). Oberle (1989) indicated that one place where temporary workers can be especially helpful is in training departments in firms where training needs can rise and fall quickly. Contract trainers are beneficial to companies because firms save money by avoiding paying for full-time workers in slow times.

The above overview suggests that many HRD practitioners are likely to face the transition from the role of corporate training professional to that of outside consultant. Hence, there is a need for better understanding of this phenomenon. However, most of books and articles on the topic of independent consulting either provide practical advice to consultants (Cook, 1996;. Cohen, 1990; Shenson, 1990), or describe competencies of HRD consultants (Eisen, Steele, & Cherbeneau, 1995; French & Bell, 1990). In my literature review, only a handful of sources described independent consulting as a way of being, explored the existential aspects of this phenomenon (Bellman, 1990; Block, 1993; Harrison, 1995). And of these, only one was based on a research study as opposed to the author's own experiences (Bianco-Mathis & Veazey, 1996).

Copyright © Alexander Ardishvili 1999

To close this gap, and to provide a broader understanding of the existential aspects of the independent HRD consulting phenomenon, the following research question was placed at the center of the present study: What is it like to be an independent HRD consultant?

Research Methodology

This study was based on *hermeneutic phenomenological research methodology*. A research methodology should derive from the question to be investigated. In the 1980s and the early 1990s, the debate between the proponents of the positivistic and interpretive paradigms in vocational education research demonstrated that there is more than one way in which to conceptualize and conduct educational research (Hultgren, 1989). Among other things, an outcome of the above theoretical discussion was the research community's acceptance of the notion that, when a study involves gaining an understanding of human experiences, one of the interpretive research methodologies would be more appropriate than a positivistic methodology. In essence, the differences between the interpretive paradigm and its counterpart, the positivistic paradigm, boil down to differences in their ontological assumptions. The ontological position of the interpretive paradigm can be characterized by the centrality of the idea of reflective, meaning-based interpretations of the world which human beings inhabit. This meaning-making activity is central to any conscious human activity because there is no "pristine, unmediated grasp of the world as it is" (Eisner, 1991, p. 46). The interpretive paradigm postulates that we do not have direct access to a singular and fully knowable external reality. All of our understandings, instead, are contextually embedded and interpersonally created. Thus, we are constantly trying to make sense of phenomena and strive to construct the reality from varied and ever-changing interpretations (Weick, 1993). There are two major ontological implications of the above characteristics of the interpretive paradigm. First, reality is plural, not singular. Since each individual is constructing his or her own meaning of reality, this subjective construction process will result in personalized, individual realities. The second implication of the interpretive ontology relates to the concept of the person's existence. In positivistic ontology, there is a one-way, direct relationship: the reality shapes the individual. In the interpretive paradigm, reality is actively shaped by the individual.

Hermeneutic phenomenology is both descriptive and interpretive (because any facts of lived experience are always already meaningfully experienced) (van Manen, 1996). In hermeneutic phenomenology the understanding of the lifeworld of a person emerges from the interpretation of texts and/or conversations with the person whose lifeworld is studied (Clifford, 1988). As a practical method of gathering narratives, I used conversational interviewing (van Manen, 1990) in which the researcher is a conversation partner with insiders, persons with lived experience of the phenomenon being studied. This method requires inductive work, creating a picture out of the analysis of the narratives rather than setting out to prove hypotheses.

Participants

I interviewed ten volunteers from my pool of contacts through the University of Minnesota's HRD department and through my job. The participants' ages ranged from 36 to 50 years. The interviewees had varying lengths of consulting experience, from veterans with more then 10 years in HRD consulting to those who had started within the last two years. The consultants represented various areas of HRD: organization development (OD), training design and development, standup training, and evaluation research. All participants were at the time of the interviews independent contractors: working on their own (as opposed to being a part of a larger consulting organization), and doing consulting as their major job (as opposed to providing consulting services in addition to some other full-time job).

The Researcher

Knowledge of the researcher background helps the readers of an interpretive study understand better the interpretations made. I have about 17 years of HRD and management education and research experience, including several years of managing needs assessment projects, job task analysis, program design, and training development. My experience as an independent consultant includes contract development of computer-based training programs, management consulting to emerging companies, and subcontracting with an expatriate management training firm. In my research, I assume that jobs and their characteristics are social constructs created by the interpretations of individual participants in the work processes, who actively create the reality they inhabit and share a common frame of reference (Gioia & Poole, 1986). Therefore, in order to understand what kind of work relationships will be created by people, we need to understand how they experience their surroundings and daily lives in terms of time, space, their own being, and their relationships with other people and the surrounding environment.

Interviews

Individual interviews (ranging from 60 to 90 minutes in length) were conducted with each participant. All ten interviews were tape recorded. There was an interview guide which I utilized during the first round of interviews. The guide included four questions. First, there was a general question about the participant's background: How did you become an independent consultant? If asked to elaborate, I added that I was looking for information on their previous work experience, and the events that lead them to become what they are now. The second question was formulated as follows: What do you do? Describe your actions during a typical project, a selected moment in your practice, or a memorable event that happened to you. My third question was: What does being an independent consultant mean to you? Question four was open-ended: Do you have any other observations to make that would help me understand what it is like to be an independent consultant? What advice would you provide to a person who is contemplating an independent consulting career?

Text Analysis

The tape recordings of the conversations were transcribed verbatim. The data were analyzed by focusing on themes that emerged throughout the conversation. Essential themes, according to van Manen (1990), are "aspects or essential qualities that make a phenomenon what it is and without which the phenomenon cannot be what it is" (p. 107). The interview texts were analyzed utilizing the selective or highlighting method proposed by van Manen (1990): "In the selective reading approach we listen to or read a text several times and ask, What statement(s) or phrase(s) seem particularly essential or revealing about the phenomenon or experience being described? These statements we then circle, underline, or highlight." (p. 93) Next, I developed a "mind map" for each of the interviews (Buzan, 1991). Major themes that emerged from the analysis were color coded both on the interview transcripts and on the "mind maps." Further, I created a composite "mind map" for the whole group and a master list of themes. Finally, I began writing about the themes. During this process I was constantly referring to "mind maps" and transcripts. In the process of writing, changes were introduced into the themes several times, due to re-conceptualizing and combining. The preliminary results of the analysis were validated by sharing a summary of emerging themes and metaphors with the interview participants and soliciting their comments during the follow-up phone calls or meetings.

Themes

My analysis produced eight themes: freedom, flexibility, and control over one's destiny, time and income; enjoying one's work; learning and exploring a variety of new things; responsibility; embracing the tenuous nature of things and coping with uncertainty; the relation between marketing, partnering, and referrals; focus; working long hours.

Freedom, Flexibility, and Control over One's Destiny, Time, and Income

The common thread for this theme was consultants' greater ability (compared to corporate employees) to utilize their talents, expertise, and time available in achieving their life goals. These goals are different for everybody (and they change as a person progresses through the life stages): it might be personal, spiritual, or professional growth, ability to provide an adequate lifestyle for their family, or enough parental attention for their children. It seems that independence from a corporate structure provides significant advantages in achieving the above goals. These advantages come at a cost, however: life is less predictable, and income levels might fluctuate significantly. Therefore, a realistic assessment of one's goals and means is necessary. Control over one's destiny was important to all of the participants, but for a variety of reasons. In addition to the opportunity for self-actualization that this control brings with it, there are two other important aspects: flexibility with time and income. For some, flexibility with time results in higher income potential, allowing consultants to be more productive: "I am more valuable thinking in the morning than in the afternoon: I can have twice as much done if I work in the morning. So I developed a schedule allocating mornings for certain kinds of work, and afternoons for meetings, because my clock tends to work that way."

Enjoying One's Work

This theme could be found virtually in all of the interviews. One of the participants said about stand-up training:

> "I do it naturally; once I am into it, I feel in complete control; I can go for 10 hours, and I don't realize how the 10 hours have gone by. I wish I had fifteen hours. I enjoy it tremendously, and I am good at it."

Ideally, anybody should enjoy their work, both the self-employed and corporate employees. However, it seems that, for independent contractors, enjoying their work is even more important:

> ...when you are self-employed, you have to be in the realm of doing something your heart is into; otherwise, this is not going to work. If you are a plumber, but you hate plumbing, you are better off being employed by somebody than you are being on your own. You have to find some way to express that art, whether that will be going back to school, practicing art on the side, and so forth. Following your calling and finding work that is more fulfilling to you, you always have to be enjoying what you are doing. Otherwise, it's not worth it on the other end. All this hassle.

Learning and Exploring a Variety of New Things

Continuous learning and exploring new things is important for two reasons: in this constantly changing business environment, it is necessary to keep one's skills up-to-date; and learning seems to have an intrinsic value for most of the consultants interviewed by me, constituting an important part of the personal growth journey. Further, independent consulting, as opposed to highly specialized and compartmentalized corporate jobs, provides an opportunity for becoming a more rounded individual. This is achieved not only through structured learning, but through on-the-job acquisition of new skills, trying out new approaches and methods. My conversation partners pointed out that the nature of projects they work on is different from the corporate environment in one additional, important aspect; it has more variety. Working at a corporation, we see, most often, only parts of the complete picture. Independent consultants, on the other hand, are most often hired to deliver a complete, finished product, for example, to prepare and conduct a complete training program. As one of the participants put it: "I am enjoying it so much, mostly because it is so varied. I am doing design and project management. I develop a concept, script, the look of the project, where we need graphics, videos, write video scripts. I work with instructional designers and manage the project." She also associated the ability to do a variety of things with being a more rounded individual: "From the career perspective, what I like about it is that I am much more rounded, if you will." Further, participants pointed out that independent consulting work brings freedom to work on those aspects of one's profession that have been out of reach at a corporation. At a business company, given today's specialization and compartmentalization, it is hard to find a job that would allow someone enough flexibility to try their skills in all the different aspects of their profession. As one of the participants said: "I wanted to expand my horizon; my last employer focused on multimedia, but I wanted to do a variety of training projects. I actually wanted to do needs assessment and other aspects of training development."

Responsibility

Since a consultant is working mostly alone, she is ultimately responsible for the success of the project and for her own success as a professional. There is also a more direct, more visible link between her day-to-day actions and her income, health, and ability to retire comfortably. This responsibility can be a heavy burden, especially because one realizes that there is nobody else there to blame for mistakes. One of the participants put it this way:

> Nothing is set for you, nothing is pre-determined: your retirement package, your insurance, how much money you are going to make, how much time you are going to take off this year, what your rate is, what you have to do, what your assignment is. You have to get your assignment; you have to stir the pot to get it. If you want to change what you do, you have to change it yourself; you cannot go to someone else and say, "Hey, I want to change this, I don't want to do this job anymore, I want to do that job." Everything becomes your own responsibility: get your own cards, send your own invoices, call your own debts in.

Another interviewee stressed an additional aspect of the responsibility issue: "You have to be able to accept responsibility--there is nobody else there to take the blame." And one more excerpt: "... at a job you might be able

to share responsibility with somebody. Here you are alone. I could hire somebody to help me out, but I am a perfectionist, so it does not always work. And you have to do a lot yourself—even making copies, for example."

Embracing the Tenuous Nature of Things and Coping with Uncertainty

A realization that they have to face uncertainty and they have to face it alone comes to independent contractors early on:

> The downside is that you never really know what the future is going to hold. My luck has been holding out, but I often wonder if I went to a bank and applied for a loan, and they looked at my calendar, that after three or four months it would look like I am unemployed...it's not an overwhelming stress by any means, but it's always there. You are always conscious of the fact that you need to make sure that you are booked. It would be nice not to worry about that.

The first recipe for coping with uncertainty is to fully accept it as a part of being self-employed and stop worrying about it:

> You also have to deal with the possibility that this all can come tumbling down one day. You can lose your clients, and you can be badly underemployed. It's been helpful to me to embrace, very actively embrace, the very tenuous nature of everything that happens, of the temporary employment. If all of a sudden I walk into my client, and they tell me: "On Monday you are fired." I will say: "OK, I am fired. What's next? We will figure out something else."

The second recipe is to develop a contingency plan for the periods when the business is slow: this will not only allow consultants to be better prepared for unexpected downturns but, more importantly, will provide them with greater piece of mind and ability to concentrate during the busy periods. One of my conversation partners offered the following advice:

> If you are going to be self-employed, have a back-up plan. Say, "if I will not be able to find any work, let's say within three months, I am going to..." – fill in the blank. Paint houses, get temporary work, do something, because if you go some time without having worked, you can find yourself being emotionally affected by this. So you need to figure out how you are going to handle those down periods.

Marketing, Partnering, and Referrals

It was clear from the texts that, at the initial stages of the independent consulting career, marketing was one of the major concerns for all participants. Many indicated that they were concerned with this issue long before they went off on their own. Will I be good at marketing? How much cold calling will I have to make? How can I prepare myself to be a better marketer? These are the questions most of my conversation partners have been asking themselves. If marketing is understood narrowly as selling and using direct selling techniques (mailing, "cold" calls, etc.), then marketing skills are not an absolute necessity for an independent consultant. However, as my interviewees pointed out, marketing should be understood in a much broader sense; as developing a strategy for promoting oneself and exploring a variety of ways for reaching the target population. Using this broader definition of marketing, consultants have multiple tools for achieving their marketing goals: partnering with other providers of similar services; networking with peers and exchange of referrals with them; networking with former employers and customers; partnering with providers of complementary services (accounting, computer support, printing, etc.).

Partnering with peers and providers of complementary services is important for two reasons: as a source of referrals, and as a substitute for corporate support structures. Reciprocal exchange of services, advice, and moral support that this partnering generates plays an important role for an independent consultant who might, otherwise, feel isolated and resource-deficient. As one of the participants has put it:

> Most of the people in my position—single operators, small operators-- you get a few contacts, and then those contacts lead to other contacts. Not a lot of cold calling is going on, sending out brochures, and this kind of thing. Networking seems to be a much more powerful method than cold calling. And networking not only with clients, but with other providers in your position.

For most of my conversation partners, networking with other consultants was as important as maintaining a network of former and prospective customers. Networking with peers can be an important source of work:

> There seems to be enough diversity in business that people refer each other—"not me, but, maybe, her." And once you get this referral, being able to back it up by sending good materials. It is always very impressive when people can shoot out materials right after the initial phone conversation. "Here is a little bit about me, here is a newsletter." And this goes back to what we talked about earlier, having a target in mind.

Working Long Hours

Having flexibility with one's time does not mean having more free time. In fact, most participants stressed that they work longer hours than they used to work at their corporate jobs. The reason seems to be the necessity to do additional, mostly administrative, tasks, which, at corporations, are centralized and taken care of by support staff:

> "These things in a way can be sometimes perceived as negatives; when I can work, if I am busy doing everything but working. Copies made: I have a copy machine at home, but it's very slow' so if I need to have a 100 copies made, I go to Kinko's."

One of the interviewees stressed that he works longer hours but still believes that it is better than at a corporate job: "In the long run I probably end up working more that way, I work more hours, but it seems like I am working much less, because it's all flexible." Still another interviewee talked about two separate times a consultant needs: long chunks of uninterrupted time to work on projects, and additional time during the day or, possibly, night, to take care of the administrative and support functions:

> I put in an average of six hours every day where I work steadily. And then I do other things: I do the translations, I do the preparation of the development materials. I worked until 3:15 a.m. last night, but that was a rare one. I usually work until one o'clock at night every night. And it doesn't end. I do dinner with my wife, and we go for a walk, and then I go back to work.

Focus

The issue of focus versus diversity in one's job was discussed by many of my conversation partners. The consensus seems to be that you need to focus on certain aspects of your profession, on certain areas. Focus is important for a variety of reasons. First, customers prefer to deal with somebody who is an expert in something. And this something needs to be easily recognizable and tangible. Here is an excellent explanation of this:

> In the marketplace you will be hired to do a "thing." And so you have to define what a 'thing' is. And in the area of training and development design is a "thing," writing is a "thing," research is a "thing," stand-up instruction is a "thing." These are finite, discrete areas where somebody may say, we need somebody to write this, we need somebody to teach this, we need somebody to evaluate this. Management is not a "thing"—people are not going to hire you to manage anything, people skills is not a "thing"—it's nice to have, but nobody will hire you for just being a people's person, and so you have to recognize a half a dozen things that you are going to be hired for.

Another interviewee believes that, besides the credentials issue, focus is important for one additional reason: professional growth. She said:

> Be focused on what you do. I, for example, focus on training and development, and specifically on multimedia. Don't try to be all things to all people; you will spread yourself too thin. Also, focusing is important for your professional development. I try to do this yearly—learn new skills. I don't know how you can do that if you don't have focus. Think why you are doing it, and what your expertise is, what your focus is going to be.

Implications for Practitioners

The goal of an interpretive study is not to make generalizable conclusions. The implications in this section are observations based on specific experiences of a group of people. Experiences of another group of consultants may be different. Therefore, my goal is not to provide an advice on how to solve similar problems in any other settings. Rather, I attempt to draw the readers' attention to the existence of certain issues, and urge them to ask their own questions within their concrete situations.

The study findings should be of interest to both the independent HRD consultants and the corporate HRD executives and managers who utilize contract employees on various projects. *Independent HRD consultants* might find it beneficial to review their own lives and work, trying to identify some dominant or guiding themes. Comparing these themes to those identified in this study could provide them with important insights and food for thought. Also, it could be beneficial to talk to their colleagues, to discuss these themes at informal meetings of consultants' interest groups, to gain collective insights into the specificity of their practice and lives.

Given the widespread use of independent consultants by HRD departments of many U.S. corporations, the ability to manage these contractual relationships becomes an important skill for any *HRD executive*. And this ability depends, in large part, on an executive's understanding of contractors' motivations, lifestyles, and modes of operation. For example, do these consultants follow a focus strategy, or are they equally good at several things? Do they have strong self-discipline? Do they prefer to work from home, or will they want to work at the client's location? Answers to these questions should provide an employer with information to assist in deciding whether there is a good match between a consultant's style and the organization's preferences. To obtain the above information, an employer could conduct interviews with prospective consulting service providers asking open-ended questions to solicit descriptions of past projects. These descriptions are much more informative in this case than evaluative statements.

Future Research Directions

The following future research directions can be suggested based on the study findings: studying consultants' networks; contrasting characteristics of an "organization person" with those of an independent contractor; and exploring the continuous learning aspect of consultants' lives.

Consultants' Networks

From the study interviews it became clear that partnering, networking, and referrals have a central importance for independent consultants, facilitating achieving the project goals and also providing a viable substitute for marketing and selling. This whole area deserves further examination. Among some questions to ask about this phenomenon are: What are the foundations and mechanism of partnering? Which partnering/networking arrangements work the best? Theoretical foundations for the proposed investigation can be found in the network analysis and theories of social exchange (Bradach & Eccles, 1989; Jarillo, 1986). Network analysis considers both the structure and the process of relationships that join individuals, groups, and organizations. The network model assumes that actors are not atomistic but exist within complex systems of other actors. It also assumes that economic institutions are socially constructed and influenced by the history and structures of personal relations and networks of such relations (Ben-Porath, 1980). The network perspective research focuses on describing networks of relationships in terms of their size (number of participants), density (a network where everybody knows each other has a high density), and distance (the number of persons a focal person has to contact to reach a specific person in a network). The same principles that are applied to the study of firm networks could be utilized in studying consultants' networks. Partnering and informal exchange arrangements described in this study can be viewed as networks, and their density, distance, and size can be analyzed. Further, the level of trust in informal exchanges of information and resources could be determined.

Contrasting the Characteristics of an Organization Person and Those of a Consultant. My study suggested that such characteristics of their lives and work as freedom and flexibility; control over one's destiny, time and income; and enjoying one's work are important for this group of independent consultants. However, it is not clear whether these preferences are unique to this group and whether they differentiate independent consultants from corporate employees. White (1956) analyzed characteristics of an "organization person," contrasting them with qualities of an independent artisan of the earlier years, and discussed a number of themes that, in his opinion, were descriptive of an "organization person's" life. Among these themes are: a quest for belonginness; a need for

security; striving for "good life" offered by corporate jobs; an ability to do something worthwhile. Knowledge of differences between the organization people and the independents may provide corporate executives and managers with a better ability to manage these groups, especially in situations when representatives of both groups work on the same projects. A whole set of questions could be asked about the difference between the "organization person" and an independent consultant. If it is true that the "organization person" strives for belonging and security, can it be that for those who opt for an independent life these attributes are not important? Further, if for both groups it is important to have an opportunity to do something worthwhile, than how do they define "worthwhile"? How different are these definitions for the two groups? Finally, if independent contractors leave their corporate jobs because of the conflict between their individual growth goals and the demands of the formal organization, can we identify specific characteristics of those who are more apt to abandon the formal structures? Can we learn more about the processes that lead to this decision, and about the amount of time this transition takes?

Lifelong Learning. Commitment to continuous learning was identified as an important theme both in my study and in the reviewed literature. Vaill (1991) pointed out that in today's rapidly changing environment lifelong learning should become a way of being for any professional. In a corporate environment, education and training are often part of a company's human resource development strategy. Therefore, many corporate learners participate in structured and managed continuous learning experiences. This is very different for independent consultants. They have to develop their own learning strategies, choose subjects to study, select learning methods, and determine how much time and money they should allocate to their education and development. An independent consultant matches the definition of self-directed learner proposed by Vaill (1991): a self-directed learner is a person "...having substantial control over the purposes, content, form, and pace of learning" (p. 59). To assist independent consultants in developing and implementing their self-directed learning strategies, we would need to learn more about their preferred learning styles, readiness for self-directed learning, and perceived value of the learning investment compared to other possible uses of their time.

Virtual Learning Communities: Creating Meaning through Dialogue and Inquiry in Cyberspace

Judy Milton
University of Georgia

Mike Davis
University of Manchester, U.K.

Karen E. Watkins
University of Georgia

This paper provides a qualitative analysis of the interactions that occurred within small groups in an asynchronous, web-based distance learning environment. Within the context of a graduate HRD course, students used action science tools of dialogue and inquiry to explore work-related issues. The findings suggest elements, presented as a model for further research, that contributed to or hindered the development of these groups as learning communities.

Keywords: Action Science, Learning Communities, Web-based Learning

Generative learning is a necessary component of the learning organization (Senge, 1990) and a vital part of the knowledge building process. The challenge is to develop organizations that are able to incorporate this process into their systems, creating the capacity for people to develop and add value to the organization. With knowledge becoming the basis of our economy (Stewart, 1997), effort toward developing intellectual capital as a tangible asset is being recognized in organizations that are adapting to the new realities. Collaborative work and learning environments are necessary to support generative learning.

Learning communities are learning environments premised on people sharing a set of common issues or problems and having the desire to learn ways to address them. Differing from the traditional ways in which teaching and training are often delivered, learning communities focus on the collaborative efforts of participants to build knowledge and develop skills through practice and to reflect on the knowledge they have constructed. Within both academic and corporate organizations, HRD professionals are working to adapt their methods to support communities of learners.

Technology is becoming an integral part of the collaborative work and learning effort in organizations, often creating virtual groups functioning across time and distance. Collaborative technologies (Roschelle, 1996), such as groupware, provide a dynamic process to support people in sharing experience through dialogue, inquiry, and "mutual knowledge" creation for the construction of "shared resolutions" to ill-defined problems (Schön, 1983). This type of technology helps to translate virtual groups into virtual learning communities, offering both a means and a solution for sharing experiences, building and capturing group knowledge, and improving performance in a distance environment.

The purpose of this research has been to explore the core dimensions that describe learning communities in a virtual environment and identify the important elements that contribute to or hinder the development of them. This paper offers a model of virtual learning communities developed after examining the interactions of the participants for evidence of team learning and collaborative knowing, exploring the group dynamics exhibited in the virtual environment, and identifying the meaningful factors evident in these processes.

Framework of the Study

In the fall of 1998, the predominately experiential graduate level course, "Cross Cultural Perspectives on Reflective Technologies in Work-based Learning", was taught jointly by The University of Georgia and the University of Manchester. The purpose of the course was to create a working laboratory using T-group experiences and action science case work to explore interpersonal competence, to facilitate group learning, and to begin to conceptualize how individuals and organizations can be changed by confronting and transforming defensive routines.

The course was designed with one week of intensive face-to-face (F2F) sessions, held in Manchester in October, followed by seven weeks of small group case work on the World Wide Web. Participants built on the

Copyright © 1999 Judy Milton, Mike Davis, Karen Watkins

T-group experiences of the first half of the week with work in small groups on their own cases of problematic work -related interactions during the second part of the week. This F2F experience formed the basis of the distance component. The course involved students and professors from different cultures who had varying degrees of knowledge about the course content and methods of delivery, as well as diverse personal work experience. Some of the participants at the University of Georgia did know each other from previous classes, but for most this course served as the introduction to each other as well as the course content. There were 15 students from the two universities: 8 women and 2 men from the United States, 1 man from Jamaica, 1 woman from Malaysia, 1 woman from Holland, 1 man from Libya, and 1man from Botswana participating in the course. The UK lecturer and his British female research assistant were participants in the on-line casework. The action science casework was facilitated by one female and one male professor from the United States. Participants were assigned to small groups for the action science case work following the T-group sessions in Manchester, with an effort to achieve diversity based on gender, and nationality, confidence and skill. The three groups were formed.

Presenting action science cases in the second part of the face-to-face component provided preparation for the work that would be the focus of the distance portion of the course. Working as small groups on the web, the learners used the action science tools of inquiry and dialogue to address issues in their own individual case studies. Each group member presented his or her own action science case for discussion for a one-week period. A group mapping session and a week of final discussion concluded the course for a total of 7 weeks of on-line work. Participants worked both asynchronously and synchronously on the web during this time. At the mid-point and end of the course there were synchronous meetings of the entire class on the web.

Theoretical Framework

Virtual learning communities offer a new way to integrate work and learning. They strive to provide active learning opportunities linked to real-world experiences in which the learning can be defined as the activity through which new collective knowledge is built by its members for itself as a system (Kasl, Marsick, & Dechant, 1997). The conceptual framework of this paper is based on these three related areas of research: action science theory (Argyris, Putnam, & Smith, 1985; Brooks & Watkins, 1994); situated learning (Brown, Collins, & Duguid, 1989); and, the dynamics of team learning (Kasl et al.).

Action Science

Action Science was both the substance and the methodology of the CMC component of this course. As the technology practiced during the course, action science has been described as the science of interpersonal action, and is *"centrally concerned with the practice of intervention"* (Argyris, Putnam & Smith, 1985, p. 35) into frequently mismatched espoused theories and theories-in-use.

Development of skill in action science is to develop reflective capacity, not only reflection-on-action, but also reflection on reflection-in-action. This can be achieved by making theories of action explicit, through the presentation and inquiry into case studies. As such, action science is located in the real world of the students' experience. What is of greatest value is access to and participation in knowledge situated in practice, and the basic unit of support is the small group that serves as a valuable resource in learning.

Situated Learning

Theories of social constructivism and situated knowledge (Brown & Duguid, 1991) offer that learning in the workplace is motivated primarily by everyday dilemmas and needs experienced in work activities and that people receive the greatest value from access to and participation in knowledgeable practice. This engages participants more actively in their learning while concurrently developing social skills of negotiation and consensus building. People are viewed as members of a common discourse community that work together to solve common problems through the collective understanding of all (Hamilton, 1994), and that knowledge building is an essentially social process (Ernest, 1995).

Situated learning is one way of reconceptualizing education (Brown et al., 1989; Lave & Wenger, 1991) to view learning as situated in communities of practice, and that becoming a member of a community entails learning the skills and culture of that community. Lave and Wenger suggest that practice is the most "fruitful" way of learning. This view is important to the general recognition that mutual assistance is a valuable method of user support, and fits well the concept of learning communities that seek to provide mutual support for learning experiences.

Knowledge is thought of as the ability to participate meaningfully; learning is seen as the process of becoming a member of the working community of practice; and tools are reconceptualized as resources that facilitate integration and interaction within the group (Jordan, 1996, p. 22).

Team Learning

Moving beyond the focus on team orientation to tasks and social behaviors, Kasl et al. (1997) provide a description of the dynamic team learning processes defined as an interaction of thinking-acting. These processes operate on a continuum of individual - group interaction, and as the focus moves from framing learning in the individual's perspectives to a synthesis of all the members' views, the learning changes from learning by the individual to collective learning and mutual creation of knowledge by the team. The synergistic mode of learning, characterized by the team's ability to frame issues and challenge deeply held assumptions, describes the type of skills valued in organizations to help people deal with change and ambiguity in their environment.

Research Questions:

This paper describes a qualitative case study with a focus on identifying the important elements that contribute to or hinder the development of the virtual learning communities. Three research questions were addressed in this study:

(1) What types of learning and meaning-making were found within the virtual groups?
(2) What types of group interactions were evident within the virtual groups?
(3) What were the essential characteristics that appeared to promote or impede the development of learning communities?.

Research Methodology:

The primary data for this research were the verbatim on-line transcripts of the web conversations of the three small groups formed for the action science casework. The use of Facilitate.com web-conferencing software enabled the authors to "observe" group behavior and analyze the participants' "talk" to understand actions and meaning created in the virtual context of the web. The on-line work of this course provided approximately 250 pages of transcripts for analysis. Additional data from participant and facilitator observations, reflection papers, and course evaluations served as supporting documentation.

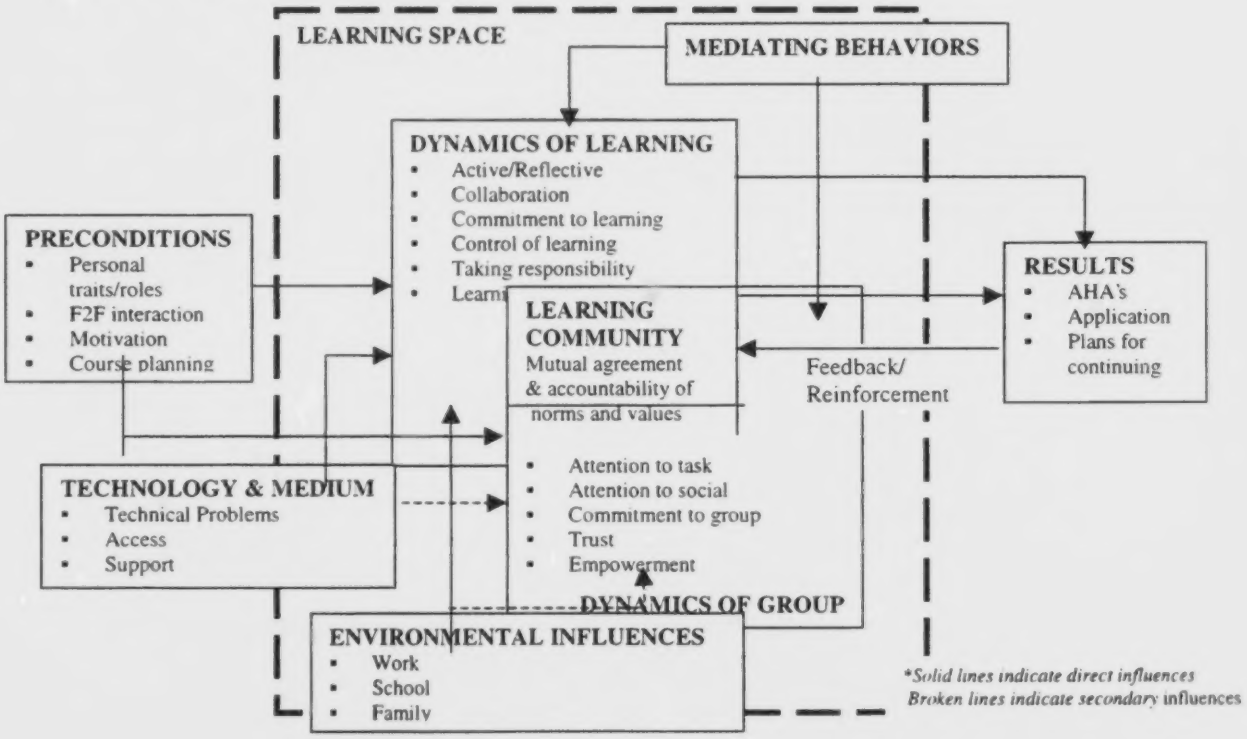
To understand the "what" of virtual learning communities, each group was analyzed as a case study, (Merriam, 1998; Yin, 1994) to focus on the "bounded" context of the small groups' on-line casework. The verbatim transcript of each group's on-line work on the web was analyzed from a constructivist perspective using conversation analysis in the constant comparative method (Corbin & Strauss, 1990) to develop categories related to the learning and group processes in the on-line environment. The text was viewed as "pieces" of conversation that built on one another to form patterns of communication and learning. The use of conversational analysis sought to provide a sociological approach for understanding the social organization and function of the groups. This methodology focused on the social aspects and natural data as a means of asking "what their order looks like and how it is put together by those who, in fact, produce it" (Button & Lee, 1987, p.3). The axial coding indicated categories were peer-reviewed for establishing trustworthiness of the analysis. In a cross-case analysis (Yin, 1981), categories were selectively coded as the elements that this research has tentatively described as core components of virtual learning communities.

The sample for this study was each of the three on-line groups. To establish their unique identities before leaving Manchester, the groups were named Arches, Doors, and Windows. The last two are based on the rooms they used during the T-groups, and Arches signifies an architectural feature used as a logo by both universities. Each group was asked to maintain the confidentiality of their own group on-line and to respect that of the others. There were general topic areas within the web conference that were available to all participants, including one for general discussion of the action science process, one with contact information for all participants, and one for an on-line conversation with Dr. Robert Putnam, a former student of Chris Argyris and an expert on action science. The two on-line sessions for the entire class and the work of the facilitators provided the common links among groups.

Findings and Discussion

Findings indicated that the virtual groups were most effective as learning communities when they acted from *mutually* established norms and values (either implicit or explicit) that governed both the learning and group behavior processes. Three contributing factors that influenced these processes from outside the distance learning environment were identified as pre-conditions, environmental influences, and results. Two factors integral to the learning environment were identified as learning dynamics and group dynamics. Technology and mediating behaviors/strategies were two factors that directly affected the dynamics of both group and learning processes, but in ways that could either support or hinder the processes of a group. These are presented in a model (see Figure 1) that shows the contributing, core, and mediating factors that existed in these virtual communities.

Figure 1. Model of a Learning Community



Types of Learning and Meaning-making

Findings revealed that collaborative learning and knowledge building (See Table 1) did occur within all of the groups on some level. The skills of dialogue and inquiry supported efforts in making connections within individual cases and across the work of the group, particularly when synthesizing work on a theory-in-use (TIU). This sometimes was as simple as asking for consideration of an overlooked idea, to pulling together the assorted thoughts of all of the group's members for a TIU, to making connections and recognizing patterns in previous pieces of information that become the foundation for new approaches to the issue. The more powerful instances of group learning, however, occurred when a group's efforts helped uncover and make new meanings of the work not only for the case writer but for the whole group, as in this example:

.... J wrote: I feel these two case studies and the interventions have been and are leading me to take a closer look at my internal conversations and with practice increase my effectiveness [sic] within groups. I have

experienced some tough moments but that is good. I'm ok. I have been really surprised at how much this has affected me emotionally. Some nuts are hard to crack. I'm still laughing at M's quote, "Are the voices in my head bothering you?" What a line! I feel like as a group you have done an incredible job of using the scant data I provided to making inquiries, attributions to get at some of these issues of mine. (I [k]now where some of the selfdoubt comes from. Thanks again for your thoughtfulness [sic].)

.... M followed with: I'm shutting down on this case and just wanted to thank J for working so hard this week, and I want to thank all of my fellow case workers for teaching me yet again how rich a case is when you look at it with a discerning action scientist's mind.

And another exchange:

..... M wrote: I tried to develop a Level II inquiry in studying my case this week. A Level II inquiry (I'm making this up as I go along--with a margarita by my side) is more open, more directed at uncovering feelings of the otner. . . . What I'm espousing is that Level I inquiries should follow any attribution or advocacy. Level II inquiries need to happen early in the transaction so you know what constitutes win-win. Without the Level II inquiry, you only have enough data to go for win-. This sounds incredibly preachy, please remember that I'm talking to myself out loud in a room of onlookers. (Are the voices in my head)

.... J responded: Some day someone is going to say, "Yes I wish you could keep it down in there." Actually, what's happening lately is my head is trusting my mouth more. I like what is happening though. . . . My sense is my interactions are becoming more Model 2 . . . what I sense in me is openness, authenticity and hopefully movement toward learning instead of just quick, efficient wrap-up.

In addition to the collaborative learning efforts that were so much a part of the group interaction, there was also evidence of other types of group learning: the learning with each other and from each other when particular skills or strengths of one member were recognized; and peer tutoring and coaching that went on within groups, especially with learning about the tools and processes of action science. The learning was experiential as people tried new techniques and new tools with the support of the other group members. It appeared that the greater the commitment of the group to the process and the greater the level of trust in the group, the more willing individuals were to learn in these ways.

The personal learning of participants was often based on off-line reflection on the work that was occurring on-line. Time for reflection is one of the benefits of virtual learning environments and particularly applicable for this type of content. Participants often mentioned "going to sleep on it so that I can take some time to reflect" and "I also notice in rereading the transcript that I attend to input and suggestions better in the reflective mode of reviewing the transcript. Part of this may be caused by my lowered defensiveness now that I've accepted conclusions they were leading to." Time for reflection was also perceived as a downside to the casework when one person said. "I've never done this much reflection on one issue in my life! Give me Manchester anyday [sic]. We were done in what. 2 hours?"

Types of Group Processes

Each group engaged in their own set of behaviors and established a unique identity that was largely the result of the group dynamics (See Table 1). Commitment to the group and to the learning seemed to be salient features of the high performing groups and made many of the group dynamics transparent. The two issues that seemed to be critical but that detracted from the performance of the groups were agreement of an acceptable level of participation and engagement with the group and the "silence" of members who were not openly committed to the process.

One group raised the question about levels of participation but never agreed on a group norm:

.... M wrote: I have to be more upfront about my concern, which is mainly about the level of activity here in this group. I am frustrated at the low level and a general lack of emotional engagement and commitment. I am misreading this? Do those of you who are here on a regular basis share my concern? It *is* a difficult medium, but it is made more difficult by silences.

.... R responded: M, I too feel that perhaps we aren't as active as we could be. But I am OK with it.

The issue of silence by a group member was related in this posting:

.... V wrote: Thank you H for giving an honest reaction to the things that we've said here and that we perhaps 'lived through' during the case weeks. I appreciate that very much. Of course your 'silence'

> reminded me also very much of T-group. And again, like in T-group, my reaction is that yes, you do have the right to be silent and I (we?) do not wish to push you, to oblige you to participate more in the dialogue. But (and I must have said this somewhere before, perhaps in the last days of M's case), although you might be learning loads, we cannot enjoy your input (and this is even stronger in cyber than f2f, because here we cannot even see that you're following the case in the first place). I honestly found your questions and comments, when they were there, often insightful. With the consequence that if you were not there, I missed these insights.

For those who were engaged in the process, it was addictive, "This gets addictive, I can't wait to get back to the PC and see[n] what's going on in the case!" and empowering, "For me to be able to do this is very empowering, that is one of the reasons why I am finding this addictive. It is interaction at quite another level from any other I have." The more open and effective a group was able to deal with conflict, the more constructively it was able to delve into the sensitive areas of an individual's learning. Trust was an essential component of the group dynamics.

Groups also had fun. The more engaged they were in the process, the more they seemed to be able to relax and enjoy the hours they spent communicating via the Web. This frame of mind is illustrated by these comments: "want to meet in chat room??? - M ..... I love this stuff!! See you there. - A" and "K, we might be on at the same time. I'm going to go over to the chat room. Come over and visit with me while I have my morning coffee. - M" And they expressed their like for each other with a great big cyberspace hug: (((X))).

Table 1. Direct Factors in the Development of a Learning Community

Group Dynamics	**Learning Dynamics**
• Attention to task management	• Mutual agreement & accountability of successful learning experience (participation & goals)
• Attention to social needs	• Active/reflective learning processes
• Mutual agreement & accountability on group norms and values	• Collaboration
• Engagement with group members	• Knowledge building / making meaning
• Commitment to others (being there)	• Feedback
• Expressed care about people	• Inquiry with data
• Awareness of group needs	• Engagement with content
• Role development	• Sincerity-honest questions & answers
• Creating presence/recognizing absence	• Responding to others
• Cross-cultural influences	• Use of metaphors
• Developing own language	• Use of language of content
• Personal sharing	• Control of learning
• Celebration	• Meta-inquiry
• Closure	• Sense of purpose
• Fun	• Peer tutoring/coaching
	• Using each other's strengths

Essential Characteristics That Promote or Hinder Development of Virtual Learning Communities

The essential characteristic that defined a learning community appeared to be the fusion of the learning and group dynamics of group into a core set of shared values and norms agreed to and accepted by the group. Within the learning space, groups could address the learning processes necessary to complete the work for the course. They could also address group process issues as they chose. However, a learning community was evident only when the processes from each of these areas were combined into the fabric that defined the group. An exchange between two members of one group illustrate the power of being a learning community:

> ... K wrote: We are on a train, whether we go through green fields, deserts, mountains or cardboard cities we are always moving. Whether the learning is obvious or obtuse, hard or easy we have kept learning and none of us has got off the train.
>
> ... J responded: I very much like the visual of the train because of its connectedness and also because it moves a[t] varying speeds. I am also thinking of a mode of travel with no tracks or a destination - kind of like the Enterprise. I feel like I've been beamed up on several occasions plus there have been experiences during our cases I've stood back and asked "what planet am I on?" I have also felt that I was in slow motion and at warp

speed. If what they say in science that matter is never destroyed, my hope for myself is that my matter is reconfiguring in a learning way each time I experience opportunities for change.

Mediating Behaviors and Strategies

A number of behaviors or strategies (See Table 2) were identified that were able either to support or to impede the development of the learning community, depending on their use by the group or individual. Used productively and sensitively in one group, a behavior such as conflict served as a way to open up a dialogue that led to new realizations for the writer. In another group, the same behavior served effectively to stop a line of inquiry that closed learning for the case writer and disengaged members of the group from the process.

All of the behaviors existed along a continuum of use from very negative to very positive. Groups and individuals made decisions about their use, as they tried them out and practiced with them in the first few weeks of the on-line work. The lack of the face-2-face responses offered the greatest challenges to participants as they looked for new ways to judge the effectiveness of behaviors in their virtual learning environment.

Table 2. Mediating Factors in the Development of a Virtual Learning Community

Mediating Behaviors/Strategies	**Technology & Medium**
• Conflict	• Technical problems
• Safety	• Access
• Empowerment	• Experience
• Emotions	• Technical support
• Humor	• Technical Facilitation
• Intimacy	
• Empathy/acknowledgement of feelings	
• Trust	
• Being explicit	
• Listening	
• Openness	
• Defensiveness	
• Expressing / recognizing fears	
• Excitement / fun / enjoyment	
• Authenticity	

The Technology

While the research questions did not directly address the technology, the fact that this study was focused on findings about the elements of a virtual learning community, the use and effect of the technology were embedded throughout the work of the groups and the study. The effect of technology (See Table 2) was seen in two primary ways: first, the problems that arose from the software or network itself that presented technical glitches for the participants; and second the psychological issues it raised for participants about communicating in cyberspace without the benefit of eye contact and body.

Similar to the other mediating factors, the technology was seen either as a means to support the learning or to hinder it. The difference appeared to be the level of commitment to the other components of the learning and group processes. For some, technical problems were sometimes an irritation but the technology itself became transparent to the user over time. For others, the reported dislike of the technology became an excuse for low participation levels.

One participant summed up her reactions to the technology this way:

.... The on-line experience has become another reality for me. At first I felt awkward with the technology and responding. After the first few attempts the thoughts and writing became less stressful. Now I find I just say it. I feel our group has strong commitment. My feelings from the responses, inquiry and support is that we care about each other both in terms of learning but more importantly in terms of humanity. Having the initial f2f relationship has made it easier to for me to do the electronic. I visualize your faces and expressions; that's a comfort to me. I've trusted myself to trust you. I also feel very territorial and protective of our group.

Contributing Factors to a Virtual Learning Community

The virtual learning space does not exist in a void, but is just one part of the participants' world. Preconditions (See Table 3) were identified as those intangible things, or "baggage", that a participant brought to the experience of the virtual community. Environmental influences were those things that had to be attended to outside of the learning community and that at times impinged on the virtual community. Results were those things that participants took away from this experience and that also provided feedback into the community.

Table 3. Contributing Factors in the Development of a Virtual Learning Community

Preconditions	**Environmental Influences**	**Results**
• Personal traits	• Work	• AHA's!
• F2F experience with group	• School	• Use in practice
• power roles outside of group	• Home	• Practice of learning
• Confidence in ability to contribute (self-esteem)	• Family	• Plans for future learning
		• Recognition of learning
• Motivation to participate		• Self-observable changes in behavior

Implications

Training has become much more than just designing and delivering courses. It is also about facilitating participation in and supporting learning communities. ". . . there is a big difference between organizing classroom training that is supposed to be the totality of the learning event, and seeing it as part of the practice of learning communities who are in charge of their own learning" (Wenger, 1997, p. 25). Using collaborative web-based technology, HRD professionals have the opportunity to redesign learning experiences and extend their support to virtual learning communities that include diverse and distributed participants, fostering the ability of individuals, groups, and organizations to learn and "reconstruct existing perspectives" in new ways (Nonaka &Takeuchi, 1995, p. 46).

An effort to understand how groups form a learning community and the processes by which learning occurs within groups across space and time builds on the research that focuses on participation and learning in a collaborative environment. The findings of this study have begun to define the "what" of virtual learning communities, indicating the integrative nature of the learning and group dynamics that takes place within them. It has also begun to elaborate the skills participants may find useful for collaborating through technology with distant and diverse people. This has implications for practitioners and learners in organizations that are using technology to communicate and build knowledge through collaborative efforts.

We wish to acknowledge Mr. Michael Hughes, a doctoral student in Instructional Technology at the University of Georgia for his thinking and input in the development of the structure of the model presented in this paper.

Conducting Multilingual Qualitative Research in Human Resource Development: Implications for Validity and Reliability

Maria Cseh
Oakland University

This paper addresses the question: "How can you ensure the validity and reliability of a qualitative study conducted in more than one language?" The decisions confronted by the author in a study conducted in three languages and the implications for validity and reliability in cross-cultural research are discussed.

Keywords: Multilingual Qualitative Research; Validity and Reliability

The recent challenges faced by the author of this paper while working on a research study conducted in three languages made her aware of the lack of guidance not only in the human resource development literature, but also in the cross-cultural research literature regarding multilingual qualitative research. The researcher's awareness of the implications of collecting data in different languages which has to be translated in English for analysis and report on the validity and reliability of a study led to this paper. This paper addresses the question of how to ensure the validity and reliability of a qualitative study conducted in more than one language.

The Study

The purpose of the study which led to this paper was to find out how owner-managers of small private companies in Romania learn what they need to know to run their businesses successfully in the transition to a free market economy forced by the collapse of the centrally planned economy and of the dictatorial, communist regime. In order to achieve this purpose, a qualitative methodology using the critical incident technique was selected and in-depth, face-to-face interviews with owner-managers of successful (on the top list of companies compiled by the Chamber of Commerce at county and country level) small (2-99 employees) Romanian companies were conducted. The managers were selected to represent both genders and the nationalities (Hungarian and Romanian) specific to the two regions of the country represented in the study. The researcher was aware that the best way in which these managers would describe their experiences would be in their mother tongue and she decided to pursue this approach. Another consideration in making this decision was that it would have become a gargantuan task to find a sample of owner-managers fitting the sample selection criteria and fluent in English. As the researcher is a native Romanian of Hungarian nationality, speaking both languages at mother tongue level, she felt confident about her decision. As the study was conceptualized and had to be reported in English, the real challenges arose after the data was gathered and transcribed verbatim by the researcher and the time came for its translation. The researcher is multilingual. In the last fifteen years, she used English extensively in her work by translating, interpreting, and tutoring from English to Romanian and Hungarian, and vice-versa. The translation of the transcribed material, in order to ensure the rigor of the study, proved to be a study by itself. In the following sections, the steps taken by the researcher to ensure the validity and reliability of her translation will be described.

Preparation for the Study and Data Gathering

As a preparation for this study, the researcher conducted a pilot telephone interview in Romanian. She transcribed verbatim the recorded interview and then translated it into English. A back translation was performed for parts of the data by a Romanian citizen residing in the United States who had previous experience in translating. The back translated parts were very similar with the original. Some of the differences were in the choice of words with similar meanings and slight differences in syntax. This process reassured the researcher that the meaning of the data was kept intact after the translation.

All face-to-face interviews were tape recorded and fieldnotes and memos were written by the researcher in English immediately after the interviews. Fieldnotes are defined by Bogdan and Biklen (1992) as "the written

Copyright © 1999 Maria Cseh

account of what the researcher hears, sees, experiences, and thinks in the course of collecting and reflecting on the data in a qualitative study" (p. 107). According to the authors, fieldnotes consist of a descriptive and a reflective part. The descriptive part represents the researcher's best effort to objectively record the details of what occurred in the field (e.g. description of the setting, depiction of activities, portraits of the participants). The reflective part represents the subjective side of the researcher (e.g. reflections on ethical dilemmas and conflicts, on the researcher's own feelings, reactions to the experience). Patton (1990) advises researchers not to trust anything to future recall and thus to take fieldnotes in the setting or as soon as possible after the event occurred. In order to be able to concentrate on the interview process, the researcher took fieldnotes immediately after each interview. During the data gathering, analysis and interpretation phases of the study, the researcher also wrote memos about the issues pertinent to each of these phases. Thus, taking fieldnotes and memos during a qualitative study where the researcher is considered the instrument is very important. It is a way to acknowledge and control the researcher's effect. In this instance, it is an important way to document the context of the interview to later guide translation efforts.

Translation of the Data

Linguists were preoccupied since centuries with the notion of accuracy in translations. The translation literature is abundant in approaches and debates about different approaches to translation ranging from transformation of a text including creation and manipulation to a faithful adherence to the original text. As Berman (1992) described:

> The domain of translation has always been the site of a curious contradiction. On the one hand, translation is considered to be purely intuitive practice - in part technical, in part literary - which, at bottom does not require any specific theory or form of reflection. On the other hand, there has been - at least since Cicero, Horace, and Saint Jerome - an abundance of writings on translation of a religious, philosophical, literary, methodological or, more recently scientific nature. (p. 1)

As these debates proved useful in raising the researcher's awareness of the difficulties involved in making decisions about how to translate a text, they failed to offer the guidance necessary for conducting her multilingual qualitative study. The words of Wilhelm von Humboldt as cited by Berman (1992) resonated in her mind in the midst of her study. On July 23, 1796, Wilhelm von Humboldt wrote the following in his Letter to Schlegel:

> Any translator must inevitably encounter one of the following obstacles: he will cleave with too much accuracy either to the original, at the expense of his people's language and taste, or to the originality of his people, at the expense of the work to be translated. (ix)

The translation task in qualitative research is significantly time-consuming. As a result, the researcher translated nine interviews; three other translators translated the other six. One of the translators is a Romanian linguist who a few years ago moved to Canada and has over twenty years of experience in translating to and from English and Romanian. The other two translators are fluent in Romanian, Hungarian, and English, have lived in both Romania and the United States, and have experience in translating. Although it is impossible to achieve a word-for-word translation, both the researcher and the three translators made an attempt to keep the rendering as consistent as possible and still convey the meaning of the original message. The interviewed managers were very eloquent in describing their learning experiences, but this translation for meaning rather than word-for-word gave even more coherence of the translated sentences and phrases. In order to arrive to this decision, the researcher spent countless hours reading the translation literature and talking to translators.

During the translation process, the researcher was aware of the selfhood paradox described by Will (1993) in the following way: "In going out to a foreign text, to translate it into our language, we carry our personal tastes, language-style, perceptions with us, and what we bring back is essentially our own self-expression in words partially prompted by someone else's expression" (p. 47). Thus, she made an attempt to control some of these translation biases by having parts of her translations also translated by two of the above mentioned translators and then comparing the two translations. An side-by-side example of two translations is presented in Table 1. The shading and parenthetical notes in the table illustrate how some of the judgment calls were made in this process. As in the case of the pilot there were a few differences in the choice of words with similar meanings and a few differences in syntax.

Table 1.
Evidence of the Translation Process

Translation 1	**Translation 2**
R: And what is your opinion why is this happening? P: Well, this is the cancer of the Romanian society - instability - you don t know what tomorrow will bring, you have no idea. Eh, you don t know what will happen tomorrow, I will die, my business will be taken away, another government will come that will do things differently, it will not allow, etc. **["Eh" and the repetition of what will happen tomorrow were kept because of the emphasis put by the manager on this part of the sentence]** People are afraid. There is no such thing as security, stability as it is in developed countries where tomorrow will be like today or a little bit worse or a little bit better, but there is a stable environment. If I open a business I do it thinking that my son will have a chance to take over and hopefully his son will also be there, but here, here it is not possible. Tomorrow they will take it, a new owner will come, or an old one or somebody, they will take it; so why should I put work into it, why should I restore it, because of this instability, how should I enter into a one year contract? **[The manager used the first person "I", but it can be interpreted as an issue/question pertaining to owner-managers in general]** They are somewhat right as this is generated by the society s instability. R: And what is your opinion why are the state owned stores not entering into a contract? Let s say that the private ones, as you told me, lack tomorrow s security, but the state owned ones receive their salaries anyway. Did you try with the state owned ones? P: Of course, but the state owned stores show no interest, no interest to make profit, why should they make profit? If the salary of the employees is ensured and the good salary for the director and the chief accountant and there are stores which have four, five, six directors and I don t know how many chief accountants, if their salaries are made there is no incentive whatsoever to make more. For example, in many cases my only chance to succeed, you can imagine what an unbearable situation, was to bribe the director in order for him to take my products - products which brought him a huge sale last year ensuring the salaries of I don t know how many employees. But he told me Sir, I m sorry but I cannot take any now from this, ok, how much do you have holding his pocket **[waiting for the bribe]**. So, this is the situation, a disaster. I m telling you this is the Romanian society. I m not sure maybe if the competition would have been stronger, but anyway in a western country we	R: What is your opinion? Why don t they enter into a contract? **[The translator clarifies the context of the comment - the contract]** P: This is the Romanian society s cancer - instability - you have no idea what will happen tomorrow. I can die, and my business will be taken away, another government will be in power and have different regulations, and will not allow, etc. People are afraid. We don t have the stability that the developed countries have, that what we have today we will have it also tomorrow, that today this is for sure and tomorrow it will be the same or a little bit worse or a little bit better, but at least it is stability. If I open a business, I open it thinking that my son will continue to do it, and after that his son will continue it, but this is not possible. Tomorrow it can be confiscated, a new owner will come, or an old one, who knows? Why to invest in it, to renovate the business, because of this instability, why should I enter into a one year contract? They are right when they say that this is generated by the society s instability. R: What is your opinion, why the state owned companies will not enter into a contract? I understand that the private companies have no stability for tomorrow, but the state owned ones, as you said, get payed anyway. Did you try with the state owned companies? P: I sure did try **[more colloquial, but we decide on "of course" as it conveyed the same meaning]**, but they will not show interest, they are not interested in profit making, why would they be? They make the salaries for their employees, the big salaries for the director, the chief accountant, and there are stores with four, five, or six directors, so they make those salaries, and above that they are not interested. For example, in many places I succeeded by bribing the director to make him buy our merchandise, what an embarrassing situation for me, merchandise which last year he sold with a big profit and he made the salaries for I don t know how many people. He told me Sir, I m sorry but I cannot buy anything from you right now, so how much do you have , and he was showing his pocket. So, this is the situation, a catastrophic one. This is the Romanian society. I don t know, maybe if the competition would have been stronger, or in a western society I would not be in this situation. After so much work I put into this business I shouldn t be in this situation. Maybe there the competition would have destroyed me, but still I should not be in this situation.

won_t be in this situation. Thus, after so much work I should not be in this situation, I should not be here. Maybe there the competition would have destroyed me, but even then I think I should not be in this stage. R: So, if you think back of all this, what do you feel? P: Helplessness, anger. You feel that your head is blowing up, but you cannot do anything. You explain, at the end you beg Please, Sir, my products are so good that even in the west you cannot find better ones_ - you can, but if you import them you have to pay three times as much than for mine and mine are as good as those. [**The underlined part was an explanation to the researcher not to the state-owned store managers which was not clear from the context, but the researcher could even recall the intonations of the manager's voice**] but for whatever reason he doesn t want them. R: In summary, what did you learn from this situation? P: Well, from this situation, compromising.	R: When you think back to this situation, what do you feel? P: Helplessness, anger. I feel that my brain is blowing up, but there is nothing I can do about it. [**Although the underlined expression was almost translated word-for-word, "your head is blowing up" was decided upon as it was felt that it is closer to what would be used in the United States and although it was used in a more general way with "you" not "I"**] You explain and even beg that Sir my merchandise is good, even better than what the westerners make - and you explain that if you import the same merchandise from a western country it will cost three times more then if you buy it from me, but for whatever reason he doesn t want it. R: What did you learn from this situation? P: From this situation I learned to compromise. [

The translation of idioms prompted some interesting discussions as there were times when it was difficult to find a matching English idiom for the Hungarian or Romanian one and the selection of words to convey the same meaning was discussed. For example, the Hungarian idiom "helyre pofozni" (where "helyre" means "back to his/her/it place and "pofozni" means "slap in the face") was difficult to translate as its meaning could be making something right after you made a mistake, bringing something/somebody back to shape, fixing something, bringing something up to date or a combination of some of these. In the context of the translation, the decision was made on "fixing something." The researcher started a dictionary of Hungarian - English (e.g. ravasz mint a roka = as sly as a fox), Romanian - English (e.g. e∏ti la cheremul lor = you are at their mercy) idioms. There were some grammatical issues in the translations which also needed to be discussed. For example, in Hungarian language, the personal pronoun for the third person singular or plural cannot be distinguished by gender, thus the gender of the person could be deducted only from the context which did not always contain this information. In such cases the decision was made to translate it as he/she. Although there were only minor differences in the translations, the researcher discussed all of them with the translators and changes were agreed upon when necessary. The six translations which were not translated by the researcher were all side-by-side double checked by the researcher with their originals in Hungarian or Romanian. The researcher marked with a red pen the few places where she thought the meaning of the translation was not clear and discussed these notes with the translators. A few minor changes were made as a result of this process. For example one of the translators wrote: "And at a certain moment I found myself with the possibilities behind the necessities." Although this translation was the closest to what was said one collective word which could have clarified this sentence was not translated. Thus, we decided on: "And at a certain moment I found myself with a shortage of equipment and workforce, thus with my possibilities behind the demands."

Validity and Reliability

In the scientific paradigm, validity and reliability are considered the yardsticks of any believable and trustworthy research. Merriam & Simpson (1995) contend that "issues of validity and reliability are important considerations in any kind of research. But how one views validity and reliability in qualitative research differs somewhat from positivist research" (p. 101). Addressing these issues, Guba and Lincoln (1991) describe how

> within the scientific paradigm, truth value, typically called internal validity, depends on the degree of isomorphism between the study data and the phenomena to which they relate. There is one

> reality, and information is internally valid if it describes that reality and facilitates its control and manipulation. The naturalistic inquirer, however deals with multiple realities; and in the area of behavioral studies, those realities exist in the minds of people. (pp. 104-05)

Merriam (1988) also points out that in the naturalistic inquiry "because reality is holistic, multi-dimensional, and ever changing, it is not a single, fixed objective phenomenon waiting to be discovered, observed, and measured" (p. 167). The author continues by stressing that assessing the isomorphism between the data collected and the reality from which they were derived is an inappropriate determinant of validity in this approach as what is being observed are people's constructions of reality and how they understand the world. Thus, according to the above authors, the validity of a study rests on the researcher's demonstration that he/she represented those multiple constructions adequately. Because of the researcher's role as an instrument of the research, and his/her proximity to its reality, internal validity is considered a strength of qualitative research (Merriam & Simpson, 1995). In order to ensure internal validity, the researcher represented the manager's construction of reality through the thick description of their accounts and by reflecting on her memos in an attempt to acknowledge and control her biases. This is particularly important when translating others' reality. It was felt in this study that it was more important to convey as nearly as possible what was meant rather than a verbatim rendering. When working in multiple languages, literal translation may be meaningless. For example the Hungarian part of a sentence "...a f ld munka ut<n, j n a m<sik ûs teszi a kalapot a fejûre", in a word-for-word translation would be "...after the dirt work the other is coming and puts his hat on his head " which in fact means that after the basement was dug out, the man decided to step out from the deal (took his hat and walked out).

Merriam (1988) and Merriam & Simpson (1995) suggest that rather than measuring reliability as it is defined by quantitative researchers, qualitative researchers should ask themselves whether the results of the study make sense, are dependable and consistent with the collected data. In order to ensure dependable results, the authors recommend several strategies such as: an account of the researcher's assumptions and the theory behind the study; a clear description of the research subjects and the environment in which the data collection took place as well as of the data analysis process; the use of triangulation by using multiple investigators, multiple sources of data, or multiple methods to confirm the findings of the study; member checking; and peer review. In talking about enhancing the quality and credibility of qualitative analysis, Patton (1990) also contends that "The qualitative researcher has an obligation to be methodical in reporting sufficient details of data collection and the processes of analysis to permit others to judge the quality of the resulting product." (p. 462)

Although member checking was not possible in this study due to the difficulties in reaching the managers participating in this study after the researcher returned to the United States, the researcher used the other suggested strategies to enhance the quality and credibility of this study as they are described in the following section. This is particularly important since she could also not check her translations with these managers since they did not speak fluent English. In her report of the study, the researcher described as clearly as possible the theoretical framework guiding the study, the sample selection, data collection procedures and the conditions under which these took place, the approach and methods of translation, and the process of data analysis. Triangulation was also used through multiple sources of data. The researcher collected several incidents from each manager, thus creating a more holistic picture of their life, struggles, and learning experiences in th ir quest for survival amidst the unprecedented changes in their environment.

Lincoln and Guba (1985) also emphasized the importance of maintaining an audit trail -- documentation about the entire research process describing procedures clearly enough so that others can understand them, reconstruct them and subject them to scrutiny. Lincoln and Guba used the metaphor of the fiscal auditor who examines both the process and the product of the inquiry, in order to arrive at certain trustworthiness judgments and provide certain attestations. For this examination the fiscal auditor needs fiscal records, thus an audit trail. Without such an audit trail he/she would not be able to determine the dependability or the confirmability of the bookkeeping. Thus, it is imperative that such records be maintained during the inquiry; otherwise there will be no possibility of an audit later. As Miles and Huberman (1994) contend, careful record keeping is a way of connecting with important audiences. According to the authors, the audience could be the self and in this case records keep track of what was done along the way and may suggest ways of improving next steps. The audience could also be the readers of the research report who need to know what was done and how, as a way of assessing the credibility of the findings. A subset of this audience could also be the other researchers who are interested in secondary analysis of the data, want to carry out meta-analysis or synthesis of several studies, or want to replicate the findings to strengthen or refute them.

The researcher developed a clear audit trail of the study. She began by filing all the raw data consisting of tapes, field notes, documents from the Romanian Chamber of Commerce and Statistics Department. Then the

transcribed materials were filed by manager together with the translated transcripts. There are two or three versions of the translated transcripts for each managers depending on who translated the materials. If the translation was done by the researcher, in some cases the translation contains notes regarding some changes as a result of its comparison with parts translated by another translator. If the translation was not done by the researcher, one of the versions has suggested changes by the researcher and the other one has the changes finally implemented after the discussion with the translator. Then for each manager there is a coded translated transcript. Each manager s file also contains a cameo including information about the manager, his/her company and a description of the critical incidents described by that manager. The researcher s handwritten memos (methodological, analytical, and theoretical) were filed separately in a special folder. The methodological memos also contain decisions taken in the translations, the dictionaries of idioms and of some words which posed challenges in translation. All citations bear the manager s code whose words are illustrated and the page number of the translated document from where the citation was extracted. Thus, all citations can be easily traced back to the translated interviews.

Conclusions and Implications

Although the researcher s study was not funded by a foundation or international institution and the managers participating in the study were not used to researchers roaming around, the researcher of this study was pleasantly surprised by the trust and interest showed by these managers in her work and study. The researcher noticed that it was important for these managers that she was a native of their country, spoke their mother tongue, grew up, was educated and worked in the same environment they did until 1990. The discussions preceding the interviews about different topics familiar to both the researcher and the managers were very helpful in establishing the trust level necessary for a meaningful interaction. Thus, the researcher believes that it is very important to collect data in the native language of the participants (especially if they don't master well the language in which the research will be reported). To build trust, it is also important for the participants in the study to see interest in their culture and the context in which they operate. Thus, collaborative work in cross-cultural research with colleagues familiar with the language and culture of the settings unknown to the human resource development researchers and practitioners is strongly recommended.

The use of several translators in translating the gathered data is considered by the researcher a very important decision in ensuring the validity and reliability of the translations. This process could be called "triangulation through multiple sources in translation." The researcher noticed that in some cases it was easier for her to translate the data as she had a better understanding of what was meant by the interviewees. As she conducted the interviews, she could recall the tonality of voice and non-verbal communication of the participant during the interview as well as the ambiance. Nevertheless, the discussions with the other translators brought to surface different points of view and issues needing clarifications and proved to be challenging and rewarding in the same time. Back translation was also used for sections of the data translated by the researcher in her pilot study. Although this was a reassuring way to test the judgment calls of the translator, it did not bring to surface the wealth of understanding of multiple translators (triangulation) and the decision making process involved. It was a growing experience to work with other people on these translations.

As in the last decade globalization opened new venues for cross-cultural research and practice in the HRD field even in countries which were unreachable before, the author hopes that the issues addressed in this paper would help both researchers and practitioners working in different cultures and with different languages.

An Ethnographic Study of Cross-Cultural Impacts on Tutoring in an Organization

Lori A. Peterson,
University of Minnesota

This ethnography portrays one organization's use of tutoring in the Japanese language of a midwestern white male by a Japanese female instructor. The behaviors displayed by both the Japanese tutor and the adult learner, whose nationality and native cultures differ, and how the adult learner was impacted by these differences was examined. Insight into this cross-cultural interaction shed light into the creation of a framework for understanding cross-cultural learning interchanges such as this one.

Keywords: Adult Learning, Culture, Instruction

Because of the increasing globalization of the marketplace, United States business organizations are interfacing on a daily basis with companies and people from other countries. Employees within these corporations are being asked to work in and adapt to settings that may place them directly within cultures vastly different from their native cultures. Adler, Doktor, and Redding (1986) concluded that "organizations are becoming more similar in terms of structure and technology, whereas people's behavior within those organizations continues to manifest [national] culturally based dissimilarities" (p.302). In light of this globalization and the tendency of individuals to manifest cultural behavioral differences, this researcher was driven to understand the role of culture in organizational instructional situations that HRD professionals are asked to assess and specifically, how culture and cultural differences impact learning and instructional effectiveness.

Background Research and Theory

Learning in business environments is complex because the cultural frames that affect business are multidimensional; employees' beliefs are shaped not only by societal values, but also by organizational affiliation and occupational alliances (Hansen & Brooks, 1994). Instruction in these environments is also increasingly and comparably complex. Bilingual tutors face a variety of challenges. What is seldom recognized, at least in published literature on the subject, is that the task that confronts the bilingual tutor goes beyond the basic, explicit aim of providing instruction in the native language for specific subject areas as a means to gain proficiency in the second language. Indeed, at the very minimum, the bilingual tutor is a negotiator between cultures (Montero-Sieburth & Perez, 1987). This study thus finds its framework in two major areas of research and theory: a) culture and b) adult learning.

Negotiating Culture

"Culture" is defined by Kluckhohn (1951, p. 86, 5) as patterned ways of thinking, feeling, and reacting which are acquired and transmitted mainly by symbols, and which constitute the distinctive achievements of human groups, including their embodiments in artifacts. All cultures create belief systems that define appropriate and inappropriate social behavior. Meaning making is clearly reflected in the often unconscious rules that guide decision making, values, perceptions, communication styles, and so on.

Hofstede (1980) defined culture as "collective programming of the mind" that is rooted in value systems of major population groups and stable over long periods of history. Like Kluckhohn, Hofstede found that these mental programs serve to guide decision making, perceptions and communication styles, as well as learning preferences. Hofstede found by theoretical reasoning and statistical analysis that four main dimensions may be used to describe cultural differences. While one is not able to make inferences about individual members of cultures from Hofstede's national summary scores, the findings are used here to describe United States and Japanese culture in general.

Measured on a national culture scale, Japan showed a higher desire for interpersonal power or influence between two people (for example, a boss and subordinate) than did the United States, although the United States fell in the middle of the scale. Implications for education are noted by Hofstede, "...students are more dependent on teachers. There is more rote learning, and the asking of questions by students is seldom encouraged; teachers are more often supposed to be omniscient, even if they do not like it" (p. 99). Hofstede found the amount of anxiety that

Copyright © 1999 Lori A. Peterson

occurs with ambiguity for the Japanese was very high and double that of the United States. This would indicate a "preference for clear requirements and instructions" versus a low ranking which would indicate a "preference for broad guidelines" (p. 132).

In a highly individualistic society, leadership is the ideal aspired to versus membership and the collectivity as the ideal. The United Stated ranked very highly on this dimension, with Japan in the middle of the range, at half of the United States ranking. "Americans," said Stewart (1972), "have a tendency to see themselves in terms of sex and social roles which allows for freedom of choice in actions. The Japanese point of reference is the network of obligations among members of a group—the social nexus. Congeniality in social interaction is a predominant value among the Japanese" (p. 69). Japan also rated very highly on a dimension demonstrating a cultural affiliation for assertiveness versus nurturing (p. 176) while the United States rated above average on this indicator.

Linking Learning Style Preferences with Instruction

Knowles' (1980) Adult Learning Theory states that consideration of prior learner experience and knowledge is critical in planning adult learning methods. Knowles also found adult learning styles to be varied, situation dependent and best utilized by the learner being in charge of his/her own learning (including setting objectives, planning content, and measuring success).

Because culture plays a key role in determining how meaning is made from various inputs and the social behaviors appropriate in learning settings, it should be considered as a major input into instructional system design and delivery within organizations. Linking instruction with culturally-derived preferences was supported by a study performed by Hayes and Allison (1988). The study used Hofstede's approach to measuring cultural differences (1984) and Honey and Mumford's learning styles questionnaire (1983) to identify and confirm links between learning style and national culture in 195 midlevel managers from East Africa, India, and the United Kingdom. This is the only study that explores cross-cultural learning style differences in corporate environments that I have located although Adler, Doktor, and Redding (1986) and Doktor (1982) did find major differences in the cognitive processes of people from different cultures. Rogers (1973) found that information that is communicated in a style very different from what is culturally common often leads to a misunderstanding or lack of comprehension.

Methodology, Methods, Data Analysis, Assumptions and Limitations

This paper is the outcome of ethnographic research carried out in studying a Japanese tutor, Ms. Kawasaki, and a midwestern corporate employee, Mr. John Smith. Mr. Smith had been receiving Ms. Kawasaki's Japanese tutelage for a total of five months at the time of this research.

Methodology

Ethnographic research methodology was chosen for this study because it has a cultural focus. Spindler and Spindler (1987) said that the "phenomenon we study as ethnographers is the dialogue of action and interaction" (p. 2). Agar (1986) labeled ethnography a process of "mediating frames of meaning" (p. 18) between the ethnographer, who brings to his or her work the tradition in which he or she participates; including the training received in professional socialization, the group among whom the ethnographer is working, and the nature of the audience for whom the ethnographer is trying to produce a report. Ethnography is appropriate for studying cross-cultural learning and interchange because it prompts the researcher to study these in the context of the larger cultural setting.

Methods

A total of twelve microcultural participant observations of the tutoring sessions held at Mr. Smith's company offices were performed. On these occasions, both the session opening and greetings between Mr. Smith and Ms. Kawasaki as well as the session closing and good-byes were observed in order to gain insight into the informal relationship between Mr. Smith and Ms. Kawasaki. The remainder of the observations were time samples (5 minutes out of every 15 minute period) during the lessons in order to reduce bias (Lundy-Dobbert, 1982). The time between the observations was used to annotate the previous observations. Mr. Smith was also observed in his home; in preparing for his lessons in order to gain insight into his behavior and his motivation for them, and during a phone call to Ms. Kawasaki to cancel a lesson. At the conclusion of the participant observations, a one hour ethnographic interview with Mr. Smith was conducted. This format was useful because it enabled Mr. Smith to feel comfortable with the researcher, and the researcher with the subject matter. The interview was written verbatim as well as tape recorded with Mr. Smith's consent.

Role analysis was chosen as a structural method for this research in order to identify behaviors associated with cultural roles for instructors and learners. To achieve this, two additional tutoring sessions were observed.

Behaviors that consistently occurred and might be conceived of as patterns relating to role definition were documented.

On the day of the second structural role analysis observation, the researcher arrived to find Ms. Kawasaki in the lobby of the FourStar office. Her earlier session had been canceled and this afforded the opportunity to obtain informal information about her work history with Mr. Smith's company, as well as some of her personal history. A similarly informal discussion occurred with Mr. Smith after all of the data were obtained. This time was used to fill gaps found in the data, such as how the company had arranged for the tutoring sessions, who had decided to engage a tutor for Mr. Smith, and so on. The research process lasted approximately one and one-half months.

Data Analysis

The data gathered by the above methods were analyzed separately as well as together. Following collection of all fifteen microcultural observations, a short summary of overall impressions was written (Miles & Huberman, 1994, p. 51). All of the data was then marked, coded and indexed. The analysis technique was completed by placing the data into matrices using Mr. Smith and Ms. Kawasaki on one axis and categories such as body language/posture, facial expression, tone, words spoken/dialogue, and materials on the other. Each of these categories was broken down into more specific items. The observations were then analyzed as three separate groups ("outside of tutoring sessions," "during tutoring sessions" and "approach to studies") and the data from them placed into three different matrices. Finally, an impression drawn from comparison and contrast of the data as a whole was written. Patterns across all of the observations were drawn and related to each other. Because the tutor-adult learner interaction was central to this study, research describing adult learning theory was drawn upon. The last step in the microcultural analysis was to identify gaps that remained in the study that became the impetus for the follow-up research that occurred later.

The first steps taken following the interview were to confirm the researcher's verbatim writings with the tape recording of the interview and to fill in gaps that had occurred. The interview information was then transcribed and analyzed for informant logic by linking key words in the questions to those in Mr. Smith's comments. The data were then identified for sentence structure and word types and laid out by drawing sentences into trees. This enabled the identification of key words, themes and data "chunks." The use of positive and negative weights across the themes, the informant's use of modifiers, and when the use of modifiers occurred, i.e., in response to which questions, were then compared and contrasted. Finally, the interview was analyzed as a whole in the context of Mr. Smith's occupational and organizational alliances and briefly related to theory relevant to the interview's outcomes.

Following collection of the structural observations, a short summary of overall impressions was written by the researcher (Miles & Huberman, 1994, p. 51). Like the microcultural data analysis, the fieldnotes of the study were marked, coded and indexed, and the data were placed into matrices. Again, the latter categories were broken down more specifically. The data were then analyzed separately for Mr. Smith and Ms. Kawasaki in order to determine their individual roles in the tutoring relationship and the behaviors that formed patterns across both observations; role content, behaviors, process, and affect. Next, the data were analyzed for assigned/assumed functions and responsibilities and these findings related to theory and research. Finally, inferences were made about Mr. Smith and Ms. Kawasaki's feelings about their duties and values in a larger social structure as evidenced by roles they played in the context of the tutoring sessions.

All of the data analysis methods contributed to the creation of a conceptual framework of the study explained in the conclusions area of this report. I believe that triangulation through use of the three methods (microcultural participant observation, ethnographic interview, and structural role analysis), as well as intersubjective agreement helped to ensure the validity of the data and its presentation in this report. Informal follow-up data primarily taking the form of facts relating to the history and context of the tutoring arrangement were not analyzed except as they provided information not obtained in the methods above.

Assumptions and Limitations of the Study

Ethnographic methodology uses the researcher as the research instrument. As such, I assumed that I was capable, as a research instrument, to enter the field and take on a role that allowed the data to emerge. My further assumption as a researcher was that this topic of study was worthwhile and that the informants provided information that is of interest to the reader and the researcher. It was also assumed that the informant, Mr. Smith, would be willing to talk about his experiences, would be comfortable talking with the researcher, and that his voicing would be a valid representation of his experiences. Finally, it was assumed that Mr. Smith had been cognizant of differences between his native culture and that of Japanese culture.

By using ethnographic research methodology, I as a researcher assumed that there were distinct patterns that could be observed and studied in individuals belonging to different native cultural groups. This use also assumed that the patterns that emerged might be characteristic of the larger culture, although one is not able to generalize to whole cultures simply by investigating the interactions between two people.

Presentation of the Data

The cross-cultural learning environment was studied through: (a) physical patterns: layout of the setting and objects used; the human setting, the tutor and the adult learner, their relationship to the physical setting, and the scheduling involved, (b) the environment's formal structure: history of the tutelage and evaluation of tutors by Mr. Smith's company, (c) the tutoring/learning environment: a typical session, Ms. Kawasaki's typical behavior patterns and teaching methods, and Mr. Smith's typical behavior patterns, and (d) the cognitive patterns that emerged: definition of good instruction, Mr. Smith's expectations of the tutoring, how these were communicated to Ms. Kawasaki, and if they were met; perceptions of culture gained, and the relationship between Mr. Smith and Ms. Kawasaki. Each of these areas will be explored below.

Physical Patterns

In order to fully understand the cross-cultural learning experience being studied, it was necessary to learn of the historical background of Mr. Smith and Ms. Kawasaki. It was also important to put the learning experience into the context of the environment in which it was conducted, namely Mr. Smith's company, FourStar*. FourStar is a large midwestern United States-based multinational corporation, an "organization active in several countries but in which there is one dominant 'home' national culture to which most key decision makers of the organization belong" (Hofstede, 1980, p. 271). FourStar is based in the city in which Mr. Smith's office is located, although his office is not in the company's headquarters. The tutoring sessions were held in FourStar's company offices, and this is where the participant observations were performed. The tutoring session room itself was small and rather stark, the walls bare of decoration, and the only furniture a table with three chairs around it, a desk with chair, and a telephone on top of the desk. The building paging system could be heard clearly from inside the room; this and the telephone ringing were the only interruptions to the tutoring sessions. Materials used in the tutoring sessions included a pair of Japanese language textbooks and Mr. Smith's additional use of a Japanese dictionary, notepad and pen.

Mr. Smith's tutoring sessions were generally held on Tuesday and Thursday mornings from 9 a.m. until 10 a.m. If Mr. Smith or Ms. Kawasaki had a conflict with a particular date, a mutually agreed upon substitute date was arranged or the session canceled. Mr. Smith is a polymer physicist and mechanical engineer who works in the corporation's molding technology center, a research and development area that serves all of the corporation's divisions. His work also involves conducting research in cutting edge technology in his discipline. These activities cause him to be a frequent traveler, both in the United States and abroad. Mr. Smith is in his forties and describes himself as "a very process-oriented problem solver."

Ms. Kawasaki was born and spent the majority of her life living in her native country of Japan. She is now in her late forties or early fifties and has lived for the last fifteen years in the United States. She and her husband both received green cards one year after arriving in the United States. Ms. Kawasaki has taught Japanese (as a tutor) for FourStar for five years. She also teaches Japanese at a midwestern United States Japanese school for students who must retain Japanese while in the United States. In addition to these pursuits, Ms. Kawasaki teaches Japanese tutors in "how to tutor."

The Formal Structure of the Environment

Information regarding the environment's formal structure was obtained by informal discussion with Mr. Smith as well as through analysis of interview data. Mr. Smith took "language classes" (his description of the tutoring sessions) for about four months in the last quarter of 1996 in preparation for a business trip to Japan which lasted from January through April 1997. In preparation for another trip to Japan in March 1998, he began to retake Japanese classes based on the same twice a week schedule, beginning about one month prior to the first observation. Expectations of Ms. Kawasaki are determined individually by Mr. Smith and another colleague of his who is also receiving tutoring lessons from her. They are the only ones who evaluate their individual tutelage and its outcomes. "FourStar and myself," said Mr. Smith, "are focused on reducing non-value activities." Implicit in this statement is Mr. Smith's evaluation of his tutelage as a valuable activity.

Tutoring/Learning Environment

The typical tutoring session began with brief greetings of "Ohiyo gozaimas" (Good morning) between Mr. Smith and Ms. Kawasaki. The session then typically flowed without interruption with the subject matter the focus of attention until the hour was over and brief good-byes shared. Then the participants would file out into the hallway, Mr. Smith leading, followed by Ms. Kawasaki. Mr. Smith would continue on down the hallway, presumably to his office, and Ms. Kawasaki would sign herself out at the security desk and leave the building.

Mr. Smith used the formal suffix of "san" to introduce Ms. Kawasaki ("Kawasaki-san"), called her by this name on the phone, and referred to her in the tutoring sessions in the same way. She did not call him by any name at all. Use of the formal "san" and not "sansie," the Japanese formality for "teacher," implied some level of formality in the sessions, but not as much as could be used. The use of "san" by Mr. Smith contrasted somewhat with the casualness of the typical session. This casualness was demonstrated by both Mr. Smith and Ms. Kawasaki being dressed more casually than business formal, and the sessions lacking the appearance of a formal structure. In contrast to the casualness of the session structure was Ms. Kawasaki's assumed behavioral role, shown through her posture and body language. She remained in an erect, correct posture prior to, during, and after the close of the sessions. This body posture, though open, had few fluctuations. Fluctuations that did occur were either those based on lesson activity (paging through the textbook or standing to assist Mr. Smith to locate a term in his dictionary, for example) or in response to Mr. Smith's encroachment on her personal space (generally kept to about two feet). These movements were all characteristically close to her body and relatively small. Direct eye contact between Mr. Smith and Ms. Kawasaki was a rarity, and when it did occur, it was very brief in duration. Mr. Smith assumed a dominant (classical male) role in process behaviors associated with Ms. Kawasaki; he led when they walked down the hall, he chose the session topics most of the time, and he signed the log book that documented their lessons. Ms. Kawasaki assumed a positive affective role by showing only positive emotion, affirming the correct use of Japanese by Mr. Smith, and seldom using negative comments. She also assumed a non-dominant role in process behaviors, such as following rather than leading, coaching versus directing, asking for consensus, and maintaining the documentation log book.

Ms. Kawasaki's dominant teaching methods appeared to be coaching and role modeling. Throughout the sessions, Mr. Smith would either read out loud from his textbook, construct sentences in Japanese using the textbook as a guide, ask Ms. Kawasaki for assistance with correspondence to and from Japanese business associates, or carry on a free-flow conversation with Ms. Kawasaki in Japanese. Many times, the sessions incorporated more than one of these elements. There was a consistent pattern throughout the sessions: Mr. Smith speaking a phrase or sentence and Ms. Kawasaki repeating the corrected phraseology or sentence, emphasizing the corrected area by stressing the syllable or diction. Coaching also took the form of answering the many questions of Mr. Smith and giving positive, supportive feedback such as "Hai!" (yes!), nodding, or smiling. More elaborate compliments on Mr. Smith's progress were less frequent in occurrence. Ms. Kawasaki seldom used negatively loaded comments, and only displayed positive emotions. Very rarely did Ms. Kawasaki herself use questioning as a teaching method or take a directive approach, however, she did occasionally encourage Mr. Smith to study his Japanese!

Mr. Smith assumed a role in the tutoring sessions of an active learner. His conversation during the tutoring sessions focused either on discussion of the subject matter or in questioning Ms. Kawasaki about the subject matter. He also took the initiative to seek out other references for assistance, i.e., his Japanese dictionary. On occasion, Mr. Smith ruminated negatively about his performance, although laughter came easily to him in the sessions as well. Throughout the sessions, he displayed a broad range of emotion: frowning, smiling, laughing, sighing, groaning, shaking his head. While reading out loud, he stressed syllables in a fashion similar to that of Ms. Kawasaki. He wrote notes to himself and had his Japanese dictionary nearby, which he used occasionally. During Mr. Smith's interview, he had this to say about his learning style and constraints:

> Study lessons are most optimized when carried out to combine both verbal usage as well as some form of visual stimuli—writing things down or highlighting, or taking time to verbalize what is read...makes lessons to be retained in memory although the pronunciation may not necessarily be correct...I should study more. My biggest complaint is the lack of adequate textbooks. The language is complicated and it is difficult to find good, reasonably inclusive texts.

Perhaps the most interesting difference between Ms. Kawasaki's behavior and Mr. Smith's was in their respective use of personal space. Mr. Smith tended to use space at will, opening his arms wide, waving ("talking with") his hands, moving from close to the table to learning away from it. These gestures, along with fidgeting such as wiggling his feet, seemed very comfortable to him. Most often he assumed an open body position, but on

occasion he used a closed one, drawing himself near to his text and placing one arm with his head resting on it between himself and Ms. Kawasaki. This seemed to occur when he was engaged in deep thought, and was typically combined with a frowning countenance and non-direct eye contact.

Cognitive Processes

During the interview with Mr. Smith, he commented that, "Ms. Kawasaki is a very good teacher. She is very encouraging." When pressed by the question, "What makes her a good teacher?" Mr. Smith stated,

> She is very familiar with her language and is still learning English. So to be able to teach a language one must know grammatical structure—she's able to explain her language in a grammatical sense because that's how she's learned English. Since she is learning English skills using an English format she is able to describe Japanese in the same format; subject, predicate, adjective...

In response to the prompt, "You state that she is also 'very encouraging.' What specifically does she do that encourages you?" Mr. Smith replied,

> What I mean is she frequently interjects, 2-3 times per lesson, an encouraging statement when I happen to do something right or when my statements are well prepared.

When probed, "What kinds of things does she interject, can you give me examples?" He responded,"She says 'josu desnay,' which means, 'Good job, you rookie!' <pause> No, which means 'good job.' I couldn't be happier with the quality of tutor I have."

Mr. Smith's answers defined "goodness" in instruction as the capability to have command not only of the subject matter, but also to be able to communicate the subject matter effectively while positively reinforcing the learner.

Mr. Smith had high expectations of his tutelage. While he noted that foreign language studies are pursued by people for reasons that "vary from an essential use of one's attributes to purely entertainment," he also stated that studying Japanese would allow him to "conduct rudimentary conversations in Japanese" during his travels to Japan. When asked if his tutelage had met his expectations prior to his 1997 trip to Japan. "Absolutely, it was helpful," he stated. He went on to say:

> It was necessary for me to navigate daily living routines singularly. The environment where I lived really required me to <pause> (sigh) to know at least fundamental aspects of the language—and this was only talking—I never did learn how to use my washing machine! I lived in an apartment building with no English speaking people. Most of the restaurant people spoke very little English. Same with most other modes of accomplishing daily tasks such as getting on the train, buying groceries...I was able to communicate on a minimalistic level even when I traversed the island.

In most of his other responses to interview questions, Mr. Smith responded with sentence structures strewn with lengthy chains of prepositional phrases and heavy use of modifiers. Mr. Smith's responses to questions regarding his evaluation of the tutelage were unique in that they did not involve this same use of modifiers. The above quote of "Absolutely, it was helpful" is relatively clean and simple in contrast to Mr. Smith's other responses. His evaluative responses were also positively weighted. This may mean that Mr. Smith was more emphatically positive about these thoughts and verbalizations.

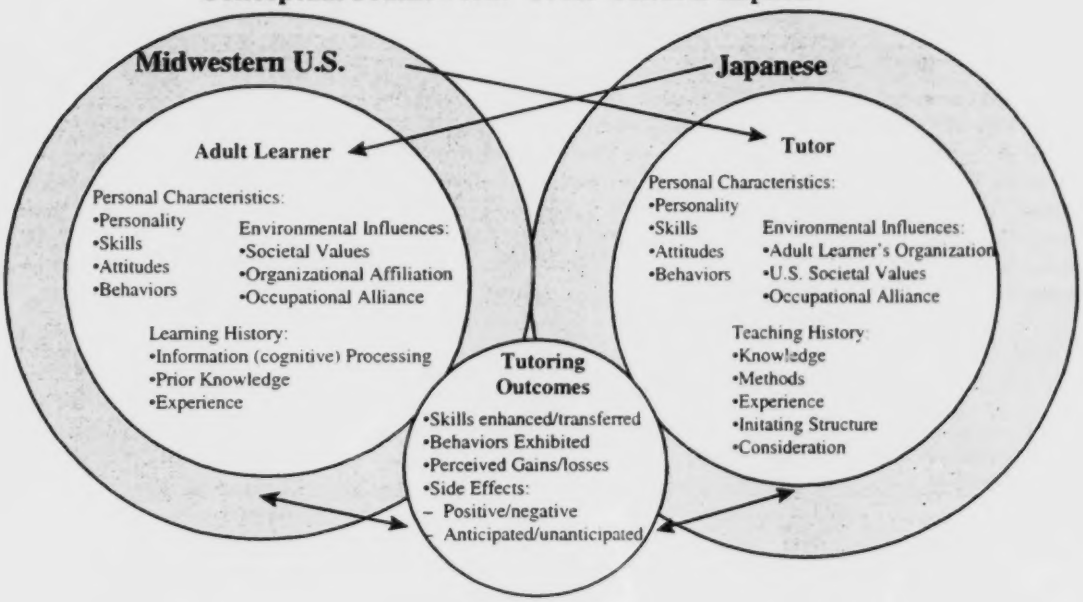
Did Mr. Smith gain any impressions about Japanese culture from his sessions with Ms. Kawasaki prior to his travel to Japan? Mr. Smith's answer to this interview question was negatively weighted and concise when he responded that "I was just learning another language. I didn't think anything special." If the same logic is applied, the very concise nature of these comments and their negative weight would imply that Mr. Smith was emphatic in the belief that he was not aware of any gained insights about Japan after working with Ms. Kawasaki.

Conclusions and Conceptual Framework

Any time a learning environment is created, an opportunity exists for the individuals involved to have differing cultural backgrounds. In attempting to relate the information gathered from this study to the larger social context, the framework illustrated below was conceptualized. Expanding the framework to a greater than 1:1 ratio could be accomplished by adding a sphere for each person involved in the educational environment. For simplicity sake, the framework will be described using this research as an example. The framework takes as a starting point the native

cultural background of the parties involved, in this case, Ms. Kawasaki and Mr. Smith. Hofstede's cultural dimensions are an example of theory and research that may be used to describe the general native cultural background of the individuals or groups involved, as done in this report. The individual or group is then assessed as a part of that culture, and described broadly within its parameters, remembering that generalizing national culture to an individual is an ecological fallacy.

Conceptual Framework: Cross-Cultural Impacts



Next, the individual's role as learner(s) or instructor within his/her or their native culture is researched as well as how that role may be changed or need to be altered to fit the cultural environment of the learning setting. For my example, this would involve trying to understand Ms. Kawasaki's role, along with its requisite knowledge and skills, as it would be held in her native Japan. One would examine the particular instructional methods that Ms. Kawasaki might use, thereby forming an impression of how she might initiate structure into the tutoring sessions and how she might give consideration to her learners. Mr. Smith's role as learner would be examined using Knowles' adult learning theory as a guide, allowing for differences given the FourStar culture (organizational affiliation) and Mr. Smith's occupation. The content of the tutoring sessions lent itself well to a participative learning environment such as Knowles found beneficial to adult learning. In allowing Mr. Smith to raise questions and in using an unstructured format, Ms. Kawasaki allowed Mr. Smith to be in charge of his own learning.

Finally, the individual's background is studied to obtain information regarding past history, personal characteristics and environmental influences. An example of this occurs in Mr. Smith's case, where it was necessary to discover what knowledge he had of Japanese prior to the observations of his learning environment, any experience he had with the language, and how he cognitively processed information in order to assess his learning. It was also important to establish an understanding of his personality, his skills, his attitudes and his behaviors while in the learning setting, as well as the societal values, organizational affiliation, and occupational alliances that all contributed to shape who he was as a learner. Mr. Smith described himself as a "process oriented problem solver." His need for control over a "problem" and his affinity for process were displayed when conducting the interview with him. Mr. Smith was told that the interview would be very open and not characterized by a lot of structure. His response was that he had expected a *very structured* interview. Over the course of the interview, Mr. Smith seemed relaxed and used open body language but his comfort at the time was probably quite low, and the lack of structure of

BEST COPY AVAILABLE

the interview intimidating. Therefore it was difficult to follow his natural logic as he did not talk freely without being questioned. In the tutoring sessions, Mr. Smith also showed a preference for structure by assuming the role of an active learner: he was able to impose his own structure onto the sessions and eliminate any possible uncertainty. How did Ms. Kawasaki respond to his problem solving, process-oriented learning style? She conducted tutoring sessions that were stable, but not highly programmed. The sessions were also at times jointly planned by Ms. Kawasaki and Mr. Smith, and this fits the collective decision making model suggested by Knowles. Adapting instructional structure and consideration to fit the learner's needs such as Ms. Kawasaki did in this case for Mr. Smith is crucial for learning success.

The arrows drawn from the largest spheres (Japanese culture and Midwestern U.S. culture) serve to illustrate the transfer of cultural knowledge and perception one gains about another culture from being involved in a cross-cultural learning environment. Although Mr. Smith stated that he had not formed any impressions about Japan from Ms. Kawasaki, there may have been subconscious perceptions or assumptions he drew from her; just she may have formed impressions or assumptions of midwestern United States culture from her interactions with Mr. Smith.

The outcomes of the educational environment may be skill enhancement or transfer, exhibited behaviors, perceived gains or losses from the experience, and side effects, either positive/negative or anticipated/unanticipated. Mr. Smith stated in his interview that he enjoyed his tutoring sessions and was learning much from them, and that he felt he was in charge of his learning. Mr. Smith's continued work with the Japanese and his upcoming trip back to Japan caused him to have a vested interest in the outcome of his Japanese lessons. The final assessment of Mr. Smith's learning will occur when he is in Japan; he will be able to judge not only Ms. Kawasaki's effectiveness as a Japanese language tutor, but his success as an adult learner as well. For this reason, the outcome sphere on the model was drawn to overlap both Japanese and midwestern U.S. cultures.

This study sought to describe cross-cultural impacts on tutoring in an organizational setting. It was concluded by presenting a conceptual framework for the study and for future reference and use. The researcher's hope is that this study has preserved and dignified ethnographic methodology in the process.

Trust and Distrust at Work: Normative and Dyad-exchange Influences on Performance

C. Ken Weidner, II
Loyola University Chicago, ValueWorks, Inc.

This paper proposes a theoretical framework for exploring and understanding trust and distrust in organizations. The model is used to define trust and distrust as behavioral intentions, and to develop reliable and valid instruments for assessing trust and distrust in organizations. These surveys are employed in an empirical study, in which support was found for major portions of the model. Implications for practice, theory, and research, and limitations of the study are discussed.

Keywords: Knowledge Management; Theory Building; Intellectual Capital

Trust in organizations is receiving increasing attention from practitioners, among whom there is considerable agreement about the importance of trust as a foundation of effectiveness. Recent attempts to improve the theoretical development of trust have been outpaced by empirical work (Weidner, under review). This lack of definitional clarity has restricted the exploration of trust, its antecedents and consequences. In this paper, Fishbein and Ajzen's framework is employed to develop a behavioral intention definition of trust (and distrust). This definition and social exchange theory are used to develop a model of trust, which is used to develop reliable instruments for assessing trust and distrust in organizations. These surveys are then employed in an empirical study that follows.

Problem and Theoretical Framework

Past Definitions of Trust

A number of definitions of trust have been offered in the literature across disciplines. Trust has alternately been defined as belief, attitude, expectation, behavior, or as a combination of these elements; unfortunately, the variety of definitions of trust has fragmented its study. Complicating inconsistent definitions of trust across studies are inconsistencies between definition and operationalizations within studies; some authors others have not reported the tools which they have used hindering analysis and replication (Weidner, under review).

Fishbein and Ajzen's (1975) framework for the measurement and understanding of social behavior spans the range of beliefs, attitudes, intentions, behaviors, and outcomes. Using this well-established framework, behaviors can be predicted from behavioral intentions, provided that the intention is specific enough to correspond to the behavior or category of behaviors of interest and that the intention does not change between the time it is measured and the time the behavior occurs. Behavioral intentions are measured as a person's location on a subjective probabilistic intention (i.e., range from 0 to 100) involving the actor and some specific action. Intentions can in turn be predicted by a combination of an individual's attitude toward his/her own performance of a specific behavior, subjective norms, and the perception that salient others desire or do not desire a specific behavior. Attitudes are a person's *bipolar* evaluative or affective response to a given stimuli. In turn, attitudes are formed from descriptive and inferential beliefs about a given exchange partner and some specified behavior. Beliefs are the extent to which an individual holds a certain characteristic, quality, or attribute to be true, and are scaled from 0 to 100.

Definition of Trust and Distrust

Bacharach (1989) made several suggestions for the introduction and development of constructs. Because organizational researchers place significant emphasis on the examination of relationships between independent and dependent variables, the construct definition requires significant, careful attention.

- Trust is a intention to increase your vulnerability to an exchange partner whose behavior is not under your control in a situation in which the penalty, loss or deprivation you would suffer if the exchange partner abuses or fails to protect your vulnerability is substantially greater than the benefit, reward, or satisfaction you would gain if the exchange partner protects your vulnerability.

Copyright © 1999 C. Ken Weidner

This definition is an adaptation of that provided by Zand (1981), in which trust is operationalized as a behavior explained by an undefined and unmeasured variable. The above definition proposes trust be defined as a *behavioral intention*, avoiding the problem of indirect measurement. The situational aspects of this definition can guide aid specifying the nature of exchange and the trustor's vulnerability. Based on this definition, the consequences of trust should be context-specific behaviors, for at least two reasons: (1) since trust has been defined as a behavioral intention, it operates at the level of cognition, and (2) an individual's trust in an exchange partner is often provided by the individual as an explanation for behavior. Defining trust as a behavior fails to draw a necessary distinction between intention and behavior. Further, this definition can help define distrust, which has suffered from a lack of definitional clarity in the literature–largely by association with trust (Baier, 1985; definition adapted from Zand):

- Distrust is an intention to decrease your vulnerability to an exchange partner whose behavior is not under your control in a situation in which the penalty, loss or deprivation you would suffer if the exchange partner abuses or fails to protect your vulnerability is substantially greater than the benefit, reward, or satisfaction you would gain if the exchange partner protects your vulnerability.

Distrust implies an individual believes another will act in ways antithetical to their own interests. As a result, we make conscious and subconscious calculations of outcome expectations of for behaviors that effect our vulnerability.

A Generalized Model of Trust and Distrust

Social exchange theory (Blau, 1964) has been applied to a wide variety of research areas, including organizational citizenship (Morrison, 1994) and psychological contracts (Rousseau, 1995). Social exchange is characterized by multiple non-economic exchanges of social consideration between actors, above and beyond formally agreed upon economic or other requirements. When social exchange ceases to exist, reducing organizational membership to a transactional exchange, disengagement, withdrawal or exit are likely to occur. Thus, the presence of trust may be important to preventing organizational exit; distrust may serve as a precursor to organizational exit.

Predicting Behavior from Behavioral Intentions

Katz and Kahn (1978) proposed that three levels of motivation patterns and individual performance are needed for effective organizational performance: (a) individuals join and remain in an organization, (b) organizational members reliably perform the duties expected of them, and (c) they engage in behaviors that go beyond specific role requirements. For an employee, these three levels represent escalating degrees of risk or dependence on the organization. Thus, patterns of continued organization membership higher levels of trust are hypothesized to be the result of higher trust in supervisor (Hypothesis 1.1a) and trust in organization (H1.1b). Similarly, higher levels of in-role performance and extra-role performance are hypothesized to be the result of higher trust in supervisor (H2.1a and H 3.1a, respectively) and trust in organization (H2.1b and H3.1b, respectively). Conversely, higher levels of employee turnover or absenteeism are hypothesized to be the result of higher levels of distrust (which is antithetical to risk) in supervisor (H1.2a) and distrust in organization (H1.2b). Fear prevents people from doing their best, and has been shown to have an adverse impact on productivity and quality (Ryan and Oestreich, 1991). Thus, lower levels of in-role performance and extra-role performance are likely to result from distrust in supervisor (H2.2a and H 3.2a, respectively) and in organization (H2.2b and H 3.2b, respectively).

Predicting Trust and Distrust as Behavioral Intentions from Beliefs

Blau's (1964) original terms for social exchange and transactional exchange were economic and social exchange, but the term "economic" tends to obfuscate the instrument of the exchange, so transactional exchange is used throughout this paper. Higher levels of trust (in supervisor and in organization) are more likely to exist when beliefs are strong that a relationship is characterized by social exchange than when beliefs are weak that the relationship is characterized by social exchange (in supervisor, H4.1a, H4.1b; in organization, H4.1c, H4.1d). Relationships characterized by transactional exchange involve a more conscious calculation of risk, and exhibit lower levels of trust (in supervisor, H4.2a, H4.2b; in organization, H4.2c, 4.2d) since such relationships are negotiated or, at the least, specified in advance. It is not reasonable to expect distrust to be lower in relationships characterized by social exchange relationships (H5.1a-b-c-d) and higher in those characterized by transactional exchange (H5.2a-b-c-d).

This paper reports on two studies. The first uses the above framework to develop reliable and valid surveys of trust and distrust as behavioral intention definitions. These surveys are then employed in an empirical study.

Study 1

Method[1]

A well-established and frequently recommended process (DeVellis, 1991) for scale development was employed. Over 1,000 potential items were generated by an open-ended survey tapping the experiences of 96 individuals in work settings. These items were subjected to a content validation by 18 faculty and 32 Ph.D. and masters' students in business administration and communication at a university in the midwestern U.S. Some items were reworded to improve clarity, and five items were added at the suggestion of the judges, who opined that the additional items were relevant to the domain of trust and distrust. A total of 23 behavioral intention items and 100 beliefs items for the supervisor survey and 23 behavioral intention items and 64 beliefs items for the organization survey survived the content validation procedure. The item pool was refined, and administered to development samples of 108 and 122 respondents, respectively, for the supervisor and organization survey. Based on factor analysis or cluster analysis of the individual items, reliable scales were developed. The resulting subscales was analyzed to evaluate the convergent validity and construct validity of the measures. Different subjects were used for each step of the development process.

Results

Development of the supervisor survey resulted in behavioral intention subscales representing: *make positive suggestions, speak one's conscience, admit one's own mistakes, criticize one's supervisor, conceal self,* and *avoid contact with supervisor.* An iterative process similar to that used to develop behavioral intentions subscales was employed to refine the beliefs subscales. However, due to the low subject-to-items ratio, initial cluster analysis results rather than initial factor loadings were used as a starting point the beliefs subscales; fifteen different subscales emerged that demonstrated adequate content validity and reliability. A factor analysis (varimax rotation) was conducted of both the beliefs and behavioral intentions scale scores. Four sets of behavioral intentions regarding increasing vulnerability or trust (*make positive suggestions, speak one's conscience, admit one's own mistakes, critical of supervisor*) and two sets of behavioral intentions regarding reducing vulnerability or distrust loaded on two separate factors (62.0% of variance), supporting the notion that trust and distrust in the supervisor are distinct sets of behavioral intentions. Factor analysis of the beliefs subscales provided a two factor solution (76.5% of variance). These factors match the proposed employee-manager relationship as social or transactional exchange. Subscales loading on the social exchange factor included: *setting effective standards, providing help and support, being credible, providing valuable feedback, valuing individuals' contributions, valuing people as individuals, considering employee interests, encouraging employee decision making, being effective,* and *being consistent.* Subscales loading on the transactional exchange factor included: *valuing having higher status than employees, being deceptive, putting pressure on employees, being non-benevolent,* and *relying on negative reinforcement.* This survey was designated the *Workplace Beliefs Survey–Supervisor* or *WBS–S.*[1]

For the organization survey, a factor analysis was conducted on each of beliefs and behavioral intentions scale scores. As expected, the three sets of behavioral intentions regarding increasing vulnerability or trust (*help others, speak one's conscience, suggest positive ideas*) and one set of behavioral intentions regarding reducing vulnerability or distrust (*exit/withdraw*) loaded on separate factors (79.0% of variance) supporting the notion that trust and distrust in the organization represent two distinct sets of behavioral intentions. The beliefs subscales from the organization survey were also factor analyzed; given the size of the development sample and the exploratory nature of the scale development effort, a two factor (varimax rotation) solution was specified (Schuler, Aldag, and Brief, 1977). The factors (73.3% of variance) are consistent with the proposed framework. Subscales loading on the social exchange factor included: *provides clear goals and expectations, acts in mutual interests of employees and organization*; subscales loading on the transactional exchange factor included: *is not credible, takes advantage of employees,* and *is unethical.* This survey was designated the *Workplace Beliefs Survey–Organization* or *WBS–O.*[1]

Study 2

Method[1]

Data for this study were collected in an academic medical center in the midwestern U.S. Data were obtained from three sources: a survey completed by 881 employees, a survey completed by 98 managers, and organizational

records. The surveys were conducted as part of a baseline measurement before a work redesign/patient-centered care initiative at the medical center. Employees were paid for their time spent completing surveys, except for those who were unable to leave their work unit for patient care reasons. A residual data collection effort was implemented for these latter 377 employees, which involved completing surveys at home and mailing them to the data processing center (44 surveys were received via this method). Participation in the survey was voluntary; A comparison of subjects' demographic statistics indicates the sample data is fairly representative of the larger employee population. These data were made available for secondary analysis in this study. Following tabulation of results, feedback (including action planning) was provided for all management teams and staff in each department.

Measures

Employees were asked to complete the *Organizational Culture Inventory* or *OCI* (Cooke and Lafferty, 1986), one of the most widely used instruments for the quantitative assessment of behavioral norms, as well as the *WBS–S* and *WBS–O*.[2] Continued organizational membership was measured at the individual level by a single item drawn from the *Job Diagnostic Survey* (Hackman and Oldham, 1975). Separately, managers were asked to complete a survey grid in which they answered questions regarding the performance of each of the employees reporting directly to them; this included measures of in-role (three-item scale developed for this study) and extra-role performance (Podsakoff et al., 1990). Completed grids were obtained from 98 of 122 managers to whom they were distributed (80.3% return); manager's ratings were received for 1,394 employees (77.0% of the employee population of approximately 1,800 individuals). All survey measures in demonstrated adequate reliability as determined by Cronbach's *alpha*. The mean *alpha* for the *OCI* scales was .83, with a range from .72 to .92 for the twelve individual *OCI* scales. The mean *alphas* for the *WBS–S* intentions and beliefs scales were .72 and .79, respectively, with a range from .60 to .83 and .58 to .90 for the individual *WBS–S* intentions and beliefs scales, respectively (only one intention and beliefs scale had an *alpha* < .70). The mean *alphas* for the *WBS–O* intentions and beliefs scales were .73 and .80, respectively, with ranges from and .65 to .84 and 70 to .98 for the individual *WBS–O* intentions and beliefs scales, respectively. The factor structure of the *WBS–S* and *WBS–O* was consistent with Study 1.

To test the above hypotheses at the specified level of analysis, the data were transformed into two datasets. The individual level dataset (n = 881) consisted of the individual employee respondent records (descriptive statistics and correlations are reported in Table 1). Since the *OCI* measures subunit level phenomena (shared norms and expectations) on the basis of information gathered at the individual level, the procedure recommended by James, Demaree, and Wolf (1984) was employed to check the appropriateness of this aggregation. Results indicated a high level of within-unit agreement for each of the twelve *OCI* styles, with mean interrater agreement of .83, with a range from .77 to .88. Then the organizational subunit culture factor culture scores were "assigned" back to each individual record. This was done so that group norms and expectations can be used as an individual level independent variable with the individual level dependent variables of trust (H4) and distrust (H5). Managers' ratings of employees' performance were matched with employees' survey data to create a "matched" individual level dataset (descriptive statistics and correlations are reported in Table 1). Restrictions on data collection imposed by the research site limited the number of matches that could be made (n = 222); the matched dataset is fairly representative of the larger dataset.

To assess the discriminant and construct validity of the *WBS–S* and *WBS–O*, individual items were each in turn factor analyzed (varimax rotation) to provide support for the argument that trust in supervisor and distrust in supervisor (and organization) are distinct from the underlying social and transactional beliefs as presented in the model. The results of the factor analysis are consistent with theoretical assignment of items to scales. It appears that the *WBS–S* and *WBS–O* possess discriminant validity inasmuch as they distinguish between (a) the trust subscales, (b) between trust and distrust subscales, (c) between behavioral intention and beliefs subscales, and (d) between social and transactional exchange with each focal target. As an additional test of discriminant validity, the regression equations with in-role and extra-role performance as dependent variables were each run again using the matched dataset (n = 222) with trust in supervisor entered into the equation first, and distrust in supervisor specified as the second independent variable entered. The change in the F statistic indicates statistical significance ($p < .001$) of distrust in supervisor for both in-role ($F_\Delta = 21.82$), and extra role performance ($F_\Delta = 26.15$). This supports the definition and operationalization of trust and distrust as unique behavioral intentions. Further, the entire dataset was searched for cases where the trust and distrust factor scores were both greater than 1 (and alternately, less than –1). Using this stringent test, 20 (2.2% of the 881 cases available) and 38 (4.3%) cases were so identified trust and distrust, in supervisor and organization, respectively. These results support the notion of trust and distrust as distinct constructs, consistent with the proposed model.

Notes. [a] SEx – Social exchange; TEx – Transactional exchange. † $p < .05$, ‡ $p < .01$. [b] n = 881. Norms are subunit average scores, "tabled" to individual cases.

All hypotheses were tested using multiple regression. Culture was first entered as an independent variable into the regression equations for H4-5; the resulting regression residuals were used in subsequent regression equations for each dependent variable, for several reasons. First, shared norms can have a broad and pervasive influence on organizational behavior; their influence on members' thinking and behavior has been found to be significant (Cooke and Szumal, 1993). Second, this method is most appropriate in a two-level hierarchical design, with individual responses "nested" within organizational subunits (Bryk and Raudersush, 1992). The chronological ordering of data used corresponds to the theoretical location of variables in the model.

Results

The regression results for hypotheses tested using the individual dataset are presented in Figure 1; a summary of results obtained regarding all of the hypotheses tested is presented in Table 2. Shared norms and the nature of the social/transactional exchange relationship with an individual's supervisor and organization account for a significant 11% of the variance in employee's in supervisor, 17% of the variance in employee's trust in organization, 38% of the variance in distrust in supervisor, and 12% of the variance in distrust of work organization (all at $p < .001$). Thus, general support was found for many but not all of the linkages proposed in the model. Of the 28 hypotheses proposed, 14 of the hypotheses were supported as predicted. Support was found for another 2 hypotheses, but this support was found in the opposite direction relationship than was hypothesized. Mixed support was found for one other hypothesis based on subsample results. Non-significant results were obtained for 11 of the 28 hypotheses.

Discussion

Implications for Practice

Managers' skills, in particular, their ability to develop social exchange relationships, have a positive impact on employee performance. This study found trust in supervisor to be positively related and distrust in supervisor to

be negatively related to in-role and extra-role performance, underscoring the need for selecting and developing managers who can develop social exchange relationships with their staff. Employers should pay close attention to situations where managers are perceived as having primarily transactional exchange work relationships. These findings suggest that organizations should be cautious in the framing of benefits or other compensation programs for organizationally members that might be perceived as entitlements or rights; such framing may be highly counterproductive. Attempts by organizations to make extra-role behaviors part of stated job expectations, as Organ (1990) has suggested, may be also be counterproductive. If employers define away heretofore extra-role contributions, employees may seek non- work outlets for their discretionary efforts. Finally, these results reinforce the importance of a leader's credibility during change; careful work with message and messenger can minimize the dissonance that can rapidly unravel trust.

Efforts to increase trust or overcome distrust may or not be appropriate for a specific organizational setting. One ethical concern is the ends for which trust is being cultivated and the sincerity of the agent; another is the misdiagnosis of the environment or relationship as being characterized as low in trust. A potential solution would appear to have at least two steps: a) the diagnosis of the situation as being low trust or high distrust (or both), and b) the intervention occurring at the right level on the right issue. The *WBS–S* or *WBS–O* might be a starting point for such an effort. Another application of the *WBS–O* might be as a leading indicator of potential turnover. Early identification of deterioration of members' trust in their organization may be a first step in preventing turnover and its potential effects on organization or subunit performance.

Implications for Research and Theory

The present research suggests a number of potential avenues for future research. These results suggest that future theory on continued organizational membership account for both individual, institutional and structural factors contributing to organizational exit/withdrawal. Although it appears that the in-role performance measure met the criterion of face validity in the current research site, the in-role/extra-role boundary may well remain moving, blurry, or nonexistent across organizations. Future work on extra-role performance should clarify this issue.

Future research on trust and distrust might deploy the *WBS–S* and *WBS–O* in a variety of settings, including trust between co-workers, team members, organizations, and managers towards subordinates. In HRD, these measures might be adapted to explore successful practices for the developing trust through interventions, and the limits and appropriateness of such practices in different settings. Research might be conducted to explore how organizational decisions that reduce the amount of exchange currency provided to employees (e.g., layoffs, benefits) can be assimilated by employees without significantly engendering distrust. Distrust may be a barrier to employees' participation, suggestion-making, whistleblowing, and desire to communicate work-related mistakes or problems.

Lack of trust may suppress each of these sets of behaviors; distrust may suppress these behaviors and their concomitant organizational benefits even further. Distrust may result in revenge or in violence in the workplace, and may be engendered by how change is implemented and how individuals' concerns are addressed during change. Future research also might explore of how managers and organizations can build social exchange relationships. Research on psychological contracts, which has centered on the content of member-organization relationships at the exclusion of leader-member relationships, might refocus on how managers develop the desire and ability to cultivate social exchange relationships with employees. The *WBS–S* and *WBS–O* might be used to explore the impact of social and transactional exchange beliefs on group and organization performance.

In summary, this study set out to answer several questions surrounding trust and distrust: (1) Do behavioral-intention definitions of trust and distrust have utility to researchers? (2) Do these definitions serve to integrate existing work on trust and distrust and lead to new, more promising directions for better understanding the dynamics of trust and distrust in work organizations? (3) Can this research provide insights for practice? and (4) Can these measures of trust and distrust aid in better understanding the dynamics of these constructs in work settings? The answer to each question appears to be affirmative. The results of this study hold promise for a fuller understanding of trust and distrust and ideas on how to act to overcome distrust and build trust and productive relationships at work.

Work Culture Adjustment: A Critical Ingredient to Organizational Change

David J. Pucel
University of Minnesota

As organizations evolve into learning organizations, changes in the work culture require employees to take on new roles and skills. Skill deficits are often more easily addressed than employee acculturation to new role expectations. Those responsible for employee development must address the extent to which desired changes will conflict with employee values, attitudes, opinions, and ideas surrounding what are considered to be the legitimate work roles if the learning organization is to be truly realized.

Keywords: Organizational Learning, Culture, Change

The Problem

As organizations move toward becoming learning organizations, employee expectations change along with the work culture of the organization. Employees are expected to have more involvement in decision making, maintaining their skills, and monitoring their own performance. They are expected to work in teams, improve work processes, and monitor accomplishment of organizational goals. These new expectations require both new skills and a change in how employees perceive their work roles. Some employees who have been comfortable and able to work in an environment where they were told what to do, how to do it, and someone else was responsible for judging if it was done correctly are not comfortable or able to work in such a new environment. They are reluctant or unable to make the adjustment to taking responsibility for their own learning and performance or contributing to the evolving knowledge of the organization. The solution has often been to apply standard training procedures to prepare the employees to operate in the new environment. Those procedures include doing a needs assessment of the psychomotor, cognitive and affective skills required, developing training programs, providing training, and assuming that once the employees know what to do and how to do it they will do it. This training model assumes that the problem is a lack of skills to perform in the new culture. For some employees this methodology works, however, for many others it does not because their problem is not a lack of skills but the comfort they feel with occupying the new roles required in this new cultural setting. Self-learning, taking responsibility for actions, contributing to decisions, and making decisions may not be consistent with the employees' perceptions of themselves as workers. Training them in how to do what is desired will not necessarily lead them to actually doing it because such actions may conflict with their basic self-image and what they consider to be a desirable work culture. For these people, employment failure during organizational change seems to be more highly associated with failure to adjust to the work culture associated with new job expectations than to a lack of skills.

For example, a large plant decided to change its organizational structure to the use of work cells within which production workers were to work in groups responsible for ordering materials, ensuring productivity, and ensuring quality. This was a radical change from their past responsibilities where they were responsible for operating their own equipment under the direct supervision of a supervisor. The supervisor had been taking responsibility for making sure the materials were available, that each person was meeting their quota, and that the quality of the products met specifications. Employee development personnel interpreted the major skills deficits to be making sure employees knew how to operate the computerized ordering and inventorying system, how to work in teams, and how to interpret required documents. After training the employees had the skills, however, things did not go smoothly. The question was why were these skilled people not performing as expected? After interviewing the employees it was found that they did not think it was reasonable for the company to ask them to work in this new way. They never worked like that before and did not feel they should take on such responsibilities. They considered themselves to be machine operators. Further probing revealed that their reluctance to take on the new responsibilities was driven by the fact that they did not feel comfortable. They were scared. Therefore, interventions were needed where employees could vent their concerns and where they could be shown not only why they needed to implement the new way of doing things, but how they should view their new roles with assurance that they were not taking on unreasonable roles and personal risk. The question facing employee development personnel was how to design and implement such interventions

Copyright © 1999 David J. Pucel

Such situations are not atypical. The challenge is to help employees prepare to cope with the new responsibilities which are in conflict with their past visions of their legitimate roles in the employment environment. As Argysis and Schon (1978) have stated, "There is no organizational learning without individual learning, and that individual learning is a necessary but insufficient condition for organizational learning" (p. 20). One could go one step further and say, there will be no individual learning unless individuals feel comfortable with where that learning is heading.

The Underlying Phenomena

Organizational change that affects employee expectations creates uncertainty within employees about the adequacy of their behavior and leads to anxiety and feelings of insecurity. If the differences in expectations between the new and old are not too large, employees will be able to adapt relatively quickly and again begin to feel a sense of comfort with the new culture. If the differences are large, they may not be able to accommodate and their insecurities will drive them to resist culture change even though they have the necessary skills. Within an organization some employees such as managers and supervisors typically perform in roles where they are required to make observations and apply knowledge to decision making, and to be accountable for their decisions. For these employees, adopting the culture of a learning organization represents less change. However, setting up these expectations for skilled workers and technicians who have been expected to take explicit directions from mangers and supervisors who have been responsible for their productivity represents a major leap. Such employees require more assistance than just help in developing the interpersonal skills, learning skills, and decision-making skills required in a learning organization. They need assistance in gaining comfort with the new environment so they feel comfortable meeting the new expectations.

Acculturation - Related Theoretical Models

Although there has been essentially no literature developed which directly addresses this problem as it affects organizational change, those who have studied the effects of cultural changes when people move between countries and geographic locations can provide insights into the problem. The same phenomena, which they describe, seem to have meaning when related to organizational change. Cross-cultural social scientists define this problem as one of acculturation. What is known about the processes underlying acculturation? Acculturation, according to Szapocznik and Kurtines (1980), consists of two independent and separable processes: (a) accommodating to the new culture, and (b) retaining or relinquishing the old culture. This suggests that as an organization changes its culture, individuals try to adapt to the new while retaining parts of the old they consider to be important.

Boekestijn (1988) indicates that in addition to cultural adaptation that can be viewed as adjustment by an individual to the new culture, individuals simultaneously experience a need for identity maintenance. This can be viewed as the self-concept adjustment required within an individual as they adjust to the new culture. For example, if a person who has been a machine operator in the factory who has been told exactly what to do and how to do it, is now asked to become part of a team to improve production processes, develop new skills needed to participate in the new processes, and be responsible for monitoring the quality of what she/he produces, the person would need substantial realignment or adjustment in their work self-identity.

The "clash" that occurs between the old and the new cultures has led Berry (1980) to identify four patterns of acculturation according to whether a person decides to try and retain past cultural identity and/or to seek positive relations with the new culture:

1. Assimilation - continuous movement toward the new culture, relinquishing the old culture;
2. Integration - synthesis of the two cultures (i.e., retaining both);
3. Rejection - of the new culture and reaffirmation of the old culture; and
4. Marginalization or "deculturation" - alienation from both cultures.

Berry points out that the particular pattern an individual adopts in reference to a new culture is strongly influenced by the strength of reinforcement factors within the person's past culture. For example, if a person is a member of a union that clearly defines the legitimate roles for its members and the new culture seems to conflict with those roles, there will be more resistance. Or, if the person comes from a family where the work culture belief is that they are workers who are to do only what others tell them to do without question, he/she may view taking responsibility for

new roles as inappropriate. Rejection and marginalization are more likely if the old culture is supported by such factors that reinforce strict adherence to the old culture and are in conflict with the new culture.

As people attempt to adapt to a different work culture, they go through a number of adjustments. Gudykunst and Hammer (1988) identify two emotions that must be dealt with during cultural adaptation: uncertainty (not being sure how to behave), and anxiety (feeling a lack of security). Ruben and Kealey (1979) identify three stages of successful cultural adaptation. First, people experience an initial, often transitory reaction during the first few weeks in a new culture that has been widely called "culture shock" (Oberg, 1960). This phenomenon has also been identified by Byrnes (1966) as "role shock". Culture shock is the realization that the new culture is not like the old and that the "rules of the game" have changed. Second, as culture shock subsides, psychological adjustment begins and people try to become more comfortable in the new culture and to improve their general psychological well being. Third, if psychological adjustment is successful, with time many people rise to a level of being able to interact effectively in the new culture, and cultural adaptation is achieved. However, those people who cannot make adequate psychological adjustment will likely return to the old cultural norms, and if they cannot do so, they will withdraw. Withdrawal can manifest itself in many ways. Often, it results in people going through the motions to seem to be cooperative but not actually contributing to the organization's goals.

Grove and Torbiorn (1985) present three psychological constructs which can be helpful in understanding how performance is affected during the acculturation process: (a) applicability of behavior, (b) clarity of mental frame of reference, and (c) level of mere adequacy. Applicability of behavior refers to the extent to which a person's behavior is consistent with the behavior expected in the environment, and is socially acceptable and is interpersonally effective. In other words, applicability of behavior is the extent to which an individual is performing to the expectations of the organization. Frame of reference refers to the extent to which a person's values, attitudes, opinions, ideas, and knowledge are internally consistent within an individual and consistent with the new culture. The more consistency, the higher the clarity of the frame of reference. If the new cultural expectations are viewed as similar to the old cultural expectations, the new culture will be consistent with an individual's frame of reference. If the new expectations are significantly different from the old cultural expectations, the person's clarity of frame of reference will be low. The new culture will not be consistent with the individuals past values, attitudes, opinions, ideas, and knowledge. Level of mere adequacy refers to behavior that is barely acceptable and minimally effective. It is the lowest level of behavioral adequacy that reflects minimal adjustment to the expectations of the new environment.

In a highly familiar environment, a person's levels of applicability of behavior and clarity of frame of reference are both high, and therefore, performance is usually much higher than being merely adequate. When a person enters a highly unfamiliar environment, the model suggests that the process of successful cultural adjustment or adaptation occurs in four distinct stages.

Stage I - Applicability of behavior drops below the level of mere adequacy, but clarity of frame of reference remains high. This is the stage in which tourists find themselves: even though their behavior does not quite apply, they retain their frames of reference because they know that their stay is temporary and they will soon be returning to their familiar environments. This stage is similar to "culture shock." This is likely to occur when the organization begins to change its culture. Many employees will tend to feel this will pass and do not pay much attention to it.

Stage II - Applicability of behavior remains below the level of mere adequacy and clarity of frame of reference drops. This occurs among those who realize they will not be returning to the familiar cultural environment and find their old frames of reference as well as their behavior ineffective or inadequate.

Stage III - Typically, with training or experience, applicability of behavior rises above the level of mere adequacy, whereas clarity of frame of reference lags behind. For example, some people learn the types of job skills required on the job but their sense of personal security and comfort has not yet been established. They are still not able to perform at their full potential.

Stage IV - Both applicability of behavior and clarity of frame of reference continue to improve and performance rises above the level of mere adequacy to desired performance levels.

Implications for Organization Development and Training

Organizational change is implemented to improve the quality and productivity of an organization. Creating a learning organization is founded on the premise that all employees should be involved and contribute their knowledge to the collective knowledge of the organization as it evolves. A further assumption is that employees in a learning organization will perform beyond the level of mere adequacy. The various theories presented above have a number of common threads that must be considered as organizational change takes place. First, a change in culture has a profound effect on employees. The ease with which individuals can adapt to such change is affected by many factors, two of which are the extent to which the new culture is different from their past work culture, and the extent to which the old culture is reinforced by other factors in an individuals environment.

Second, adapting to a change in culture requires not only learning new skills but it requires an adjustment in self-concept. Different cross-cultural scholars have addressed this issue in various ways, Grove and Torbiorn refer to this process as adjusting clarity of frame of reference, Gudykunst and Hammer refer to it as reducing uncertainty and anxiety, Boekestijn refers to it as maintaining identity, and Szapocznik and Kurtines refer to it as accommodating the new culture and relinquishing the old.

How can trainers help employees with adapting to a new organizational culture? First, they must obviously help the employees to develop the skill sets required in the new culture. These might be technical as well as interpersonal skills. But beyond skill training, attention must be placed on addressing the stress and anxiety that comes from culture change. The process might start with an analysis of the differences in expectations between the new and old culture. For example,

Old Culture	New Culture
1. Work Instructions a. Given by the supervisor b. Explicit to exact method of carrying out the tasks c. Management will determine the method	1. Work Instructions a. Given by the supervisor b. Work group expected to develop and recommend best process c. Each employee is expected to contribute to the process
2. Method of judging performance a. Supervisor	2. Method of judging performance a. Supervisor, and b. Workgroup - each employee is expected to rate the productivity of each other member
3. Responsibility for training a. Company	3. Responsibility for training a. Company - for company wide initiatives b. Employee for specialized employee skills
4. Work environment a. Work alone	4. Work environment a. Work as part of a team

The analysis might then continue with a traditional analysis of the types of skills a person will need in order to function in the new culture. Given the example above, the employees might require teamwork skills, performance assessment skills, etc. But in addition, they will need to adjust mentally regarding the new expectations and their roles in carrying them out. For example, their comfort with and beliefs about: (a) evaluating their performance or the performance of others, (b) working in teams to helping set work expectations and develop work processes and then to implement them, and (c) assessing the specialized skill sets they need and taking the initiative to develop them. These less tangible skills also need to be analyzed and attempts need to be made to help employees adjust their frames of reference if the employees are going to move beyond the level of mere adequacy. If these frame of reference items are not addressed, it is unlikely that individuals will participate fully in the organizational change and the benefits of a learning organization will not be fully achieved.

One technique for identifying interventions which might allow employees to adjust their frames of reference and embrace the new culture more quickly might begin with a list of the differences between the new cultural expectations and the old, as was exemplified above. The next step would be to ask employees within

different sub-cultures associated with various types of jobs within the organization to review the differences and have them indicate their comfort with behaving in the new ways and why they feel they are or are not appropriate. This information could be gathered in group sessions or with anonymous questionnaires. The information could then be used to develop materials and to conduct discussion sessions focused on addressing the barriers to adopting the new culture. If employees are uncomfortable with implementing new expectations, process facilitators might be needed during the initial phases of adopting the new culture. For example, teams might be led by facilitators who would concentrate as much on how people were feeling about implementing the new expectations as on the processes for implementing the new expectations. The emphasis would not be on how they felt about the team processes but about their participating in teams to meet organizational expectations. The information might also be used to identify factors in the environments of the employees that tend to reinforce the old culture in opposition to the new. For example, if union expectations are not consistent with the new culture, there may be a need for discussions with the unions aimed at resolving differences. If employees' families are identified as external factors inhibiting change, materials focused on influencing family views about the value of employees working differently might be appropriate.

After analyzing the skill sets needed by employees to meet the new cultural expectations and factors affecting their frames of reference, the two lists could be reviewed to determine where to start implementing the change. Training could then take place on the skill sets required and interventions could be designed to address frame of reference concerns. Training and the interventions would probably need to take place on both sets simultaneously. The challenge will be to determine which is the most significant barrier to each specific performance expectation. Is it the lack of skill that is affecting a person's frame of reference or is it the person's frame of reference that is affecting their ability to develop and implement the skill set? If employees do not see a need for or are not interested in developing a skill set, they probably do not see value in it or do not believe in it. Therefore, frame of reference interventions might often be the first level of intervention in organizational change, often preceding training.

The Moderating Effects of Individualism and Collectivism on HRD as an Instrument of Modernity

Carol D. Hansen
Georgia State University

This paper challenges the ability of Western-based models of HRD to culturally contribute to organizational modernity in developing countries. Constructs of individualism and collectivism provide the basis for theoretical discussion. Exerts from studies conducted in Cote d'Ivoire, Ghana, and Senegal offer illustrative examples.

Key words: Organizational Modernity, Individualism/Collectivism, Culture in developing nations

In recent years, scholars have explored how new forms of organizational design and development might improve the productivity and international competitiveness of emerging and transitioning economies. Much of this inquiry has occurred through the ideological lens of modernization theory (Bradshaw & Wallace, 1996,). This view emphasized cultural, economic, and institutional factors within countries to explain why some regions and countries were richer, more democratic, technologically advanced, and internationally competitive than others. To study the cultural factor, researchers found it attractive to focus on the constructs of individualism and collectivism (I-C). This theory suggested that collective societies were less advanced because they discouraged innovation, risk-taking, competition, and personal recognition and achievement (e.g. Hofstede, 1980; 1991; Giddens, 1991; Schwartz, 1994; Triandis, 1995). Indeed, much research suggests that collective societies are, for the most part, less modern (Hofstede, 1991; Triandis, 1995).

Collectivism, in less modern societies, presents a formidable challenge to Western based HRD models that are grounded in the cultural norms of individualism. In addition to different concepts of self and group behavior, our understanding of collectives is made more difficult because of the underestimated and potentially destructive power of group alliances. That is, the solidarity found in collective cultures can cause not only fierce loyalty within groups, it can lead to territoriality and rivalry between groups in the workplace. In culturally heterogeneous societies, these trends can dominate organizational life and fragment HRD attempts at advancement through the erosion of trust and cooperation. Such is the case in many developing nations; especially those found in Africa.

This paper will present a theoretical discussion of the moderating effects of I-C on HRD as an instrument of modernity in lesser-developed nations. Three points will shape this discussion:

1. The human side of organizational advancement and modernization requires workers to trust and cooperate with one another. Aspects of I-C influence trust and cooperation.
2. Western based HRD models encourage organizational advancement and modernization, through trust and cooperation, by appealing to the attributes of individualism.
3. These values are at odds with collectivists and can thwart advancement and modernization in collective cultures, especially in culturally heterogeneous nations.

Modernization, Trust and Cooperation

Modernization theory divides the world into two categories, the modern and the less modern or traditional. Higher levels of industry, advanced technology, an educated population, a large middle class of consumers, low unemployment and food sufficiency characterize modern nations. Culturally, the modern world values, for example, a strong work ethic, clear goals, timeliness, creativity and initiative, entreprenurialism, savings and investment. The traditional world exemplifies opposite values and characteristics (Rostow, 1960). Modernization theory is, in essence, a theory of social change (Bradshaw & Wallace, 1996). Thus, with the assistance of Western, more modern, countries, lesser-developed nations will become modern economies, institutions, and cultures. The major risk associated with this theory is its ethnocentrism; the notion that the West is best and that one model can fit all. Scientists and international development leaders now recognize that development efforts often fail because they imposed Western models that were culturally foreign (Jones, 1989; Dia, 1996). That is, Western-based efforts must

Copyright © 1999 Carol D. Hansen

have the buy in and trust of the local recipients. To ensure trust and cooperation in change interventions, new approaches and models must be culturally sensitive to current values and belief systems (Rogers, 1973).

In general, it appears that high trust cultures are associated with modern organizations. Trust promotes cooperation (Mayer, Davis & Schoorman, 1995;McAllister, 1995) which can contribute to organizational effectiveness through extrarole behavior and better citizenship (Organ & Ryan, 1995; Van Dyne, Cummings & Parks, 1995). Many researchers have additionally argued, for example, that high trust cultures support cooperation and teamwork (Jones & George, 1998), innovation and synergy (Fukuyama, 1995), strategic alliances (Das & Teng, 1998), and a competitive advantage (Barney & Hansen, 1994).

For trust to transpire, certain conditions are necessary which include risk and interdependence (Rousseau, Sitkin, Burt & Camerer, 1998) and venerability (Bigley & Pearce, 1998). In essence for trust to occur, individuals must be open and willing to believe in the goodness of others and depend on them for help in times of perceived threat. Equally important, was Rotter's (1980) research as reported by Bigley & Pearce. Rotter concluded that one's predisposition to trust is influenced by one's early life experiences, which suggests that the cultural referent of one's family and kin is especially meaningful. Also addressed was the importance of trust in situations of change. According to Rotter, as situations become increasingly unfamiliar, the influence of one's predisposition to trust has more influence over behavior. Thus, alien situations, such as the modernization of an organization's HRD practices, will enhance a natural inclination to trust or distrust while greatly influencing the willingness to depend, share, and cooperate.

Trust and cooperation are also culturally bound. Culturally contingent models of trust (Doney, Cannon & Mullen, 1998) and cooperation (Chen, Chen & Mendl, 1998) have been tied to I-C. Both models suggest that individualistic cultures are more calculating in their decision to trust and cooperate. Issues of professionalism and performance influence individualists. They expect their partners to full fill contractual arrangements and treat each other fairly. Moreover, individualists are likely to join groups only when this is instrumental to their personal goals. Collectivists, on the other hand, are more affective in their reasoning. Role expectations are not confined to task performance nor are they formally prescribed. Enduring social relationships that are both formal, i.e. ethnic ties and informal, i.e. school friendships drives trust and the willingness to cooperate. For individualists, emotional trust rarely comes before cognitive trust. The reverse is true for collectivists.

Culture, Collectivism and Individualism

All cultures operate from conceptual prototypes by creating belief systems to filter expectations for appropriate and inappropriate behavior. Business cultures are influenced by the societies in which they reside (Hofstede, 1980). Their work along with that of Adler (1997) and Laurent (1986) suggested that professional and organizational beliefs are shaped during childhood and are determined by family and societal referents. Given the early influence of kinship and community values, it follows that these belief systems retain a great deal of power, especially in culturally diverse nations, and that such early ties play strong roles through one's lifetime.

In addition to constituting a set of beliefs, culture is also a source of solidarity in both a territorial and spiritual sense (Bruner, 1990; Hamill, 1990). These ties tend to cause members of a given culture to see themselves as separate and unique. As cultures are, to a certain extent, ethnocentric (Adler, 1997), cultural groups, in many cases, tend to see themselves as superior to those of other cultures. In turn, cultural solidarity is emphasized and increased when individuals from one culture come in contact with those of another (Adler & Graham, 1988). What occurs is a tendency to protect and defend one's cultural identity as a way of maintaining the integrity and relative importance of its beliefs and values.

In recent years, scientists (e.g. Triandis, 1972; 1995; Hofstede, 1980; 1991; Trompenaars, 1993) have advanced the use of collective and individualistic constructs in the cross-cultural study of societal and work cultures. The following is a listing of conceptual attributes for individualism and collectivism as defined by Hofstede's 1980 study of IBM employees in 50 countries.

Individualism
"I" consciousness (self-orientation)
Value individual accomplishment
Tolerate individual behavior and opinion
Low loyalty to other people and institutions
Interact on an individual, competitive basis
Loose interpersonal ties

Collectivism
"We" consciousness (group orientation)
Value joint efforts and group rewards
Norms for behavioral conformity, personal opinions do not exist
High loyalty to other people and institutions
Interact in an interdependent, cooperative mode
Strong interpersonal ties
Group protection in exchange for unquestioning loyalty
Importance of harmony; saying no is considered confrontational

It is important to note that I-C is a continuum. That is, cultures may exhibit aspects of each dimension. The differential is where they place their priorities. For example, both individualists and collectivists may hold individual opinions as well as conform to group norms. A culture is classified, in this case, as either individualist or collectivist because of the relative importance it places on opinion types. In general, scholars agree that collective cultures are interdependent, place priority on communal goals, focus on group norms, obligations and duties and on relationships even when they are disadvantageous. The opposing attributes associated with individualism have been linked with modernity (Hofstede, 1980, 1991; Triandis; 1995). Triandis developed a model of cultural movement from collectivism to the modern state of individualism. He identified mobility, affluence, job specialization and exposure to mass media as contributors to this shift.

An aspect of the I-C dimension, that is extremely important to this paper is the tendency for collectivists to make a greater distinction than individualists between in-groups and out-groups (Triandis, 1995). Collectivists compete (Espinoza & Garza, 1985) more vigorously, exploit (Pandey, 1986) and are less likely to share information (Triandis, 1995) with out-groups than individualists. The importance of these issues has led not only to civil war, but also to the preferential allocation of jobs, public works, and educational opportunities.

Individualism in American HRD Beliefs

American culture has been classified as highly individualistic (Hofstede, 1980; 1991; d'Iribarne, 1989). Organizational cooperation and trust in American corporations is possible when people feel secure in their individual rights. Americans want to believe that their individual efforts and, in particular, the willingness to go the extra mile, will make a difference to the overall outcomes of the organization. Likewise, they as individuals, will benefit respective to the effort that they personally contribute.

To guarantee independence in work approaches and to ensure recognition for their accomplishments, Americans symbolically think of work as a contractual relationship with detailed limits, rights, and expectations (d'Iribarne, 1989). In his ethnography of the American workplace, d'Iribarne found that individual self-reliance was critical to the cultural makeup of the United States because the American's greatest fear was to be dependent on others. The contract, he concluded, permits Americans to protect themselves from the arbitrary control of their superiors. A well-defined contract explains what the individual will sell of himself to an organization and what the individual can expect to receive in return for services rendered. Thus a contract, in the form HRD practices, promotes trust in the American workplace through its use of clearly stated job descriptions, promotional criteria, career paths, training objectives, etc. Such instruments define expectations and reduce the risk of subjectivity.

HRD principles and models were first developed in the West. Most specifically, we first saw a professional identity and an establishment of definitions and professional goals in the United States. Born out of a highly individualistic culture, American developed HRD models require the legitimacy of individual thought and development. This does not mean that group efforts are devalued. Rather, this means that the individual is not culturally subordinate to the group in his right to creativity contribute and learn.

The following are belief statements about American HRD functions. These assumptions were supported by Hansen, Kahnweiler, and Wilensky's ethnographic study of practitioner ideals and expectations for how their profession should be exercised (1994) and were reflected in research where HRD practitioners described their anticipated role and functional scope in American corporations (McLagen, 1989; 1993). McLagen's results were used by the American Society for Training and Development to develop a set of professional HRD competencies. Please note the following characteristics do not necessarily offer information about how HRD is currently practiced in organizations. They describe, instead, what American practitioners *believe to be true* about the purpose and goals of their field.

Training should permit individual learners to grow and develop beyond the present needs of his or her job. In addition to task-related material, trainees should learn about such skills as communication, team building, and strategic planning and participative management.

Career development should include committed, systematic, professional advising, career planning, career paths, developmental appraisal systems, and results tracking. Career planning should reflect an integration of individual and business goals.

Organizational Development should permit individuals and their organizations to move towards more collaborative, developmental, flexible, delayed, customer-focused cultures. It should enhance communication, work structures, and processes.

American HRD values, while encouraging collaboration, place emphasis on the developmental freedom of the individual and so, the locus of control is clearly personal. Thus, individual drive, creativity, and collaboration with other individuals can and should promote organizational development. Training, for example, is more than a job requirement. It is an opportunity for personal advancement. Such thinking may in part explain why American companies spend more on management development training than on any other form of corporate instruction. As Americans we believe in workplace democracy and that any individual who is willing to work hard at learning can advance if given the right educational opportunity. Even statements about organizational development, which is the category that focuses the least on the individual, encourage flexible work cultures where individual ideas and initiative can thrive through less bureaucracy and hierarchy. Likewise, shared decision making approaches imply that judgement should not rest in the hands of a select few; but rather the ideas of all pertinent individuals should be taken into account because creative perspectives and solutions can come from anywhere within an organization. Thus as the individual grows in responsibility and participation, so does the organization, as a whole.

HRD and Collectivism

In collective cultures, individual rights, freedoms, and accomplishments are not as important. What drives behavior is a deference to the group at the cost of individual or organizational performance. Thus, the locus of control is in the collective and not in the individual.

In the logic of collectivism, it would be appropriate to replace the term individual with the word group in beliefs statements associated with training, career, and organizational development. Likewise, the emphasis would be on relationships and how HRD practices might be used to reward group loyalty and advance the status and prospects of one's group. Conformity and group norms would be emphasized over individual growth and achievement. Finally, performance expectations would be nonspecific and remarks about results and objectives would be vague.

An important aspect of the collective model is group preservation. HR decisions in collective cultures, especially in socially heterogeneous societies where there are many different groups vying for position and advantages, are often influenced by the need to favor and reinforce the status of one's in-group at the expense of out-groups. In this case, the emphasis is not just on the group; it is on *protecting* the group. The obligation to protect safeguard's the group's survival, solidarity, and image. HRD models in collective cultures should be especially sensitive to this feature.

Data from three West African countries, Cote d'Ivoire (Hansen & Headley, 1998), Ghana (Gardiner, 1996) and Senegal, (Tidjani & Gaye, 1995) illustrated the characteristics of collectivism in societies that were socially heterogeneous, especially how the need to preserve and protect one's collective impacts the workplace. In Pan African terms (Binet, 1970; Khorza, 1993; Triandis, 1995) and on a regional basis (Hofstede, 1991) the value systems were described as consensual, nurturing, predisposed to high power gaps and possessing low levels of anxiety. Hofstede ranked West Africa, as a region, low on individualism with a score of 41 on a scale of 50 nations and three world regions.

Over 60 ethnic groups, each with their own language or dialect were reported for the Cote d'Ivoire. In Ghana and Senegal there were approximately 20 key kinship groups and languages. However, in Senegal religion sects played a stronger role in diversifying groups than ethnicity. In pre-colonial times, ethnic and religious groups were a part of a large West African empire that tended to bind groups under one hegemony while governance was decentralized. In essence, the notion of a nation state was artificially created by the Europeans as a way of balancing their political interests with those of their colonial rivals. Currently, the head of the largest ethnic group in Cote

d'Ivoire lives in Ghana. Given this tendency, it was not surprising that political boundaries have often been ignored by the local citizens as ethnic and religious groups retreated into the relative security, solidarity, and protection of their *own kind*.

In all three countries, the *obligation to protect* the in-group was key to understanding organizational behavior in all types of business, occupations and at all levels within a company. Members of the same in-group generally held positions of trust. Jobs were often unnecessarily created in order to provide employment for group members. Obligation pressures clouded issues of accountability, as kinsman believed that they were entitled to protection by other family members, regardless of their mistakes, which often complicated accountability and sanctioning measures. Moreover, managers distrusted their employees and vice versa. This lack of control and confidence in managerial competence were outcomes of subjective hiring and promotional methods. Obligation and protection concerns typically led to some degree of group rivalry and nepotism that impacted workplace decision-making and reward structures. As a result, less favored employees became demotivated, psychologically distanced themselves from their companies and unconsciously sabotaged attempts to transform work practices and attitudes.

Hansen and Headley's research yielded findings about HRD practices in the Cote d'Ivoire. In general, they found a lack of systemic and systematic approaches to training, career and organizational development. Training decisions, for example, were seldom linked to organizational needs and performance deficiencies. Career development was inconsistent and often occurred more as an informal form of mentoring between a manager and a favored employee from the same social network. In Cote d'Ivoire and Ghana, social relationships and group membership were discreet. It was simply known who was related to whom and who was a close friend of whom. In Senegal, sect solidarity was more obvious. Groups called *dahiras*, whose purpose was to reinforce both the spiritual and social aspects of their sect, openly existed and operated in the workplace.

Implications

While the moderating effects of culture are generally recognized as significant in HRD (Hansen & Brooks, 1994; Petersen, 1997) scant importance has been given to I-C. To develop culturally sensitive and appropriate interventions for nations with different value bases, we need to comprehend the cultural roots of our own models. The I-C dimension is a helpful tool for understanding the emphasis on the individual that is reflected in Western, especially American, developed approaches to employee and organizational development. These values, while linked to modernity, may not necessarily be an instrument of modernization. When models vary significantly from prevailing cultural norms, their acceptance can be delayed, distorted, or ignored. In short, HRD models grounded in the attributes of individualism may thwart trust and cooperation and thus be counterproductive in collective cultures.

The avocation of individualist values in collective societies is problematic in several ways. First, in collectives one's first consideration is to one's in-group. The expectation is that individuals will achieve, grow, and make organizational contributions that respect the needs and priorities of the group. When individual development occurs independently, in ways that do not respect group obligations, the individual is considered selfish and often penalized through social abandonment. Individual misfits must then psychologically deal with the sense of shame that comes from failing to protect one's in-group. Second, encouraging individualist values may diffuse the natural order of group solidarity and cause dramatic chaos that organizations may not be prepared to address. Dramatic change, in some cases, is the only way to transform nonproductive traditions. However, change of this magnitude goes to the heart of societal values and beliefs. Organizations must be able to offer the same emotional and financial support that group members find in their family and religious in-groups. Organizations must also be willing to make a long-term commitment to change, as transformation must additionally and perhaps first occur within society. Observers in Cote d'Ivoire estimated that it would take one to two generations to eradicate the collective solidarity of ethnic clans. Finally, the individualist's need for personal recognition, when elevated to the level of the group, may exacerbate competition and conflict between groups. Perhaps the aspect of collectivism that has been the most underestimated in importance is the rivalry between groups.

Three theoretical propositions emerged as a result of the arguments put forth in this paper. They are:

1. In culturally collective and socially heterogeneous countries where resources are limited, the obligation to protect one's ethnic in-group will counter the trust and cooperation needed to support organizational modernity.
2. Where organizational trust and cooperation are lacking, HRD interventions will be less effective.
3. HRD interventions grounded in the principles of individualism will be less effective in culturally collective and socially homogenous countries.

Research is needed that explores the I-C dimension in HRD in less modern nations. This paper discussed the two constructs as diametrically opposed. However, as earlier stated, I-C occurs as a relative continuum. That is, cultures *tend* to be more individualistic or collective. Thus a culture may have characteristics of both I-C. Scholars might question if the positive aspects of both constructs could be joined to reflect the relative tendencies of a given society. Culturally specific models of HRD could explore, for example, ways to encourage the spirit of individualistic creativity and performance that do not ignore the social solidarity of the group. It would be helpful to study these issues in real life situations of organizational change where tasks require people to trust and cooperate with one another. HRD models derived from ethnographic research would yield more culturally sensitive approaches through its emphasis on the emic perspective and the natural emergence of cultural categories and patterns. Likewise, longitudinal study could assess the effects of culturally specific interventions.

HRD Faculty as Leaders: The Application of the Full Range Leadership Theory to Graduate Level HRD Instruction

Ochieng Fred Walumbwa
K. Peter Kuchinke
University of Illinois atUrbana-Champaign

We used the Full Range Leadership (FRL) model to examine whether HRD faculty exhibit transformational, transactional, and laissez-faire leadership behaviors when conducting graduate level classes. Results are consistent with transformational leadership style. Transformational leadership and contingent reward behaviors were positively related with students' willingness to exert extra effort and student perception of instructor effectiveness.

Keywords: Instruction, Leadership, Training

Problem Statement

Human Resource Development (HRD) graduate instruction constitutes an important avenue for HRD professionals to attain the skills and competencies needed for successful professional practice. As such, graduate level instruction can be viewed as the preparation and training of future leaders in the field. Issues related to the process and quality of instruction and the characteristics of graduate faculty are, therefore, an important topic of research. Whereas research on the required skills and competencies of instructors and trainers is plentiful (e.g.: Leach & Sandall, 1995; Olson, 1994; Weischale, 1984), the instructional style of graduate HRD faculty has, so far, received little attention. Because graduates of HRD Master's and doctoral programs often advance into position of leadership in the profession, their training might be conceived within the framework of leadership education and development. The role of HRD faculty, in this context, expands from the exclusive focus on delivering content to one of modeling behavior, engaging students' affective identification with their future roles, and engendering a sense of pride and belonging to the profession.

These characteristics—role modeling, imbuing a sense of pride, and developing the ability to critically challenge assumption—are at the core of the notion of transformational leadership as developed by Bass (1985). While not leaders in the traditional sense, it is the premise of this study that HRD faculty teaching graduate level instruction might exhibit behaviors very similar to those of transformational leaders, and that such instructor behavior might affect the outcomes students experience during a course. The purpose of this study is, therefore, to examine whether or not HRD faculty exhibit transformational, transactional, and laissez-faire behaviors when conducting graduate level classes, and what outcomes might be related to such behaviors. The outcome of this study might point to new directions for the conduct of training and education in the university environment and, if found to apply elsewhere, in other training and development settings.

Theoretical Framework

The theoretical framework for this study is the Full Range Leadership (FRL) framework and instrumentation developed by Bass and Avolio (1995). FRL distinguishes among three groups of behaviors that leaders might exhibit: transformational, transactional, and laissez-faire. These do not occur as pure types, and no normative claim is made for the superiority of a given behavior. Many empirical studies, however, have indicated that transformational behavior is frequently associated with higher levels of employee satisfaction and willingness to exert extra effort to reach a given goal (Bass & Avolio, 1995). Further, there is a growing body of empirical literature that links transformational behaviors to organization-level results (e.g.: Shamir, 1998). In this study, this framework will be adapted to fit a university instruction setting. Borrowing from transformational leadership theory, the following dimensions of instructional styles will be investigated: charismatic, inspirationally motivating, intellectually stimulating, and considerate of individual needs. Transactional styles will be defined as either contingent reward or negative reinforcement. The third style, laissez-faire, is defined as a single dimension.

Copyright © 1999 Ochieng F. Walumbwa and K. Peter Kuchinke

Three instructional outcomes were investigated: students' willingness to exert extra effort to meet course objectives, students' perceptions of the instructor as effective, and students' levels of satisfaction with the instructor. The FRL framework and existing instrumentation were modified to reflect the instructional setting of this study.

Research Questions

The overall objective of this study was to examine the extent to which the Full Range Leadership (FRL) theory applies to graduate level HRD instruction settings. In particular, the following research questions were addressed:

1. Do instructors demonstrate transactional, transformational, and laissez-faire instructional styles?
2. How are the transactional, transformational, and laissez-faire dimensions correlated in graduate classroom situation?
3. How are the transactional, transformational, and laissez-faire styles associated with learner satisfaction, perception of instructor effectiveness, and learner willingness to put in extra effort?

Literature Review

Organizations throughout the world are experiencing a state of uncertainty and change. In the United States, the productivity of work organizations and changes in the demographics of the work force are major concerns (Goldstein, 1993). The shift in the economy from manufacturing to service orientation, the trend toward more highly technological, sophisticated systems, increased globalization, and high customer expectations are major concerns for most organizations today (Goldstein, 1993). To address these issues, training has not only been viewed as a positive prospect for new entrants and those already in the work place, it is seen as a feasible alternative for providing opportunities and skills required to increase performance and productivity (Goldstein, 1993). It is, therefore, not surprising that the issue of required skills and competencies of trainers has received an increasing attention in the field of HRD in recent years (Leach & Sandall, 1995; Olson, 1994).

Some researchers suggest that despite the need for up-to-date training methods—needed because of the rapid changes in the workplace created by new technology—educators in business and industry still use traditional methods of training (Stuckey & Berardinelli, 1990). To address this problem, researcher like Keith and Gresso (1997) have proposed the introduction of new innovative strategies to.

Transformational Leadership

Empirical studies on transformational leadership demonstrate that it has significant effects on followers' attitudes, commitment, satisfaction, and performance (Kirkpatrick & Locke, 1996; Lowe et al. 1996; Shamir et al. 1993). It is a key ingredient in gaining confidence and coping with stress among teams (Neumann, 1992). Burns (1978) used the term transformational leadership to refer to individuals who recognize the existing needs of potential followers, but go further and seek to satisfy higher needs to engage the full follower's full self in terms of Maslow's hierarchy of needs. Transformational leaders raise followers' levels of awareness of the importance of achieving valued outcomes, suggest strategies for reaching those outcomes, and encourage them to transcend their self-interests for the sake of the team, organization, or larger policy (Bass & Avolio, 1997).

Bass (1985) identified four components of transformational leadership: charisma, inspirational motivation, intellectual stimulation, and individualized consideration. Charisma is leader behavior that gains the respect, pride, trust and confidence of followers by transmitting a strong sense of vision and mission. Charismatic leaders are viewed as role models because of the personal sacrifices and their ability to competently remain calm in crises. Inspirationally motivating leaders behave in ways that motivate and inspire those around them by providing meaning and challenge to their followers' work. Such leaders creates a positive and cheerful environment for identifying conflicts and expected solutions (Bass, 1998). Leaders are intellectually stimulating to the extent that they challenge followers to be creative, think critically on their own, and encourage them to question old assumptions and find new ways of solving existing problems. Thus, followers are encouraged to seek a wide range options to reach desired results (Bass, 1998). Individualized consideration is concerned with developing followers by coaching and mentoring. Such leaders pays special attention to each individual's abilities, aspirations and needs to enhance followers' confidence in responding to problems facing them and their organizations.

Transactional Leadership

Transactional leadership is based on the idea that leader-follower relations are enhanced by a sequence of bargains between the leader and the follower (Den Hartog, Van Muijen, & Koopman, 1997). It emphasizes the exchange that takes place among followers and leaders. Bass identified three components of transactional leadership: (1) contingent reinforcement or contingent reward, (2) active management-by-exception, and (3) passive management-by-exception (Bass, 1985). The contingent reward component of transactional leadership is based on the assumption that reward is the overriding principle for effective performance. The follower's needs are identified and then linked to both what the leader wants to achieve and the rewards associated with the effort of the follower. Leaders who practice management-by-exception take action only when things go wrong and standards are not met. Active management-by-exception represents a style where leaders take an active role by continuously monitoring followers' performance to avoid any possible error that might emerge. Passive management-by-exception leadership is characteristic of leaders who intervene and take actions only after problems have occurred.

Laissez-faire Leadership

Laissez-faire or non-leadership is the third component of FRL. In laissez-faire leadership, there is complete absence of leadership. The leader is entirely not responsible for anything. Laissez-faire leaders avoid decision making and assuming responsibility. By definition, it is the most inactive and ineffective type of leadership according to most research studies (e.g.,: Bass, 1998).

Although research studies indicate that transformational leadership has stronger association with followers' satisfaction and performance, this does not imply transformational leadership is a substitute for transactional leadership. According to most research studies, transactional leadership provides an essential base from which transformational leadership extends its influence to broaden leader effectiveness (Loo, Kennedy, Dean, & Sauers, 1998).

Research Design and Methodology

The sample for this exploratory study consisted of graduate HRD students in four classes at a large Midwestern University. Overall enrollment was about 60 students. Consequently, four graduate level classes were selected, two small classes (6 - 10 students) and two larger classes (15 - 20 students). Sixty percent of the participants were female and 40 percent male. Students as well as the instructors were asked to complete written surveys.

Data was collected during the last three weeks of the semester after approval to conduct the study was obtained from the Human Subject Committee. The purpose of the study was explained to the participants, and it was stressed that the aim of the study was not to evaluate their instructors, but to seek their perception of the instructor's instructional styles. Students and faculty were asked to complete the questionnaires. Students' participants ranged in age from 21 to 54 years (M=31; SD=9.14). Forty percent of the students had bachelor's degrees in arts and science; 56 percent had master's degrees in the fields of arts, business administration, education or science. The students' full working years of experience ranged from zero to 33 years (M=6.91; SD=4.48). Most of the student participants came from the field of business administration, education and psychology. Tables 1 and 2 below show the descriptive statistics and frequency distribution for the demographic information of faculty and student participants.
A modified version of MLQ Form 5X (Bass & Avolio, 1995) was used in this study to identify the behaviors underlying the transactional, transformational and laissez-faire instructional behaviors. The MLQ has extensively been used in nearly over 200 field and laboratory research studies in numerous business and industrial firms, military organizations, governmental agencies, colleges, and secondary schools. The MLQ items were based on a 5-point scale (0=Not at all to 4=Frequently, if not always). There were two questionnaire forms: the self-rating form, where the instructors rated themselves and the rater form, where the students rate their instructors. The instructors were asked to complete the self-rating forms, while the students completed the rater form. The MLQ 5X (revised) had 45 items (36 leadership items and nine outcome items) in each form that identify and measured key leadership and effective behaviors. Transformational leadership style had 20 items (sample item: "My instructor treats me as an individual and not just as one of the class"), the transactional style had 12 items (sample item: "My instructor provides me with assistance in exchange of my effort"), and laissez-faire had four items (sample item: "My instructor avoids getting involved when important issues arise"). The key leadership outcome of extra effort had

three items (sample item: "My instructor heightens my desire to succeed"). Effectiveness had four items (sample item: "My instructor leads a class that is effective") and satisfaction had two items (sample item: "My instructor works with me in a satisfactory way").

Table 1
Demographic Information of Student Participants (N=53)

Descriptive	n	Mean	Min	Max	SD
Age		31	21	54	9.14
Working Experience		6.91	0	33	4.48
Degree					
Bachelor's	21	40%			
Master's	30	56%			
Advanced Certificate	1	2%			
Ph.D.	1	2%			
Gender					
Female	32	60%			
Male	21	40%			

Table 2
Demographic Information of the Faculty Age and Years of Full-Time Working Experiences (N=4)

Descriptive	n	Mean	Min	Max	SD
Age		40	30	44	6.68
Working Experience		16	10	21	4.69
Degree					
Ph.D.	4	100%			
Gender					
Female	1	25%			
Male	3	75%			

Although the MLQ has previously been used in institutions of higher learning certain terms were changed to suit this study. The term 'leader' was substituted with 'instructor'; 'others' in the self-rating form with 'students'; 'group' with 'class', and 'performance' goals with 'training' goals. These changes were necessary to minimize confusion that could arise in the use of such terms in an educational setting.

Data Analysis

The reliability and internal consistency of the MLQ 5X instruments were assessed by calculating Chronbach's alpha (α). According to literature (Nunnally, 1967), an α greater than .70 (α>.70) is acceptable. In this study, Cronbach's α and the average of inter-item correlations (phi-coefficient) were calculated for each of the 7 leadership scales and the three outcome variables. A general criterion of an α >.70 was adopted. Scales that did not meet this criterion were left out of subsequent analyses. Finally, the Pearson Correlation Coefficients between the six leadership scales and two outcome variables of the MLQ 5X were calculated.

Results

The scale statistics for the leadership scales and three outcome variables are reported in Table 3. Six leadership scales and two outcome variables recorded high reliability and internal consistency as calculated by alpha. The Laissez-faire leadership and satisfaction scales were excluded from the final analysis because they did not meet the general criterion of an α >.70.

Table 3 shows the MLQ 5X items and their means and standard deviations. These results are consistent with the previous studies (see for example, Bass & Avolio, 1997). The means for transformational scales ranged between

2.91 and 3.35 which implies that these behaviors were observed more often than transactional behaviors. This may further suggest that instructors are typically transformational. Similarly, the means for the two outcome variables (EE, EFF) were reasonably high, 3.14 and 3.34. Table 3 also shows the means, standard deviations and alpha for the transactional leadership, transformational leadership and laissez-faire leadership dimensions. The mean for the transformational scale was high (3.18), while the mean for the transactional scale was lower (1.65).

Table 3
Descriptive Statistics, Co-efficient and Reliability Scores for MLQ 5X for Students (N=53)

Scale	No of Items	Mean	SD	Alpha
Transformational	20	3.15	.62	.92
CL	8	2.91	.67	.77
IM	3	3.32	.71	.81
IS	4	3.35	.60	.70
IC	4	3.19	.82	.78
Transactional	11	1.65	.55	.70
CR	4	3.42	.62	.71
MBE	8	.93	.74	.81
Laissez-Faire	4	.41	.48	.18
EE	3	3.14	.80	.81
EFF	4	3.34	.71	.83
SAT	2	3.38	.75	.60

Note. ***Key***: CL = Charisma IM = Inspirational motivation IS = Intellectual stimulation
IC = Individual consideration CR = Contingent reward MBE = Management-by-exception
EE = Extra effort EFF = Effectiveness SAT = Satisfaction

Table 4 shows the correlation between transformational and transactional and the two outcome variables. The Intercorrelations among the four transformational leadership scales and the transactional scale were positive and significant. These results are consistent with previous investigations that indicate that leaders exhibit both transactional and transformational leadership (Bass & Avolio, 1995).

Table 4
Correlations Between MLQ 5X Leadership Scales and Outcome Variables

	Trans	CL	IM	IS	IC	Transact	CR	MBE	EE
Trans									
CL	.98**								
IM	.88**	.82**							
IS	.71**	.67**	.73**						
IC	.91**	.86**	.75**	.50**					
Transact	.31	.48*	.32	.30	.24				
CR	.85**	.68**	.62**	.51**	.81*	.16			
MBE	-.01	.24	.12	.07	-.05	.93**	.21		
EE	.52**	.50**	.51**	.35*	.57**	.13	.64**	.03	
EFF	.51**	.42*	.49**	.46**	.55**	-.07	.69**	-.31	.70**

*P < .05; **p < .01
Key: Trans = Transformational; CL = Charisma; IM = Inspirational motivation;
IS = Intellectual stimulation; IC = Individual consideration;
Transact = Transactional; CR = Contingent reward; MBE = Management-by-exception;
EE = Extra effort; EFF = Effectiveness; SAT = Satisfaction.

Consistent with previous studies (1990; Bass & Avolio, 1997; Bycio, et al. 1995), transformational leadership was positively correlated with the learner willingness to put in extra effort and perception of instructor effectiveness.

Consistent with previous investigations (Bass & Avolio, 1993; Bycio et al. 1995), Table 4 indicates a positive, although not significant correlation between the transactional leadership scale of contingent reward and extra effort.

Discussion

The purpose of this study was to examine to what extent the Full Range Leadership (FRL) theory applies in a training/instruction situation. The results of the study lend support to the previous investigations that have shown the ratings of leader effectiveness associated positively with transformational leadership and contingent rewards; and negatively to transactional scale of management-by-exception (Bycio et al. 1995; Lowe et al., 1996). However, these results could be attributed to a number of factors, including the class and overall sample size. Consequently, further investigations are needed to ascertain these results before any generalization.

Limitations

Some limitations of this study merit a basis for future research regarding the applicability of Full Range Leadership to an instructional environment before the conclusions can be generalized. First, the student participant in this study came from different majors (e.g., business administration, education and psychology). Perhaps, the results would be different if the study involved students from the same major or a particular department with similar interests. Second, large samples size result in statistically significant differences between the means and correlations coefficients that may be practically significant. In this study, the sample size was small, not reasonably enough to make generalization.

Conclusions and Contributions to HRD

This was an exploratory study aimed at determining whether or not Full Range Leadership applies to an instructional setting. Although the study can not be generalized beyond the participants studied, from a research perspective it is a good starting point to further explore the relationship between training and the components of Full Range Leadership. Specifically, this study lays the groundwork for further investigation of FRL behaviors in other education and training settings, such as management development programs, in business and industry; and with a more diverse population and in larger settings. We recommend a full scale study with a large number of participants, particularly outside the school environment to determine if similar results can be found. In terms of its contribution to theory and practice, this study has added to the debate on the universality of the new leadership paradigm (Bass, 1997). It also lays the groundwork for innovative practice in training and education and to more effective development of trainers and HRD professionals.

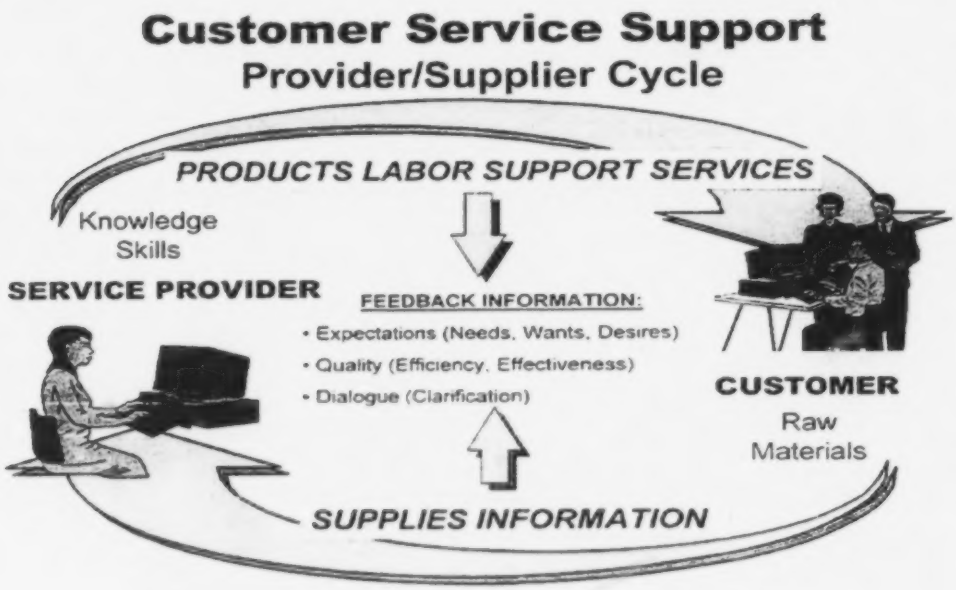
2-Way Customer-Service Provider Cycle

Harriet V. Lawrence
Albert K. Wiswell
Virginia Tech



Presenters Discussion

There are paradoxes in communicating a customer service orientation. First, responsiveness to customers can be detrimental when their needs are met beyond reasonable expectations. Second, who customers are can change depending on who is providing information, materials, services or products at a particular time. However, without satisfactory, ongoing dialogue and feedback throughout the service process, there are not likely to be "repeat" customers.

To provide a product or service to a customer, the customer's input is required. Importantly, this input needs to be solicited by the provider and given by the customer in a clear, complete, unambiguous and timely way. When this input on the part of both client and service provider falls short, then the result is often problematic.
This interactive model depicts responsibilities and transactions between the customer and service provider that must be communicated if optimal satisfaction is to occur. In this relationship, each party serves two interchangeable roles--sender and receiver of verbal and non-verbal information--but not necessarily at the same time.

A customer serves as a supplier when providing raw material to a contractor. A contractor serves as a recipient-customer specifying the requirements of the raw material and judging its quality; a contractor's work depends on communicating those factors.

Copyright © 1999 Harriet V. Lawrence and Albert K. Wiswell

Theoretical Base of the Model

Contemporary research into dialogue has taken a path through the human sciences (sociology, anthropology, communication, and psychology) as well as the physical sciences.

Martin Buber (1997), philosopher, described "dialogue" in 1914 as an interactive exchange between human beings who really listened to and mutually valued what each had to say to the other.

In 1957, Carl Rogers, psychologist--originator of "active listening"--held a dialogue with Buber where the back and forth conversation revealed a new self-awareness on the part of the participants, opening up new perceptions and shared meanings (1997).

David Bohm (1985), physicist, has contributed to a new way of understanding social organization and the workings of the human mind. Bohm believed our perceptions, meanings and communication are enfolded, one thought within another, so reality is never complete. Through dialogue, Bohm suggested that perceptions, assumptions, and "undiscussables" can be surfaced and clarified in a non-confrontational way. In an individual or group setting, Bohm believed a *collective mindfulness* could be maintained.

Kurt Lewin (Schein & Bennis, 1965) first used the word "feedback" in the late 1940s to underscore the necessity of feeding back the message to the sender so that the message could be adjusted or changed. Feedback influences decision making, problem solving, and information transmission; it creates energy and monitors automatic blaming. Chris Argyris (1985, 1993) described destructive attributions, defensive routines (model #1 theory-in-use) and the use of testing inferences (model #2 theory-in-use) for overcoming barriers to change in organizations.

This theoretical base and model is important to HRD in that it focuses on the breakdowns and problems between individuals and department teams that often take place during the internal customer service process. These problems in organizational communication reflect (a) ineffective (e.g., incomplete, inaccurate, unclear) human communication, and (b) conflicts and confrontations inherent in how differently people think and perceive "truth" in organizations. This model would inform decisions related to organizational development, training and interpersonal skills.

Poster Exhibition

This 2-way supply cycle model illustrates that the characteristics of a finished product depend largely on the tangible raw materials and the intangible issues affecting the two-way relationship. Some of these relational issues central to this model are the following:

- needs / wants
- expectations
- quality
- timeliness
- cost
- requirements
- discrepancies
- feedback

Customer-Contractor Transactions: A Dialogue Between T&D and Publications

Sally Turner has been in the publishing and printing business for 25 years. Respected as a no-nonsense, assertive, department head, Sally is known as a manager who communicates honestly. She catches up with Bill as he turns the corner mumbling to himself.

"Bill, what's happening?"

"Nothing much; that's the problem. I was counting on getting new configured PCs with our training video and course registration software. Now, it looks like it will be much later before its up and running for our use. The training center has been empty for the past two months waiting for the PCs and software. New employees and many other employees are waiting for training here and in the field."

"I can't promise when Information Systems (IS) will deliver. But I can promise my editors will work on your video and registration materials as soon as possible, Bill."

"What do you mean by *as soon as possible*, Sally?"

"I mean, as soon as we get your drafts, once the IS people have edited these materials, we can work with them to set up the catalogue like we always do."

Bill takes a deep breath: "I appreciate your willingness to listen to me and help me get this done sooner rather than later. Also, thanks for letting us make last minute changes last time."

"Glad you brought that up, Bill. Last minute changes are costly ones to make. So, we ask that you follow our procedures. Because the final binding and printing go outside, any last minute changes after the blueline is approved is an expensive proposition. You were out of town when your assistant asked to add two pages of programs. My department ate the supplier's extra costs. When that happens, we go over budget and eat into our profits from external sales which pay for services to internal customers like you. Can we count on the training department to follow the procedures outlined in the publications brochure?"

Dialoguing, as this example demonstrates, is a collaborative process where both parties share their meaning and inquire about their individual perceptions. This process helps to ensure that the transaction will be civil, non-confrontational and supportive of getting everyone's needs met.

Posted Guidelines

Here are some guidelines to support the customer-supplier provider partnership.

- Maintain a dialogue to build trust and openness; ask questions, suspend judgement
- Listen effectively to improve mutual understanding; share information, questions and concerns
- Work jointly to set goals, establish boundaries and plan action steps
- Streamline the time it takes to deliver services and material through action teams
- For the teams, select key people who are accountable for maintaining product and service quality
- Publish procedures so that suppliers and other parties can commit to achieving quality checkpoints
- Monitor changes to the customer service process, people, and tasks so you can make the necessary adjustments
- Use quality assurance and measurement control to attain and maintain standards
- Apply two-way feedback each step along the way

Clearly, customer service, especially among departments in organizations, has to be a two-way approach to be beneficial for both customer and service provider.

Using Art to Explore a Metaphor for the Training Process

Darren Short
Office for National Statistics, London, England

The poster offers the visual metaphor of the transition of ice to water to steam for the potential effects of the training process on individuals. Conference attendees are invited to interpret the work, contrast the metaphor with their own, and comment in the journal attached to the easel. This short paper is a summary justification of the poster using references from the fields of HRD, adult education, and art.

Metaphor in Art and HRD

In non-visual forms, metaphors offer highly graphic mental pictures that enable the transformation of words from a context in which their use is literal to a context in which they provide an analogy (Palmer & Dunford, 1996). Metaphors therefore have the potential to make the complex simple, aid understanding, and provide ways of seeing and thinking, for example about organizations (Morgan, 1986). They are therefore a powerful tool for aiding and extending the understanding of a complex issue. Within organizations, metaphors promote communication of complex phenomena through creative symbolism (Brink, 1993). In many cases, art provides the source of those metaphors, and Palmer and Dunford (1996) referred to fifteen articles where metaphorical insights into either the practice or the teaching of management had been drawn from the arts, including from storytelling and literature, music, film, drama/theater, and art. Art in-turn also has a strong historical association with metaphor (Ades, 1994).

Building on the historical role of metaphor in both art and organizational issues, and the links between the two, the poster provides a visual representation of a proposed new metaphor appropriate to HRD. That metaphor focuses on the potential effects of the training process and is offered to promote discussion of its suitability and utility, and to provide new ways of seeing.

Ice, Water, and Steam

The journey metaphor is one of the most common, if not one of the central metaphors of Western culture, and is often used in an organizational context (Lackoff & Johnson, 1980). The metaphorical journey of the training process is portrayed in the poster using photographic transitional images of ice, water, and steam.

The pre-training or early-training individual is portrayed by a cube of ice. Cubes are a frequent metaphor in art and have been used to convey: the monotony of modular-determined units, the very opposite of freedom, and the equality of parts (Gablik, 1994); plasticity and lacking free-flowing (Green, 1994); and the suppression of the intimacy of detail (Fineberg, 1995).

Ice, or at least the concept of freezing, can be found in both adult education and HRD literature. Sugarman (cited in Merriam & Caffarella, 1991) described seven stages that accompany a wide range of transitions in adult education, the first being immobilization or a sense of being overwhelmed or frozen; Lewin also used freezing in his three stages of learning (described in Rothwell, Sullivan, & McLean, 1995).

Artistically, everyday objects are often used to reduce an artwork's appeal to strong emotions by reducing the association to the human figure (Green, 1994). Similarly, mass-produced goods are used by some artists to emphasize functionality rather than individuality (Lucie-Smith, 1994). Ice can be said to fall within both categories.

Combining the metaphorical properties of cubes and ice marries the monotony and suppression of the cube with the reduced emotion and hidden individuality of the ice. That combining produces an object indistinguishable from others of its kind and valued only for the function it performs. The symbolism is of a non-humanistic view of the pre-training individual who lacks freedom, has suppressed individuality, whose true potential has not yet been realized, and who is valued for the function performed.

The change of state from ice to liquid to steam symbolizes the transition of an individual through the training process. That change is depicted through a three dimensional poster – the third dimension being time (a similar argument to the fourth dimension used by constructivist sculptors - Barrett, 1994). Art has made little

Copyright © 1999 Darren Short

metaphorical use of steam, and so its use in the poster is not grounded in past works. Nevertheless, steam does have properties that make its use appropriate in the proposed metaphor and poster. Steam differs from ice in many respects, and water is a mid-point on the journey. Those differences include: the position of steam as the realized potential of both ice and water - steam is at a higher 'state' of being; steam's greater freedom and reduced restriction compared with the fixed position of ice or a container of water; steam's potential for impact over a far greater area and for impact on a greater number of people; steam's potential as a power-source; and steam's propensity to rise up whereas water and ice both fall (although not for ice in water).

The metaphor also raises deeper issues for discussion, such as: how to retain steam in its higher state; how to renew water to produce more steam; how to harness the potential of steam; how to renew the heat source; the importance of the energy required to heat the ice and water; and so on.

Of course, like all metaphors, this one is not perfect. As Palmer and Dunford (1996) stated, "it is important to recognize that any metaphor can only provide a partial insight. Two situations cannot be perfectly analogous without becoming one and the same, therefore understanding a situation via a transferred image must always be less than comprehensive" (pp. 8-9). In the case of the proposed metaphor, other properties of ice, water, and steam exist which would not fit comfortably with a description of the effects of training, for example steam tends to just disappear and it is usually more desirable to keep water in its existing state than to take it to its higher state. Nevertheless, similar problems exist with most metaphors, but their utility stems from their ability to open up new ways of seeing old situations (Lackoff & Johnson, 1980). The test for the proposed metaphor is whether or not it triggers such new ways of seeing.

Justification for the Presentation Style

The poster provides little detail other than of the main object. As Matisse stated, "all that is not useful in the picture is detrimental... for superfluous details would in the mind of the beholder, encroach upon the essential elements" (cited in Whitfield, 1994, p.24). The limited detail forces the viewer's focus away from the process, the heat source, to concentrate instead on the consequences of the process. For the same reasons, color is an unnecessary distraction from the process effects (and therefore follows on from some of the justifications used for the monochrome landscapes of Braque or paintings of Kline or de Kooning).

The use of photographs rather than painting or drawing reflects the increasing use of photography in art (Wolf, 1989) and the view of camerawork as not only reflecting the truth but also, by alterations or inaccurate reporting, as having the potential to report what else things are or might be (White, 1989). The photograph as art has the special attraction of combining the visual rhetoric of the picture with the actuality of the photograph (Weaver, 1989). The poster is therefore in-line with the artistic use of photography, seeks to show what might be as well as what is, and seeks to combine the reality of the photograph with the alternatives offered by visual metaphor.

Finally, in using the transition between natural states, the photographer has relinquished control of the work, letting the changing object determine the form of the art, as in the work of Huebler and Dibbet (Smith, 1994). The influence of natural laws on the training process is implied.

Questions for Conference Attendees

At the conference, a second poster will be used to prompt attendees to reflect on the one described in this paper. It will contain key words and questions, and attendees will be invited to comment on the posters in an attached journal. The three main prompting questions will be:

- How does the proposed metaphor provide you with new ways of seeing the effects of the training process?
- What do you gain from using the proposed metaphor?
- What other training process metaphors are you willing to share with the AHRD community?

ACADEMY OF HUMAN RESOURCE DEVELOPMENT

Standards on Ethics and Integrity

PREFACE [1]

Human Resource Development (HRD) as a profession is an interdisciplinary field. It is focused on systematic training and development, career development, and organization development to improve processes and enhance the learning and performance of individuals, organizations, communities, and society.

An HRD professional is an individual engaged in HRD-related practice, research, consulting, and instruction/facilitation/teaching. As HRD professionals, members of the Academy of Human Resource Development (AHRD) strive to create a body of research-based knowledge. They apply that knowledge to human resource development in various organizational, community, and societal settings while functioning as professors, researchers, consultants, administrators, analysts, trainers, performance improvement technicians, and other practitioners.

A central goal of AHRD professionals practicing in the arenas of training and development, organizational development, and career development is to broaden understanding of the complex activities involved in assisting individuals or organizations to improve their ability to develop themselves.

---

[1] Ethical statements and/or standards from several organizations were reviewed during the development of these Standards on Ethics and Integrity for the Academy of Human Resource Development. These organizations are the American Educational Research Association, American Evaluation Association, American Management Association, American Psychological Association, Society of Human Resource Management, and the Organization and Human Systems Development (OD-HSD) group.

PURPOSE

The purpose of these Standards on Ethics and Integrity for the Academy of Human Resource Development is to provide guidance for HRD professionals engaged in practice, research, consulting, and instruction/facilitation/teaching. Although these principles are aspirational in nature, they provide standards of conduct and set forth a common set of values for HRD professionals. Adherence to these standards builds ethical, professional, and research accomplishments for HRD professionals and adds to the further definition and clarification of HRD as a profession. The primary goal of these standards is to define more clearly a holistic balance among individuals, groups, organizations, communities, and societies whenever conflicting needs arise.

To ensure this balance, these Standards identify a common set of values upon which HRD professionals build their professional and research work. In addition, the Standards clarify both the general principles and the decision rules that cover most situations encountered by HRD professionals. The Standards have as their primary goal the welfare and protection of the individuals, groups, and organizations with whom HRD professionals work.

Adherence to a dynamic set of Standards for a professional's work-related conduct requires a personal commitment to the lifelong effort to act ethically; to encourage ethical behavior by students, supervisors, employees, and colleagues as appropriate; and to consult with others, as needed, concerning ethical problems. It is the individual responsibility of each professional to aspire to the highest possible standards of conduct. Such professionals respect and protect human and civil rights and do not knowingly participate in or condone unfair discriminatory practices.

In providing both the universal principles and limited decision rules to cover many situations encountered by HRD professionals, this document is intended to be generic and is not intended to be a comprehensive, problem-solving, or procedural document. Specific statements and solutions for special HRD-related situations will emerge from the development of case studies appended to this Standard. Each professional's personal experience as well as his or her individual and cultural values should be used to interpret, apply, and supplement the principles and rules set forth in these pages.

GENERAL PRINCIPLES

A. Competence

HRD professionals strive to maintain high standards of competence in their work. They recognize the boundaries of their particular competencies and the limitations of their expertise. They provide only those services and use only those techniques for which they are qualified by education, training, or experience.

Professionals realize that the competencies required when working with various groups and organizations differ. In those areas in which recognized professional standards do not yet exist, HRD professionals exercise careful judgment and take appropriate precautions to protect the welfare of those with whom they work. They maintain knowledge of relevant research and professional information related to the services they render, and they recognize the need for ongoing education. They use appropriate research and professional, technical, and administrative resources.

B. Integrity

HRD professionals seek to promote integrity in their research, teaching, and practice. They are honest, fair, and respectful of others. In describing or reporting their qualifications, services, products, fees, research, or teaching, they do not make statements that are false, misleading, or deceptive. They strive to be aware of their own belief systems, values, needs, and limitations and the effect of these on their work. To the extent feasible, they attempt to clarify for relevant parties the roles they are performing and to function appropriately in accordance with those roles. They avoid potentially conflicting relationships.

C. Professional Responsibility

HRD professionals uphold professional standards of conduct, clarify their professional roles and obligations, accept appropriate responsibility for their behavior, and adapt their methods to the needs of different populations. They consult with, refer to, or cooperate with other professionals and institutions to the extent needed to serve the best interests of their clients.

Their moral standards and conduct are personal matters to the same degree as is true for any other person, except as their conduct may compromise their professional responsibilities or reduce the public's trust in their profession. They are concerned about the ethical compliance of the professional conduct and research of their colleagues. When appropriate, they consult with colleagues in order to prevent or avoid unethical conduct.

D. Respect for People's Rights and Dignity

HRD professionals accord appropriate respect to the fundamental rights, dignity, and worth of all people. They respect the rights of individuals to privacy, confidentiality, self-determination, and autonomy, mindful that legal and other obligations may lead to inconsistency and conflict with the exercise of these rights. They are aware of cultural, individual, and role differences, including those due to age, gender, race, ethnicity, national origin, religion, sexual orientation, disability, language, and socioeconomic status. They try to eliminate the effect on their work of biases based on those factors, and they do not knowingly participate in or condone unfair discriminatory practices.

E. Concern for Others' Welfare

HRD professionals seek to contribute to the welfare of those with whom they interact professionally. In their professional actions, they weigh the welfare and rights of their clients. When conflicts occur among professionals' obligations or concerns, they attempt to resolve these conflicts and to perform their roles in a responsible fashion that avoids or minimizes harm. They are sensitive to real and ascribed differences in power between themselves and others, and they do not exploit or mislead other people during or following their professional relationships.

F. Social Responsibility

HRD professionals are aware of their professional responsibilities to the community, the society in which they work and live, and the planet. They work to minimize adverse affects on individuals, groups, organizations, societies, and the environment. They understand that a healthy economy, healthy organizations, and a healthy ecosystem are intricately interconnected. They apply and make public their knowledge of learning and performance in order to contribute to human welfare. They are concerned about and work to mitigate the causes of human suffering.

When undertaking research, they strive to advance human welfare, human development, and a sustainable future. They try to avoid misuse of their work. They comply with the law and encourage the development of laws and social policy that serve the interests of their clients, the public, society, and the environment. They are encouraged to contribute a portion of their professional time to enhance societal, organizational, human, and environmental development for little or no personal gain or advantage.

STANDARDS

1. GENERAL STANDARDS

These General Standards apply to the professional and research activities of HRD professionals.

Boundaries of Competence	a. HRD professionals provide services, teach, and conduct research only within the boundaries of their competence, based on their education, training, supervised experience, or appropriate professional experience. b. HRD professionals provide services, teach, or conduct research involving new areas or new techniques only after first undertaking appropriate study, training, supervision, and/or consultation with persons who are competent in those areas or techniques. c. In those emerging areas in which generally recognized standards for preparatory training do not yet exist, HRD professionals nevertheless take reasonable steps to ensure the competence of their work and to protect clients, students, research participants, and others from harm.
Maintenance of Expertise	HRD professionals maintain a reasonable level of awareness of current research and professional information in their fields of activity and undertake ongoing efforts to maintain competence in the skills they use.
Basis for Research and Professional Judgments	HRD professionals rely on research and professionally derived knowledge when making research or professional judgments or when engaging in scholarly or professional endeavors.
Description of HRD Professionals' Work	a. When HRD professionals provide services to an individual, a group, or an organization, they make available appropriate information beforehand about the nature of such services and, later, appropriate information on results and conclusions. b. If HRD professionals will be precluded by law or by organizational roles from providing such information to particular individuals or groups, they so inform those individuals or groups at the outset of the service.

Respecting Others	a. Where differences of age, gender, race, ethnicity, national origin, religion, sexual orientation, disability, language, or socioeconomic status significantly affect the work of HRD professionals as related to particular individuals or groups, HRD professionals obtain the training, experience, consultation, or supervision necessary to ensure the competence of their services, or they make appropriate referrals. b. In their work-related activities, HRD professionals respect the rights of others to hold values, attitudes, and opinions that differ from their own.
Nondiscrimination	In their work-related activities, HRD professionals do not engage in unfair discrimination based on age, gender, race, ethnicity, national origin, religion, sexual orientation, disability, socioeconomic status, or any basis proscribed by law.
Exploitative Relationships	a. HRD professionals do not exploit persons over whom they have supervisory, evaluative, or other authority such as students, supervisees, employees, research participants, and clients. b. HRD professionals do not engage in sexual relationships with students or supervisees in training over whom the HRD professional has evaluative or direct authority, because such relationships are too likely to impair judgment or to be exploitative. c. HRD professionals do not engage in sexual harassment. d. HRD professionals accord sexual-harassment complainants and respondents dignity and respect. e. HRD professionals do not knowingly engage in behavior that, based on factors such as a person's age, gender, race, ethnicity, national origin, religion, sexual orientation, disability, language, or socioeconomic status, is harassing or demeaning to the persons with whom they interact in their work.
Misuse of HRD Professionals' Work	If HRD professionals learn of misuse or misrepresentation of their work, they take reasonable steps to correct or minimize the misuse or misrepresentation.

Multiple Relationships

a. In many communities and situations, it may not be reasonable or feasible for HRD professionals to avoid social or other nonprofessional contacts with persons such as clients, students, supervisees, or research participants. They must always be sensitive to the potential harmful effects of such contacts on their work and on those persons with whom they deal. An HRD professional refrains from entering into or promising a personal, research, professional, financial, or other relationship with such persons in the following situations: (1) when the relationship might impair the HRD professional's objectivity; (2) when it might interfere with the effective performance of his or her function; or (3) when it might harm or exploit the other party.

b. Likewise, whenever feasible, an HRD professional refrains from taking on professional or research obligations when preexisting relationships would create a risk of such harm.

Consultations and Referrals

a. With appropriate consent and subject to other relevant considerations, including applicable law and contractual obligations, HRD professionals arrange for appropriate consultations and referrals based principally on the best interests of their clients.

b. When appropriate, HRD professionals cooperate with other professionals in order to serve their clients effectively and appropriately.

c. The referral practices of HRD professionals are consistent with the law.

Third Party Request for Services

a. When agreeing to provide services to a person or entity at the request of a third party, the HRD professional, at the outset of the service, clarifies to the extent feasible the nature of the relationship with each party. This clarification includes the professional's role (such as organizational consultant, trainer, or evaluator), the probable uses of the services provided or the information obtained, and the fact that there may be limits to confidentiality.

b. If there is a foreseeable risk of being called upon to perform conflicting roles because of the involvement of a third party, the HRD professional clarifies the nature and direction of his or her responsibilities, keeps all parties appropriately informed as matters develop, and resolves the situation in accordance with these Standards.

Delegation to and Supervision of Subordinates

a. HRD professionals delegate to their employees, supervisees, and research assistants only those responsibilities that such persons can reasonably be expected to perform competently on the basis of their education, training, or experience, either independently or with appropriately provided supervision.

b. HRD professionals provide proper training and supervision to their employees or supervisees and take reasonable steps to see that such persons perform services responsibly, competently, and ethically.

c. If institutional policies, procedures, or practices prevent fulfillment of this obligation, HRD professionals attempt to modify their role or to correct the situation to the extent feasible.

Documentation of Professional and Research Work

a. HRD professionals appropriately document their professional and research work in order to facilitate the provision of services later by them or by other professionals, to ensure accountability, and to meet other requirements of institutions or the law.

b. When HRD professionals have reason to believe that records of their professional services will be used in legal proceedings involving recipients of or participants in their work, they have a responsibility to create and maintain documentation in the kind of detail and quality that would be consistent with reasonable scrutiny in an adjudicative forum.

Records and Data

HRD professionals create, maintain, disseminate, store, retain, and dispose of records and data relating to their research, practice, and other work in accordance with the law and in a manner that permits compliance with the requirements of these Standards.

Fees and Financial Arrangements

a. As early as is feasible in a professional or research relationship, the HRD professional and the client reach an agreement specifying the compensation and the billing arrangements.

b. HRD professionals do not exploit recipients of services or payers with respect to fees.

c. HRD professionals' fee practices are consistent with the law.

d. HRD professionals do not misrepresent their fees.

Accuracy in Reports to Payers and Funding Sources

In their reports to payers for services or to sources of research funding, HRD professionals accurately state the nature of the research or service provided, the fees or charges, and, where applicable, the identity of the provider and the findings.

Referrals and Fees

When an HRD professional pays, receives payment from, or divides fees with another professional other than in an employer-employee relationship, the payment to each is based on the services (consultative, administrative, or other) provided and is not based on the referral itself.

2. RESEARCH AND EVALUATION

Research and Evaluation in a Professional Context

a. HRD professionals warrant their research and evaluation conclusions adequately in a way consistent with the standards of their own theoretical and methodological perspectives.

b. HRD professionals' reports and statements are based on information and techniques that are sufficient to provide appropriate substantiation for their findings.

c. HRD professionals design, conduct, and report research and evaluation in accordance with recognized standards of research competence and ethics. They keep themselves well informed in both their own and competing paradigms, where those paradigms are relevant to their research, and they continually evaluate the criteria of adequacy by which research is judged.

d. HRD professionals plan their research to minimize the possibility of misleading results.

e. HRD professionals consult with institutional review boards and use committees, peer consultations, and other avenues to consider the ethical acceptability of their research.

f. HRD professionals take reasonable steps to protect the rights and welfare of human subjects and other persons affected by the research.

Data Collection

a. HRD professionals who develop and conduct research with tests and other assessment techniques use research procedures and current professional knowledge for test and research design, standardization, validation, reduction or elimination of bias, and recommendations for use.

b. HRD professionals attempt to identify situations in which particular assessment techniques or norms may be applicable or may require adjustment in administration or interpretation because of factors such as individuals' gender, age, race, ethnicity, national origin, religion, sexual orientation, disability, language, or socioeconomic status.

c. HRD professionals are careful to interfere with the participants or milieu from which data are collected only in a manner that is warranted by an appropriate research design and that is consistent with research investigation.

Responsibility	a. HRD professionals conduct research competently and with due concern for the dignity and welfare of the participants. b. Researchers and assistants are permitted to perform only those tasks for which they are trained and prepared. c. HRD professionals consult those with expertise concerning any diverse population under investigation or that is most likely to be affected.
Compliance with Law and Standards	HRD professionals plan and conduct research in a manner consistent with federal and state laws and regulations, as well as with professional standards governing the conduct of research, particularly those standards governing research with human subjects.
Institutional Approval	HRD professionals obtain from host institutions or organizations appropriate approval prior to conducting research, and they provide accurate information about their research proposals. They conduct the research in accordance with the approved research protocol.
Informed Consent	a. When obtaining research participants' informed consent, HRD professionals use language that is reasonably understandable to the participants, and professionals then document the informed consent. b. HRD professionals inform participants of the nature of the research; they inform participants that they are free to participate or to decline to participate or to withdraw from research; they explain the foreseeable consequences of declining or withdrawing; they inform participants of significant factors that may be expected to influence their willingness to participate (such as risks, discomfort, adverse effects, or limitations on confidentiality). c. When HRD professionals conduct research with students or subordinates, they take special care to protect the prospective participants from adverse consequences of declining or withdrawing from participation. d. When research participation is an educational course requirement or an opportunity for extra credit, the prospective participant is given the choice of equitable alternative activities. e. HRD professionals obtain informed consent from research participants prior to filming or recording them in any form, unless the research involves simply naturalistic observations in public places and it is not anticipated that the recording will be used in a manner that could cause personal identification or harm. f. HRD professionals inform research participants of any anticipated sharing or further use of personally identifiable research data and of the possibility of unanticipated future uses.

g. HRD professionals provide a prompt opportunity for participants to obtain information about the nature, results, and conclusions of the research and attempt to correct any misconceptions that participants may have.

h. HRD professionals take reasonable measures to honor all commitments they have made to research participants.

Incentives to Participants

a. When offering professional services as an inducement to obtain research participants, HRD professionals make clear the nature of the services as well as the risks, obligations, and limitations.

b. HRD professionals do not coerce participation in research projects by offering excessive or inappropriate inducements.

Deception in Research

a. HRD professionals do not conduct a study involving deceptions unless they have determined that the use of deceptive techniques is justified by the study's prospective research, educational, or applied value and that equally effective alternative procedures (without deception) are not feasible.

b. HRD professionals never deceive research participants about significant aspects that would affect their willingness to participate, such as unpleasant emotional experiences, discomfort, or physical risk.

c. Any other deception that is an integral feature of the design and conduct of an experiment must be explained to participants as early as feasible, preferably at the conclusion of their participation, but no later than the conclusion of the research.

Interpretation and Explanation of Research and Evaluation Results

a. When interpreting research and evaluation results, including computer-generated results, HRD professionals take into account the factors that reduce the accuracy of interpretations. They indicate any significant reservations they have about the accuracy or limitation of their interpretations.

b. Unless the nature of the relationship is clearly explained in advance to the person being assessed and precludes an explanation of results (as in some organizational consulting or pre-employment screening), HRD professionals ensure that an explanation of the results is provided in language that is reasonably understandable to the person assessed. Regardless of whether the scoring and interpretation are done by the professional, by assistants, or by automated or other outside services, professionals take reasonable steps to ensure that an appropriate explanation of results is given.

c. HRD professionals retain responsibility for the appropriate application, interpretation, and use of instruments, whether they score and interpret such tests themselves or use automated or other services.

d. HRD professionals do not make recommendations based on data that is outdated or obsolete for the current purpose.

3. Advertising and Other Public Statements

Definition of Public Statements

HRD professionals comply with these Standards in public statements relating to their professional services, products, or publications or to the field of human resource development. Public statements include, but are not limited to, paid or unpaid advertising, brochures, printed matter, directory listings, personal resumes or curricula vitae, interviews or comments for use in media, communications via computer technology, statements in legal proceedings, lectures and public oral presentations, and published materials.

Statements by Others

a. An HRD professional who engages others to create or place public statements that promote his or her professional practice, products, or services retains professional responsibility for such statements.

b. In addition, HRD professionals make reasonable efforts to prevent others whom they do not control (such as publishers, sponsors, organizational clients, and representatives of the print or broadcast media) from making deceptive statements concerning human resource development practice or professional activities.

c. If HRD professionals learn that deceptive statements about their work have been made by others, HRD professionals make reasonable efforts to correct such statements.

d. HRD professionals do not compensate employees of press, radio, television, or other communication media in return for publicity in a news item.

e. A paid advertisement related to the HRD professional's activities must be identified as such, unless that is already apparent from the context.

Avoidance of False or Deceptive Statements

HRD professionals claim as credentials for their work only those degrees that were earned from an accredited educational institution.

Media Presentations

When HRD professionals provide advice or comment by means of public lectures, demonstrations, radio or television programs, prerecorded tapes, printed articles, mailed material, or other media, they take reasonable precautions to ensure that (1) the statements are based on appropriate human resource development literature and practice, (2) the statements are otherwise consistent with these Standards, and (3) the recipients of the information are not encouraged to infer that a relationship has been established with them personally.

4. PUBLICATION OF WORK

Reporting of Research and Evaluation Results	a. HRD professionals do not fabricate data or falsify results in their publications. b. If HRD professionals discover significant errors in their published data, they take reasonable steps to correct such errors with a correction, retraction, erratum, or other appropriate publication means.
Plagiarism	HRD professionals do not present substantial portions or elements of another's work or data as their own, even if the other work or data source is cited occasionally.
Publication Credit	a. HRD professionals take responsibility and credit, including authorship credit, only for work they have actually performed or to which they have contributed. b. Principal authorship and other publication credits accurately reflect the relative professional contributions of the individuals involved, regardless of their relative status. For example, mere possession of an institutional position, such as department chair, does not necessarily justify authorship credit. Minor contributions to research or to writings for publication are appropriately acknowledged in footnotes, for instance, or in an introductory statement. c. A student is usually listed as the principal author on any multiple-authored article that is substantially based on the student's dissertation or thesis.
Duplicate Publication of Data	HRD professionals do not publish as original work those articles that have been previously published. This does not preclude republishing work accompanied by proper acknowledgment.
Release of Data	After research or evaluation results are published, HRD professionals do not withhold the data on which their conclusions are based from other competent professionals who seek to verify the substantive claims through re-analysis and who intend to use such data only for that purpose, provided that the confidentiality of the participants can be protected and that no legal rights concerning proprietary data preclude such release.
Professional Reviewers	When reviewing material submitted for publication, provided for grants, or included in other research and evaluation proposals, HRD professionals who recognize the author(s) of that work respect the confidentiality of these author(s) and their proprietary rights.

Ownership of Intellectual Property

While ideas and other intellectual products may, under suitable circumstances, be viewed as commodities, any arrangements made concerning the production or distribution of ideas or other intellectual products must be consistent with academic freedom and the appropriate availability of intellectual products to scholars, students, and the public. Moreover, when a conflict between the academic and scholarly purposes of intellectual production and the profit from such production arise, preference should be given to the academic and scholarly purposes. Ownership of intellectual products should be based upon the following guidelines:

a. Individuals are entitled to profit from the sale or disposition of those intellectual products they create. They may, therefore, enter into contracts or other arrangements for the publication or disposition of intellectual products and may profit financially from the arrangements.

b. Arrangements for the publication or disposition of intellectual products should be consistent with appropriate public availability and with academic freedom. Such arrangements should emphasize the academic functions of publication over the maximization of profit.

c. Individuals or groups who fund or otherwise provide resources for the development of intellectual products are entitled to assert claims to a fair share of the royalties or other profits from the sale or disposition of those products. Because such claims are likely to be contentious, funding institutions and authors should agree on policies for the disposition of profits at the outset of the research or development project.

d. Authors should not use positions of authority over other individuals to compel them to purchase an intellectual product from which the authors benefit. This standard is not meant to prohibit use of an author's own textbook in a class, but copies should be made available on library reserve or otherwise available so that students are not forced to purchase the book.

5. PRIVACY AND CONFIDENTIALITY

Discussions of the Limits of Confidentiality

a. Permission for electronic recording of interviews is secured from clients.

b. HRD professionals discuss with persons and organizations with whom they establish a professional relationship (1) the relevant limitations on confidentiality, including limitations, where applicable, in organizational consulting, and (2) the foreseeable uses of the information generated through their services.

c. Unless it is not feasible or is contra-indicated, the discussion of confidentiality occurs at the outset of the relationship and thereafter as new circumstances may warrant.

Protection of Confidentiality

a. HRD professionals have a primary obligation and take reasonable precautions to respect the confidentiality rights of those with whom they work or consult, recognizing that confidentiality may be established by law, institutional rules, or professional relationships.

b. In order to minimize intrusions on privacy, HRD professionals include in written and oral reports, consultations, and the like only that information germane to the purpose for which the communication is made.

c. HRD professionals discuss confidential information obtained in consulting relationships or evaluative data concerning clients or students only for appropriate professional purposes and only with persons clearly concerned with such matters.

Maintenance and Ownership of Records

a. HRD professionals maintain appropriate confidentiality in creating, storing, accessing, transferring, and disposing of records under their control, whether these are written, automated, or in any other medium. They maintain and dispose of records in accordance with law and in a manner that permits compliance with the requirements of these Standards.

b. HRD professionals make plans in advance so that confidentiality of records and of data considered confidential is protected in the event of an HRD professional's death, incapacity, or withdrawal from the position or consulting practice.

c. Recognizing that ownership of records and data is governed by legal principles, HRD professionals take reasonable and lawful steps so that records and data remain available to the extent needed to serve the best interests of individual and organizational clients, students, or appropriate others.

Disclosures

a. HRD professionals disclose confidential information without the consent of the individual or organization only as mandated by law or where permitted by law for a valid purpose, such as (1) to obtain appropriate professional consultations, (2) to protect the individual or organization from harm, or (3) to obtain payment for services, in which instance disclosure is limited to the minimum that is necessary to achieve the purpose.

b. HRD professionals also may disclose confidential information with the appropriate consent of the individual or organizational client (or of another legally authorized person on behalf of the client).

Consultations

When consulting with colleagues, (1) HRD professionals do not share confidential information that reasonably could lead to the identification of a client, student, or other person or organization with whom they have a confidential relationship, unless they have obtained the prior consent of the person or organization or they cannot avoid the disclosure, and (2) they share information only to the extent necessary to achieve the purposes of the consultation.

Confidential Information in Databases

a. If confidential information concerning recipients of the HRD professional's services is to be entered into databases or systems of records available to persons whose access has not been consented to by the recipient, then HRD professionals use coding or other techniques to avoid the inclusion of personal identifiers.

b. If a research protocol approved by an institutional review board or similar body requires the inclusion of personal identifiers, such identifiers are deleted before the information is made accessible to persons other than those of whom the research subject was advised.

c. If such deletion is not feasible, then before HRD professionals transfer such data to others or review such data collected by others, they take reasonable steps to determine that appropriate consent of personally identifiable individuals has been obtained.

Use of Confidential Information for Didactic or Other Purposes

a. HRD professionals do not disclose in their writings, lectures, or other pubic media any confidential, personally identifiable information that concerns their individual or organizational clients or other recipients of their services and that was obtained during the course of their work, unless the person or organization has consented in writing or unless there is other ethical or legal authorization to do so.

b. Ordinarily, in such professional presentations, HRD professionals disguise confidential information concerning such persons or organizations so that they are not individually identifiable to others and so that discussions do not cause harm to subjects who might identify themselves in a different or later context.

6. Teaching and Facilitating

Design, Development, Implementation, and Evaluation of Programs

HRD professionals must seek to ensure that their programs, or those in which they participate, are competently designed and developed, provide proper exchanges and experiences during implementation, meet the requirements of the objectives made by the program, and are accurately evaluated.

Descriptions of Programs

a. HRD professionals responsible for such programs seek to ensure that there is a current and accurate description of the program content, goals, and objectives and that the requirements for completion or implementation are clearly specified. This information must be made readily available to all interested parties.

b. HRD professionals seek to ensure that statements concerning their course outlines or program objectives are accurate and not misleading, particularly regarding subject matter to be covered or final outcomes to be achieved. Also, the basis for evaluation of progress, successful completion, or successful implementation are clearly identified to avoid false or deceptive statements.

c. To the degree to which they exercise control, HRD professionals responsible for announcements, catalogs, brochures, advertisements, agendas, or proposed interventions that describe workshops, seminars, non-degree-granting programs, degree-granting programs, or proposed deliverables accurately describe the audience and the intended influence or effect on that audience. All fees involved also must be disclosed.

Accuracy, Objectivity, and Professionalism in Programs

a. No data, information, or knowledge presented in a learning environment is distorted, manipulated, or misused.

b. When teaching or training, HRD professionals recognize the power they hold over students, supervisees, and consultees. Therefore, they make reasonable efforts to avoid engaging in conduct that is personally demeaning or harassing, and they do not engage in conduct that demonstrates a lack of respect for others.

Limitation on Training and Instruction

HRD professionals do not train or instruct individuals in the use of techniques or procedures that require certification, licensure, or expertise if those individuals lack the required prerequisite preparation.

Assessment of Performance

a. HRD professionals establish proper processes to provide feedback about individual performance to students, supervisees, or consultees.

b. HRD professionals base the evaluation of students, supervisees, or consultees on each individual's actual performance relevant to the expected requirements.

7. Resolution of Ethical Issues and Violations

Familiarity with Ethics	HRD professionals have an obligation to be familiar with this document, other applicable standards, and the application of ethics to their profession. Lack of awareness or misunderstanding of an ethical standard is not itself an excuse for unethical conduct.
Informal Resolution of Ethical Violations	If informal resolution appears appropriate and if the intervention does not violate any human rights, attempts to resolve such violations should be made by bringing the issue to the attention of the individual involved.
Conflicting Pressure with Organizational Demands	If a conflict arises between these Standards and organizational demands, the HRD professional should consult with a group of peers who will clarify the nature of the conflict, make known their commitment to these Standards, and, to the extent feasible, seek to resolve the conflict in a way that permits the fullest adherence to these Standards.
Improper Complaints	HRD professionals do not file or encourage others to file complaints that are frivolous and/or are intended to harm the person(s) involved rather than protect the public and the profession.
Resolution of Ethical Issues	When an HRD professional is uncertain whether a particular situation or course of action would violate this document, he or she should consult with other professionals knowledgeable about ethical issues, with the AHRD Ethics Committee, or with other appropriate authorities in order to choose a proper course of action. The AHRD Ethics Committee operates as an advisory group only.
Cooperation with Ethics Committees	HRD professionals cooperate in ethics investigations, proceedings, and the resulting activities of any professional organization involved with performance improvement, training, instruction, or learning. In so doing, they make reasonable efforts to help resolve any issue in a violation of ethics. Failure to cooperate is itself an ethics violation.
